The huge cement foundations for the G.T.P. steel bridge at the Pembina river, which will be the largest bridge on the new Transcontinental system have been completed, and stand ready for commencement of the construction of the steel frame work. There are eight cement piers in the foundations of the bridge, which rival in size those on the G.T.P. bridge at Clover Bar. The bridge itself will be 225 feet in height from the water's edge, and will total an outlay of about $250,000. The steel for the bridge will be shipped in immediately the line reaches the Pembina, which will be in July or August.

Work on the construction of the foundation of the railway bridge at the Macleod river, for which it is expected Gunn & Co. will have the contract will be commenced this fall, and the bridge will be completed next summer. It will be as large as the bridge across the Pembina.

Betts-Brown & Co., Montreal, Secure English Agency.

Betts-Brown & Co., 433 Guy Street, Montreal, have secured the agency for Ontario and Quebec for Schonfield & Co., London, Eng., one of the largest dealers in Great Britain and the continent of Europe, in iron, steel, bar iron, cold steel bars, angles, tees, channels, joists, boiler plates, steel sheets, brass and copper sheets and tubes, etc., steel nuts and bolts, tin plate, terne plates, Russian iron, pig iron, etc., also machine tools and engineering tools of all descriptions of British and foreign make.

Among the machines to which Messrs. Betts-Brown & Co. will give special attention are the patent universal revolving parallel vise, containing seven tools operated by means of a level, and the Vulcan Patent Universal Spring Sledge Hammer, which does away with the striker in the blacksmith shop. Messrs. Betts-Brown & Co. have recently fitted up an up to date machine

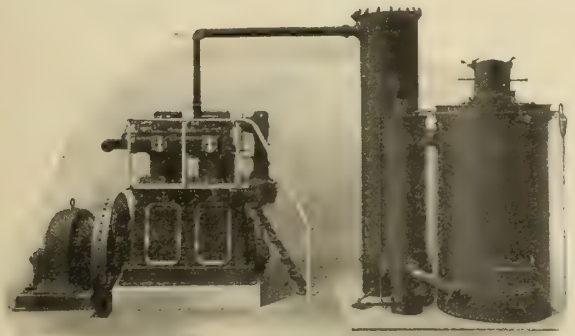
Cheaper Than Steam——And As Reliable

That's the kind of power most progressive manufacturers are looking for. And we can prove to your absolute satisfaction that

Warren Gas Power Plants

are every bit as reliable as the best types of steam engine, and far cheaper than any type of steam engine to operate. This claim is being proven day after day by more than 10,000 h.p. of Warren Engines operating within a few hours' travel of Toronto. No matter what kind of power you are using, it will pay you to send for our literature, which is vitally interesting to every power user.

WRITE FOR IT TO-DAY



Cut shows the Warren Vertical Automatic Gas Engine and Suction Gas Producer, manufactured by the Struthers-Wells Co., Warren, Pennsylvania, in sizes to 300 h.p. Other equally efficient types, from 10 to 1,000 h.p.

THIS SENSITIVE BENCH DRILL

WILL PROVE A MONEY-SAVER IN YOUR SHOP

It is the handiest bench drill on the market for rapid drilling up to 5-16 of an inch. The spindle has two speeds and is driven by a one inch flat belt. It is entirely relieved of belt strain; is counterbalanced by a weight inside of the frame, and is provided with the means for taking up wear.

This machine will last a long time and stand a lot of wear, as only the highest grade material is used in its construction.

shop, equipped to handle all kinds of special machine work, architectural iron work, and general repairs.

Important Hydro-Electric Development.

The Grand Falls Power Company, which is to spend about $5,000,000 in the development of a large hydro-electric plant at Grand Falls, New Brunswick, will purchase the permanent equipment for the plant through its New York office 542 Fifth Avenue. The main power house will be equipped, when completed, with eight units of 10,000 h.p. capacity each. In addition to the large amount of power equipment that will be purchased for this installation, it is likely that the company will purchase a good sized equipment of machine tools for the machine shop it will be necessary to maintain in order to take care of so large an installation of power equipment. The power plant will be situated near the C.P.R., about 2 miles north of St. John and about 2 miles east of the State of Maine, and substations and long distance transmission lines will be established to distribute current in both New Brunswick and Maine. Work of construction has already been started by the contractor, Frank B. Gilbreth, 34 West Twenty-sixth Street, New York, who will purchase a great deal of additional equipment for carrying out the contract. The machine tools for the contractor's repair shop will be placed within the next two or three months.

Canadian Machine Tool Markets

ST. JOHN.

St. John's export trade is increasing very materially. Up to Saturday April 17, the exports to Great Britain and South Africa in the winter steamers amounted to $21,118,510 which is an increase of $526,114 over the same number of steamers a year ago. Indications point to 1908-09 being the banner season and the total value is expected to reach the $25,000,000 mark.

The export of lumber to the United States for the quarter ending March 31, 1909, is the largest in the port's history. The value of the product of American logs in that period is given as $224,881.99 as compared with $42,539.32 for the corresponding period in 1908. The total value of exports to the United States for the March quarter 1909 was $858,716.39 as compared with $280,700.21 in 1908, a gain for this year of $578,016.18. The exports of lumber to transatlantic ports for the first quarter this year show a falling off of 7,500,000 feet in deal shipments while there is a slight increase in the birch timber trade.

WINNIPEG.

The Winnipeg Industrial and Development Bureau, which has been recently formed here, has booked many enquiries from manufacturers during the past few days, regarding the outlook of opening industries in this city. These enquiries cover many branches of manufacturing.

A Glasgow house proposes to open a Canadian branch for the manufacture of fire fighting apparatus; two agricultural implement firms state that they wish to get more closely in touch with the western Canada market; three men who have worked in the west for eastern concerns propose to open a factory for the manufacture of ornamental iron and brass work, and metallic office specialties; one firm proposes to start a shop for making hardware specialties and kitchen utensils; and two firms manufacturing gasoline and gas engines propose a Canadian factory, not only for the Canadian trade, but to take advantage of the preferential duty with the British colonies, with whom they already have a heavy business. In addition to these there are manufacturers of cotton gloves, traction engines of the "caterpillar" type and similar concerns looking for an opening.

A recognition of the fact that there is at present in the Canadian west a considerable amount of capital for industrial development, has had much to do with the interest being taken. If this capital can be invested in legitimate manufacturing industries, outside concerns feel that not only will it give good returns, but it will help materially toward the development of the country. A committee of the bureau has charge of these enquiries and wherever possible makes suggestions as to location or the securing of funds.

The Stuart Machinery Co., the large machine jobbing firm of this city, report a mammoth trade this spring in milling machinery. They are recovering from a $25,000 fire sustained on March 18th, in which they lost $5,000 worth of belting alone and many thousands of dollars worth of small tools, and wood equipped machinery. They will erect an up-to-date office and warehouse this coming season at a rather advanced figure. The Fort Francis door and sash factory is being equipped at the present time with milling machinery from the Stuart house. Peter Lyall, the famous Canadian contractor, is also receiving power machines, and electrical generators from the Stuart Co. for the Union depot construction work.

A greater part of the month of March was spent by representatives of the allied trades of the C.P.R. mechanics in preparing schedules to be submitted to the company's officials. The conference was held in Winnipeg, although mechanics in Montreal and Vancouver were meeting at the same time and submitting suggestions to the Winnipeg body.

The chief problems which faced the mechanics were, proper representation on the conciliation board, the restoration of rights to senior employes, and the matter of union shops.

The company received the mechanics' appeals very favorably, and passed upon the various petitions with practically no opposition from any member present.

The threshing machine business has not opened up well this spring in western Canada. All companies are working hard to land orders for the fall business, but they come in slowly.

Many companies report extensive sales for ploughing engines, and up-to-date this is the greatest part of the business which has thus far been done.

The late spring has seriously impeded the sale of threshing machinery and if the season is progressive there is no doubt that the trade will be good during the summer. It will depend largely upon the crop outlook as to whether there will be increased sales. The Sawyer & Massey company report the outlook good from the fact that the acreage under cultivation is materially increased.

Although thresher companies endeavor as much as possible to secure orders months ahead of time, yet many farmers who contemplate buying will not do so until the threshing season opens, when machines can be had conveniently from local points. It has often been the case also, where orders were placed early, that when the crop outlook became discouraging the orders would be cancelled.

Among the recent developments in the machine repair shop business in this city is that of electrical repair shops which [illegible] during the past few months. The James Stuart Electric Company have the largest and most complete shop in the city. It may be safely stated that thus far it has not been a highly remunerative branch of work, but under careful management it can be put upon a paying basis.

The difficulties in running a shop of this kind are these: The special machinery and tools required are very expensive in comparison with the volume of business to be done. The skill required to do the work necessitates high wages for the workmen who can do a fine piece of work in a short time and are consequently idle most of the time. To offset this second feature the above named company have adopted the system of paying high rates by the hour. In this way men are not continually engaged, but are only engaged when there is work to be done.

For the past few months motor repairs and new installations have shown a marked increase and little slack time has occurred. This condition will no doubt continue, and at any rate the management are quite certain that as electrical work becomes more popular in the growing city, it will become an extensive industry.

The Allis-Chalmers-Bullock Co., of Winnipeg, report a splendid outlook for the coming season in the machine trade. They are at present equipping the power plants of Calgary and Nelson with steam and electrical engines and machinery. A few days ago the company completed the equipment of the Maple Leaf flour mills at Kenora, with milling machinery and power plant. This is one of the largest mills west of Fort William, having a capacity of 2500 barrels per day.

H. A. R. Macdonald, secretary of the Portage La Prairie Board of Trade was in the city a few days ago conferring with manufacturers with a view to having them establish quarters in Portage La Prairie. He is very enthusiastic over the outlook and declares that the present year promises to be very successful. A by-law was submitted to the citizens a few days ago meeting certain requirements of the Waterloo Manufacturing Company, conditional upon locating in Portage La Prairie. The terms of the company were quite satisfactory to the city council and the by-law will unquestionably pass with a large majority.

There will be a third telephone exchange built during the coming summer in the western part of the city to accommodate the rapidly growing residental section of this part.

The Williams Machinery Company whose premises are now on Notre Dame Street, in Winnipeg, are having plans prepared for a four storey warehouse estimated to cost $40,000 which will be erected in another part of the city. The material used will be brick and re-inforced concrete. The foundation will be built to sustain six storeys to which height it is expected the warehouse will eventually be carried.

D. B. Hanna, third vice-president of the C. N.R., who was in the city a few days ago on a business trip, said: "Every car works in Canada is now busy manufacturing cars for the Canadian Northern Railway, and there will be $2,000,000 worth of equipment for the western lines delivered before the harvest season. Of the new equipment there will be 2,000 box cars and a large number of refrigerator and passenger coaches."

A. HARKNESS.

TORONTO.

Business in the machine tool line is very good, a moderate amount of new work cropping out in different lines, wood working machinery, sawmills, machine tools, etc. The trade give encouraging views regarding the future.

A representative of Canadian Machinery made a personal canvass of a number of large dealers in western Ontario recently and all gave hopeful reports. In Galt the many manufacturers of machine tools were busy and were turning out some special lines in addition to regular machines.

The wood working industry is in good shape and McGregor, Gourlay Co., and Cowan & Co., were busy. The latter had in course of construction several carloads of machine tools for the Canadian Fairbanks.

The boiler industry has picked up during the past three weeks and there is a happier tone in the builders' reports. The boiler business is the last to feel the upward movement. The greatest demand in the boiler line so far is for return tubular boilers and a great number of these are being shipped to the West.

MONTREAL.

A cheerful tone underlies nearly every industrial line, all feeling the effects of the increased trade. The dealers in machine tools report some good orders. The wood working tools are selling well and one dealer is keeping a western Ontario manufacturer busy with orders.

A number of new machine shops are starting in Quebec, which will require equipment but these orders will all be small.

There has been a marked improvement in steam specialties. There is an increase in the number of inquiries and there is a decided gain in the number of orders. The increase in building operations has stimulated this and it is expected that a still greater increase will follow.

CATALOGUES.

STEEL TAPES—From L. S. Starrett Co., Athol, Mass., booklet describing steel tapes manufactured by them.

FRICTION CLUTCH—Carlyle Johnson Machine Co., Hartford, Conn., full description of their friction clutches and their application.

MOTORS—Motor Talks No. 4, containing table for finding the current in a 3-phase circuit from Westinghouse Electric & Mfg. Co., Pittsburg, Pa.

ROLLER BEARINGS—From Hyatt Roller Bearing Co., Section No. 300M describing and giving prices of Hyatt standard bushings, high duty type.

RECORDERS—Series of papers on the manufacture of pressure gauges, master clocks, recorders, etc., from the Industrial Instrument Co., Foxboro, Mass.

TOOL AND CUTTER GRINDER—Pamphlet from the Stevens Co., Galt, give specifications and general description of their Universal grinder and list of attachments.

FRICTION CLUTCHES—From Carlyle Johnson Mch. Co., Hartford, Conn., catalogue D 1909. The clutches for machines, countershafts and line shafts are described.

MACHINE TOOLS—Catalogue from Burke Machinery Co., Cleveland, Ohio, describing milling machines, drill press, tapping machines, cutting off saws and saw grinders.

SHAPERS—From Gould & Eberhardt, Newark, N.J., catalogue of high duty shapers and attachments. The prominent features of the shapers are described and well illustrated.

and Get Free Booklet, which "Says Things"

J. E. THOMPSON,
Industrial Commissioner - City Hall, Toronto, Canada

BALL BEARINGS—From New Departure Mfg. Co., Bristol, Conn., a treatise on their two-in-one annular ball bearings on bond paper, well illustrated, showing their application to machinery.

EXPANDED METAL—Bulletin giving information in regard to structure of steel used, formulae for reinforced concrete design, etc., from the Northwestern Expanded Metal Co., 930-950, Old Colony Bldg., Chicago.

CHUCKS—From E. Horton & Son Co., Windsor Locks, Conn., describing their large line of churcks for cutting off machines, car wheels, lathe and drill chucks. These are universal, two-jaws, independent jaw, etc.

THERMIT WELDING—Booklet from Goldschmidt Thermit Co., 103 Richmond Bt. W., Toronto, describing a number of repairs made by the use of thermit, welding motor cases, truck frames, armature shafts, etc.

SUPPLEMENTARY TURRET—Booklet ST—1 from the Bullard Machine Tool Co., Bridgeport, Conn., describing and illustrating the use of the supplementary turret, a multi-tool holder for the boring and turning mill.

MOLDERS' TOOLS—Catalogue of molders' tools from the Peninsular Tool and Specialty Co., 26 Pitt St. West., Windsor, Ont. Descriptions and prices are given of the standard molders' tools manufactured by them.

MACHINE TOOLS—From Garvin Machine Co., corner Spring and Varick Streets, New York, edition D of milling machines, grinding machines, tapping machines, lathes, etc. Catalogue is in German, French and English.

PUNCHES AND SHEARS—Catalogue 20 B, from the Buffalo Forge Co., Buffalo, N.Y., illustrating and describing portable forges, shears, punches, angle and tee iron cutters, riveters, ball bearing drills, exhausters, etc.

REACTIONS—First quarterly issue 1909 from Goldschmidt Thermit Co., 103 Richmond St. West, Toronto, Can., showing a number of interesting repairs made by thermit. These include repairs made in railroad shops.

CONCRETE CHIMNEYS—From The Weber Co., 929—934 Marquette Bldg., Chicago, a review of concrete chimneys giving their origin and development. A number of illustrations of reinforced concrete chimneys are given.

THERMIT—Book of instructions for the use of thermit in railroad shops from Goldschmidt Thermit Co., 103 Richmond St. W., Toronto. Directions are given for welding locomotive frames, driving wheels, connecting rods, etc.

DRILLS AND HACKSAWS—Catalogue from Hoefer Mfg. Co., Freeport, Ill., describing fully their drills and power hacksaws. It is on good paper, well illustrated and deals with automatic hub drills, bench drills, gang drills, boring mills, etc.

TOOLS AND MACHINES—From Brown, Baggs Co., Hamilton, catalogue, section A, 125 pages on coated paper, 10 x 6½ ins. Various tools for tinsmiths and sheet metal workers are described including folding machines, forming machines, rolls, shears, etc.

GRINDING MACHINERY—Catalogue No. 12, from J. G. Blount Co., Everett, Mass., giving illustrated descriptions of grinding machines, wet tool grinders, truing device, buffing and polishing machines, and Blount speed lathes, both belt and motor driven.

MOTORS—From Canadian Westinghouse Co., Hamilton, circular 1164 describing type MS mill motors for polyphase alternating current circuits, squirrel cage rotors, constant speed. Applications of the motor are given in addition to the detailed description.

STEAM SPECIALTIES—Annual catalogue from Darling Bros., Montreal, illustrating and describing the special machinery manufactured and handled by them. These include all the requirements for heating apparatus for large factories and public buildings.

TUBE ON PIPE CUTTER—Catalogue No. 92 from Fox Machine Co., Grand Rapids, Mich., describing pipe cutting machines including the Fox heavy tube or pipe cutter, motor driven. These machines are used to cut off boiler flues, and by steamfitters, plumbers, etc.

ANNEALING AND HARDENING FURNACE—Booklet from W. S. Rockwell Co., Hudson Terminal Bldg., 50 Church St., New York, describing the Rockwell Rotory Annealing Furnace for brass, copper, steel, iron, aluminum gold, silver and other metals using oil or gas fuel.

CEMENT—Illustrated catalogue from International Portland Cement Co., Ottawa. This handsome catalogue is a souvenir of the history and development of Portland cement. It describes the factory and gives tests of cement. A number of structures built of cement are illustrated and described.

CHAINS AND SPROCKETS—135 page catalogue from the Dodge Mfg. Co., Toronto, giving approximate horse power developed at the speed of chain noted. The sprocket chain is fully illustrated and described, also attachment links, elevator buckets, etc. The catalogue is very complete, prices being also included.

HOISTING MACHINERY—Fourth edition of catalogue from Georgian Bay Engineering Works, Midland, Ont. General specifications of hoisting engines are given, and descriptions of double cylinder hoisting engines, single cylinder hoisting engine, traveling derricks, drums, builders' engines, hand derricks, bond wheel grinders, pile hammers, buckets, cars, car wheels, cast iron split pulleys, etc.

MACHINERY AND TOOLS—551 page catalogue, 1909 issue, from Brown & Sharpe, Providence, R. I., describing their lines of milling machines, grinding, automatic gear cutting and screw machines, cutters, accurate test tools and machinists' tools. Descriptions of the various machines are given and much valuable information, rules and formulae are included in the catalogue. Several new machines, attachments and tools have been added and a list of these is included on colored pages in the centre of the catalogue.

TOOLS FOR SHEET METAL WORK—From Brown Boggs Co., Hamilton, Section A, 125 pages. The catalogues have been divided into three, A dealing with tinsmiths' tools and light machines for sheet metal work; B, with heavy sheet metal working machinery, presses, can making machinery, and C, evaporating machinery, etc. The catalogues are on coated paper and well printed. Catalogue A includes folders, wire cutters and formers, tube formers, rolls, shears, squaring machines, encased machines, standards, power groover, shears, hammers, etc. The catalogue is worth keeping on file.

DRAWING MATERIALS—35rd edition of catalogue from Keuffel & Esser Co., 252 Notre Dame St., Montreal and 127 Fulton St., New York, 540 pages, well illustrated. The general appearance of the catalogue has been much improved and it is well bound. An important change in the general arrangement of the catalogue has been made by creating a special section for "drafting office furniture," which is now forming an important department among the goods manufactured. Many additions have been made to the catalogue making it very complete. It will be sent free to engineers and companies on request.

EXCEEDING the SPEED LIMIT?

You don't need to worry about that if you're using

Peerless Reamers

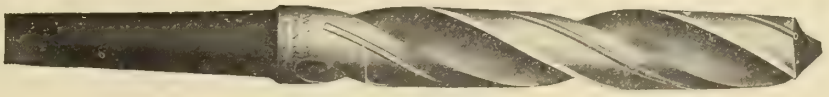
Many times the efficiency of the Carbon Reamer.
Tougher and stronger than the Solid High Speed Reamer.
Yet way below the latter in cost.
Send for Catalog No. 36-C, which tells you WHY.

The CLEVELAND Twist Drill Co.
CLEVELAND, O., U.S.A.

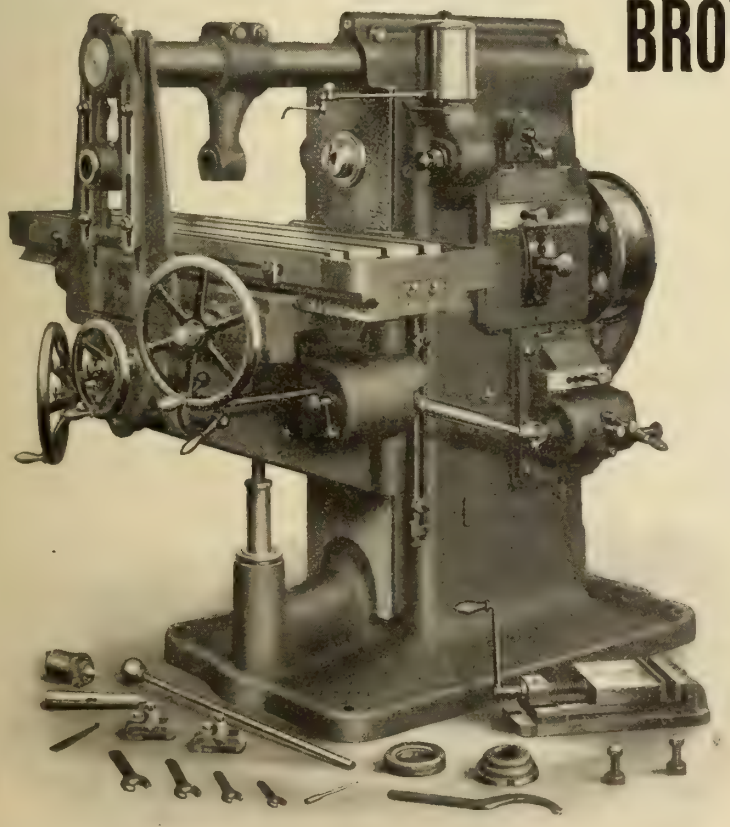
HIGH SPEED TWIST DRILLS

The marvellous results obtained from the use of our Drills are facts, not theories.

Write us for Catalogue and Discount Sheets.



LINCOLN-WILLIAMS TWIST DRILL CO., - - Taunton, Mass., U.S.A.



BROWN & SHARPE MFG. CO.

PROVIDENCE, R.I., U.S.A.

With the Constant Speed Drive Milling Machine you have the Advantage of Ample Power.

The growing use of High Speed Steels requires of milling machines increased power, especially in large machines, and those factors which are necessary to develop power are realized to the fullest extent in this type of machine. The constant speed drive permits the use of counter-shaft and machine pulleys, of large equal diameter, taking a wide belt and running at a high constant speed. This gives large belt contact and high belt velocity, the two requisites of power.

Professors of Civil, Mechanical and Electrical Engineering

The Government of Nova Scotia will appoint men to above three chairs in its Technical College during June or July. Applicants must have college degree and also practical experience.

Address: The Director, Department of Technical Education, Halifax, N.S. (5)

FOR SALE

Canadian Patents on Steam Traps

which includes a line of Separating Traps, Direct Return and Vacuum Traps. Address

Taylor Steam Trap Company

Battle Creek, Mich, U.S.A.

ESTABLISHED 1849

BRADSTREET'S

Capital and Surplus, $1,500,000. **Offices Throughout the Civilized World**

Executive Offices: Nos. 346 and 348 Broadway, New York City, U.S.A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claims as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the Company at any of its offices.

Visitors to the Brass Founders' Convention to be held at Music Hall, Cincinnati, Ohio, May 17-22, 1909, are cordially invited to witness the casting and finishing of brass manufactured by using **BASSITE** as a substitute for tin, **at the foundry immediately in front of Convention Hall, 1212 Race St.**

Every courtesy possible will be shown and an attempt will be made to demonstrate practically to the visiting brass manufacturers the **exact value** of **this alloy as a substitute for tin.**

It Is Pleasing To Hear

the increasing number of unsolicited testimonials from the growing lists of users of

Vinton Ideal Coke

The reasons for satisfaction are simple : The coke is very high in carbon and very low in sulphur. It gives a uniformly hot iron and eliminates losses due to fines, breeze, breakage in handling, etc., because it is delivered in large, tough pieces, which all stay on the forks.

Let us estimate on your Coke Supply. Tell us your approximate annual coke consumption. We can demonstrate how you can effect a large saving in coke.

Send for our new Catalog and read what some Canadian and a host of American Foundrymen say about it.

Are You Satisfied with Your Melting Furnace?

LISTEN!

The Fisher Crucible Fuel Oil Furnace

IS THE KING OF OIL FURNACES

Built in Sizes from 100 to 350 Crucible Capacity.

WE GUARANTEE MELTING COST from 40 to 50 less than with other fuel, with little or no shrinkage in metal.

"IT'S UP TO YOU"

To prove that the Fisher Furnace will SOLVE YOUR FURNACE PROBLEM we will INSTALL ONE in your plant ON TRIAL without the least obligation on your part.

LET'S TALK IT OVER

ALFRED FISHER

103-5-7-9 West Monroe St., CHICAGO, Ill.

Don't Lose Time

Time is the one expensive item shown in the footing of your pay roll.

You can save time, meaning money, by using my Tripoli Composition in buffing your plated castings. It's the old fashioned "pure quill."

You can save your defective castings by using STEVENS' STOPPER, in filling your "blow-holes." It's lower in price, and better in quality than the other "Cements" so elaborately advertised.

You can avoid making defective castings by using STEVENS' PURE PLUMBAGO. Altogether—we ought to get together. Have you time to write to me? It will pay you to take the time for that purpose.

The Largest and most Reliable Foundry Supply House in Canada

This is a cut of our new catalogue which will be ready for distribution in a few days. It is the only catalogue issued by a Foundry Supply House in Canada. Should your copy fail to reach you notify us promptly, as no Foundry in Canada can afford to be without this book.

One of the essentials in a modern foundry is our

HAMILTON DRY CORE COMPOUND

This compound embodies every element necessary for the production of perfect cores, whether made in a core box or machine. Scores of Foundrymen are using it to-day with splendid results. They tell us it produces cores that have a free vent and which do not swell or blow ; and that when the iron is poured the heat burns out the compound, leaving the sand in a condition to be easily rapped out and resulting in a beautiful surface on the casting.

We are manufacturers. Don't you think it will pay you to buy direct from the manufacturer?

Give this Compound a trial and you will never bother mixing up your own compound again. Prices on request.

The Hamilton Facing Mill Co.

Limited

Hamilton : Canada

Everything for the Foundry, from a Dust Bag to a Cupola.

YOU

are interested

along with every Foundryman in Canada in reducing cost and improving your product.

In your Core-Making Department, for instance, you may be using as a Core Binder flour or rosin, with fairly satisfactory results.

There is a better and cheaper way of making cores—use

MILLS DRY CORE COMPOUNDS

CONSTANTLY IMITATED—NEVER EQUALLED.

We manufacture three grades, all of which are giving the very highest satisfaction to-day to a very large number of Foundrymen.

No. 1 is for Heavy, Grey Iron Work.

No. 2, while being good for any work, is particularly adapted to smaller Grey Iron, Malleable and Steel Cores.

No. 3 is a compound which is made to fill the wants in Car Wheel Foundries, and is successfully used for making the difficult car wheel pan cores and for the hub cores. It also can be generally used for any Foundry Work.

THE MILLS DRY CORE COMPOUNDS will mix 50 to 75 per cent. more sand than rosin or flour. No sticking in the core-box, swelling or cracking of the core results when MILLS DRY CORE COMPOUNDS are used. Stock Cores will not gather moisture.

"WAGO" CORE BINDER—This is a patent article and is manufactured only by the H. E. Mills Manufacturing Company. It is the only compound on the market made specially for cores for brass foundries. No blowing possible. After shooting cores, castings are left perfectly clean.

Wherever a Liquid Core Binder is essential, our SYRACUSE LIQUID CORE COMPOUNDS are used with economy and the best satisfaction by our scores of customers. For brass work, use our SYRACUSE X grade. For general work, our SYRACUSE XX grade answers every purpose. For intricate and difficult cores, our SYRACUSE XXX grade cannot be equalled. For radiator cores, ask for our No. 1 grade.

ONE FAIR TRIAL WILL CONVINCE YOU.

Our materials may be ordered on approval at any time.

FOUNDRYMEN!

The past year marked the introduction of our Foundry Supply Department and although a new line with us, we feel gratified at the large amount of business secured during the year 1908, and we thank you for your very generous patronage and hope to have a continuance of the same during the present year.

In order to give greater attention to our growing Foundry trade and to take the best means of presenting the many advantages of our specialties and productions, we have divided the ground into three territories which will be covered by our representatives as follows:

Eastern Territory - Mr. Albert U. Coté
Western Territory - Mr. T. Essery
Montreal Territory - Mr. G. F. Cowper

When in doubt specify Hyde quality.

Calumet

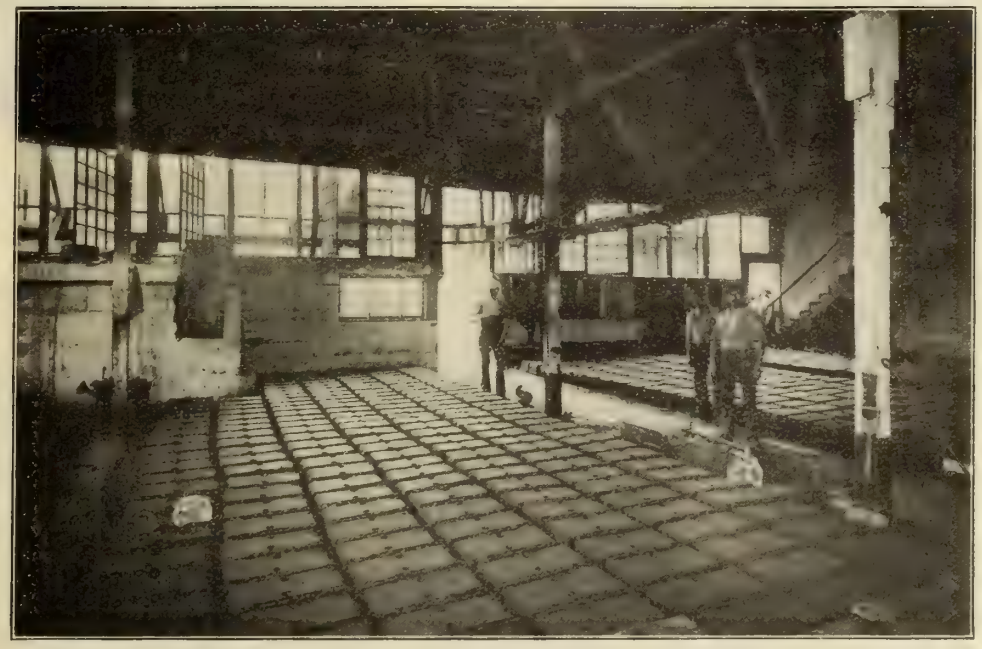
Calumet Yard Crane

One Man Put Up This Floor In Seven Hours With a

Modern Molding Machine



Your floors can look like this if you want them to.

The MODERN is a simple and inexpensive machine that turns out perfect molds at a speed that makes a tremendous saving in the cost.

The castings made in this way are so perfect that the machine shop expense is very greatly reduced—one of our customers says 40 per cent.

Send us a casting you are making in large quantities and we will tell you how many would be a day's work for the MODERN with unskilled labor.

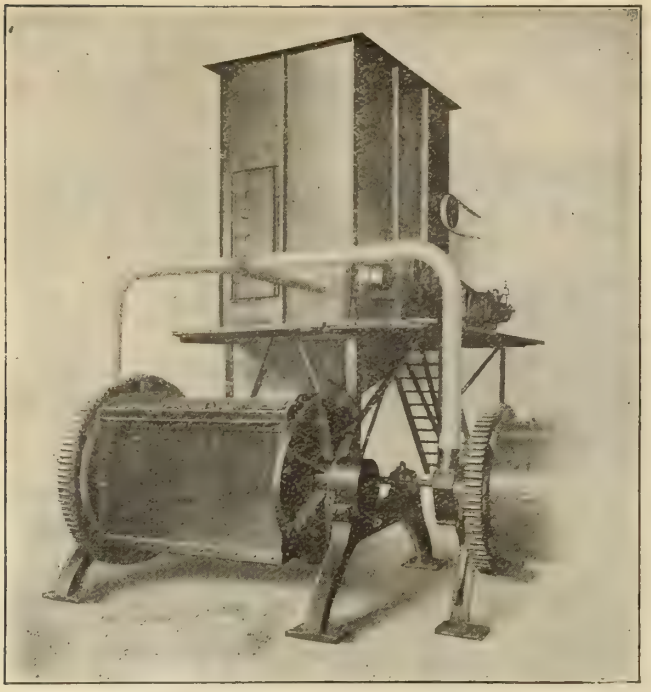
Do not delay action any longer.

ANNOUNCEMENT

We desire to announce that we are now the manufacturers of the NORCROSS Jolt Ramming Molding Machine and also the BUCK'S Roll-up Device. If you are considering further foundry equipment you will be well repaid for communicating with us.

Arcade Manufacturing Co.

FREEPORT, ILLINOIS, U.S.A.



The above cut shows two of our up-to-date mills properly piped for exhaust to our patent **Dust Arrester.** Your mill room should be just as free from dust as the best equipped machine shop.

Have you a model plant? Why not be in the lead? You are not using flint to kindle your fires, nor candles to light your plant, nor a two-wheeled cart to deliver your castings. Modern improvements are working to the front every day, and if we want to be abreast with the times, we must follow suit.

Apply this same logic to your foundry cleaning room. The old impression that a scratch shop must be similar to a hurricane on a desert, is fast fading away. Sly Mills will work wonders in your cleaning room. Castings tumbled by the exhaust process will present a clean, polished surface, and give your foundry prestige in that your work will be the best. In order to have clean castings, the dirt must be drawn away from the mills as fast as it is scratched from the castings. This dust pulled by an exhaust fan to our Dust Arrester will settle your cleaning problem. Your mill room will be free from dust, your men can do better work, your castings will be cleaned in one-half the time, and the dirt and grit will not fly about your plant to injure your machinery, and go beyond your plant to become a public nuisance. We have made a scientific study of the cleaning room, and our experience is at your disposal simply for the asking. Plans and specifications gladly furnished.

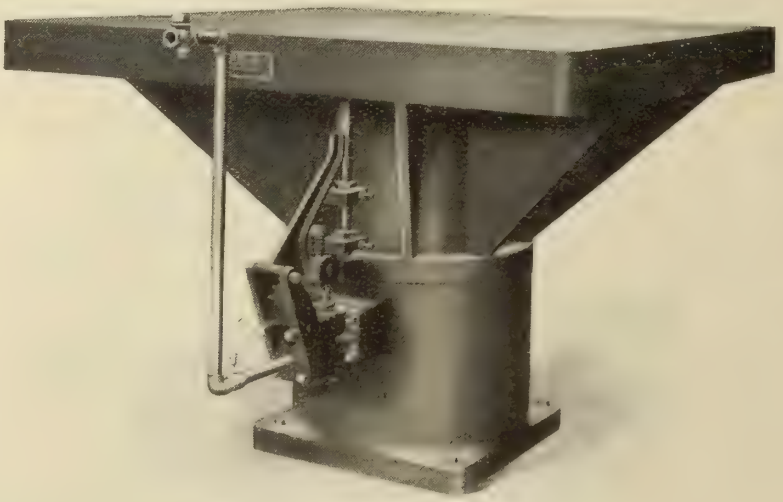
Tabor Jarring Machine

Saves nearly all the ramming time.

By combining the two machines the production of times, depending upon the nature of the work, as is capable of handling flasks weighing up to 4,000



Tabor Jarring Machine.

The Tabor Jarring Machine consists of four parts : i.e. valve, platen and cylinder, piston and anvil.

Rams with fewer blows than any other type.

Operating valve so constructed as to eliminate air cushioning.

A blow is struck for every depression of a hand lever.

The length of stroke can be varied to suit conditions.

Built to handle flasks weighing up to TEN TONS.

The Tabor Hinged Molding Machine is designed to handle a class of work here-to-fore not adapted to machine molding on account of hanging sand.

Adapted to molding large patterns where a limited number of castings are required.

Facilitates rapid changing of pattern boards.

Is essentially a machine for drawing the pattern and saving the time usually consumed in making the parting and finishing the mold.

Tabor Hinged Molding Machine. Power Turn-over and Power Draft.

Tabor Hinged Machine

Saves pattern drawing and finishing time.

complete molds can be increased from three to ten compared to floor work by hand. This machine pounds with 80 pounds air pressure.

The Tabor Combination Jarring and Hinged Molding Machine rams, turns over large molds and draws the pattern without the use of cranes or hoists and eliminates all of the heavy manual labor required on large work.

See our exhibit at the Cincinnati Convention.

Export Trade
Represents the Great Future Market for American Goods

Manufacturers that cultivate the field **NOW** are assured of the largest share of this trade in the future.

Our service, the greatest single power in Export Trade, enables manufacturers to get their products prominently before the trade abroad. An efficient service, covering all export markets at minimum of expense.

The aim of the **American Exporter** is and has always been the up-building of a world-wide demand for American machinery and goods. Issued in two editions each month, one in English, and other in Spanish **(Exportador Americano.)** The two together cover all countries that import American goods.

It is the only journal of foreign circulation which regularly publishes its exact circulation every month in its editorial pages.

Stronger evidence of the AMERICAN EXPORTER'S strength in its chosen field could not be brought forward than the phenomenal growth in its advertising pages during the past three years. The AMERICAN EXPORTER in net volume of advertising business carried three years ago 52 pages of net advertising; two years ago 88 pages; one year ago 116 pages; carries to-day 122 pages. Its number of regular advertisers three years ago was 325; two years ago 400; one year ago 550; and to-day 650. It is seen that notwithstanding a "panic," there is a growth in the last 12 months.

An increasingly important feature of the **American Exporter** is the Foreign Trade Service maintained on behalf of its advertisers. This service includes the sending of our representatives into foreign markets to study conditions in the interest of our clients, the furnishing of selected names of possible customers or agents in any country, commercial ratings on prospective foreign customers, translation of foreign correspondence from and into any and all languages resulting from or pertaining to the advertiser's announcements.

Representative space regularly in the **American Exporter** gives you all the export advertising you need, for this publication covers every foreign market for your goods. This publicity. coupled with our Foreign Trade Service, provides you with the necessary facilities for conducting intelligently an export trade.

May we send more particulars?

AMERICAN EXPORTER
135 William Street, New York City

The City that Above All Others H
by the

To the United States Manufacturer who is seeking a market in Canada, **Welland** is the solution of his problem. **Welland** is the final solution of the Canadian Customs. It has met the situation for a dozen large branches of leading American industries. The reason of this is that no other manufacturing centre can offer inducements so alluring or commercial advantages so powerful. **Welland** is adjacent to four of the largest electrical power plants in the world. Three of these are located at Niagara Falls, with a combined development of over four hundred thousand horse power. The fourth plant is at DeCew's Falls.

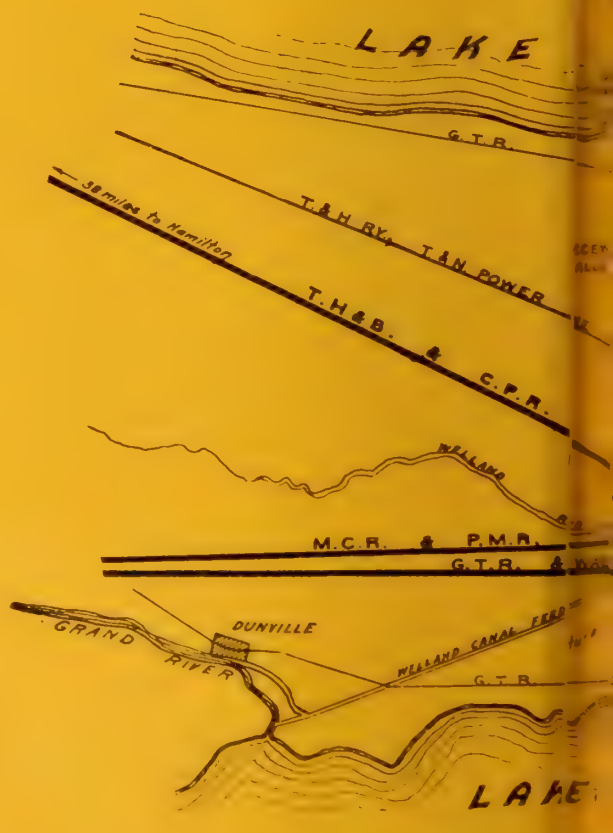
Because of the great quantities of power available, and the keen competition, steam power is unknown in Welland. Electricity is cheap. It can be had for power purposes at the very lowest figure. Welland's municipal lighting costs only $40 for each 2000 candle power light all night every night for a year. Lower rates are quoted than in any other Canadian Industrial centre. : : : : :

WEL
CA

Welland has secured more Canadian branches of American industries in the last two years than any other Canadian city. Think this over --- it means something.

Welland has the cheapest electric power, the best sites and land values, the most lines of transportation, the advantages of lake shipping, the cheapest natural gas.

Welland has two sources of electric power in competition---DeCew's Falls and Niagara Falls. Four of the largest power plants in the world are within a radius of twelve miles. Electric power is sold at one quarter the cost of steam. : : :



Map of Niagara Peninsula, showi

Welland deals with her industries in a spirit of fairness. Exemption from taxation, sewer connection and free water, and such other reasonable concessions as may be desired, can be obtained. : : : :

NOW LISTEN. Are you alive to the commercial development taking p
Do you intend to erect a Factory in Canada to supply this demand?
Do you act on information based on facts?
Welland is in the biggest natural gas belt in Canada.
Do you realize that with the above advantages you can have complete
Do you realize that Factories located outside the zone of these advantag

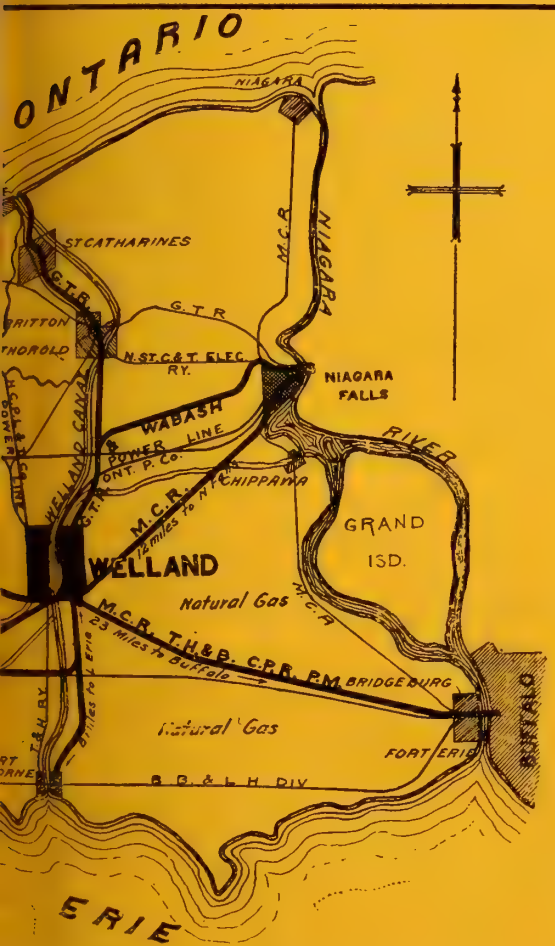
Do You Know That Fifteen Manufacturing Firms Have Loc

Benefitted Development of Electrical Energy

Welland stands just as far ahead in shipping as it does in power facilities. **Welland** is on the Michigan Central; Toronto, Hamilton & Buffalo; Grand Trunk; Wabash; Pere Marquette; Canadian Pacific; N., St. C. & T. Electric. That's the strongest combination north of the border. Then, too, **Welland** offers to the manufacturer the advantage of cheap rates by water. The Welland canal, which is electrically lighted for its entire length of twenty-six miles, runs through the heart of the city. The Canadian Government has constructed a harbor and turning basin for the loading and receiving of freights. That means low rates to any point on the great lakes. : : : The best of sites are to be had within easy reach of rail and water. Available areas run from half an acre up to 25, 50 and 100 acres. The prices are reasonable. : : : :

AND

DA



Water, Rail and Power Facilities

Welland is situated on the route of direct water transportation between Montreal and the Northwest. The Welland canal passes through the heart of the town. A harbor and two turning basins supply local industrial needs. : : : : : :

Welland has every trunk railway there is in Canada—six altogether—and forty-two passenger, mail and express trains daily.

Welland will grant reasonable concessions in the way of exemption from taxation, water, sewers, etc., to industrial companies desiring to locate here. : : : :

Pattern Making

By James Ritchey

Instructor in Wood Working, Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

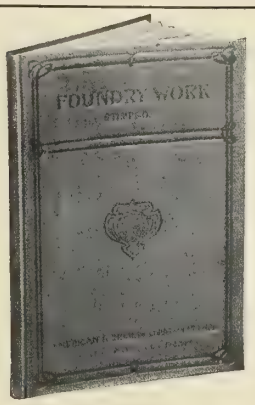
Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

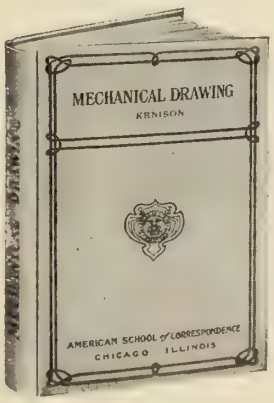
Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology



176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

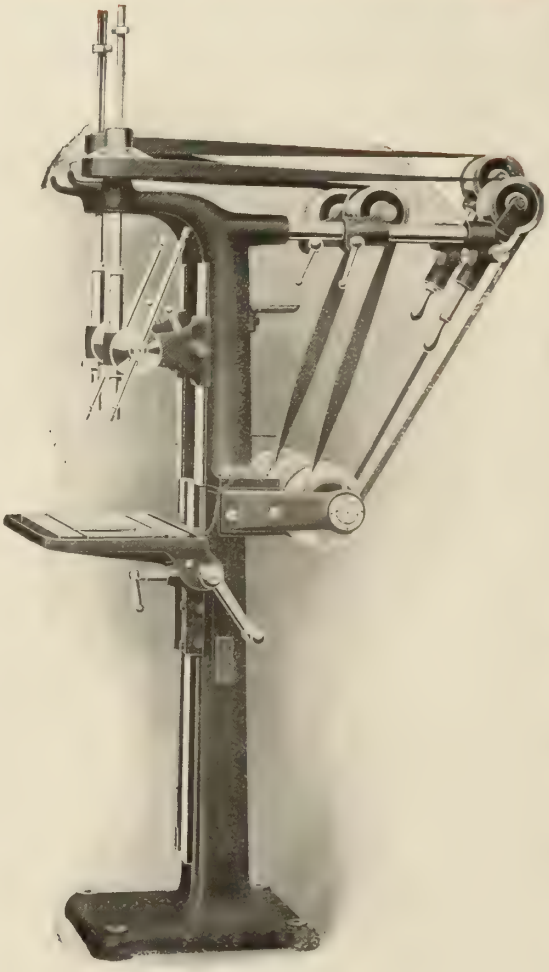
You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

Published Monthly at **$1.00** per year. **Address Subscription Dept.**

CANADIAN MACHINERY, 10 Front St. E., Toronto

ALFRED HERBERT, LIMITED
COVENTRY

PATENT BALL-BEARING
Drilling Machines



To get the best results from drills made of high-speed steel, it is necessary that the spindles of the machines in which they are used should run at speeds altogether impossible for the ordinary Sensitive Drill.

We have overcome this difficulty by fitting every running bearing with our Patent System of Ball-Bearings, which have so reduced friction that not only can small high speed drills be run at their maximum capacity, but it is possible to drill very much larger holes than with the ordinary machine.

Our Patent System of Ball-Bearings enables the spindles of these machines to be run fast enough to get the best results from small drills made of high-speed steel.

The following can be done in cast-iron:—

Diameter of Drill	Revolutions per minute	Time to Drill 1 in. deep	Diameter of Drill	Revolutions per minute	Time to Drill 1 in. deep
¼ in.	2,050	1 1-5 seconds	⅝ in.	600	2½ seconds
⅜ in.	900	2 "	¾ in.	600	3 "
½ in.	900	2 "	⅞ in.	600	4 "

Built with 1, 2, 3 or 4 spindles.

IMMEDIATE SHIPMENT

We carry a large number of high-class tools manufactured by the above well known firm, including: **Automatic Machines, Horizontal and Vertical Milling and Profiling Machines, etc.**

from 12 to 20 times faster on P. & W. Vertical Surface Grinder than on any other grinder made.

Above illustration shows a few samples of automobile parts, ground at a great saving on a P. & W. Vertical Surface Grinder.

One concern states that these machines are saving them several hundred dollars per day over former methods.

Send us drawings or samples of your work which will be returned promptly with time for grinding them on this Machine.

Write for Illustrated Circular "The Vertical Surface Grinder."

Milling Slots with Closed Ends

The Spline Milling Machine is an entirely new machine for milling slots with enclosed ends, keyways, and an endless variety of other work, greatly reducing time and cost of production.

The great advantage of this tool will appeal to the manufacturer who has formerly been compelled to resort to expensive broaching operations or to hand milling for cutting keyways with closed ends, and tang slots which, owing to their depth, require extreme care in manipulation of tools as well as the continuous services of a skilled operator.

Write for Catalog "Spline Milling Machine."

Made by TRIMONT MFG. CO. 55 to 71 AMORY ST. Roxbury, Mass.

A Reliable 16-in. x 20-in. Shaper

It will pay you to get complete specifications and price of this shaper before purchasing any other. In design the bulk of the metal is placed in line with the cutting strain. The workmanship is of the best, all bearing and sliding surfaces are hand scraped to surface plates, shafts are machine ground, gears are all machine cut, small gears are made of steel and each machine is thoroughly tested under actual work before leaving the shop.

The ram has square slides and is worked by an improved adjustable crank and slotted lever, the length of stroke being instantly set by a dial and pointer on the operator's side of the machine, the longitudinal adjustment is made quickly and positively by means of a double thread screw, operated very conveniently. Shafting up to 3 inches in diameter will pass under the ram for keyseating.

The tool block slide has automatic or hand feed, up or down and at any angle. The screw of this has a micrometer index graduated in thousands of an inch.

The cross feed screw is also provided with micrometer index, and the feed stops automatically at either end of the slide which prevents breakages through carelessness. This feed can be conveniently and positively changed as required when the machine is running at highest speed.

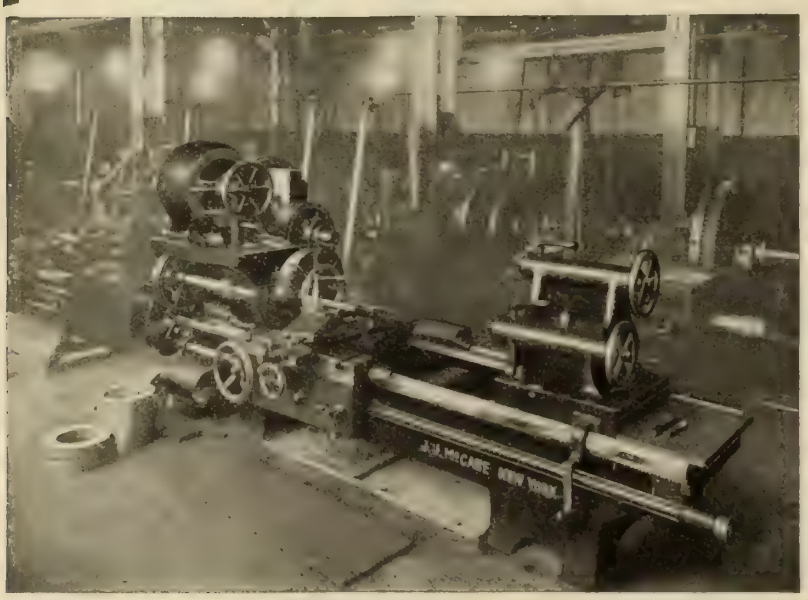
Cost and Size Talk



means something to you when talking about Lathes.

Translate "it will do everything" into Lathe-language and it means McCABE'S "2-in-1" DOUBLE-SPINDLE LATHE.

You ought to know what we're driving at, when this "2-in-1" DOUBLE-SPINDLE LATHE handles driving-wheels or any other heavy duty on the big 48-inch Swing, just the same as any 48-inch Lathe that costs twice as much.

McCabe's "2-in-1" is a 48-inch Triple-geared you can turn into a 26-inch Back-geared and return to a 48.

It's a "bigger" Lathe than advertising can tell you—its facile handling can be demonstrated in hundreds of prominent shops all about you.

THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

Let us send you more particulars.

HIGH POWER VERTICALS

This job does not call for heavy cutting, but we do it remarkably fast. With a cutter 10in. diameter, the No. 4 Vertical takes a roughing cut 3/16in. deep, at a feed of 20in. per minute, and follows with a finishing cut at 20in. per minute also. The surface is 18¾in. x 26½in. and is covered by using table and cross feeds alternately and in combination. And we get accurate, smooth surfaces! A lighter machine could probably take this cut, but it could not possibly give the same accurate results.

In addition to having great power, our verticals are also tremendously rigid.

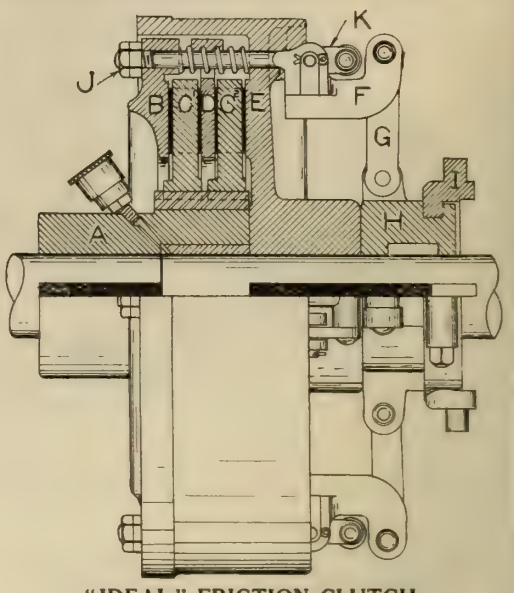
CLUTCHES THAT GRIP

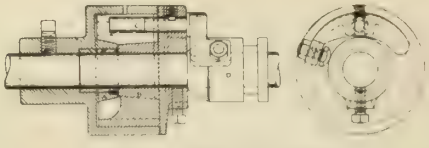
The "Ideal" Friction Clutch

MADE IN SIZES RANGING FROM 3½ TO 360 HORSE POWER.



"IDEAL" FRICTION CLUTCH

- This Friction Clutch can be made solid or split.
- Perfectly safe, because it cannot start when out of gear.
- Easily adjusted because simply and scientifically constructed.
- Draw Bolts and Straps are make of steel and do not break.
- Big power for size of clutch due to large friction surfaces and powerful lever movements.
- It is provided with solid iron sleeve and split Babbitted sleeve—interchangeable and removable without disturbing the mechanism.
- This clutch is perfectly balanced.



"IDEAL" HUB CLUTCH

The "Ideal" Hub Clutch

MADE FOR SMALL POWERS RANGING FROM ONE-HALF TO SEVEN HORSE-POWER.

- The "Ideal" Hub Clutch can be thrown in and out easily at high speed—therefore a first-class clutch for countershafts.
- Being simple in construction it is easily adjusted and low in price.
- This clutch can be used in duplex.

We guarantee these clutches to transmit the Horse Power they are rated at.

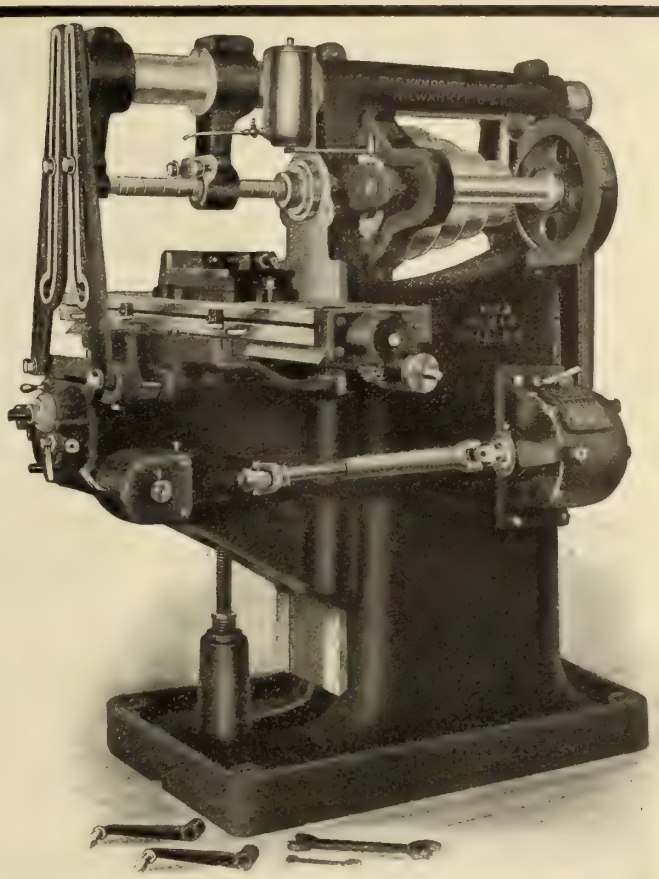
KEMPSMITH

The entire arrangement of tripping feeds, centralized in ONE lever for ALL feeds, at front of knee—the powerful, simple and compact geared feed change mechanism—powerful and substantial construction throughout—these three very vital points only go to show the general excellence of this machine as the type of the modern manufacturing miller.

Fully shown in the catalog.
Prompt deliveries.



The Kempsmith Mfg. Co.,
Milwaukee, Wis.

Canadian Agents: London Machine Tool Co., Ltd., Hamilton, Ont.; The Rudel-Yeates Machinery Co., Montreal, Que.

The "New Haven" 24" Square Planer

The illustration shows our new and improved pattern planing 5 and 6 feet (inside the pockets) 24 in. wide, 24 in. high. Driven by two belts, the main driving shaft having tight and loose pulley attached on each side of the machine, giving a very steady driving motion. The bed is very deep, wide and strongly braced, supported by cabinets. The head has automatic power feeds in all directions, and the crossbar is deep and strongly braced. The cross-feed screw is cut with double threads, giving rapid adjustment; the bronze cross-feed nut can be taken out without removing the saddle from the cross-bar.

The tool head can be adjusted in any direction without disturbing the feed pawl; the table can be run back to examine work without changing the position of the dogs, and the feed can be quickly changed from nothing to very coarse without stopping the planer. The T slots in the table are planed out and the holes drilled.

Machines are set up, and thoroughly tested before leaving the works, and guaranteed accurate.

ACME AUTOMATIC MULTIPLE SPINDLE SCREW MACHINES

ONE MAN can run these machines—all four of them—he can make more parts in a given length of time—because the machine is built with the convenience of the operator as one of the necessities. The entire control of the machine is brought under his hand while in position to watch the tools on the work - - - - - - -

¶ The troubles of multiple belts are gone—the one belt—when there is a belt—is run without change from tight to loose pulleys. The Electric drive is beltless - - - - - - - - - -

¶ Breakage of tools or parts—an old trouble on screw machines—is prevented by automatic release of the tools from the drive in emergency - -

¶ They save and earn more than others - - - - - -

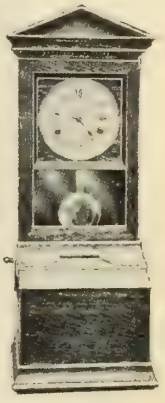
If You Believe that Time is Money

You ought to be using an up-to-date Time Recording System. The small cut on the right illustrates the New



Bundy Autographic Recorder

which is especially suited to small plants. It aids you to get the full time for which you are paying wages. With this clock each man signs his name when ringing in with the result that one man cannot ring in for another without being immediately detected by the difference in signature.

This large cut shows the

Dey Dial Time Recorder

This machine is entirely automatic and has proven its practical utility in many of the largest industrial plants on the American continent. When registering either "in" or "out" the employee moves the pointer around till it is opposite his number. Then he presses the pointer in the hole or slot corresponding to his number, and his exact time of arriving or leaving is accurately recorded. It cannot cheat, lie or show favor. Its evidence is indisputable. Late arrivals are shown in ink of a different color to that of the prompts. This machine saves your pay roll from being padded; enforces punctuality; expedites the compiling of wage and overtime sheets.

We can meet your requirements whether you employ ten men or a thousand

THE CELEBRATED

Dreadnought Milling File

A substitute for files which is revolutionizing file work

A great cost reducer.

A simple and radical improvement on the ordinary style of Hand Files.

It cuts from 300 to 500% faster than an ordinary file.

It is self cleaning.

It can be sharpened four times.

It cuts equally well all metals, also wood and marble.

Its cutting edge outlasts from five to ten ordinary files.

Although practically a rasp, it leaves the surface smooth.

N.B.—The Dreadnought is adaptable to every job in which ordinary files can be used, expediting the work and doing it better, and for numerous jobs usually milled in machines.

Starrett Micrometers

Features of Superiority Patented

Our micrometers have a more exact and easier way of adjustment than by the old method of a moveable anvil. This is obtained by placing over the barrel a thin graduated sleeve, which carries the base or zero line, instead of having this line marked on the barrel itself. This sleeve may be turned by means of a small spanner wrench to bring the zero line correct to compensate for wear. The thin sleeve also keeps dirt from the screw. A knurled locking nut contracting a split bushing around the spindle tightens and keeps the spindle central and true, or by a slight turn locks it firm, making a solid gauge when desired.

Our 176-page Catalogue shows many styles of Micrometers, from ½ in. to 12 in., and in Metric from 30mm. to 300mm.

Export Trade

Represents the Great Future Market for American Goods

Manufacturers that cultivate the field **NOW** are assured of the largest share of this trade in the future.

Our service, the greatest single power in Export Trade, enables manufacturers to get their products prominently before the trade abroad. An efficient service, covering all export markets at minimum of expense.

The aim of the **American Exporter** is and has always been the up-building of a world-wide demand for American machinery and goods. Issued in two editions each month, one in English, and other in Spanish **(Exportador Americano.)** The two together cover all countries that import American goods.

It is the only journal of foreign circulation which regularly publishes its exact circulation every month in its editorial pages.

Stronger evidence of the AMERICAN EXPORTER'S strength in its chosen field could not be brought forward than the phenomenal growth in its advertising pages during the past three years. The AMERICAN EXPORTER in net volume of advertising business carried three years ago 52 pages of net advertising; two years ago 88 pages; one year ago 116 pages; carries to-day 122 pages. Its number of regular advertisers three years ago was 325; two years ago 400; one year ago 550; and to-day 650. It is seen that notwithstanding a "panic," there is a growth in the last 12 months.

An increasingly important feature of the **American Exporter** is the Foreign Trade Service maintained on behalf of its advertisers. This service includes the sending of our representatives into foreign markets to study conditions in the interest of our clients, the furnishing of selected names of possible customers or agents in any country, commercial ratings on prospective foreign customers, translation of foreign correspondence from and into any and all languages resulting from or pertaining to the advertiser's announcements.

Representative space regularly in the **American Exporter** gives you all the export advertising you need, for this publication covers every foreign market for your goods. This publicity. coupled with our Foreign Trade Service, provides you with the necessary facilities for conducting intelligently an export trade.

May we send more particulars?

The Canadian Appraisal Co.,
Montreal, Que.

Dear Sirs:-

We feel that in justice to you we should advise you that your appraisal was of invaluable assistance to us in adjusting the loss through the fire that took place on Dec. 24th. last and entirely destroyed our factory and plant.

Your figures were accepted without hesitation by the insurance adjustors and we were complimented upon the way in which we were able to prove the values of our buildings and machinery.

We could hardly write you a letter expressing too strongly our views on the matter of the necessity of an appraisal, and our recent experience has convinced us that we should in the future always have an up-to-date independent valuation of all our fixed assets, and we consider the fee paid you was one of the wisest outlays we ever made.

This letter is unsolicited and we would be glad to have you use us as a reference.

Yours truly,

THE SANDERSON-HAROLD CO. LTD

J. Harold

MANY FRAUDS

of gasoline engines are on the market.

FIGHT SHY

of them.

OUR "Stickney" Gas or Gasoline Engine is exactly what we claim for it.

It is simplicity itself. No engine on the market with as few parts, or easier to operate.

It has no conglomeration of pipes. We use the open tank cooling system. Nothing better.

The igniter is outside the cylinder—always cool.

We publish size of cylinders, and ask why others don't do so. Do you tumble?

We absolutely guarantee power of every engine.

See one and be convinced.

Ontario Wind Engine & Pump Co., Ltd.

ANNOUNCEMENT

AS manufacturers of a standard line of Power Transmission Machinery and Elevating and Conveying Machinery; also as Engineers, Founders, and Machinists in general and special equipment, we not only offer a most complete range of up-to-date lines, with great quantities in stock in our own warehouses for immediate deliveries in any territory, but we offer something even more important still, i.e., the experience and the know-how of at least a dozen matured engineers, men who are high-grade mechanics, and who have made such lines as we refer to a life-long study, both from a practical and theoretical standpoint.

These men are known to be experts and do really know more than the average mechanical man would know about these particular lines, because we are **specialists!** We do not charge for this **"know-how."** It pays us to have the talent because of our large volume. But it is a decided advantage to the buyer to know that he is placing his order with a concern who can give it all the attention it should have from an Engineering standpoint, and from a **best practice** standpoint. There is a lot in this, and people are finding it out every day.

We can always send an able man to discuss **work.**

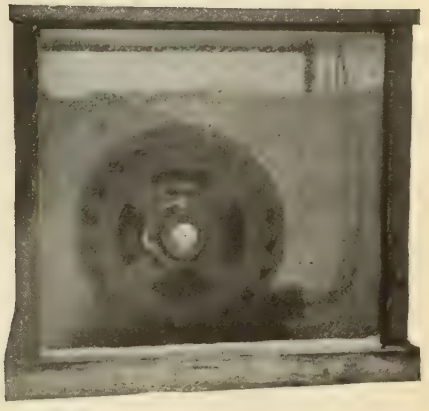
THE WATER TEST

Packard

Type "D" Motor



Reproduction from an actual photograph, showing the "Water Test" as applied to a Packard Type "D" Motor.

shown in the picture, proves one of the many points about the PACKARD Type "D" Motors, that combines to make them peculiarly adaptable for severe operating conditions.

The test consisted of a submersion of the motor in a tank. Connection being made to the circuit, the motor was allowed to run—completely under water – for several hours at a time— and, after repeated tests, the insulation was found to be in no-wise affected.

Could you ask better proof of the **ruggedness of design** and **careful construction** of the motor; or of the success of our Vacuum process of insulation?

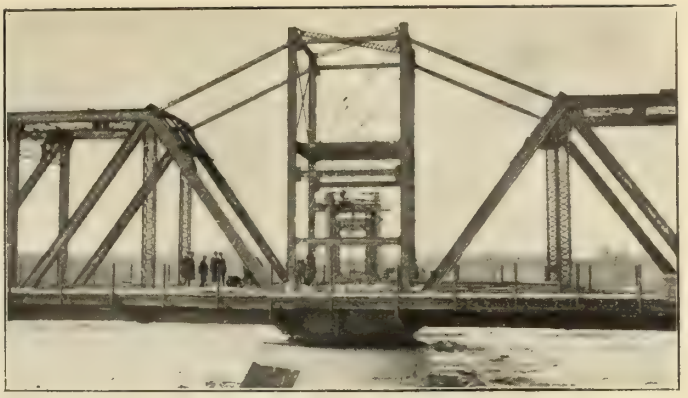

Fig. 2.—Prince Albert Swing Bridge at Right Angles.

Manufacture of Steel Bridges at Hamilton Bridge Works

Development in Bridge Building From the Points of Manufacturing and Erection—The Plant of the Hamilton Bridge Works Co., Hamilton.

In speaking of bridge-building, it might well be said that this is the age of steel. Where once wooden bridges were erected over rivers and canyons, now modern steel bridges have replaced them. With the advent of the latter class, efficient methods were evolved to manufacture and erect them, for, the members being much heavier than those of wooden bridges, it was necessary that something be done to facilitate the machining and handling the work.

The C.N.R. bridge being erected at Prince Albert over the Saskatchewan is an example of modern construction, that that almost impossible a few years ago. Fig. 1 shows a portion of the steel superstructure. The bridge consists of five 150-feet single track through riveted spans and one 260-feet swing span, and on each side of the bridge there is provided a 12-foot roadway for vehicle traffic. Under ordinary modern conditions this would be a comparatively simple piece of work, but owing to the fact that the conditions necessitated this bridge being erected during the winter time, the work was very difficult and expensive. For weeks and even months at a time the temperature was very severe, for a great portion of the time being 30 below zero and going as low as 50 and 60 degrees below zero.

Fig. 2 shows the swing bridge at right angles. It is equipped for hand-turning, but electricity may be used if desired.

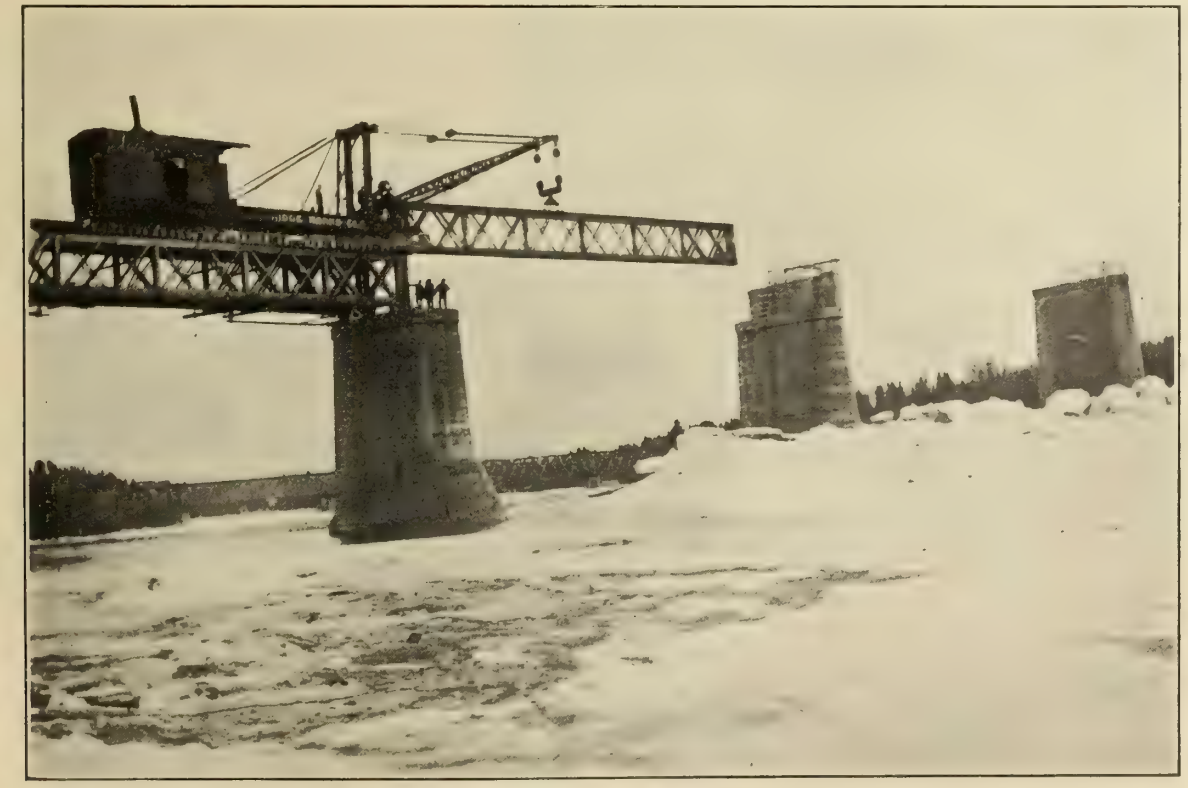

Fig. 3.—Modern Method of Erecting Girders.

The weight of the superstructure is approximately 3,000,000 lbs. The bridge is an expensive one, and the Alberta Gov-

Fig. 4.—Stock Yards at Bridge Shops.

Fig. 5.—Stock Yards at New Shop.

ernment contributed towards the construction. The piers and abutments are of concrete. Both sides of the 12-foot roadway are protected by heavy steel lattice work so that should a horse get frightened there is no danger of its getting off the bridge.

Modern Erection.

The modern system of erection is illustrated in Fig. 3. This cut shows a steel erection car placing a 100-foot deck lattice girder in the C.P.R. bridge at Grand Falls, N.B. The bridge consists of four deck plate girders, four through-girders and one 325-ft, span.

Before the adoption of the erection car it was necessary to erect a false work so that it now takes much less time to erect a steel bridge. The Hamilton Bridge Works Co. have three erection cars in service in various parts of the Dominion. With an erection car is a companion car containing beds for the men, tools, etc., making a modern bridge-erecting outfit very complete.

Bridge Manufacture.

Great advances have been made in the manufacture of steel bridges and modern methods are best illustrated by a reference to the Hamilton Bridge Works at Hamilton. The large, heavy pieces are handled with surprising facility. When the material, angles, channels, I-beams, etc., are brought to the stock-yards from Pittsburg, the material is lifted by the 15-ton electric traveling cranes and piled in the stock-yards according to size.

Views of the stock yards are shown in Figs. 4 and 5. Another crane runs at right angles to the two shown in Fig. 4, further facilitating the handling of the heavy steel shapes.

The Bridge Shop.

The same modern manner of handling work is shown within the bridge shop. Five and ten-ton Rand air hoists are used as shown in Figs. 6, 7 and 8. These run on single tracks, some across the the shop and some lengthwise, as can be seen in Fig. 8.

Fig. 6 gives the best idea of the bride shop. It is built of steel and concrete, 465 feet long by 190 feet wide, with a capacity of 25,000 tons per annum. The power used is electricity, air and natural gas. The machinery is arranged for individual and group drive. Natural gas is used as fuel in the rivet heating furnaces and forges.

In the east end are a nut tapper for large truss rod nuts, steam hammers, a belt-driven hammer, upsetting machine, etc. The upsetting machine is for use on truss rods on combination bridges where a turnbuckle is used and will upset rods

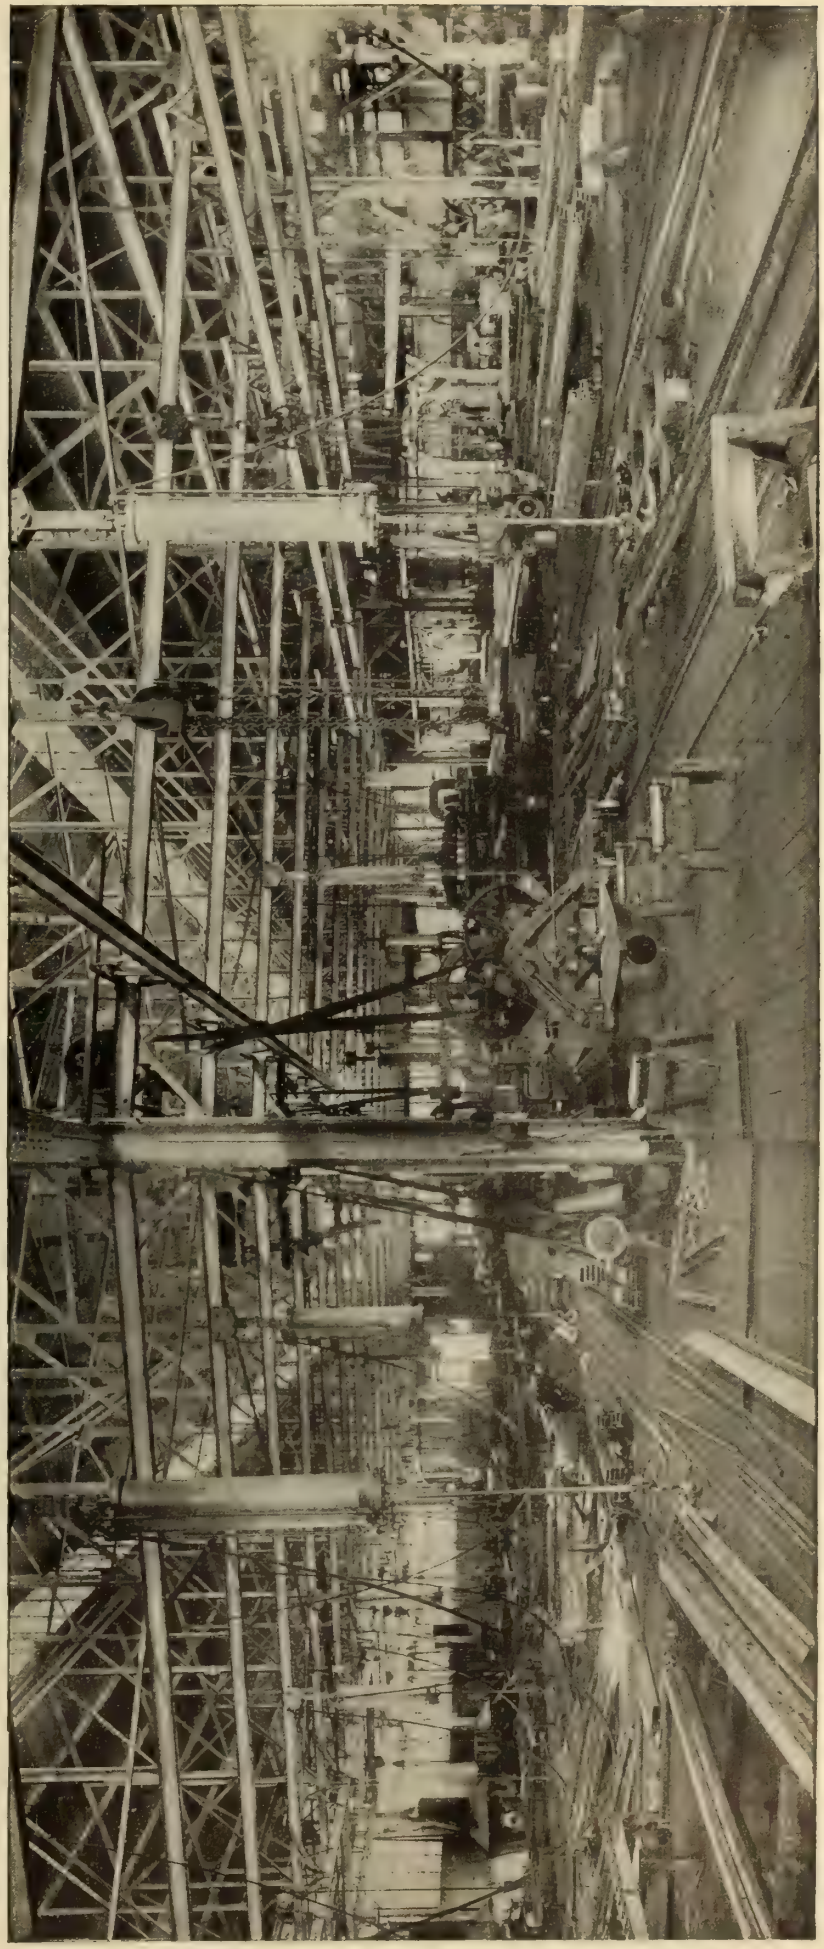

Fig. 6.—Hamilton Bridge Works Co., Interior Bridge Shop.

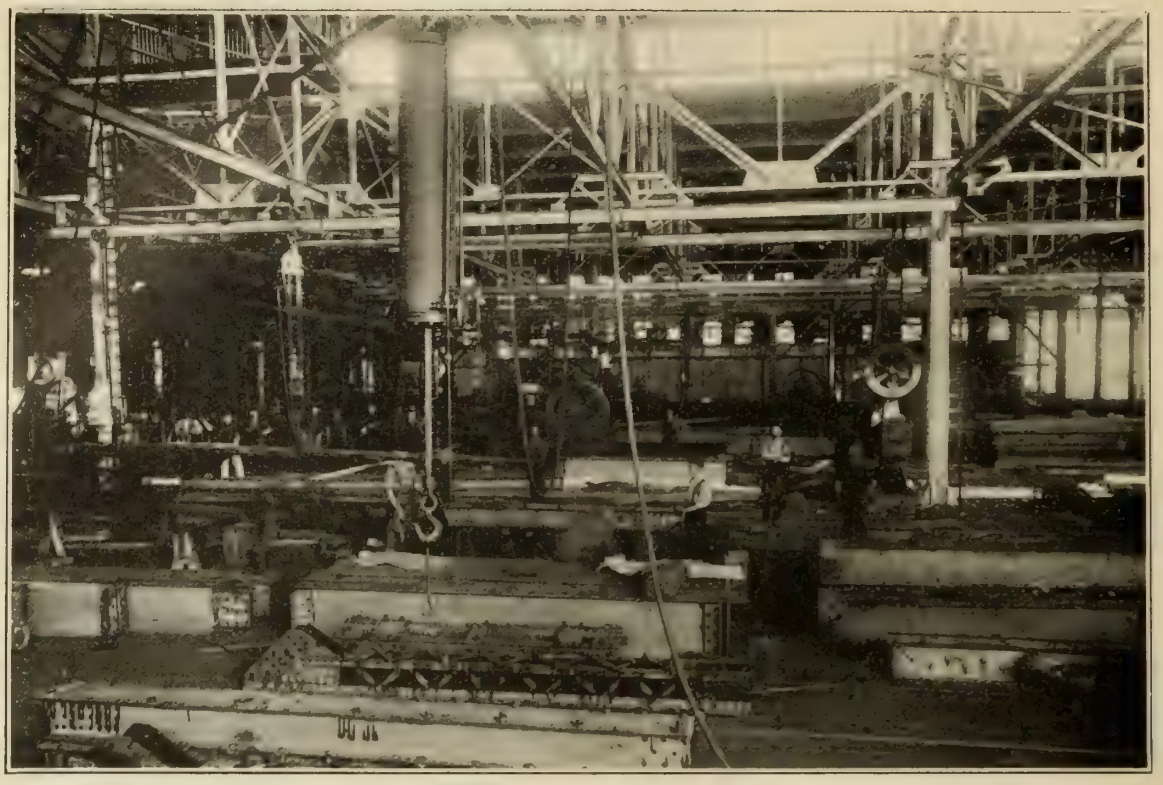

Fig. 7. Assembly Floor in Bridge Shop.

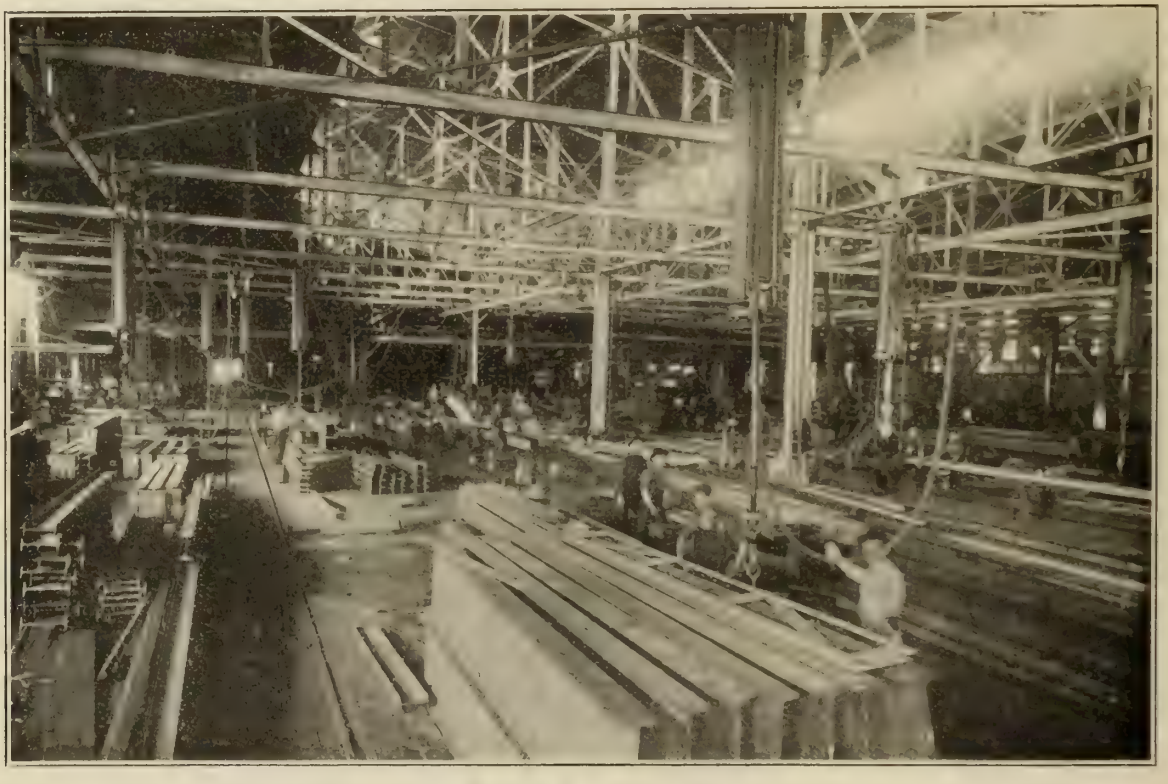

Fig. 8. Main Bridge Shops.

from ¾-in. to 3½-ins. Fig. 6 is taken from the west end looking east.

In the foreground are the angle iron shears, with revolving table. It will cut angles 8x8x⅞-ins. Back of the angle iron shears is the John Bertram plate shears. It will cut plates 6 feet wide and 1 inch thick. In the back of Fig. 6 are the machines first mentioned. There are also two rotary planers, one with a 50-in. face and a smaller one with a 40-in.

Along the left side, Fig. 6, are the rivet furnaces and at the east end are a Wm. Sellers riveter and an I-beam boring machine, which will bore 35-ft. centres. In the corner is the superintendent's office and over it is the men's lunch room. This is provided with washroom, tables, chairs and all the latest technical papers. The men use this at the noon hour, and while enjoying a quiet smoke can peruse the mechanical journals.

Along the righthand side are jib cranes, and reaming machines. These each have a 22-ft. arm, with independent motor drive and are used to ream the holes that are drilled small.

At the east end is the power house, where the compressors supplying air power for the Allen riveters and Rand hoists and hand air machines are situated. Power is obtained from the Cataract Power Co. and one of the air compressors is run by motor. The other is run by steam supplied by a B. & W. boiler. In winter the exhaust steam is used for heating the works, a Buffalo Forge Co.'s system having been installed.

On the south side is a track below the level of the floor to facilitate loading bridge members. A system of narrow-gauge tracks, with turntables where necessary, further facilitates the handling of the heavy steel bridge members.

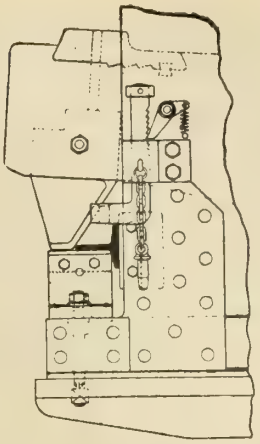

Fig. 9.

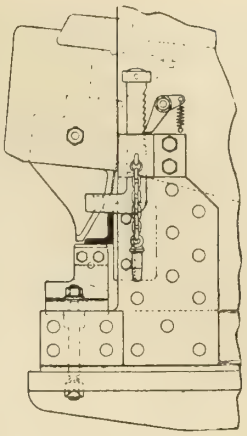

Fig. 10.

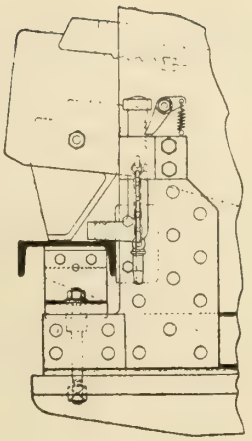

Fig. 11.

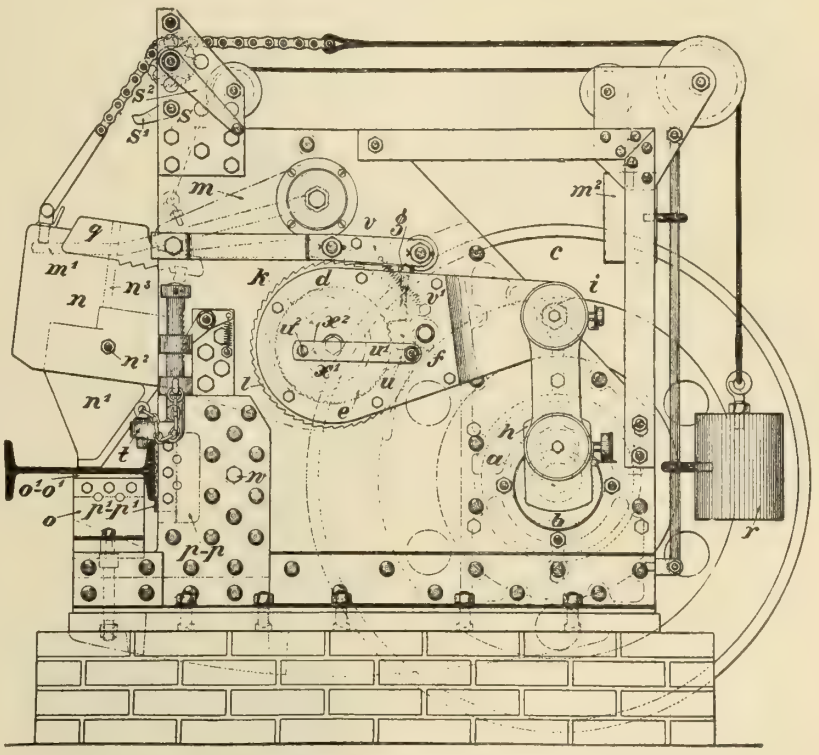

Fig. 12.—Johns Beam Shears.

Fig. 13. Steel Work of New Bridge Shops.

At the west end is situated the machine shop and above it the carpenter shop. The new machine shop shown in Fig. 13 has been erected and new machinery is being installed. The machinery is being moved from the machine shop at the west end of the bridge shop to make room for bridge work.

Johns Beam Shears.

Probably nothing shows the development in bridge building more than the invention of the machine shown in Fig.

12. It shows the machine ready to cut an I-beam, which is done in two operations. Fig. 9 shows the machine cutting a T-shape; Fig. 10 an angle, and Fig. 11 a channel. The machine is manufactured in Germany and it is one of the great time-savers used in bridge building. Steel shapes can be cut to length by the pulling of a lever, where formerly a power hack saw would saw off a very limited number in a day.

At the Hamilton Bridge Works there are two of these beam shears, which will cut 15-in.x42 lbs. to the foot in the bridge shop, and a 24-in.x100 lbs. to the foot in the new shop. The machine and work is handled by two men with the aid of an air hoist.

Pattern Shop.

The pattern shop is upstairs at the west end and contains the necessary machines for pattern work. Here the shapes are laid out for the different bridges, so that workmen in the bridge shop know exactly what they should do, making a great saving in time, besides allowing the foreman more time to devote to his other work.

New Machine Department.

Fig. 13 shows the steel work of the new shop when in course of erection. It contains a full equipment of tools, as well as overhead tracks and air hoists. A narrow-gauge track connects it with the bridge shop. All the machines are on concrete foundations, with a concrete base on which to test bridge turntables before they leave the works.

Among the new machines being installed in this department are two 40-in. John Bertram radial drills, two 60-in.x 20-ft. London Machine Tool Co.'s planers, one 60-in. Bertram boring mill, and three new lathes, 36-in., 24-in., and 18-in., from Goldie & McCulloch. Three bolt-making machines with forges using gas as fuel are installed in this shop. At the back of this workshop is a storehouse, where portable boilers, block and tackle, etc., are kept in places prepared for them. The whole arrangement has been made from an economic viewpoint and is an example of modern practice in bridge building.

REAMING MACHINE.

Not so many years ago, it was the common thought that almost any factory whatever its equipment, could turn out machine tools at a profit, and probably it could then. But men everywhere have begun to realize that in the face of modern competition, specialization of both product and equipment is demanded.

Into the manufacture of their line of drill presses, the Hoefer Mfg. Co., of Freeport, Ill., have put into use many new ideas and devices which they have designed and built for their own use.

Every mechanic has realized the difficulty in obtaining a true hole when reaming is done in a lathe or drill press, and this difficulty is augumented when the parts to be reamed have chambered holes, from then it is almost an impossibility to get the two ends of the hole to line up perfectly, even though floating reamers be used for this purpose.

To overcome many such difficulties which they had encountered in the manufacture of the spindle sleeve, pulleys

Reaming Machine.

and other parts of their line of drill presses, the Hoefer Mfg. Co. designed the reaming machine as they call it, as shown in the illustration. They have taken the base and column of one of their standard 16-inch drills, and to the base under the metal shield have fastened a special bracket which carries a crown gear and pinion transmitting the power from the pulleys to the spindle head, the drift hole of which is seen just below the cone pulley. Into this spindle head is placed a reamer shank having a No. 3 Morse taper. This reamer shank carries an adjustable shell reamer which can be so adjusted that a standard size hole is maintained at all times, and ends just above the reamer in a small pilot, which enters into the guiding arbor above it. This guiding arbor is held in the long ways rotating spindle carried by the column.

On the back of the spindle is cut a rack in which operates the cross spindle through the wheel and lever shown. The pulleys and sleeves are drilled in a drill press by means of a special cutter bar which extends through the cored hole of the sleeve, into a revolving bushing in the base of the jig, and which has two double ended cutters placed about one inch apart, one cutter roughing, the other sizing it to about .010 under standard size. The guide bar in the reaming machine is ground to a sliding fit for the pulley or sleeve, while the reamer is .001 smaller than standard. In operating the machine, the guiding arbor is raised by the spindle and the pulley is slid onto it. The spindle is lowered until the guiding arbor engages the pilot on the reamer bar and the pulley is forced over the reamer onto the reamer shank beneath by a slight pressure on the pulley by the operator. Since the two bars, the one above and the shank beneath the reamer quite closely fit the hole before and after reaming, any error in the alignment of the hole is fully corrected.

The upper and lower corners of the reamers are stoned off by a small oil stone and the result is a very smooth hole. The work as turned out by the machine is very accurate, as it is almost impossible to detect any varation with micrometers. This reaming is done by the drill press operator, near whose press this machine is placed, while the hole is being drilled.

By means of this method of reaming, it is found that a far better bearing is obtained in the pulleys and sleeves for the shafts and spindle.

OBITUARY.

C. E. Kilmer, electrical engineer, of Kilmer, Pullen & Burnham, McKinnon Building, Toronto, met with an unfortunate accident on Wednesday, May 19, at Walkerton, which resulted in the loss of his life. The firm of which he was a member represent the General Electric of Sweden, and they have been doing considerable business in Canada. This made it necessary for him to visit Sweden. He arrived in New York on Tuesday, and was in Toronto Tuesday evening. He went to Walkerton the same evening to visit his father, and was stepping from the train when the unfortunate accident occurred. The business will be carried on by Messrs. Pullen & Burnham, McKinnon Building, Toronto, electrical engineers, who were associated with him.

A Practical Cost System for a Manufacturing Plant

A Simple and Efficient System used in the Works of the London Machine Tool Co., Hamilton, Giving Excellent Results With a Minimum of Labor.

One who knows the value of a cost system would hardly believe it, but there are managers who think that the cost system is only another method of increasing office expenses. But this is not so. An efficient system with a minimum of outlay for outkeep is a valuable asset. The system must be complete, however, and give information of no uncertain character. It must show actual facts in relation to the business.

In the system installed in the London Machine Tool Co. complete shop costs are shown. The work done in the machine department is accomplished by a young man under the direction of the Superintendent, P. M. Yeates, while the material cost and total cost are kept by a lady clerk under the supervision of Richard Harding, the secretary, who designed the system.

The London Machine Tool Co., manufacture machine tools, and while this system is made applicable to the requirements of that company, it may suggest a simple practical system to manufacturers looking for information on costs and cost systems.

Parts are Numbered.

Every casting or part must bear a number and for convenience a letter prefixing a pattern number denotes the class of material from which the part is made. The patterns, whether brass, or cast iron, etc., come under the class of patterns and the numbers are prefixed by the letter P. Thus it will be seen that the number P—2400 in the illustrations refers to pattern No. 2400. All pieces from the bar or forge shop come under the heading of forgings and the number is prefixed by the letter F. Thus, F—2500 represents forging No. 2500. Every part made in the shop must bear a number.

Departmental Orders.

When an order is received, the main office makes an order to the drawing office in the form shown in figure 1, and all specifications must be put on this order. The drawing office in turn makes out an order to the works office on the form shown in figure 2, and this order bears the sales number which is put on the machine when completed, and also the shop order number against which all labor is charged. This order is accompanied by complete specifications of the machine, giving the names and numbers of all its several parts, and also gives a list of all supplies going with the machine.

Enough copies of these specifications are made to supply all departments with a copy, and as each department does its work on the different parts they are checked off. Every morning these are gathered in, and the check marks are duplicated on the copy in the works office. This, as can be seen,

enables the superintendent to see at a glance the amount of work done on a machine, and greatly aids him in setting a date of delivery. Along with the specifications the drawing office also sends complete drawings, each part being on a separate sheet, and unless the drawing of the part is difficult all detail drawings are made freehand. A great saving in the drawing office is thus effected, and in time the draftsmen get so expert at it that it is hard at times to discriminate between freehand sketches and those made by square and compass.

Fig. 5.—Record Card.

Day Work Cards.

Fig. 3 shows the daily time slip on which each man's time is recorded as shown. It must show the part number and the number of pieces, and also his exact time for the day work whether he is working day or premium. In the card shown in Fig. 3, workman No. 70 was working on casting 2400 for 8 hours and forging 2500 for 2 hours. The man's rate is 25cts per hour. The amount of time he works on day work, 2 hours in this case at 25c per hour is recorded according to operation on the sheet shown in Fig. 4. The work in this case was done on a lathe and the amount, 50cts., is entered in the lathe column. The castings were for an 18 inch lathe.

Premium Card.

His actual time "working premium" is recorded on premium record card shown in Fig. 5, and when the premium is paid the time recorded on the premium card, together with the premium, is recorded on the sheet shown in Fig. 4. Thus this sheet forms a complete record of the actual productive labor put on each machine or batch of machines.

The premium slip given to the man with the job he is to do is of the form shown on Fig. 6, and the foreman must put down the time he started and the time he finishes. The difference between his time allowance and the time he takes forming the premium, based at his rate per hour.

The time taken to turn 12 pieces on his lathe was 8 hrs. and the allowance is 9 cts. each, or a total of 10.8 hrs. for the twelve pieces. The premium is therefore 2.8 hours. The price paid for premium can be a fixed rate per hour, but in The London Machine Tool Company's system the rate paid for the saving in time is based on the workman's wages.

Fig. 6.—Premium Card.

Final Cost Sheet.

From the sheet shown in figure 4 the time on each piece for each operation is singled out and summarized on the sheet shown in figure 7, which is the final sheet. On this sheet all material is recorded, the weight and the cost in the rough being given. Thus by adding horizontally the total manufacturing cost of each piece is obtained. To this is added all supplies and fixed charges, bringing out the grand total at the bottom of the sheet.

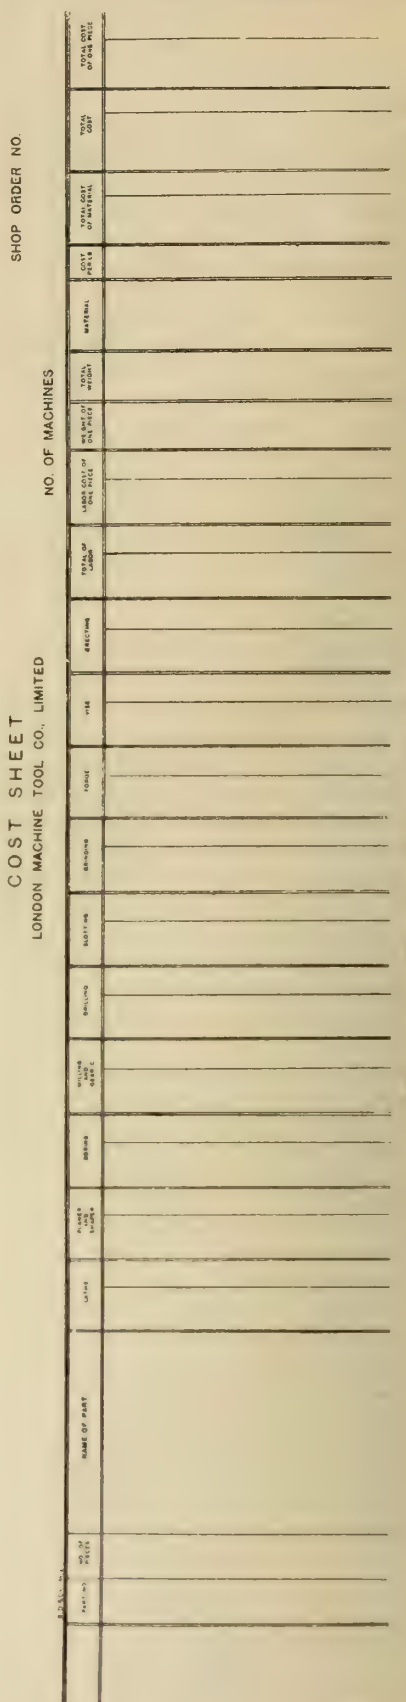

Fig. 7.—Cost Sheet for Practical Cost System.

These summary sheets are filed away

under their shop number, and are used as a permenent reference. When machines are to be duplicated it is only necessary to refer to these sheets to know, after a comparison of the metal market, the exact cost of the new machines.

The methods of handling and keeping track of materials are as follows: For each pattern a card of the form shown in Fig. 8 is made up and filed. This card shows the location of the pattern in the pattern storage and also gives a record of when it goes out to the foundry and when returned and also to which foundry it goes. The foundry sign a shipping bill showing receipt of the pattern and if lost or destroyed while at foundry, the foundry is held responsible.

All castings are ordered from the specification sheets sent out from the

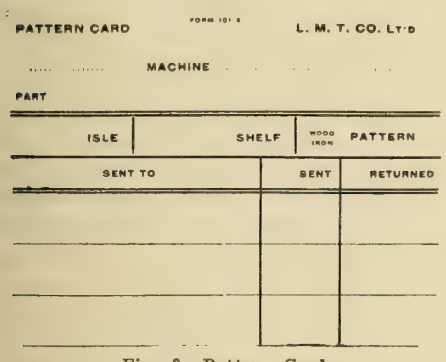

Fig. 8.—Pattern Card.

drawing office, the form of this sheet being shown on Fig. 9. The receiver, as the castings come in, records on his sheet the weight of each piece and when the list is completed these sheets are handed over to the Accounting Department and here the weights are transferred to the final sheet, shown on Fig. 7.

The same routine is carried out by the man looking after the bar stock. He cuts the required parts and his

sheets are turned over to the accounting department. From the receivers specification sheets a casting record card of the form shown in Fig. 10 is made out. This card gives a record of all castings in stock, and when they are used a requisition must be made for them and the number on the requisition is deducted from the number in stock.

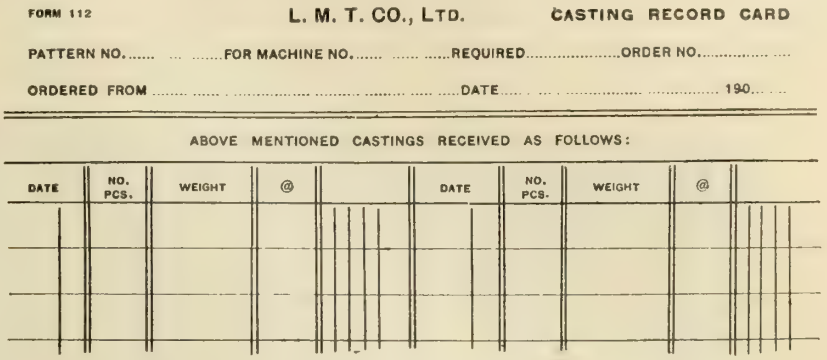

Fig. 10.—Castings Record Card.

At the end of the year the numbers shown in stock by the card must correspond with the number in the bins. A system similar to this is employed for keeping track of supplies such as screws, nuts, wrenches, etc. Fig. 11 is a requisition card and this is used by the foreman when he requires stock from the stores department.

A study of this system will show that accurate costs are obtained with out any complicated methods being introduced. Simplicity is one point that should be aimed at in the installation of a cost system and it should combine with simplicity, completeness and accuracy and bring to the eyes of the superintendent the necessary information he should have for turning out the work as quickly as speed is consistent with good workmanship.

HARDENING ALUMINUM WITH COPPER.

Except where high tensile strength is essential, copper makes the best hardening adjunct to aluminum owing to the excellent pouring properties of the alloy, the contraction being low and the metal free from the tendency (characteristic of aluminum-zinc alloys) to crack in the mold. The high melting point of the copper renders it inadvisable to melt the two metals together, as the castings are liable to be spoilt by air bubbles. The better plan is to melt the copper first in a graphite crucible, covering the surface with charcoal, and then to add an equal weight of aluminum by degrees, the mixture being stirred between times, and becoming white hot in consequence of the thermal reaction. When poured into molds this alloy is white and brittle and can be crushed with a hammer. To harden ordinary aluminum-copper alloys—e.g. the usual casting alloy containing 42 parts Al. and 3 Cu.—with the 1:1 alloy, all that is necessary is to heat 39 parts of the former and 6.3 parts of the latter in a crucible, and stir the mass.

Fig. 11.—Requisition for Material.

C. H. Macmillan, formerly superintendent of the Dominion Iron & Steel Co., who has been recuperating in Maine for the past year has been appointed superintendent of the steel dedepartment of the company, and has taken up his new duties.

The United States steel industries are reporting great improvements in the steel trade, either in the tonnage of new orders secured or in specifications on contracts or in slightly higher prices for finished material. The demand for steel rails is improving and large sales are reported. Coke and ore contracts are also increasing.

REGULAR POLYGONS.

By G. D. Mills.

The accompanying diagrams are regular polygons, one having an even number of sides and the other an uneven number of sides. Fig. 2 is a table of formulas and Fig. 3 a table of constants to aid in calculations.

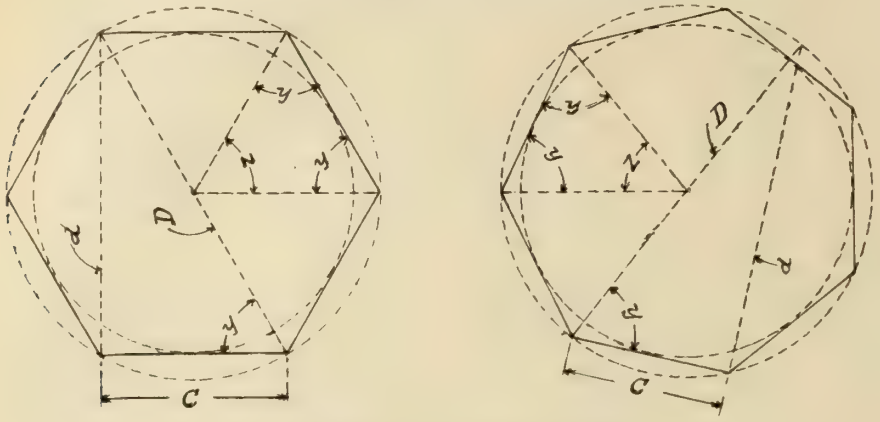

Fig. 1.—Diagrams for Calculating Polygons.

The formulas are derived from a right angle triangle which is dotted in each of the diagrams and may be briefly explained as follows: If we erect a right angle triangle on the side of any regular polygon, its vertical will be the inner diameter of the figure or d, its hypothenuse the outer diameter or D, and its base the length of a side or C. The apex of the triangle must necessarily fall on the outer circle providing the hypothenuse is drawn through the centre of the figure. From this it will be seen that we have only to determine an angle of the triangle to calculate its sides.

The center angle Z is readily found by dividing 360° by the number of sides and the desired angle Y by deducting ½ ½Z from 90°. Both of these angles will be found in the table of constants for figures of from 3 to 25 sides, together with the constants of sine Z, sine Y, cosine Y and tangent Y. Following will be found a few examples which serve to better illustrate the practical application of the formulas.

Example 1.—What diameter round bar shall we use to cut an octagon whose sides are to be 1¼ inches? In this case we require the outer diameter D, having the length of a side, C, or 1¼ inches. By referring to table of formulas, on line to find D, knowing C the formula, $D=\frac{C}{\cos. Y}$; and in table of constants, cosine Y for octagons is .3827. Our formula will therefore read $D=\frac{1.25}{.3827}=3.266$ inches in diameter or about 3¼ inches.

Example 2.—If the distance across sides or inner diameter of a regular hexagon is to be 4½ inches, what will be the length of a side C? By referring to table of formulas to find the length of a side C, where the inner diameter or d is known, the formula $C=\frac{d}{\tan. Y}$ and tangent Y for hezagons is 1.7321. Our formula will therefore read $C=\frac{4.5}{1.7321}=2.598$.

If we desire to know the outer diameter or D, our formula will read $D=\frac{d}{\sin. Y}$ or $D=\frac{4.5}{.866}=5.196$. If the area of the figure is required the formula $A=\frac{d^2}{\tan. Y}\times\frac{N}{4}=\frac{4.5^2}{1.7321}\times 1\frac{1}{2}=\frac{20.25}{1.7321}\times 1\frac{1}{2}=17.536$ sq inches.

Example 3.—If the area of a regular pentagon is to be 15.516 sq. inches, what will be the length of a side? By referring to the table of formulas where A is known to find C, the formula

$$C=\sqrt{\frac{A}{\tan Y\times\frac{N}{4}}}=\sqrt{\frac{15.516}{1.3764\times 1.25}}=$$

3 inches.

Example 4.—What will be the area of a segment of a circle which is included between one side and the outer circle of a regular octagon whose outer diameter is 12 inches? In this case we must find the area of a circle 12 inches in diameter and deduct from it the area of the enclosed octagon which gives us the area of 8 segments, and as all are eequal, one-eighth of this is the required answer.

The area of a circle 12 inches in diameter can be found by squaring 12 and multiplying by .7854 or much more readily, by referring to a table of circles in which it will be found to be 113.098 square inches. The area of a regular octagon whose outer diameter is 12 inches, may be found by the formula $A=D^2\times \text{sine } Z\times\frac{N}{8}=12^2\times .7071\times 1=144\times .7071=101.822$ sq. inches, and this deducted from 113.098 gives us 11.276 sq. inches. The answer is ⅛ of 11.276 or 1.409 sq. inches.

Knowing

Find	A	C	D	d
A		$A=C^2\tan Y.\frac{N}{4}$	$A=D^2.\sin Z.\frac{N}{8}$	$A=\frac{d^2}{\tan Y}\frac{N}{4}$
C	$C=\sqrt{\frac{A}{\tan Y.\frac{N}{4}}}$		$C=D.\cos Y.$	$C=\frac{d}{\tan Y}$
D	$D=\sqrt{\frac{A}{\sin Z.\frac{N}{8}}}$	$D=\frac{C}{\cos Y.}$		$D=\frac{d}{\sin Y}$
d	$d=\sqrt{\frac{\tan Y.A}{\frac{N}{4}}}$	$d=C.\tan Y.$	$d=D.\sin Y.$	

Fig. 2.—Table of Formulae.

Example 5.—If a regular polygon is to have an area of 44.7 sq. inches, and its sides are to be each 2 inches in length, how many sides will the figure have? In this case we have the area and length

of a side, C. By referring to the table of formulas will be found formula $A=C^2 \times \text{tan. } Y \times \frac{N}{4}$. As we have A and C and are to find tan. Y and $\frac{N}{4}$, we divide A by C^2 or $\frac{44.7}{4}$ which gives us 11.175 sq. inches and tan. $Y \times \frac{N}{4}$ must equal 11.175. By referring to the table of constants and glancing along the column headed tan. Y, it will be seen that we must find a tan. Y which, multiplied by its proper $\frac{N}{4}$, will produce 11.175. Thus, selecting a 10-sided figure tan. Y is 3.0777, and multiplied by $\frac{10}{4} =$ $3.0777 \times 2\frac{1}{2} = 7.694$, which is insufficient Again, selecting a 12-sided figure, tangent Y is 3.7321 and multiplied by 3 gives us 11.196, which is the nearest to 11.175. The figure will therefore have 12 sides.

The tables will be found of great value and aid in other calculations which arise in daily practice and the three detached formulas also convenient at times.

$$A = C\ d\ \frac{N}{4} \qquad C = d\ \frac{\frac{A}{N}}{4} \qquad d = C\ \frac{\frac{A}{N}}{4}$$

$$Z = \frac{360^\circ}{N}$$

$$Y = 90^\circ - \frac{Z}{2} \qquad Y = \frac{180^\circ - Z}{2}$$

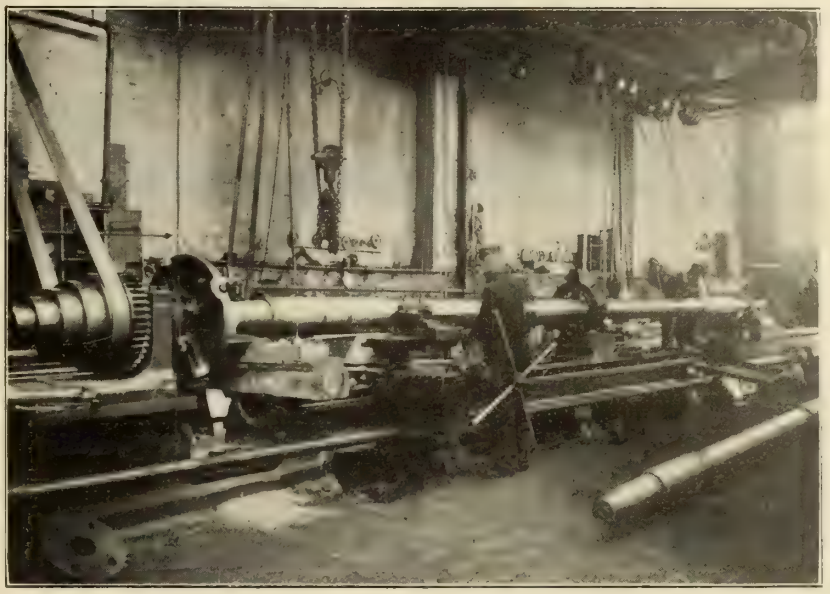
A= Area of polygon.
N= Number of sides.

COLD DRAWN STEEL.

The Union Drawn Steel Co., Hamilton, manufacture cold drawn steel in round, flats, squares, hexagon and special sheets. The operation of cold drawing is a very interesting one. A specially designed machine draws the steel jaws, grips the raw product and draws it to standard size. The steel has to be of perfect structure to withstand the tensile stress to which the bars are subjected.

The next operation is straightening the cold-drawn bars. The bars are fed over revolving rollers and if a defective bar escapes the drawing machine it cannot pass the straightening machine.

All sizes from 1-16 in. to 6 in. round are carried in stock, also flats, squares and hexagons. This steel is used for agricultural shafting, roller bearings, etc. Shipments have been made to New Zealand, but the tariff of other companies will not permit shipping from the Canadian works, but the Canadian business is now keeping them working to their capacity.



Turning a Large Shaft on Two Lathes

TURNING A LARGE SHAFT ON TWO LATHES.

The accompanying photograph shows how a shaft 27 feet 6 inches long by 10 inches diameter was turned by using two lathes. This necessitated no moving of either machine, as they had been lined up accurately when first set up. It will be noted that both machines are cutting, one working at either end. On each apron there is an extension so that whatever is missed, in the space between machines, by one tool, is reached by the other.

This shaft is one of three large propeller shafts being turned in the shop of the Hall Engineering Works, Montreal.

SOLDERING ALUMINUM.

According to La Vie Automobile, the best soldering medium for aluminum is an alloy of that metal and tin. The proportions vary according to the extent to which the soldered articles are intended to be worked; 45 parts of tin and 15 of aluminum forming a good solder, for such as are to be shaped afterwards. A harder solder, but less easily applied with the soldering iron, is prepared by melting 4½ parts of red copper, to which are then added 3½ parts of zinc and 4½ of tin, the heating being continued until a homogeneous alloy is obtained, which is cast into sticks.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

NORKA DRILL AND CHUCK.

This drill is made by twisting a bar of special section, leaving a portion straight for the shank. This is ground to insure centering in the chuck, and the outside of the drill is also ground so as to drill a hole round and true to size. The jaws fit into the straight grooves left for the shank and unquestionably hold with a grip that can only be disturbed by breaking the drill or the chuck.

Dig. 1.—Norka Drill.

The chuck has two heavy jaws, held by a substantial nut, which insures a drive that will stand up to any work it may be called on to do.

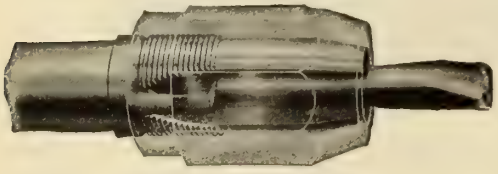

Fig. 2.—Norka Drill Chuck.

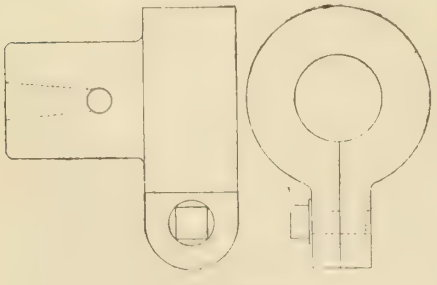
Both drill and chuck are made by the Whitman & Barnes Mfg. Co., St. Catharines, Ont.

NEW CHUCK.

The chuck illustrated is made to fasten to a lathe tail-stock. In the accompanying illustration A is tapered to fit the Derrer tapered shank, but may be made to suit the ordinary tapered drill if desired; B is a drift hole and C is made to fit any tail stock. The chuck is fastened to the tail-stock by the clamping of the chuck.



New Chuck.

The chuck can be used for boring cams, bushes, etc. The drill when in use bores steady and true and twist or flat drills of any length may be used. Reducing sockets does not lessen the trueness of drilling.

The socket is manufactured by the Elevator Specialty Co., corner Church and Lombard Streets, Toronto.

HIGH POWER I-BEAM AND CHANNEL HAND PUNCH.

The advantages, capacity, ease of operation and durability of the hand-power punch illustrated herewith makes it adaptable to all kinds of punching on I-beams from 5 ins. up to 12 ins., and the light weight, with its durability recommend it to structural steel users.

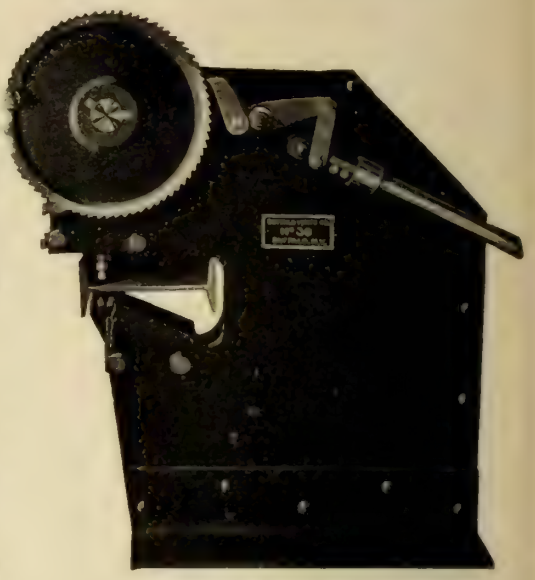
The strength and rigidity of the armor plate frame is seen at a glance, and the large punching power is very great, a medium sized hole is punched in plate thicknesses up to ½-in. The maximum capacity of this punch is one-inch holes in ½ in. plate, which would take a dead weight of over 47 tons upon the plunger, based upon a shearing strength, of the material being punched, of 50,000 lbs. to the square inch; which is equivalent to the ordinary steel used in bridges and structural steel work of all kinds.

This power is made possible by a combined 3-stage lever motion, which has a leverage of 1 to 2,200 from the end of a 6-foot lever to the shearing edge of the punch. This is equivalent to 2,200 pounds pressure at the punch with one pound pull on the lever; but does not include the power lost in friction of working parts, which is small for a machine of this kind.

The two frame plates are rigidly bolted and riveted together in a box form construction. The ratchet wheel is cut and hardened steel, upon which works the pawl and lever motion. It will be noticed that the lever-bearing studs are bolted through the frame, making them extra rigid, and that there are three pins in the lever handle, over which the first link is placed to secure a one, two or three-tooth movement of ratchet wheel. The ratchet wheel can be turned by a convenient handle to quickly adjust the punch to the work, as well as to run the punch up after completing an operation.

The plunger crankshaft, upon which the ratchet wheel is pressed, is securely supported by flange bearings, bolted to the main frame. The throw of the crankshaft is ¾ of an inch, and the motion is transferred to the plunger head by means of a heavy steel one-piece connecting rod, which has a width of the frame space, and is bored from the solid and bronze-bushed.

The planed sides of frame form guiding surfaces on two sides of plunger, while the main guides are bolted between the frame and have adjustable gibs which assure premanent alignment of punch and die. The die holder is a steel casting of improved shape and design adaptable to working on webs of channels, I-beams, etc. It is mounted on the frame and bolted by an extension machined to fit the frame space.



High Power I-Beam Punch.

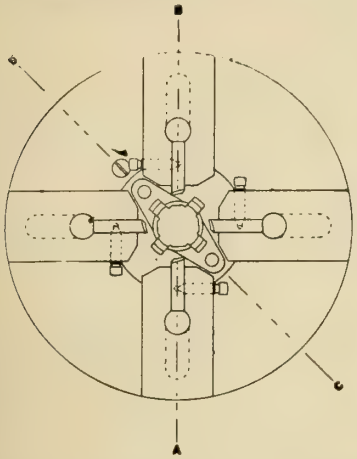
Heavy angle irons are riveted to the frame on both sides, making a substantial base plate. Its weight is 1,000 lbs., and can be mounted on truck for portable use. The machine is made by the Buffalo Forge Company, Buffalo, N.Y., and has been styled their No. 30 punch.

IMPROVED DIE HEAD.

The Improved Automatic Opening Die Head is composed of four principal parts, namely, the body, sliding collar, adjusting shell and die holders.

The body is of strong, close grained cast iron, bored and turned perfectly

true, standard size for interchangability of parts.



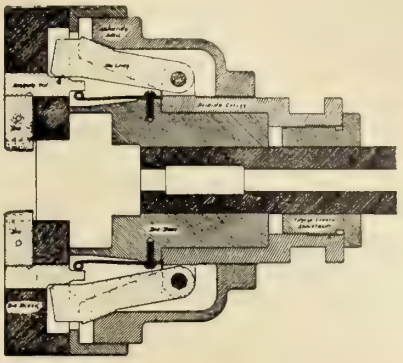


Fig. 1.—Section.

Across the face of the body are milled heavy T slots for carrying the steel die blocks. The outside flange of this part of the head is machined at the back internally as a guide for the adjusting shell and also serves to exclude cuttings from the working parts of the die head.

The hub is bored and keyseated for the steel driving shaft, the outside is fitted for the sliding collar to work upon.

The sliding collar is fitted part of its length internally to slide upon the hub of the body, the remaining portion threaded to receive the collar for adjusting the length of thread to be cut when machine is in operation. The exterior of the sliding collar has four lugs milled and drilled to receive the fulcrum end of the bearing levers, also thread upon which adjusting shell is carried and the recess to receive the shoe attached to the yoke for closing the die head.

The adjusting shell carried upon the sliding collar at the back and guided within the flange on the die body at the front, is the means of positive, universal adjustment of the dies through the double wedge action on the bearing

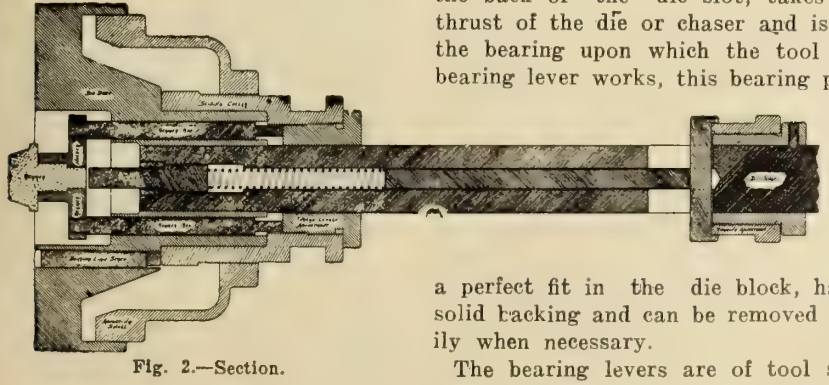

Fig. 2.—Section.

levers, plainly shown on sectional cut Fig. 1.

The die blocks are of machine steel, case hardened, carefully fitted to the slots in the die body, to exclude cutting and give extra long and durable wearing surfaces.

The tempered steel bearing pin forms the back of the die slot, takes the thrust of the die or chaser and is also the bearing upon which the tool steel bearing lever works, this bearing pin is a perfect fit in the die block, has a solid backing and can be removed readily when necessary.

The bearing levers are of tool steel, hung in the lugs of the sliding collar, tempered at the point of bearing on the bearing pin and turned to give ample bearing on the adjusting shell.

The dies are of the best tool steel obtainable, are plain, straight back, held firmly in position, each with one pointed set screw, entering pit in the die, making it quick and easy to change sets when desired. Dies may be recut from three to four times to original size before discarding.

The adjustment for light or heavy internal reaming is independent varied as desired and shown in sectional cut, Fig. 2. Owing to the construction, extra reaming tension that may be applied, will effect the reaming only when the thread is well through the dies where the heavy reaming will not cause a thin thread.

The reamer holder is malleable iron, part of its depth being squared to receive the square on reamer shanks. Reamers are held in place by a single pointed set screw.

Reamer rods attached to the reamer holder pass through long guide holes in the body of the die head and coming in contact with the adjustable collar in the back of the sliding collar, push the bearing levers off the bearing pins, allowing the die blocks to be thrown open by the positive spring action when the thread length has been attained, determined by the position of the thread length adjustment collar (see Fig. 2). To prevent accident the reamer rods are shouldered to strike the sliding collar should the adjustable collar be too far out.

When the die head is open the reamer holder with rods may be drawn out, permitting long or "running threads" to be cut. The adjustments for this die head are few, simple and quickly

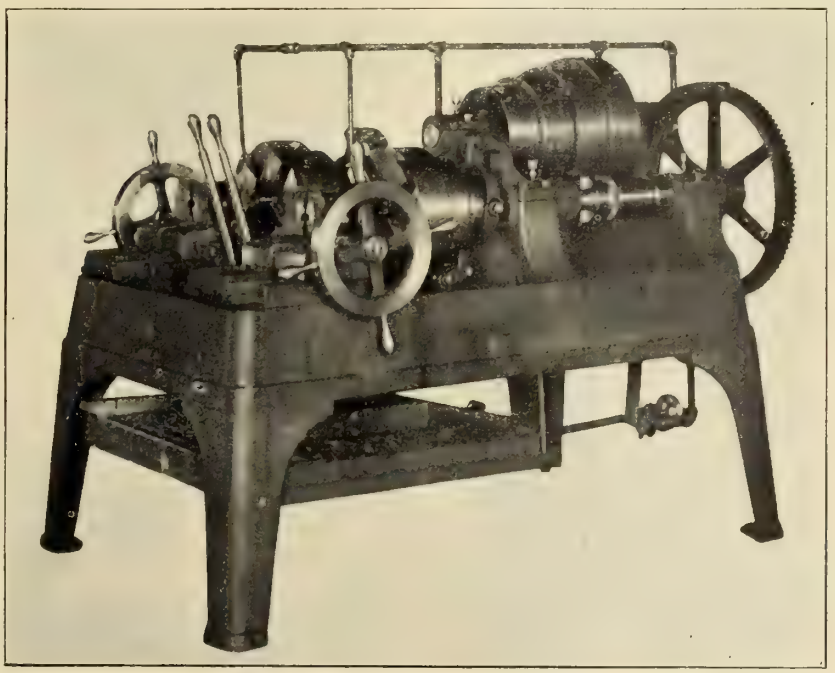

Fig. 3.—Improved Pipe Threading Machine.

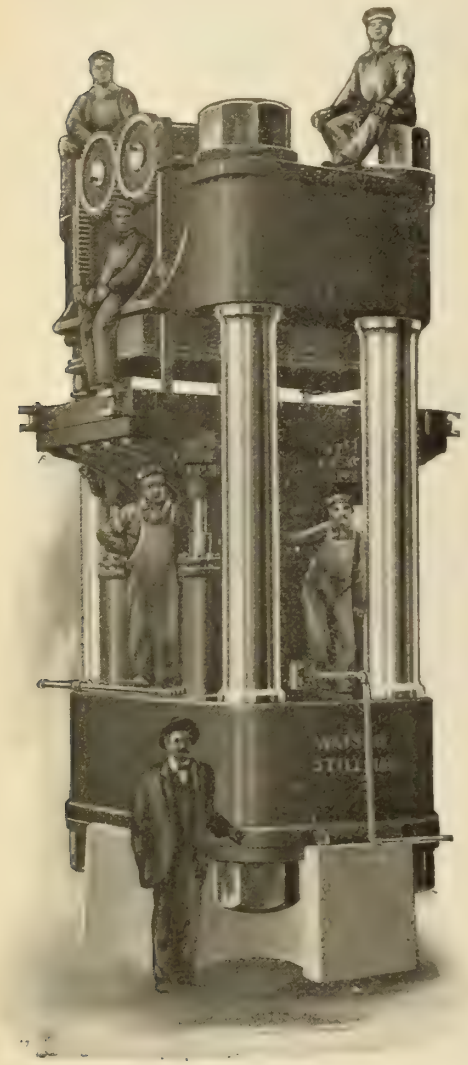
made, but accomplish all that can be desired viz: size of thread, length of thread and any amount of internal reaming of the pipe end. Extreme adjustment both ways from standard size make it easily possible to rehob dies in these die heads.

This automatic opening die head is manufactured by the Murchey Machine & Tool Co., corner 4th and Porter Sts., Detroit, Mich.

NEW 4,000 TON HYDRAULIC PRESS.

Almost every large hydraulic press embodies some peculiar features or operates under unusual conditions. The Watson-Stillman Press shown in the illustration is interesting not only on account of its large size, but it was built under specifications which stipulated that the moving platen should not spring more than 1-100 of an inch under the maximum load of 4,000 tons.



New 4,000 Ton Hydraulic Press.

The machine was specially designed by the Watson-Stillman Co., of New York, to compress a plastic material to almost uniform thickness within a mold of which the upper and moving platen form the top and bottom faces respectively. The sides of this mold consist of a practically solid steel band, 7 inches high and 5 inches thick, which rests on the moving platen while the material is under pressure. Absolutely uniform dimensions and great density of finished product are two essential requirements of the press. The extent to which these are secured may be inferred from the fact that the top of the mold clears the sides by about 1-64 of an inch and that 8,000,000 pounds pressure can be equally distributed over the mold (about 25 square feet in area and about 9 feet across the diagonal.)

To obtain this enormous pressure upon the material in the mold, an operating pressure of 5,800 pounds per square inch is required upon the main ram, which is 42 inches in diameter. With the exception of the ram, which is of chilled iron, all parts under stress are of steel. The three platons are steel castings, and the columns are turned of steel. The three platens are steel The cylinder is cast from nickel steel, which, as is well known, is far superior to ordinary carbon steel in strength and toughness, and permits of the lightest weight of metal to safely perform a given duty. This steel construction keeps the total weight of the machine to the comparatively low limit of 115 tons and also makes a press of much smaller dimensions than any cast iron machine of equal power.

The stroke of the ram is 18 inches, but the actual work of compression is accomplished through less than one tenth of that distance. A hydraulic accumulator is used to speed the ram up to load and the operating pressure is then taken direct from the hydraulic pumps.

After the material has been compressed, the mold is stripped by raising the sides. This is accomplished by simultaneously turning the operating pressure into the four 6-inch stripping cylinders, whose piston rods pass up through the moving platen and rest near the corners of the flask. Any inequality of pressure from the cylinders or tendency of the flask to stick in spots is prevented by racks and pinions, effecting the even raising or lowering of the flask.

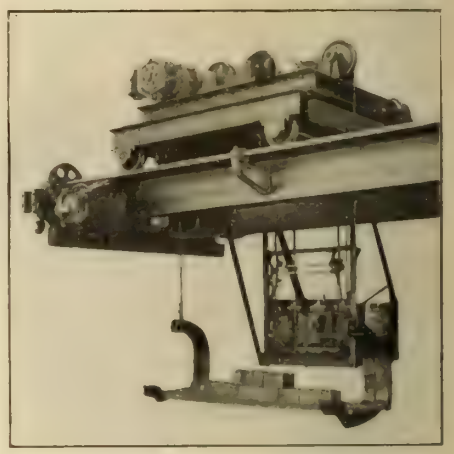
The two corners of the flask on each end are made to move uniformly by the intermeshing of the pinions at the centre, while the corresponding movement of one end with reference to the other is assured by mounting the two pinions of the same side upon the same shaft. It is thus evident that force exerted on one corner would be equally distributed to raise the whole flask. This prevents strain and bad alignment. The stripping cylinder rams have a travel of 23¼ inches, so that they will bring the flask down into position on the moving platen when the main ram is at the extreme bottom of its stroke.

The main ram lowers by gravity when the operating pressure is released and thus sends the water in the cylinder back into the pump reservoir.

The press is manufactured by the Watson-Stillman Co., 50 Church Street, New York.

THREE-MOTOR ELECTRIC TRAVELING SCALE CRANE.

The cut accompanying this article illustrates a new type of scale crane. All movements are operated by electric power. The novel feature of this crane consists in the application of the scales for weighing material, which are supported on trolley truck frame and carry the hoisting mechanism mounted on independent steel frame work. The scale beams are in the cage suspended from the trolley and readings are taken and recorded by operator. There are three beams: two scale beams with self-recording poises, and one tare beam, enabling scale weights to be determined of several different items of material with utmost ease and accuracy. A simple movement of hand-lever transfers, when desired, all load from the knife edges of the scale to the trolley truck frame, and then operation is the same as with ordinary trolley.



Three Motor Scale Crane.

An open side platform is furnished as shown for carrying long pieces such as rods, bars, etc. The design of this platform is made to suit the material to be handled. A crane of this type is most useful in loading material, checking invoiced weights, and in loading for shipment, for inventory, etc., etc.

This crane was designed and is manufactured by the Whiting Foundry Equipment Co., Harvey, Ill.

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical.
Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

TRANSMISSION OF POWER BY ROPES.*

Rope driving may be divided into two leading branches known as the American or continuous system, and the English or individual rope system.

Briefly described, the continuous system is that of winding a single rope as many times round both driving and

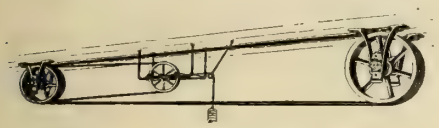


Fig. 1.—Continuous Rope Drive.

driven pulleys as there are grooves to fill, then conveying it from side to side as it completes the circuit by means of a "jockey" pulley fixed at the required angle upon a weighted slide, to regulate the tension automatically.

Size of Pulleys in Relation to Diameter of Ropes.

The first item in this connection is the relationship of ropes to pulleys in the matter of dimensions. The absolute point of detraction in power from the employment of relatively small pulleys cannot, of course, be determined with mathematical accuracy. Experience teaches, however, that it is not advisable to run a cotton rope over pulleys less than 30 times its own diameter without making extra allowance for loss of grip. Even then, be the alowance ever so liberal, this rule may not be violated without interfering with the vitality of the rope, which suffers from the strain of alternately bending and straightening in its passage over small circumferences.

Fig. 3 will serve to illustrate the detrimental effect upon a rope by bending

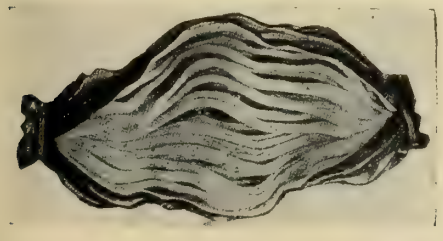

Fig. 2.—Kenyon's Inter Stranded Driving Rope.

round abnormally small pulleys. For the purpose of emphasizing, the circle round which this rope is fixed is only 14 diameters. By taking an angle of 45 degrees to represent the chord of the ogee arces forming the interstices of the strands at the horizontal portion of the rope, and carrying this angle through

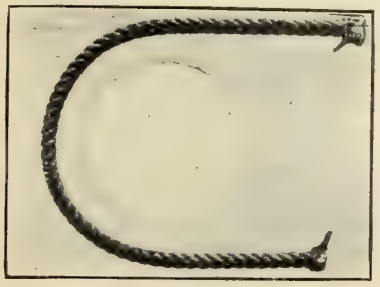

Fig. 3.—Showing Strains.

at its junction with the vertical centre line, the diameter is found of the small circle to which tangent lines are drawn from the bent portion, which graphically displays the extension of the outer periphery at the expense of the inner pitch of the rope. It will thus readily be seen how the circle could be so reduced that the grip of the rope would altogether cease.

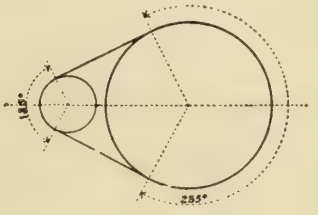

Fig. 4.

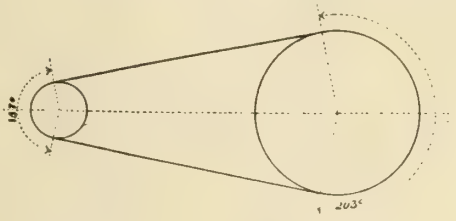

Fig. 5.

Arc of Contact.

The question now is, as to whether the amount of rope in direct contact with the pulleys influences in any way the power transmitted. This question may probably be best answered by reference to the two diagrams, Figs. 4 and 5.

Ignoring for the moment the curve represented by the "trailing span" and allowing straight lines to stand for the rope, it will be seen that, while the total contact remains the same, the respective arcs are governed by the relative distances between the two pulleys. Thus with the circles at close quarters, as in Fig 4, the arc of contact is represented as 125 degrees upon the small pulley. But as the distance between the pulleys is increased, the arc of contact also increases until the position represented by Fig. 5 brings it to 157 degrees, or a difference of 32 degrees between the two.

Although this implied detraction may not prove a realizable quantity in a drive where the factor of safety is recognized, it is always as well to make some allowance where large and small pulleys are in close proximity, if only for the benefit of the rope. When both pulleys are the same size, juxtaposition in respect to arc of contact is no disqualification.

Trailing Span or Idle Side of Ropes.

Although there is a distinct increase in the arc of contact when the tight or working side of the rope is below the pulley, as shown in Fig. 6, this position is not always attainable, or even desirable. For instance, in cases where an erratic delivery of power is required, such as the driving of iron rolling mills, the shock is taken up by the ropes, which display every irregularity by a series of wave-like oscillations.

If the direction of rotation is reversed, the working strain being uppermost, prevents the ropes wandering from their appointed track, while the slack, still feeling the impulses, falls naturally away by its own weight. When irregular impulses are given off or in down driving, i.e., where the driven pulley is lower than the line of the driver, the trailing span may with advantage be allowed to fall below. Although such detractions differ with differing conditions, 10 per cent. is usually considered a sufficient allowance. With oblique driving the case is, of course, different, because

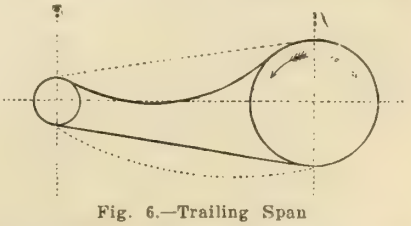

Fig. 6.—Trailing Span

of the check administered by its upward tendency.

The ultimate sag of a rope on the trailing side is generally reckoned at one-tenth the distance between centres, but extra is allowed upon this when estimating for clearance at the bottom of a drive.

* First of a series of articles describing the system of rope drive used by William Kenyon & Sons.

A PLANER JOB.

By Mac K.

The press frame shown in the line cut fig. 1 is a steel casting 7' 3" high weighing approximately 4 tons. It was planed on a 6' x 6' x 12' planer.

The extension used shown in Fig. 2 is

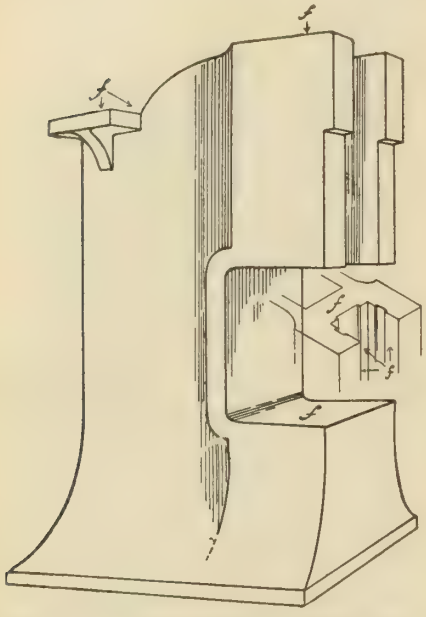

Fig. 1.—Drill Press Showing Finished Faces.

of cast iron 1¼" thick, planed on both faces and drilled to bolt on the cross rail using the four bolts that clamp the swiveling head.

The holes for the head were drilled 16" higher up in the extension plate. The two ¾" set screws were put in to take up any spring of the extension. The press frame was set up vertically

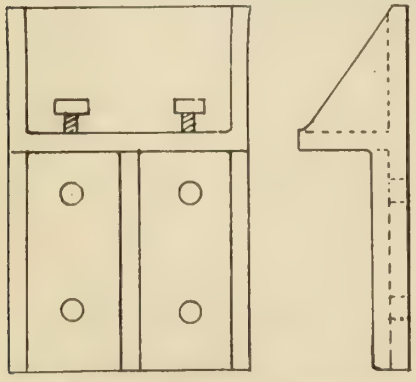

Fig. 2.—Plate Attached for High Work.

or on its own base on the planer, and finished on the faces besides the front and underside of projection. Using the finished faces on the top of the press square up by, when in a horizontal position the planing of the front faces was straight work.

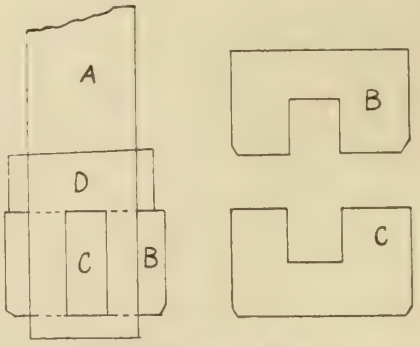
PIPE TAP AND DRILL.

By W. Richmond.

The accompanying drawings show a simple and cheap way to make a pipe tap and drill, which I have found very useful. The same idea can be used in a boring bar.

The holder A (Fig. 1) is made of ordinary tool steel with a shank to fit into the machine it is to be used on, the tapping end to be turned at least ¼-in. less than size of finished hole. Cut out two slots ¼-in. from end, at right angles to each other, a close fit, for cutters.

I use ⅜x1-in. high speed steel for taps for 1¼-in. up to 2-in, pipe. Make



Pipe Tap and Die.

one slot a little more than 1½ times the width of cutter, and 1-16-in. wider at one end, The cutters are cut out in the centre, as shown in Fig. 2, so that one will fit over the other.

On account of one slot being half as wide again as the other the cutters are very easily put in place, then drive in key, D, and they are ready to turn or thread. as desired.

CROSS HEAD REPAIR.

The high pressure side of a 300 h.p. cross compound tandem engine went through herself one morning shortly after starting. When the wreckage was cleared away, the frame, cylinder and crosshead on that side was all that was usable. After repairs and new parts were made and when the engine was being assembled, the crosshead, a steel casting was found to be cracked through at A, Fig. 1, and partly through at B. This was at 10 a.m. on Saturday, and the engine was billed to run at 6.45, Monday a.m.

To cast and machine a new one meant a week's delay, so the old one was repaired in the following manner: The crosshead was put on a taper mandrel and turned and threaded at C, 5

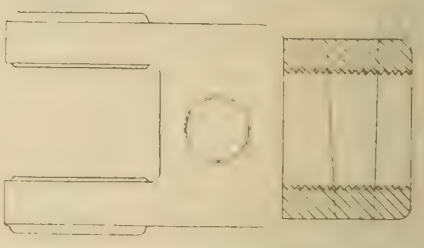


Fig. 1.—Completed Repair.

in. diam. x 5½ in. long, 8 threads per inch.

A mild steel collar 7 in. diam. x 5½ in. long was bored and threaded a very tight fit for the hub C. It could not be put on more than 1½ in. using a chain wrench with a 4 ft. handle. The crosshead was then returned to the lathe and the first 2½ in. of the thread on the hub C widened on top but not cut any deeper. The taper mandrel the crosshead was machined on, was marked and taken out and the crosshead bolted securely to the platen of a large planer, with the threaded hub C up ped and the collar polished. The taper

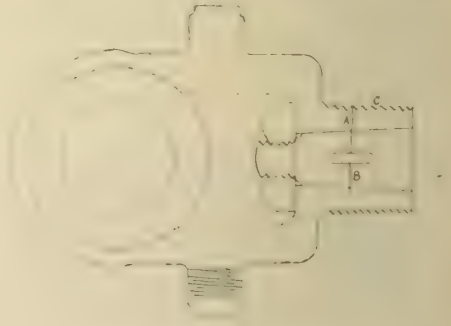

Fig. 2.—Broken Crosshead.

Fig. 3.—Clamp Used to Screw on Collar.

mandrel could not be driven in within 5-16 in. of its former distance.

To make sure a new piston rod was

gotten out that extended through the crosshead 1½ in. and threaded and after the piston rod and crosshead were coupled up a 1½ in. nut was driven in solid. The engine ran under full load Monday a.m., and is running yet with the temporary repair in place.

PUNCH AND DIE.

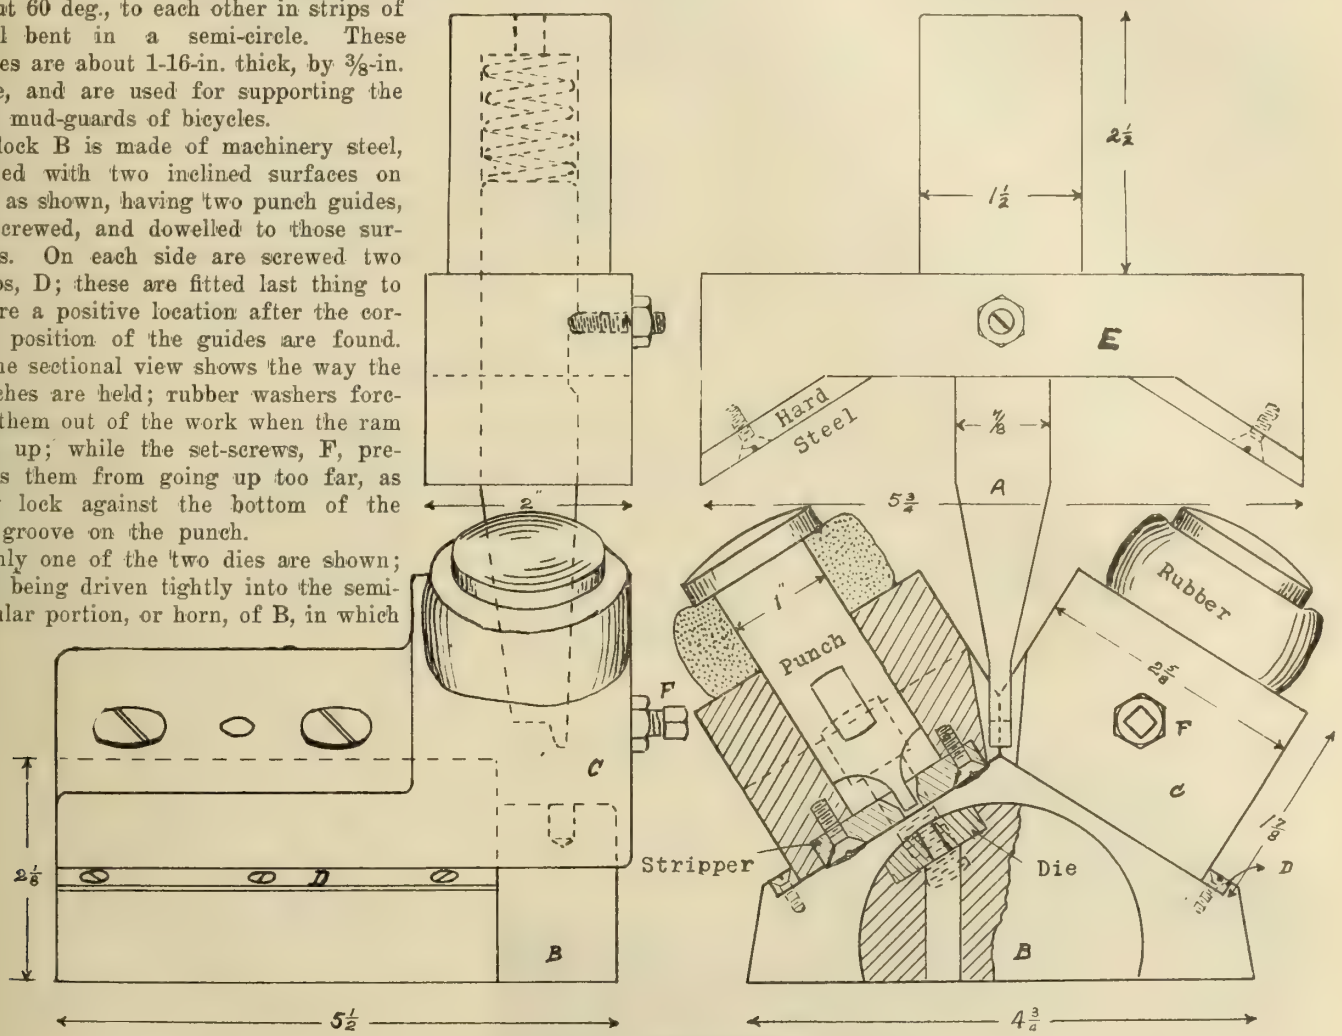
By W. J. T., Toronto.

The sketch shown is of a tool made some weeks ago, for punching in one operation, two holes at an angle of about 60 deg., to each other in strips of steel bent in a semi-circle. These pieces are about 1-16-in. thick, by ⅜-in. wide, and are used for supporting the rear mud-guards of bicycles.

Block B is made of machinery steel, planed with two inclined surfaces on top, as shown, having two punch guides, C, screwed, and dowelled to those surfaces. On each side are screwed two strips, D; these are fitted last thing to insure a positive location after the correct position of the guides are found.

The sectional view shows the way the punches are held; rubber washers forcing them out of the work when the ram goes up; while the set-screws, F, prevents them from going up too far, as they lock against the bottom of the flat groove on the punch.

Only one of the two dies are shown; they being driven tightly into the semi-circular portion, or horn, of B, in which



Punch and Die for Bicycle Mud Gear Supports.

clearance holes in line with the dies are drilled.

The action of the die should be clear from the sketch. The spring finger A strikes the work first, holds it down, and crowds it back in position, until the punches are forced through by the incline faces of E. As the sketch is intended to convey the principle only, detail dimensions are not given.

DRILLING HOLES ACCURATELY.

By S. A. Francis.

A method I have used for drilling holes accurately through the centre of round or square stock at right angles to the axis which has given very satisfactory results in actual practice and is simple in procedure, may be new and useful to some of your readers.

The common method pursued in a good many shops is to hold the work in the chuck or centres of the milling machine and adjust the height of the table when the drill or reamer is revolving in the spindle chuck until it just clears the top of the work, and then raising the table by means of the index screw a distance equal to half of the diameter of the work plus half of that tool in order to afford centre height. This method accomplishes the purpose satisfactorily but without knowing the pitch accuracy of the screw, and exact diameter of the work and tool, aside from the fact that drill must be running perfectly true, trouble will be experienced with it in obtaining accurate results.

A simpler method is to hold the work in the chuck or centres and cover both top and bottom of the work with a coat of chalk or other marking substance capable of being easily rubbed off, holding the drill in the spindle as is customary. Then raise the knee as is done in the other method, exercising care in the operation, to a point that when the table is moved back and forth, the revolving tool just rubs off the marking material. Replace the marking and adjust the height of the table, repeating the operation several times to obtain the exact lowest position in which the tool and the work are in contact, and set the screw index to zero.

Now run the work back clear of the tool and raise it a distance equal to approximately the diameter of the work plus that of the tool, repeating the operation on the underside of the work, adjusting the height as before until the highest position is found in which the marking is removed, being careful, of course, to keep the screw moving in the same direction all the time so as to avoid any back-lash. Then take the reading for the second setting and lower the table, adjusting the height to exactly half the distance shown between the two settings, all the time being careful to advance the screw in the same direction. The machine is now correctly set and the holes can be started with a short stiff centre reamer or drill with a find point.

The method is performed a great deal easier than it is to describe it and in practice gives exceedingly close results.

REPAIRING CAR PLATES IN POSITION.

The rapidity with which the steel car is supplanting the old wooden type has been due in considerable degree to the opportunity afforded by the former for the making of repairs with greater ease and economy. A large part of this work consists merely in straightening out bent and battered plates and can be done in place, without the additional cost of removing the injured section; for such purposes as this portable tools have been particularly designed and have found wide favor.

In the March issue of Canadian Machinery it was shown that oil burners, being entirely portable and self-contained, can be used in any position. The one illustrated herewith was built by the Hauck Mfg. Co., Brooklyn, N. Y. It has been brought out especially for use in building and repairing steel cars, repairing engine frames, expanding tires and discs, boiler making, pipe bending and similar work common in the railroad, boiler and machine shop.

The illustration shows a burner in operation on car repair work. Aside from the powerful and even character of the flame, an important feature is found in the fact that it can be regulated either to heat a large surface or concentrated on a small area. The rapidity

Repairing Car Plates.

with which work of this character can be done is illustrated by a job recently handled with an ordinary No. 2 burner, a steel plate one-half inch thick and measuring 6 by 10 feet, was bent to right angles the longer way in 15 minutes, a space 8 inches wide by 10 feet long being heated for this purpose. The burner is also adapted for brazing and welding work.

BORING BAR FOR CYLINDERS.

The accompanying sketches illustrate the arangement of a bar and cutter head suitable for borning cylinders from 10 in. up to say 30 in. Fig. 1 is a front elevation, and Figs. 2 and 3 end views, of the gearing and cutter head respectively. Referring to the drawings, the bar A is carried by heavy bearings mounted on a table (not shown) to which the cylinder to be bored is bolted. Three cutters are fastened in slots in the head by small hardened set screws, as shown. The head is fitted with a die B which slides in the slot C and prevents the head from turning on the bar. The end of the die is threaded to suit the square-threaded feed screw D, from which it receives motion in a direction

FIG. 1.

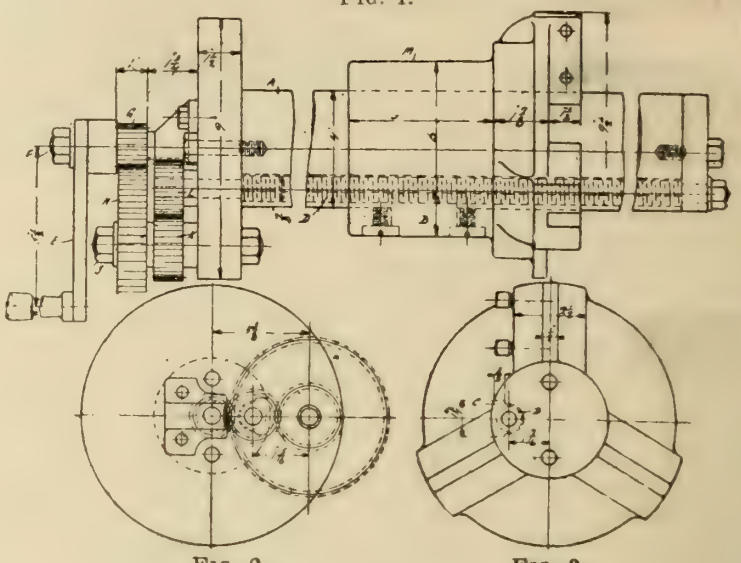


FIG. 2.

FIG. 3.

Boring Bar for Cylinder.

parallel to the axis of the bar. For quick adjustment the handle, which is free to revolve on the stud F, is turned by hand. The rotary motion is transmitted from the pinion G, which is fixed to the handle, to the wheel H, which is carried on the stud J, and is fixed to the pinion K, which gears with the pinion L keyed on the end of the feed screw D. The bar is rotated by a suitably driven worm gearing with a worm wheel keyed on the bar. The worm wheel is fixed close up against one of the bearings, on the other side of which is fixed a loose collar to prevent end play. When using the feed for cutting, a weight is hung on the handle. Then, as the pinion G is now fixed, the wheel H will be caused to revolve at a speed different from that of the bar, which through the medium of the pinions K and L, and the screw D, will move the head along the bar. Suitable wheels for a bar of this size will be about $\frac{3}{8}$ in. pitch and 1 in. face. If pinion G has 11 teeth; wheel H 45 teeth; pinion K 18 teeth; and pinion L 14 teeth, and the screw is $\frac{1}{4}$ in. pitch, the feed will work out at about 1-16 in. For boring cylinders larger in diameter than 12 in. different size heads are provided which fit the parallel part M of the head shown on the drawing, on which they are keyed. —Mechanical World.

Dr. Milton L. Hersey, of Montreal, has returned from Germany, where he went in connection with the sampling of Crown Reserve ore purchased by the German Government.

Vol. V. JUNE, 1909 No. 6

SUGGESTIONS FOR IMPROVEMENTS.

There are several ways in which great economies may be effected in machine departments. In the G.T.R. shops at Stratford it is the duty of one mechanic to inspect the machine equipment and suggest improvements. In the Alymer Pump & Scales Co. a prize of $100 was set apart for suggestions, and while it met with a certain response on the part of the men, was not as successful as might have been expected.

Many improvements in machinery are directly due to ideas of men in the shops and more should be done to encourage them in thinking out ideas for labor and time saving. In the works of Somerville, Ltd., the superintendent has instituted a scheme which he has found to bring good results. A notice was posted where all the men could read it as follows:

Complaints or Sugestions.

A prize of $1.00 is offered for any suggestion which, by its adoption, will show a saving in money or time. Box opened 1st and 15th of each month.

Quarterly Prizes.

March, June, September and December, according to value for the best three suggestions adopted.

By this method the reward is not too great and the men are encouraged to send in ideas for saving in the little things and the results are gratifying.

The Toronto Railway Co. welcomes ideas from their men and the coupling for trailers is the suggestion of a motorman who was rewarded handsomely. Previous to the adoption of the device now in use repairs caused by the jerking of the trailer amounted to several hundred dollars per month while now the repairs from the same source is less than one-sixteenth. It will be of advantage to both manufacturer and workmen to encourage the co-operation of the workmen in securing improved methods of manufacturing or an improvement in the design of the manufactured product

TOPICS FOR THE MONTH.

Nickel steel will be used in the construction of the new Quebec bridge. This has a greater strength than the carbon steel used in the first structure. The new bridge will have a span almost as great as the 1,800-foot span of the first bridge. This means that the present piers, which cost a million and a half dollars, will be made use of. The carrying capacity will be considerably greater than was designed for the first. The new bridge will carry any load that can be transported over 80-pound rails. The height of the bridge has been definitely fixed at 150 feet above water at high tide.

* * *

Trade returns of the Dominion for April, the first month of the fiscal year, shows a steady improvement. The total trade for April amounted to $34,998,851, an increase of $4,028,267 over the same month in 1908. Imports for the month totalled $22,531,673 an increase of $2,609,078. Exports amounted to $11,862,797, an improvement of $1,567,969. The customs duty collected amounted to $3,788,480, an increase of $490,739.

* * *

Dr. Milton L. Hersey, M.Sc., has donated $10,000 to the Metallurgical Department of McGill University. The revenue from this sum is to be applied to the purchase of special apparatus for research work. It will be remembered that Dr. Hersey recently gave a similar amount to the School of Mining, Kingston. His example might well be followed by a few others.

* * *

The Foundrymen's Convention held in Cincinnati May 17-22 was a big success. The papers were of great interest and a number of them will be reprinted in Canadian Machinery. The exhibition of foundry equipment was very complete. The report of the convention in this issue will give the reader an idea of the exhibits of machinery for increasing the efficiency of the foundry. A study of the apparatus shown is an education in itself and every foundryman who did not attend, missed an opportunity of gaining some valuable knowledge. Ho, for Detroit, 1910!

* * *

As an instance of development in Western Canada, it is estimated that $85,000,000 will be spent in construction work alone during the present year. The work under construction by the C.P.R. will be $20,000,000, Great Northern $15,000,000, C.N.R. $11,000,000 and the G.T.P. $11,000,000. The industrial life of Canada is steadily forging forward and the railways are only keeping pace with the development of the country. The twentieth century is the century of Canada.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

Convention of American Foundrymen's Association

Report of Gathering in Cincinnati---The Programmes and Papers---Arthur T. Waterfall, Detroit, President for Coming Year---Convention in Detroit, June, 1910.

Another convention has passed into the records of the American Foundrymen's Association, a convention which clearly demonstrated the interest in foundry affairs taken by all concerned. The scene of the exhibits and meetings was the Music Hall, Elm Street, Cincinnati, where the main floor of the south wing was devoted to exhibitors' booths. In the rear of the building was erected a temporary structure devoted to those exhibiting operating furnaces, torches, etc.

Although the convention was not officially opened until Tuesday, Monday May 17th, found a large percentage of the out of town visitors on hand. Exhibitors used this day in putting the final touches to their exhibits and "getting settled."

As was the case last year, the four associations, the American Foundrymen's Association, the American Brass Founders' Association and the Foundry and Manufacturers' Supply Association were all concerned in this convention.

L. L. ANTHES
Past President.

Each association held its own meetings and there were the regular educational meetings of the A.F.A. and the A.B.F.A. at which papers were read and discussed. The effect of these papers lies not so much in their actual reading as in the discussion invoked. Each one

ARTHUR T. WATERFALL.
New President A. F. A.

of those in attendance has at least one or two points of interest of which he could speak, but is held back by thinking that everyone present knows these self-same points as well as he and so is reticent about speaking. Hence the value of the discussions which lead to questions being asked and answered and more knowledge gathered of this important factor in manufacturing. So let us have lots and lots of discussion and then some.

Opening Session Tuesday Afternoon.

The sessions of the A.F.A. were held in the Music Hall and were all well attended. The discussions attending the reading of the papers were entered into with an increasing amount of interest. This fact was clearly demonstrated at this convention by the large attendance and number of speakers.

The President's Address.

After one or two introductory opening speeches of welcome, Mr. Anthes delivered his presidential address. In opening he touched upon the growth of the association, bringing attention to the different allied bodies which have evolved from the original organization made necessary by the growth and specialization of the various branches of the foundry business and mentioned that the steel interests are now inclined to form an additional section. He urged the necessity of harmony and broadmindedness among the associations that good results already obtained should be multiplied and not retarded. "We have struck the right key note, let us keep in tune."

Attention was called to the necessity of a deeper knowledge—a more comprehensive grasp of the laws of nature which bear upon industrial development. For this reason he was in favor of the increase in the annual fee from five to ten dollars because experiments cannot be conducted with an empty treasury and it was for the purpose of conducting experiments to solve difficulties for foundrymen that the American Foundrymen's Association was created. "The A.F.A. is the hub of foundry progress and we surely will not stop the band wagon because we are stingy with the axle greese."

An important move, he said, was under consideration which would prove

WM. R. WEBSTER.
New President A. B. F. A.

of inestimable value to the metal industries. This is the establishment of

an endowed laboratory and bureau of standardization for these branches of our industrial institutions. Many discoveries important to the trade, are no doubt lost because of the inability of the discoverer to continue experiments and investigations owing to lack of funds and facilities, whereas if a central bureau were established where reports could be made to practical men, the necessary attention could be given and in many cases beneficial results would accrue.

The necessity of imparting up to date practical knowledge in technical schools was touched upon and a suggestion made that the text books be compiled by a central bureau (as the one mentioned above) manned by men qualified to conduct experiments and compile these text books ensuing the students receiving a training in accordance with up-to-date foundry practice.

The development in foundry work attendant upon the introduction of the molding machine was touched upon, the importance of this innovation to the foundry trade, and the bearing it has on the development of foundry business. Now the important question is, "What is the most economical and efficient method to handle the molds that are turned out by the molding machines?" To answer this question the association had endeavored to secure as many papers as possible on this subject so that educational discussions would ensue.

Other Addresses and Reports.

In the absence of President Caley of the American Brass Founders' Association, Wm. R. Webster, vice-president, read his address. This constituted a brief review of the progress of this section and an outline of the future policy to be pursued.

Following this the reports of the secretary and treasurer of the A.B.F.A. were read, after which Dr. Moldenke read his report as secretary of the A. F.A. He informed the meeting that he is conducting a series of experiments that, if successful, will eliminate the use of flour in foundry work. He also gave the result of the letter ballot on the question regarding the raising of the annual fee. Out of 724 members qualified to vote only 187 answered, 143 being for the increase and 44 against, this majority not being large enough the fee still stands at five dollars. The condition of the association's finances was touched upon and the necessity of a higher fee pointed out.

The reading of the report of the committee on standard specifications for foundry iron was postponed and then followed the report of the committee on prevention of accidents in foundries, which was read by T. D. West, chairman. The session closed with the reception of reports of the other various committees of the A. B. F. A.

Tuesday Evening.

Cincinnati tendered a civic reception in the Hotel Sinton, for the visiting associations. This was largely attended and was the "get together" meeting of the convention, and was thorougaly enjoyed by everyone. It was estimated that about 2,000 took advantage of the event, the chief features of which was a dance in one of the large halls. A buffet luncheon was served throughout the affair.

Dr. Moldenke Welcoming the Foundrymen.

Wednesday Morning.

This session was devoted to papers of both the A.B.F.A. and A.F.A. A paper on "The Manufacture of Red Brass Ingot ; its uses and Advantages," by W. M. Corse, Detroit, Mich., was read. The purpose of the paper was to give an account of the manufacture of high grade ingot brass, so that the foundry man may understand why it is now extensively used in castings in which the use of the ingot was not allowed a few years ago. The six principal points of advantage in using ingot brass was summarized as follows : uniform composition, low shrinkage in melting, decreased cost in handling, exact amount of impurities known, value received for the price paid, saving in first cost over new metals.

In a paper on "Waste Heat," by F. W. Reidenbach, general manager Genesee Metal Co., Rochester, N.Y., the following pointed questions were asked :

"Do we as foundrymen get all the value from the combustible materials we use in melting the various metals ? Or do we just melt metals ? It seems to me we ought to utilize this waste heat to good advantage. Open-hearth steel mills, by the use of waste heat units, generate steam sufficient to operate large plants. Why not brass foundries ? Construction of plant, would, perhaps, be the first consideration. A plant would have to be constructed upon lines whereby all of the valuable points appertaining to the use of the waste heat could come in for consideration. I would suggest a core-oven as one important factor; a suitable rack for skin-drying molds would be another; or, like the steel mills, a stream sufficient to operate a tumbling barrel, a sprue-cutter, a saw or emery wheels ; or one may at least use the heat for producing hot water. That would add to the comforts of the help in washing up for supper after their daily toil."

In a paper on "The Cost of Steel Melting in Foundries by Dr. Bradley Stoughton, New York, he said that wherever the electric process has come into use it has supplanted the crucible process. One of the important considerations in this connection is the cost of instalation which is at least 10 times that of the crucible process. The electric process, he said, has the advantage in that the cheapest form of scrap available in the market can be used while it turns out a very high grade finished product.

"The electric process can hardly hope to compete in the cost of production with any of the prevailing processes except the crucible process, and then only when electric power is available at three cents per kilowatt-hour or less. It may well be, however, that recent developments in the electric process will bring its cost down to the point where the converter process will be superceded to some extent, especially in view of the very high quality of electric steel. This suggestion, however, is not to be taken in any sense as a prophecy. The costs of the electric process available only for large tonnages is materially lower than those given above, but the cost of instalation of this type of electric furnace is so

large that many immediate replacements are not probable."

Other papers of the morning session included "Open Hearth Methods for

F. N. PERKINS,

President Foundry and Manufacturers' Supply Association.

Steel Castings," by W. M. Case; "Notes on Air Furnace Construction for Malleable Castings," by W. H. Kane; "The Use of Pulverized Coal for Foundry Purposes," by R. K. Meade.

Wednesday Afternoon.

The value of some of the papers to be read at this session was marred by the interference of the Cincinnati Fire Prevention Bureau. The inspector forbade the showing of the lantern slides and moving pictures until a standard cabinet to inclose a standard moving picture machine could be procured. By the time the matter had been settled to the inspector's satisfaction it was too late to use the machine.

However those whose papers needed the illustrations got on as best they could. The papers included one on: "Continuous Melting in the Foundry of the Westinghouse Air Brake Co.," by S. D. Sleeth, Wilmerding, Pa. He said:

"When we started work in the new foundry at Wilmerding, we ran two cupolas, one in the morning and one in the afternoon. We were afraid to hold over dinner hour. After running for some time in this way we decided to run one cupola all day; at 11 o'clock, or a little later, we added 200 lbs. of coke for two or three charges so that we would have an extra amount of coke to hold over the dinner hour. Our great trouble at this time was with the cupola man, as he insisted that the iron would freeze at the tapping hole, but we finally persuaded him that he would not be held responsible should this occur. We drained all the iron out at 12 o'clock and closed the slag hole with sand, stopping the tapping hole, and shutting all other openings tight, so there would be no draught. About ten minutes before starting time we tapped out all that was in the cupola and pigged it, then put the blast on full, so as to be ready when the starting whistle blew. Sometimes we have to pig two or three hundred pounds on account of the metal not being hot enough.

"We had two sizes of cupola—48 inch and 60 inch inside the lining. When the heats were heavy we would run the 60 inch. We had to enlarge the plant again so we took out the 48 inch cupola and installed two new cupolas, the shells being 90 inch, so that we could line them up to 78 inch if required. We have them lined at the present time to 70 inch. When running full, i.e., night and day, we melt 280 tons, running each cupola about ten hours. We have operated one cupola from Friday night at 6 o'clock until Saturday noon of the following day, closing down at 11 p.m. for one-half hour for lunch, and again at 6.30 in the morning for three-quarters of an hour for breakfast. This is rather hard on the lining so we do not make a practice of it. We have tried a great many experiments with cupolas, but as yet have been unable to find any that will give better results than the double row of tuyeres the upper row about 10 inches above the lower. It is not necessary to keep the upper ones open all the time. Our blast pressure is about 11 ounces in the cupola bustle. We use a fan for blast. When running full we melt ten to eleven pounds of iron to one pound of coke."

F. N. PERKINS

President Foundry Supply Association

The paper by Edgar A. Custer on "The Permanent Mold," was to have been illustrated by moving pictures but, owing to the misunderstanding mentioned, this was not possible. Other papers were "Cores and Core Making," by F. K. Cheney; "Continuous Melting," by R. H. Probert; "The Practical Value of Chemical Standards for Iron Castings," by Dr. J. J. Parker.

In the latter paper attention is drawn to the importance of understanding mixing by analysis and the meeting was urged to take under consideration the advisability of appointing a committee for the formation of chemical standards for iron castings.

Evidently, then, the most feasible way of placing this metallurgical data before the foundryman in such form as to make it of practical value, is to first classify castings according to the physical properties which are of importance in them, and then to tabulate the chemical compositions which are found suitable for each class. It would also be highly desirable to take some cognizance of the factor of the cost of the mixture and show, where possible, how the foundryman could cut down the cost of his iron without decreasing the quality of his product.

An investigation carried out along these lines, while involving considerable work, would not be impossible and would certainly be of immediate and direct benefit to the foundry industry. The data needed could be obtained very largely from material already published

EUGENE W. SMITH,

President Associated Foundry Foremen.

and from inquiry among plants making the various lines of castings. Some experimental work would undoubtedly be needed to fill in the gaps, but I do not

believe that it would be very great in amount.

New Officers of A.B.F.A.

The president for the coming year is W. R. Webster, Bridgeport, Conn.; the vice-presidents are Edward O. Goss, Waterbury, Conn.; L. W. Olsen, Mansfield, Ohio; W. L. Abate, New York; Thomas Evans, Philadelphia, Pa.; J. N. Gamble, Kewanee, Ill.; W. D. Allen, Chicago; J. C. Sharp, Chattanooga, Tenn.; N. K. B. Patch, Toronto; Richard R. Mitchell, Montreal. The secretary-treasurer will be W. M. Cosse, Detroit, Mich.

New Officers of A.F.F.

The men who will hold the reins of the Associated Foundry Foremen were elected as follows: President, E. H. Smith, Chicago; first vice-president, W. F. Grunan, Erie, Pa.; second vice-president, I. C. Marshall, Milwaukee; secretary-treasurer, C. E. Hoyt, Chicago.

Thursday Morning.

The weather man must have overslept this morning as rain started early and continued all day. The morning was devoted to papers of both the A. B. F. A. and A.F.A.

Thursday Afternoon.

Notwithstanding the continuous downpour about 2,000 of the visitors and their friends took advantage of the outing provided by the entertainment committee. They gathered at the Sinton and left on the Steamer Island Queen for a trip on the Ohio river. The excursionists were first given a view of the lower river as far as Anderson's Ferry. Then turning round the trip was made to Coney Island.

In the pouting rain the delegates and their ladies, headed by Smitties' band, marched up to the shelter house where refreshments in the form of "Kentucky's celebrated burgoo" was served. The city was reached on the home trip about 10 p. m. a buffet luncheon being served on the boat.

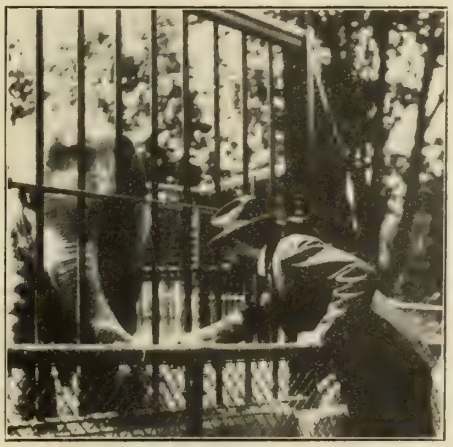
Friday Morning.

The morning session which was the last of the A.F.A. meetings was devoted to a discussion on the adoption of the report of the committee on standard specifications for foundry iron; the acceptance of Detroit for next year's convention an the election of officers. Those papers which had not already been taken up were read by titles only.

The report of the nominating committee was adopted and the following officers were elected: President, Arthur T. Waterfall, Russell Wheel and Foundry Co., Detroit; secretary-treasurer, Richard Moldenke, Watchung, N.J.; the vice-presidents are F. B. Farnsworth, McLagen Foundry Co., New Haven, Conn.; Walter Wood, R. D. Wood & Co., Philadelphia; J. T. Speer, Pittsburg Valve, Foundry and Construction Co., Pittsburg; E. W. Smith, Crane Co., Chicago; J. W. Sherrif, Sherrifs Mfg. Co., Milwaukee; A. E. Howell, Phillips and Buttorf Mfg. Co., Nashville, Tenn.; Wm. Gilbert, Buckeye Foundry Co., Cincinnati; A. N. W. Clare, Clare Stove Co., Preston, Ont.; L. L. Anthes was elected an honorary member.

F. & M. S. A. Meeting.

The annual meeting of this association was held in the Hotel Sinton on Friday night. It was decided that no souvenirs were to be given away at the next convention. If any firm desired to have souvenirs they were to be mailed to them later. Discussions as to delinquent members took place and reports of officers read.



H. M. Lane Feeding the Elephant at the Cincinnati Zoo.

The officers for the ensuing year were elected as follows:

President, F. N. Perkins, Arcade Manufacturing Co., Freeport, Ill.; vice-presidents, F. B. Stevens, Detroit; R. S. Buch, Philadelphia; S. T. Johnson, Chicago; Wm. Lodge, Cincinnati; secretary, C. E. Hoyt, Chicago; treasurer, J. S. McCormick, Pittsburg; trustees for three years, E. A. Pridmore, Chicago; Geo. Wadsworth, Cuyahoga Falls; H. R. Atwood, Cleveland; E. J. Woodison, Detroit.

Notes of the Convention.

Detroit next year!

Let every Canadian foundryman be on hand who can possibly get away.

"Rest thy weary bones" looked very inviting, backed up as it was by E. J. W.'s welcoming smile.

Did you get a pyrometer?

That "make-a-noise-like-an-order" stunt was good—and very much in evidence (everywhere) as was the "bubble novelty" from the same booth.

The Ontario Wind Engine and Pump Co., Toronto, took advantage of the convention to add to their already strong foundry line the lines of the Calumet Engineering Co., Harvey, Ill., consisting of cranes, ladles, cupolas and other foundry equipment. They will also handle for Canada, the Acme parting and red facing of the Central Foundry Supply Co., Columbus, Ohio. Edmund Stanley will have charge of the foundry supply and equipment department.

The S. Obermayer Company's Convention Guide was very opportune. Besides giving a list of Cincinnati hotels with their rates, it pointed out the various points of interest to sightseers and gave directions how to reach them. The illustrations of the Obermayer Maid and some of the company's supply lines were good and the titles reflected the company's usual snappy style.

It was too bad the convention group photo was not taken earlier in the week. Many were at the convention who had left before Saturday morning.

One of our esteemed contemporaries had a placard on their exhibit giving their circulation last month as ten decimal nought three two. Nuff sed.

The Canadians present included the following list which is not altogether complete owing to the fact that many did not register. The list is:

L. L. Anthes, Toronto Foundry Co., Toronto, Ont.; Miss Anthes, Toronto; Miss Libbie Anthes, Toronto; Geo. A. Armstrong, McKinnon Dash & Machine Works Co., St. Catharines; T. Ben. Bennett, D. Maxwell & Sons, St. Marys, Ont.; Solomon Barnes, Warden King, Limited, Montreal, Que.; T. J. Best, Warden King, Limited, Montreal, Que.; Mrs. T. Ben. Bennett, St. Marys, Ont.; J. A. Crossman, Amherst Foundry Co., Amherst, N.S.; A. N. W. Clare, Clare Bros. & Co., Ltd., Preston, Ont.; S. H. Chapman, Ontario Wind Engine & Pump Co., Toronto; John J. Cunningham, Western Foundry Co., Wingham, Ont.; John Douglas, Gurney Foundry Co., 38 Fuller St., Toronto, Ont.; J. H. Fryer, Galt Malleable Iron Co., Limited, Galt, Ont.; Mrs. J. H. Fryer, Galt, Ont.; Horatio Gooder, John Inglis Co., Ltd., 161 Lansdowne Ave., Toronto, Ont.; Frank Hughes, International Harvester Co., Hamilton, Ont.; A. R. Hockin, Taylor Forbes Co., Guelph, Ont.; Mrs. J. P. Hockin, Taylor Forbes Co., Guelph, Ont.; J. P. Hockin, Taylor Forbes Co., Guelph, Ont.; W. F. King, F. Hyde & Co., Montreal; W. J. Kevy, F. Hyde & Co., Montreal; F. W. King, McClary Mfg. Co., London, Ont.; James E. Long, McKinnon Dash & Metal Co., St. Cath-

arines, Ont.; J. R. Meadowcroft, The Garth Co., 28 Craig, West Montrose; Mrs. J. R. Meadowcroft; R. R. Mitchell, The Robt. Mitchell Co., Ltd., Montreal; W. K. B. Patch, Lumen Bearing Co., Toronto, Ont.; A. J. Palmer, Emp re Mfg. Co., London, Ont.; N. K. Reid, Reid & Brown, Toronto, Ont.; C. Rehder, Bowmanville Foundry Co., Bowmanville, Ont.; Geo. D. Smith, Montreal Steel Works Co., Montreal; Edmund Stanley, Ontario Wind Engine & Pump Co., 504 Spadina Ave., Toronto; W. W. Taylor, Jas. S. Taylor, John M. Taylor, jr., Taylor-Forbes Co., Ltd., Guelph, Ont.; Robt. B. Thomson, Buffalo Pitts Co., Buffalo; Samuel Terrell, Raymond Mfg. Co., Guelph, Ont.; H. V. Tyrrell, Canadian Machinery, Toronto; William B. Thomson, Brockville, Ont.; Douglas Wilkes, Canadian Machinery, Montreal; Fred

The Music Hall, Cincinnati, where the Foundry Supply Exhibition was Held.

Washburn, Taylor-Forbes, Guelph, Ont.; Geo. H. Weaver, Dominion Foundry Supply Co., Montreal; F. S. Campbell, Taylor Forbes Co., Guelph, Ont.

"With the excursionists came ingredients for 5,000 mint juleps, 200 quarts of good old mellow Bourbon and 1,000 siphons of seltzer, besides a large quantity of beer"—Daily paper. What do you know about that?

We will publish a photo of the souvenirs in our July issue.

The Exhibitors and Exhibits.

MONARCH ENGINEERING CO., BALTIMORE, MD., were showing two Steele Harvey tilting furnaces of 170 and 375 pounds respectively; a non tilting furnace of 170 pounds capacity, a five shelve Monarch core oven, a Monarch ladle heather, a Monarch blower and one skin drying burner. These were manufactured, shipped, set up and in operation in less than 10 days from the time the order went into the shop. Representing the company were H. D. Harvey and D. R. Steele.

W. W. SLY MANUFACTURING CO., CLEVELAND, OHIO, had an exhibit consisting of a series of photographs showing different installations made by them. They also showed a model of their cinder mill. The representatives of the company were W. W. Sly, W. C. Sly, H. R. Morse and D. A. Livensparger.

CANADIAN MACHINERY, TORONTO, CANADA, were represented by H. V. Tyrrell and F. C. D. Wilkes and made their booth the headquarters for the Canadians present.

E. H. MUMFORD CO., PHILADELPHIA, had a joint exhibit with Curtis Mfg. Co., St. Louis, showing the Curtis-Mumford Overhead Molder, which is a suspended mechanism by which large flasks jolt-rammed on an arcade jolt-ramming machine will be lifted and rolled by power and the patern drawn from the joint while the mold is suspended. They had also a new 10" high trunion power squeezer, and a standard power ramming split pattern vibrator machine on exhibition. Representing the company were E. H. Mumford and E. M. Zwing.

CURTIS MANUFACTURING CO., ST. LOUIS, MO., exhibited in conjunction with the E. H. Mumford Co., and besides the machines noted above they showed an air hoist, a small belt driven air compressor and a sand blast outfit. E. H. Steedman was the company's representative.

CARBORUNDUM CO., NIAGARA FALLS, N. Y., had an interesting exhibit. It consisted of samples of the finished product in almost every conceivable shape, wheels, rubbing bricks, abrasive paper, etc.; by-products such as silican and fine sand; also samples of carborundum in the different stages of manufacture. Visitors were presented with a stick pin of carborundum crystals. G. R. Rayner, W. W. Sanderson, H. A. Eaton, and R. B. Fuller represented the company.

ARCADE MFG. CO., FREEPORT, ILL., exhibited the latest models of No. 1 and No. 2 Modern Molding Machines. These are equipped with pneumatic vibrators and automatic trip adjustments, which have a number of new features of great interest. There was also a demonstration of Buck's Roll-Up Device, which is achieving wonderful results in stove foundries. Perhaps the most interesting feature was the exhibit of the Norcross jolting machine which is designed to ram molds weighing up to 20,000 lbs. They also exhibited a large number of castings that are being made by prominent manufacturers in the U. S. and Canada. The representatives on hand were Chas. Morgan, Ed. Morgan, F. N. Perkins, W. C. Norcross, Henry Stcherning. The souvenirs of this exhibit were a small shovel and a paper weight, the shovel having a small tag attached to it.

CALUMET ENGINEERING WORKS, HARVEY, ILL., were on hand and were represented by O. G. Lewis, R. A. Dugan, J. T. Krieger, R. Scully. Their exhibit consisted of a model, in section, of a Calumet cupola showing its construction, and a standard 2-ton label. A patent air hoist valve was also shown.

CLEVELAND WIRE SPRING CO., CLEVELAND, OHIO, were ably represented by J. W. Campbell. They showed samples of steel shop barrels, kegs and handy trucks for moving them from place to place in the shop. The wire exhibit consisted of heavy and light coil wire springs for agriculture implements, machinery and automobiles; specialties in wire and cans for oily waste.

GOLDSCHMIDT-THERMIT CO., NEW YORK, were represented by A. M. Guenther. Their exhibit consisted of a display of welded pipes, motor casings and shafts; thermit cans for foundry purposes; crucibles and apparatus for welding purposes; rare metals free from carbon; demonstration of the thermit reaction, welding pipes and burning holes through one inch plates. The souvenir of this exhibit was a very handsome stick pin, emblematic of the thermit process, done in enamel and gold.

THE MILLERS PRODUCTS CO., CHICAGO, ILL., had samples of Black Diamond Core compound, foundry flours, etc. The souvenirs consisted of a wooden rattle which bore the pointed exhortation to "Make a noise like an order," and a mechanical bubble novelty. Representing the company were C. B. Spaulding, N. T. McGrath, S. H. Baird, Jas. Harrison, Wm. J. Brant.

NEWPORT SAND BANK CO., NEWPORT, KY., were represented by J. Frank Dye and George Dye. Their exhibit consisted of a neat array of sand samples from their mines. Souvenirs of this booth were a paper weight and a cake of soap.

THE BUCKEY BELL FOUNDRY CO., also had space in this booth with an exhibition of various bell castings.

S. OBERMAYER CO., CINCINNATI, had an extensive exhibit consisting of 702 Ceylon plumbago, kantbebeat dry core compound, blue leather bellows, Rockwell riddles, National Island filler cement, core ovens, etc., making a showing of a full line of foundry supplies. The largest of their two booths was reserved as a resting place and plentifully supplied with comfortable chairs. They also had published a guide to the convention which was much appreciated. Representing the company were H. F. Frohman, F. D. Frohman, S. T. Johnson and a number of others.

J. A. FAY & EGAN CO., CINCINNATI, had an exhibit of their well known wood working machinery consisting of a No. 50 36 inch band saw, a No. 156—24" surfacer, a No. 195—20 inch hand planer with draft attachment, and a No. 205 double circular rip and cut off saws. The band mill is made with a straight column instead of the old style goose neck and has a solid lower wheel which permits of running at a very high speed. A feature of the surfacer is the new style clamp boxes which eliminate pouring of babbit. These boxes have an arrangement of plates with babbitted edges which are clamped in place. When it is necessary to take up wear these plates are loosened and gently tapped to take up new position and present a new bearing. In the circular saw outfit the saws are placed outside of the frame so that no dust gets into the working parts. The saws and table are fitted with micrometer adjustments. All machines are motor driven. Representing the company were C. P. Egan, Wm. Spencer, W. H. Koumer.

HENRY E. PRIDMORE, CHICAGO, ILL., exhibited a Pridmore power ramming rock-over drop molding machine in which both flasks are rammed with air cylinders. They also showed rock-over, drop, hand rammed machines a stripping plate machine fitted up with a gear pattern. This is also a hand rammed machine. On hand to look after this booth were E. A. Pridmore, H. A. Pridmore, W. H. Phinney, W. W. Miller, R. E. Turnbull.

THE SAND MIXING MACHINE CO., NEW YORK, who were represented by V. E. Minich, had in operation one of their auto sand mixers. This machine runs over a long ridge of sand thoroughly mixing it. The power used is electricity. In Canada this machine is being made by N. D. Neil, Brantford.

THE DIAMOND CLAMP AND FLASK CO., RICHMOND, IND., showed the Diamond improved plunger type core machine, a Diamond automatic core machine, a core cutter, a core coner, snap flasks, a pattern maker's lathe chuck, etc. Representing company were W. N. Gartside, G. W. Phiel, T. Johnson. The souvenir from this booth was a match safe made of core sand.

J. D. SMITH FOUNDRY CO., CLEVELAND, OHIO, had their exhibit in the temporary building. Representing the firm were J. S. Smith, F. A. Coleman, M. S. Finley, Joseph Harris. The exhibit included a Cleveland tumbling barrel; a Cleveland sprue cutter; a rolling drawer core oven with overhead frolley for drawing the drawers eliminating all jar and thus reducing the breakage of cores; a complete brass furnace setting with an overhead crane for removing the crucibles, and a sand blast outfit.

HAUCK MANUFACTURING CO., BROOKLYN, N. Y., exhibited in the temporary building a line of portable burners of all kinds for foundry purposes, ladle heaters, etc. Demonstrations were carried on throughout the convention. A.

E. Hauck, A. P. Link, and A. H. Stein were the company's representatives.

THE STANDARD SAND AND MACHINE CO., CLEVELAND, were located in the temporary building and showed an operating 15 ton per hour machine for proportioning and treating all materials used in making up molds also for separating the iron from the Sand. They also showed portable power screens. Representing the company were H. G. Boughton, C. J. Morgan, W. H. Smith.

JAMES B. WISE, WATERTOWN, N. Y., were represented by R. F. Govne who looked after the operation of a M.R.V. brass melting tilting furnace in the timporary building.

THE HERMAN PNEUMATIC MACHINE CO., ZELIENOPLE, PA., exhibited a large Herman jarring molding machine in their booth in the temporary building. Other features of their exhibit included smaller jarring molding machines. The company was represented by M. L. Heyl, J. J. Lawlor, C. E. Pettee.

ROCKWELL FURNACE CO., NEW YORK, who were represented by W. S. Quigley, A. L. Stevens, and W. H. Fitch, had space in the temporary building where they exhibited a No. 1 double chamber melting furnace ; a No. 10 tilting crucible furnace ; a No. 92 simplex furnace ; a lift out crucible furnace (pit or above-floor type) ; a soft metal melting furnace a hardening, tempering and annealing furnace ; two portable heaters for skin drying and heating crucibles one self contained, the other of the compressed air type. This firm also makes general furnaces and furnish them all the way from those used in tempering a watch spring to that used in tempering huge chunks of armour plate.

THE BROWNING ENGINEERING CO., CLEVELAND, OHIO, were represented by H. E. Green. They had no exhibit beyond a complete line of literature.

THE OLIVER MACHINERY CO., GRAND RAPIDS, MICH., represented by A. N. Spencer, J. P. Schmidt, W. Mentzer, had a very complete exhibit of their wood working machinery including a Wadkin Universal wood worker in operation and a direct connected motor driven speed lathe and a new bench trimmer which will work at any angle, acute and obtuse. A feature of the exhibit was a quick acting pattern maker's vise. They also showed samples of steel and wood clamps and other pattern making equipment.

OSBORN MANUFACTURING CO., CLEVELAND, OHIO, exhibited a hand and jolt rock over molding machine, molders brushes of all descriptions, riddles, etc. The souvenir of this booth was a shoe brush. Representing the company were H. R. Atwater, F. D. Jacobs, J. H. Galloway, C. D. Fadie.

THE FALLS RIVET AND MACHINE CO., CUYAHOGA FALLS, OHIO, exhibited a line of core making equipment consisting of one sand mixer and compounder ; three standard core making machines Nos. 1, 2 and 3 ; one core cutting off and coning machine ; a core oven ; standard core paints and cabinets ; section of steel shelving for receiving stock cores after manufactured. The machines were all in operation and were run by a 3½ h.p. motor. Geo. H. Wadsworth was in charge of the exhibit and had with him John Reese and Chester Cox.

A. BUCKS & SONS, Co., ELIZABETHTOWN, PA., occupied a large booth in the center aisle where they operated one of their gravity molding machines. The exhibit created a good deal of interest and called forth many complimentary remarks regarding the efficiency of the machine. The machine elevates the sand and drops it into the flask from a height of about 12 feet filling and ramming the flask at the same time. They also had a jar and squeeze molding machine in operation. Other exhibits included snap taper flasks, large and small. Representing the company were R. S. Buck, C. A. West and P. J. Parker, while F. H. Chapman and E. Stanley were present for the Ontario Wind Engine and Pump Co., Toronto, the Canadian agents for these machines.

HOLLAND LINSEED OIL CO., CHICAGO, were represented by P. M. Baumgardner, A. W. Crawford, C. O. Nelson, and had an exhibit of their core oils and indestructible paint. Throughout the convention they made souvenirs of core sand in the form of tiny barrels useful as match holders. These were baked in the Wadsworth core oven in the Falls Rivet and Machine Company's booth.

OSCAR BARNETT FOUNDRY COMPANY, NEWARK, N. J., were represented by F. S. Barnett. They had an exhibit of flasks for all purposes.

THE BERKSHIRE MANUFACTURING CO., CLEVELAND, OHIO, showed in operation a Berkshire automatic molding machine for all classes of work from radiator loops to small brass trimmings. This machine was the center of a great deal of interest. The sand is fed to a rotary riddle and from thence it is elevated to a hopper, dropped in the flask, squeezed and ready for the metal, the whole operation consuming a very small amount of time.. They also exhibited a hand worked, squeezing, pattern drawing molding machine using patterns on both sides of a steel plate, wooden plate, gated work with hard sand match also plates with patterns on one side. All these patterns may be run without changing the machine in any way. Representing the company were J. N. Battenfeld and C. F. Battenfeld.

HICKMAN-WILLIAMS CO., CINCINNATI, exhibited samples of northern, southern and Virginian irons, and 48 and 72 hour coke. The company's representatives were F. M. Eaton, H. Black, J. V. Byrd, R. S. Fox. The souvenirs from this booth was a very useful stylographic pencil.

THE DETROIT FOUNDRY SUPPLY CO., DETROIT, MICH., were on hand with an exhibit of cast iron chaplets and "Bull dog" shovels. Representatives were E. J. Woodison and W. B. Howard. The company is mailing visitors a souvenir pencil.

E. KILLING'S MOLDING MACHINE WORKS, DAVENPORT, IOWA, exhibited three different types of roll over molding machines including a universal roll over straight drop machine that deposits the mold directly on the floor eliminating, lifting and carrying.. The company was represented by E. Killing, H. W. Langfelder, C. P. Aabye.

WALTER McLEOD & CO., CINCINNATI, had a large exhibit of Buckeye torches, etc. A new nozzle for sand blast was shown that is meant to operate without wearing out the nozzle. This is accomplished by leading two pipes to the nozzle and entering the sand in such a manner as to have it leave the nozzle in the center of an air jet which keeps the sand from coming in contact with the metal. A complete model of the McLeod water softner was also shown. This type is new on the market and is meant for use in power plants, laundries, etc. Representing the company were Walter McLeod, W. F. Stodder, W. F. Woodbridge.

THE DETROIT TESTING LABORATORY and the Toronto Testing Laboratory were represented by J. D. Stoddard and Hugh Lamont. Post cards booming Detroit for next year's convention were distributed.

THE SOLVAY PROCESS CO., SYRACUSE, were represented by G. A. T. Long, G. Drysdale, E. D. Winkwork and C. G. Howe. Samples of the well known Solvev Coke were shown and a useful souvenir distributed. This was a steel folding foot rule in a leather case.

HAWLEY DOWN DRAFT FURNACE CO., who were represented by F. C. Ringer, T. P. Gourley, D. R. O'Brien, had exhibits both in the main and temporary buildings. The former consisted of a ten ton tilting steel furnace and a 32 inch brass furnace. The latter was a 42 inch brass furnace capacity 500 pounds every 15 minutes. Souvenirs of this booth were cast iron ash trays and small buckles. The latter were cast iron running 320 to the pound and 160 to a gate. Gate and castings weigh 1½ pounds. The ash trays were made by D. & W. Fuse Co., Providence, R. I.

BROWN SPECIALTY MACHINERY CO., CHICAGO, who were represented by E. A. Rich, Jr., showed a hammer core machine in operation, a core cabinet and samples of diamond pattern lumber.

THE JONATHAN BARTLEY CRUCIBLE CO., TRENTON, N. J., were represented by Jonathan Bartley and L. H. Lawton. Their exhibit consisted of a large assortment of regular and special graphite crucibles in all shapes and sizes, also stirrers and stirrer handles. There were also five crucibles of clay handsomely painted and finished, which made a very fine showing. An interesting feature were three baskets such as are used by the natives of Ceylon in sorting graphite. These were filled with graphite showing three stages of fineness of the graphite which is all hand picked. A souvenir was distributed which was a match holder in the form of a crucible made of porcelain and set in a saucer.

THE PENTON PUBLISHING CO., CLEVELAND, publishers of The Foundry and The Iron Trade Review, were represented by R. E. Dennison, A. O. Backert, G. H. Griffiths, D. C. Warren, F. J. Ryan, W. B. Robinson and J. D. Morton. Their booth, which was furnished with large comfortable arm chairs for visitors, was decorated with photographs of past conventions.

THE FOUNDRY SPECIALTY CO., CINCINUATI, showed samples of Partine, Fluxine, and Faceine. This latter is a new product of this company and is used in place of resin or oil for smoking brass molds. They also exhibited castings which were made by the use of these products. Representing the company were F. W. Weissmann and W. S. Anderson.

THE JOSEPH DIXON CRUCIBLE CO., JERSEY CITY, N. J., were represented by D. A. Johnson, F. Krug, S. H. Doherty, F. Brandon, W. B. Allen, G. Neighbor, A. L. Hassis and J. A. Condit. Their exhibit consisted of an assortment of crucibles, stoppers, nozzles, and all kinds of refractory graphite ware. Two crucibles were arranged to have the appearance of being surrounded with flames the effect being obtained by the use of streamers of red tissue paper in a blast of air. A stick pin in the form of an imitation fly was given as a souvenir also a trick pencil and a "seven dollar pyrometer."

BURROUGHS ADDING MACHINE CO., DETROIT, showed their cost keeping, book-keeping, foundry cost keeping machines. Their pay roll machine (a recent invention) was also shown. This takes the workman's time for each day, total hours per week, rate, amount of earnings and also the total of entire pay roll. Representing the company were F. D. Wilde, C. M. Smith and F. H. Dodge.

A Group of Cleveland Supply Men.

THE HILL AND GRIFFITH CO., CINCINNATI, were represented by Wm. Oberhelman, John Hill, J. M. Glass, R. B. Hastins, F. Weissman and M. Z. Fox. A large assortment of foundry equipment was exhibited including shovels, riddles, brushes, smooth on castings, snap flasks, electrical grinders, waxwire machines, etc.

THE AMERICAN SMELTING AND REFINING CO., CINCINNATI, who were represented by H. Cantor, showed samples of their different metals, including American Flag Genuine Babbit.

THE CENTRAL FOUNDRY SUPPLY CO., COLUMBUS, OHIO, were showing their "Acme" parting and red facing substitute for plumbago. J. S. Ball and Wm. Fenton, represented the company.

THE WHITING FOUNDRY EQUIPMENT CO., HARVEY, ILL., who were represented by F. A. Rundel, R. H. Baurne and C. Hughes, showed their ladles ; a new design of tumbler with self-aligning bearings and friction clutch for battery use in place of the sliding pinion in large machines ; a drawer type core oven with overhead trolley for removing drawers ; an exhibition of the electrical and mechanical brake used on their traveling crane trolleys.

LANE AND BODLEY, CINCINNATI, showed a sample Corliss engine cylinder with gear attached, also one of their Corliss engine governors.

J. W. PAXON CO., PHILADELPHIA, had an exhibit consisting of samples of their various lines of foundry supplies. This included a rock over machine for general work, a special machine for brass foundries, a magnetic separator, aluminum flasks, the only hay rope exhibit at the convention and general molding machine supplies. The souvenir of this company was an exceedingly handsome ash tray of pressed metal. They also gave away a rattle. The representatives of the company were H. M. Baugher, L. A. Crandall, Geo. W. Moore, T. F. Kremer.

"CASTINGS." THE GARDNER PRINTING CO., CLEVELAND, occupied booth 103 and were represented by S. R. Lewis, R. T. Clegg, C. G. Kisner.

THE TABOR MANUFACTURING CO., PHILADELPHIA, exhibited a 30 inch power roll over machine with 12 inch power draft; an 18 inch hand roll over machine with 8 inch hand draft; a 10 x 13 inch power squeezer, a 14 inch power split pattern machine with 16 inch power draft. The souvenir of the company was a penknife which was mailed after the convention. Representatives were Wilfred Lewis, J. Ramsden, C. W. Coleman, C. H. Ellis, J. Coleman, Hugh Gallagher and John Pfendner.

MANUFACTURERS' EQUIPMENT CO., CHICAGO, were represented by Paul J. Goebel, who exhibited a 14 inch Warner-Swasey turret lathe with one of the Equipment Co.'s latest two jawed aero chuck. The feature of this chuck is the toggle joint arrangement for closing the jaws. It is arranged with supplemental master jaws that can be adjusted independently of the toggle with a range of from 2½ to 4 inches, inclusive. This chuck is also arranged so that any ordinary manufacturers' box chuck may be used.

LODGE AND SHIPLEY, CINCINNATI, exhibited one of their 24 inch lathes with patent head.

KROESCHELL-SCHWARTZ, CHICAGO, ILL., had on exhibition a stationary gyrating flame crucible furnace and an oil pumping system connected to the blower of the furnace. The melting of the metal in the crucible is done from the bottom up, which permits of holding charcoal on top of the metal in the crucible. The furnace which is quiet in operation will make from 6 to 8 heads in 9 hours.

WILLIAM SELLERS CO., INC., PHILADELPHIA, were represented by Edward L. Holljes, showed two centrifugal sand mixing machines, one belt driven and the other motor driven. The latter was in operation throughout the convention showing how all kinds of foundry sands, core oils and compounds may be mixed centrifugally. The thoroughness of the machine caused many complimentary remarks.

GULICK-HENDERSON CO., PITTSBURG, were represented by J. W. Henderson and B. B. Strand. They had no exhibit beyond booklets, descriptive of their systems.

ED. E. SQUIER, ST. LOUIS, was represented by R. H. Squier and exhibited samples of their sand.

STIRLING WHEELBARROW CO., MILWAUKEE, had an exhibit of rolled steel flasks and wheelbarrows. They were represented by T. R. Smith.

ROBESON PROCESS CO., AM. SABLE FORKS, N. Y., had a very inviting booth. It was hedged in by fir trees in tubs which is significant of their product "Glutain." On hand were D. S. Robeson and L. R. Donald.

J. S. McCORMICK & CO., PITTSBURG, had on exhibit a sand mixing machine, taper flasks, ladles, etc. In operation was a rotary magnetic separator for brass chips and filings. They also had the J. S. McCormick "roadster" made up entirely of foundry supplies. Representing the company were J. S. McCormick, T. E. Malone and S. R. Costley. The souvenir from this booth was a serviceable three foot folding pocket rule.

STANLEY DOGGETT, NEW YORK, exhibited a miscellaneous lot of fancy castings showing the effect of Perfection Parting Compound on the work, in the smooth finish of the iron and brass. Samples of foundry talc, foundry charcoal, facing, fill-it iron and steel cement were also shown. Souvenirs were given away in the form of small pocket mirrors and pocket pincushions. The booth was in the hands of Stanley Doggett, A. J. Johnson, W. S. Rupert.

S BERKENSTEIN & SONS, CHICAGO, ILL., were represented by Louis Berkenstein, S. M. Rush, J. B. Neiman, E. E. Berliner. Their exhibit consisted of samples of ingot copper, pig tin, pig lead, aluminum, antimony, phosphor tin, etc.

TAUNTON CRUCIBLE CO., TAUNTON, MASS., had an exhibit of crucibles and gave away as souvenirs a small crucible which can be used as a handy match holder. Their representative was A. J. MacCormack.

CURTIS-MUMFORD OVERHEAD MOLDER.

The Curtis-Humford Overhead Molder is a machine combining roll over and pattern draft with crane and hoist service. It is for use in large work and is of special use when pattern drawing is of the roll over variety. It is intended to overcome the difficulties met with in certain classes of work, the ramming which destroys the accurate mechanism necessary to the pattern drawing process. Other good features are included in the design of the molding machine, which are of interest.

The machine shown at the exhibition in Cincinnati is one having a capacity for handling molds 6 feet x 8 feet, weighing not more than 9,000 pounds when supplied with 80 pounds air pressure. The machine takes a follow boarded pattern with the flask upon it filled on the floor with sand, raises and transports it to the table of the jolt rammer, whence, after it has been rammed, it lifts it, and while turning it to the floor, rolls it by power with absolute smoothness and draws the pattern fairly from the joint while suspended. The method by which all this is accomplished will be apparent on reference to the photograph. It is this large cylinder which gives the machine its capacity of lifting 9,000 pounds six feet. When a foundry crane

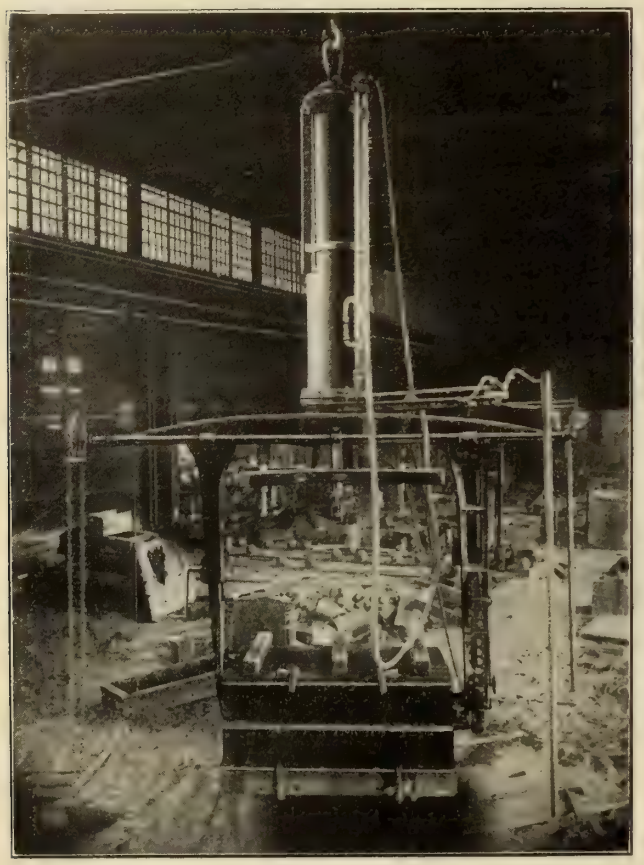


Fig. 1.—Machine After Ramming Before Rolling.

Fig. 2.—After Rolling, Pattern Drawn.

of large capacity is available the machine is limited only by the size of flask and the large cylinder at the top is not required.

Below and projecting from the bottom of the large cylinder is what appears to be a plunger of this cylinder. This is the pattern drawing cylinder proper, the plunger of which carries the four armed cross pendant from which are four small spuds. These four spuds slide readily in slots, and are never rigidly tightened. They are slid to such points on the back of a pattern or follow board as they may find resting place upon during the pattern drawing operation. While the mold is suspended on the hanger pendant from the cross rail, which hanger may be set to correspond with any length of flask up to 8 feet, the pattern drawing plunger, which is square, is dropped with its cross and the four spuds mentioned upon the back of the pattern or follow board. As soon as it contacts with the pattern or follow board it automatically sets up a pressure of 700 pounds thereon. As the valve controlling the roll over mechanism is now at lap so that the flask is free to adjust itself axially on the trunnions, the contact of the first two spuds which bear, throws the joint of the mold square in one direction with the line of pattern draft which is the line of the plunger. In order to complete the adjustment, the hanger oposite the one upon which the roll over cylinder and sprocket wheels are shown, is lengthened or shortened by an adjusting screw driven by a 12-inch hand crank through miter pinions. This brings the other two spuds in contact with the back of the pattern or follow board, thus squaring the mold joint with the pattern draft in this other direction.

Simultaneously with the pressing down of the spuds to square the joint with the line of draft, a pair of grab hooks at the end of the pattern drawing plunger seizes a button headed plate in the back of the pattern or follow board. Upon the starting of the pattern draft these pull the pattern from the sand while the four spuds still maintain a downward pressure which holds the pattern rigidly.

Before starting the pattern draft the flask is rapidly secured against rolling on its trunnions by the same mechanism which is used to roll it, and being so held, and the pattern also rigidly held, the pattern draft is absolutely clean, unaffected by uneven bottom boards insufficient bedding devices, etc.

The apparatus may be used with a special cradle for handling large split core boxes and also for shaking out and handling flasks if this is required of it.

No change in patterns, follow boards or flasks of any sort is required except a fixture for the roll over drive permanently fastened on end of any flask, wood or metal. It will readily be seen that it is not essential to the operation of this apparatus that the pattern should be secured to the follow board and drawn with them, which always involves a blind lift. It is one of its great advantages that the follow board may be loose and removed from the pattern before it is drawn which, as in the case of spur gears, gives an opportunity to watch corners which may stick and start with the pattern, and to nail such parts as will not draw without nailing. Inasmuch as neither patterns nor follow boards are in any way secured to the machine, but are simply picked up by it, it will take at random flasks which have been filled on their follow boards by a shovelling grab.

Firg 1 shows the machine after ramming, before rolling. Fig. 2 shows the machine after rolling, patern down. This shows the secondary cylinder after lifting the follow board with the pattern from the mold. The Curtis-Mumford Overhead Molder is manufactured by E. H. Mumford Co., 1223-25 Spring Street, Philadelphia, Pa.

IMPROVED CUPOLA, TWYER SYSTEM.

A system of twyers for a cupola has been designed and patented in the United States and Canada by John C. Knoeppel of 577 East Ferry Street, Buffalo, N.Y. These twyers are especially intended to effect the introduction of the blast at as low a pressure as possible so as to insure a low melting point with its attendant advantages.

The essential features of this twyer system are the air flues or mixing chambers, which insure a uniform pressure in all parts of the twyer system, together with special twyers for introducing a small amount of air above the melting zone. These upper twyers are so arranged that the amount of air passing through them can be regulated by suitable dampers.

This introduction of a large volume of blast at a low pressure insures the keeping of the melting point or zone in its original position as the heat progresses, providing the proper fuel proportion is maintained in the charges.

By referring to Fig. 1 it will be noticed that there is a series of flues extending up from the twyers inside of the cupola shell. These vertical flues are connected with one or more rows of small twyers placed well above the melting zone. The first object of these upper twyers is to supply a small amount of oxygen at different levels which will burn some of the carbon monoxide to carbon dioxide. The heat thus liberated will be to a large extent absorbed by the descending stock and will thus assist in preparing the material for rapid fusion when it arrives at the melting zone. Valves or dampers are provided for controlling amount of air flowing through these upper twyers or openings. Another advantage claimed for the upper twyers or openings is that at the end of the heat these passages can be thrown wide open, allowing a rapid circulation of air through them, which assists in cooling the lining down quickly.

Where thick linings are employed in very large cupolas, the main twyers are composed of two separate parts, a bottom and top piece, while for cupolas of smaller diameter the segments of the twyers are cast complete with top and bottom plates attached. To facilitate the removal of the twyers in case of repairs, two key twyers are provided, one at the front and the other at the back. The brick lining of the cupola is supported upon rings of angle iron riveted or bolted to the shell so that it is possible to remove the twyers or the lower portion of the lining for renewal, should this be found necessary.

Two of the twyers are provided with notches which are lower than the regular twyer system. These are intended as safety notches, and are fitted with fusible plugs at their outer ends, so that should the iron rise to these notches it will flow through them and escape by way of the fusible plug, thus warning the cupola man before the metal actually enters the twyers proper. The key twyers are usually placed at the spout and slag hole.

When the inside diameter becomes less than 56 inches, the amount of bosh must usually be reduced. To accomplish this, twyers with vertical faces are sometimes constructed. A slight bosh, however, is provided by placing a plate above the twyers, which is a flange fitting down over the lower edge so as to provide an overhang of one inch or more. This style of practically vertical lining is known as the "B" type, while the heavily boshed type, Fig. 1, is known as the "A" type of cupola. In other respects the two types are practically identical. The volume of air which must be introduced into a cupola is of necessity proportioned to the area of the cupola. As the diameter of the cupola becomes less, the necessary amount of air can be introduced through a twyer having less vertical height, and hence the smaller amount of bosh or overhang in the "B" type may still be sufficient to prevent the twyers from clogging or stopping.

A section of the cupola just above the twyer is shown in Fig. 2 which also illustrates the direction of the air current in the case of a cupola having a tangential admission for the air to the

outer wind belt. The arrows plainly indicate the course of the blast. This view also shows the key twyers very plainly.

Fig. 3 shows a section of the cupola at some distance above the twyers. The divisions of the twyers, however, are plainly shown by dotted lines, as are also the positions of the key twyers and the safety or overflow twyers. The projecting plates used on top of the twyers are also applicable to the standard style of twyers with a heavy overhanging bosh, and may be used to provide a more decided bosh or in cases where the cupola is to be lined down to a smaller diameter. The plate itself is usually designed to give an overhand of from one to two inches. Twyers of this style can be introduced into any cupola now in service.

THE CANADIAN RAILWAY CLUB.

On Tuesday evening, May 4th, the annual meeting of the Canadian Railway Club was held in the Windsor Hotel, Montreal. The business of the meeting consisted in hearing the reports of the various officers and committees, and the election of officers for the ensuing year.

The reports showed the club to be in a first-class condition. The membership is steadily increasing and the interest taken in the meetings is far from being languid. The present enrollment list shows 722 members. The club is also in very good condition financially.

After the business session an hour or so was devoted to an informal musical programme and refreshments were served.

The following officers for 1909 were elected: President, H. H. Vaughan; vice-president, A. A. Maver; second vice-president, A. A. Goodchild; executive committee, J. Coleman, A. W. Wheatley, R. W. Burnett, F. Ditchfield, C. Manning and P. R. Diamond; audit committee, W. H. Stewart, H. A. White, J. S. Johnstone; secretary, James Powell; treasurer, S. S. Underwood.

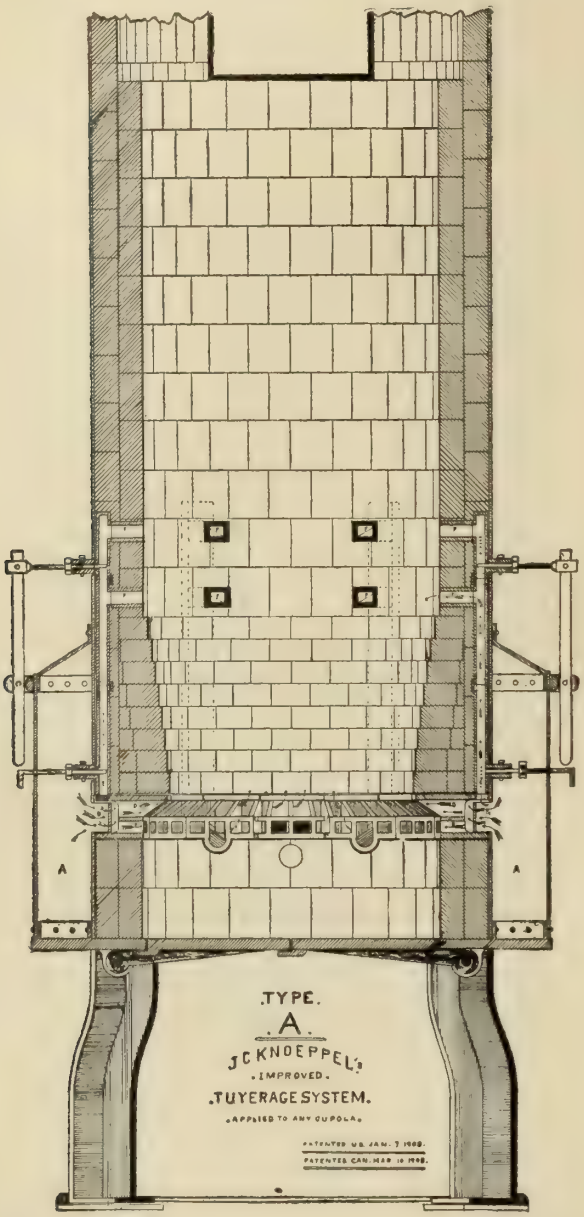

Fig. 1.—Section of Cupola, Boshed Lining.

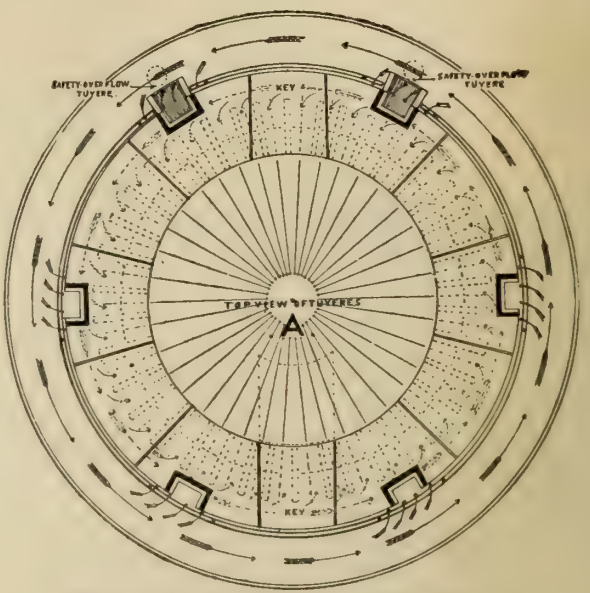

Fig. 2.—Course of Air Through Tuyere System.

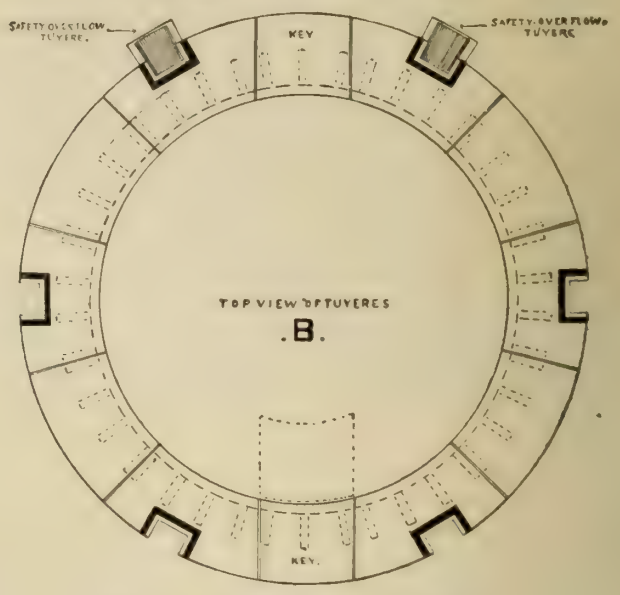

Fig. 3.—Arrangement of Various Parts.

Announcement is made that the proposed Hamilton and Guelph Junction Railway will be built this year. The proposed line will connect with the C.P.R. at Guelph Junction and the C.P.R. is going to build the road.

New Mechanical Woodworker for Pattern Work

A High-Class Universal Milling Machine with Many Interesting Features Applied to Woodwork; Adaptable to All Kinds of Pattern Work and Core Making.

This mechanical woodworker has a number of novel and interesting features which make it applicable to the varying intricacies of pattern and core work, as well as a great many other operations in woodworking. Fig. 1 illustrates a very few of the many patterns, etc., that may be made on this machine.

The machine consists essentially of two parts, the machine proper and the table, which, with their universal movements form a complete machine requiring only minor adjustments for a large variety of work. It is substantially built and is capable of dealing with delicate and intricate pattern work and also the larger and heavier work. The movements are all simple and the machine is easily adjusted by the workman. Its special feature is that it is at once both a special machine and a common machine, as circumstances and convenience demand, and capable of completely finishing work without the necessity of rehandling.

The drive in all cases is a variable speed with reverse, and may be either direct by motor carried on the back of the machine, the motor spindle driving direct onto the cutter spindle, or intermediate by reversible and variable-speed motor driving onto the back shaft of the machine from any convenient position; or belt-drive direct through a variable-speed auxiliary countershaft.

The Table.

The table body or base is free to be moved bodily upon its foundation frame on ways and is conveniently actuated by a hand wheel. The table body can be instantly moved across the front of the machine from under the cutter spindle and away sideways altogether clear of the machine head, and when in this position the rocking arm with the spindle head may be rapidly tilted bringing the spindle into any required relationship with, or below the level of the table top. In addition to the lateral movement of the table body the table is provided with independent longitudinal and cross-motions. The table may be moved upon sensitive ball races by a feed screw actuated by a hand wheel at the front of the machine, which screw may be thrown out of gear when required, leaving the table free to be easily fed or floated by hand over the ball races while a right-angle motion is imparted by a rack and pinion also actuated by a hand wheel in front of the machine.

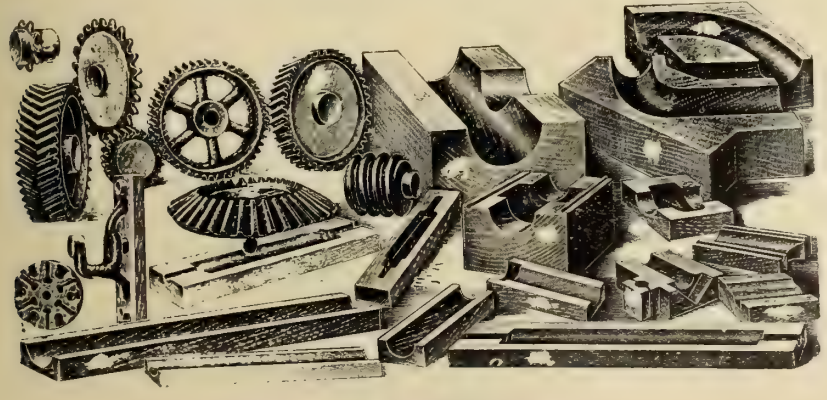

Fig. 1.—A Few Pattern Shapes.

The table in addition to having a considerable vertical adjustment, can be turned in a horizontal plane through a complete circle, thus combining rapid right-angle, longitudinal cross and circular movements, whereby it is enabled to move circularly, lengthways, crossways, or even at any angle relative to the spindle at the will of the operator; the whole series of table movements being provided with quick, adjustable stops.

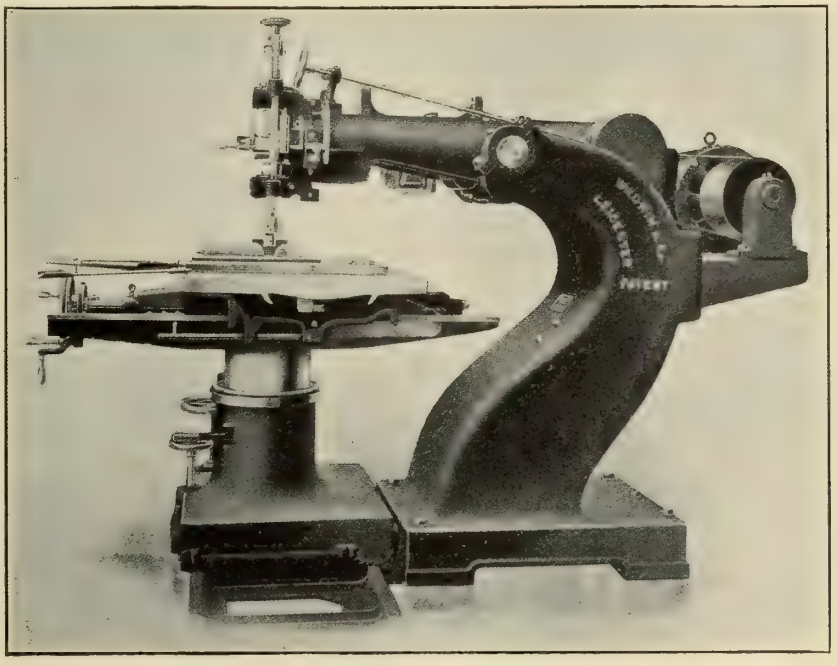

Fig. 2.—Latest Model Wadkin Mechanical Woodworker.

Rocking Arm.

The rocking arm carrying the spindle head is sensitively balanced on the trunnions, which allows of the manipulation of difficult irregular-curved face work, a slight pressure of the hand only on the head of the machine being sufficient to cause it to follow any required form clamped to the machine table; the work being fed past the cutter by the screw, and the cutter spindle rising and falling over the form clamped down on the table top, thus enabling core boxes and other work with curves and shapes of a compound nature to be easily manipulated.

The spindle head is revolvable at the end of the rocking arm and suitable means are provided to maintain it in any desired position. In addition to the quick positive, self-locking lever feed and the sensitive screw feed of the spindle, the latter may be adjusted to suit the various positions of the feed lever.

Core boxes of almost every conceivable form can be made on the machine, Chamberings of almost any section or radius can readily be cut, also bends of all kinds, obtuse, return, compound, or at any angle with sockets or recessings.

Generally speaking, the cutters employed are simply shaped from flat bar steel and are carried in suitable cutter holders fixed in the chuck of the spindle.

The machine will cut patterns of gears, either helical, worm, bevel or spur, by means of a spiral head. The full range of usefulness of the machine may be judged from the following partial list of operations to which the machine lends itself: Molding, straight or ir-

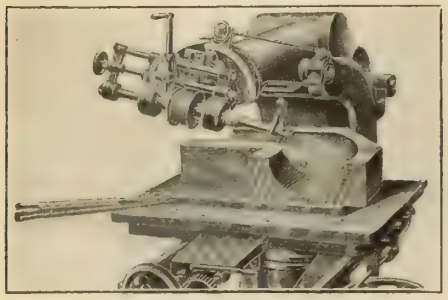

Fig. 3.—Operating on Large Section Corebox.

regular; cross-grooving, trenching, halving and jointing; recessing and routing; rounding curves; boring and slotting holes at any angle; facing, sinking; molding straight or curved arms of wheels and shaping bosses; recessing and trenching of every variety and description; boring up to 6 inches in diameter, or any larger size by rotating the work table; filleting; cutting dowels; cross-cutting; straight-corner locking, half lapping, jointing, plowing; dovetailing; slot mortising and recessing; square mortising; single and double tenoning and scribing; panel raising and molding to any design, square or irregular; turning spiral and ornamental twists, etc., to any design, size or length; fluting, etc.

Fig. 2 is a view of the latest model with double cone ball bearings, variable speed, motor driven. Fig. 3 shows the machine operating on a core box of 12 inches diameter. In this operation the head is deflected, and canted to a suitable angle, as shown. The cutter head shown is one of the four arm expanding cutter heads; this type is used for core boxes from 7-in. to 14-in. diameter.

Fig. 4 shows a method of forming the arms of a pulley pattern. The pattern is mounted on a stud secured in a cast-iron plate which is fastened to the auxiliary table. As the table is swung about its pivot, the arm A is operated upon by the cutter first on one side and then on the other; then the pulley is indexed to bring arm B into the position first occupied by A and the second arm finished. The same procedure is followed for each arm, the whole series thus being shaped expeditiously.

With this machine a general equipment and a full range of cutters, mostly of the expanding type, and appliances of various kinds may be supplied to suit any particular class and kind of work to be done. The machine is manufactured by Messrs. Wadkin & Co., of North Evington Engineering Works, Leicester, England. The Oliver Machinery Company, of Grand Rapids, Michigan, have the selling rights for America, and had it on exhibition at the A.F.A. convention.

CENTRAL RY. AND ENGINEERING CLUB.

The regular monthly meeting of the Central Railway & Engineering Club, Toronto, was held in room 315, Union Station, on May 18. C. Geldart, erecting shop foreman, G.T.R., Stratford, read a paper on "Use of Pneumatic Tools."

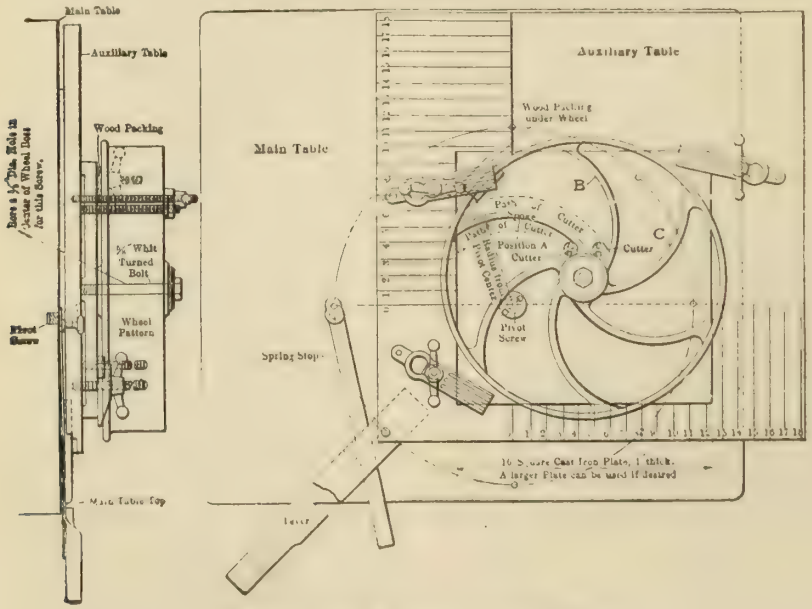

Fig. 4.—Shaping Arms of Pulley Pattern.

The second annual picnic will be held at Jackson's Point, June 19, via Metropolitan Electric Ry., leaving the station at North Toronto at 8.00 p.m. Tickets for the round trip, including dinner at Jackson's Point are $1.00. Tickets may be obtained from any member of the Reception Committee, the Secretary, C. L. Worth, Room 409, Union Station, Toronto, or at North Toronto before departure on the morning of the 19th.

A baseball match between the supply men and mechanics will take place and a suitable program of games has been arranged for. By the kind permission of Robert Patterson, Master Mechanic of G.T.R. Works, Stratford, the shop band will accompany the excursion. Members and their friends are cordially invited.

SOME LARGE ENGINES.

Goldie & McCulloch, Galt, have a number of orders under construction for some western cities. They are building for the city of McLeod a 400 h.p. engine 14 and 28x30, 150 r.p.m. It is a vertical cross compound Corliss, direct connected to a 260 k.w., 60 cycle, 3 phase, 2200 volts A. C. generator furnished by the Northern Electric, Winnipeg. There is also a 10 and 16x15 jet condenser.

For the city of Edmonton they are building a 1800 h.p. cross compound horizontal engine, 25 and 50x36, 120 r.p.m., direct connected to a Canadian General Electric 1500 k.w., 60 cycle, 1000 volts A. C. generator. The engine is being equipped with a Richardson sight feed oiler and Tripp's metallic packing. A jet condenser 14 and 26x24 is also being supplied.

They are also supplying Edmonton with a tandem compound Ideal engine 8 and 16x12, direct connected to a C. G. E., 75 k.w., D. C. 275 r.p.m. generator.

Edmonton is installing other equipment, including a 300 k.w. Canadian Westinghouse generator, two 300 k.w. Crocker-Wheeler generators, one 600 h.p. Robb-Armstrong engine, two 600 h.p. Bellis & Morcom engines and eight B. & W. boilers of 400 h.p. each. A 6,000,000-gal. Inglis pump, described in the April issue of The Power House, is also being installed.

At the annual meeting of the Winnipeg Electric Railway it was decided to issue $1,500,000 in new stock for extensions and improvements to the system.

The London & Northwestern Electric Railway, from London to Sarnia (65 miles) will be begun this season. About 50 miles of branch lines will be constructed next year.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shops.

The Lee Mfg. Co. propose to build a new foundry at Pembroke.

The American Laundry Machinery Mfg. Co., Chicago, contemplate locating a Canadian branch factory in Toronto.

The International Roturbine Engine Co., of America, Minneapolis, propose to locate a Canadian branch factory in Winnipeg.

The Bond Transmission and Foundry Co., of Mannheim, Dakota, intend locating a branch in Canada, and are looking over the possibilities of Alexandria, Ont.

The E. Long Mfg. Co., Orillia, will build a new plant at a cost of $30,000, and will double their present staff. It is the intention of the Long Company to add a boiler plant to their machine department.

P. H. Whitington, of Cleveland, and T. H. Russell, of Geneva, Ohio, have purchased the business of Maple Leaf Harvest Tool Co., Tillsonburg, and will conduct the same without any change in the firm name.

The works of the Provincial Steel Co., Cobourg, were formally opened on May 21, when the Council, Board of Trade and citizens inspected the new plant which is now ready for operations, just six months after work of construction was started.

The Capital Scale, Brass and Iron Foundry Co., Ottawa, has purchased a large lot on which a factory will be erected. Construction will be begun at once. The factory will be for the manufacture of special patents and devices and there will be a foundry in connection.

The by-law granting the Structural Steel Co. a free site for the erection of a factory and exemption from taxation was passed by Sherbrooke ratepayers. The company will erect a plant valued at $25,000. The manufacture of bridges and boilers will be the main industry.

Arrangements have been made for the addition at the Soo of an extra furnace to the existing open-hearth plant, to increase the production of steel. An additional blast furnace for the production of pig iron will also be installed. The construction of these furnaces alone entails an immediate expenditure of at least $1,000,000.

Welland has secured another industry in the Canadian Seamless Steel Co., manufacturers of bathroom fixtures and all heavy articles of pressed steel. A plant to cost $125,000 will be built, and 75 hands will be employed at the start, to be increased to 200 by January 1, next. The parent company of the local industry is the Seamless Steel Mfg. Co., of Detroit.

Allan McAvity, Andrew Jones and Arthur M. Irvine, have just completed a deal by which they have secured control of Parker Bros. foundry, Montreal. Mr. Jones is engaged in the machinery business in Montreal and McAvity and Irvine are managing the Canadian business of the Buffalo Forge Company. The venture will not be allowed to interfere in any way with the present businesses of the three proprietors. The property will be considerably improved and some new machinery installed.

The foundry of Butterworth & Co., Limited, erected in 1874, has been sold to Fleming Grate Bar Co., an organization composed of Ottawa men who will continue the foundry under the name of the Butterworth Foundry Co., for the manufacture of stoves, ranges and Fleming Grate Bars. For this purpose the factory will be enlarged. The Fleming Grate Bar people will increase their capitalization from $40,000 to $89,000. The officers of the company are: H. W. Chamberlain, president; A. F. Chamberlain, secretary-treasurer; Jas. A. Gardner and J. M. Fleming, directors.

Barrie freeholders have endorsed an agreement made between the town and the Weber Foundry Co. for the establishment of a manufactory for gas producer plants, gas engines, etc. The town gives a loan of $40,000, repayable in twenty years without interest, exemption from taxation, and some concessions in water and light. The company must have site, plant, etc., valued at $60,000, of which at least $35,000 must be fixed plant and machinery; must employ at least 50 men continuously, with an annual pay-roll of not less than $25,000. Simon Dyment is to be President of the company, and the chief men associated with him are Mr. E. C. Hill and Mr. Wm. Thompson, of Toronto.

The new buildings and extensions of the Victoria Machinery Depot replacing those destroyed by fire about a year ago are nearing completion. The frame work of the boiler shop, the largest of the extensions to be made, has been erected and will be rushed to completion. In this structure, which is 192 feet long by about 90 feet wide, will be housed an entirely new boiler plant which has been shipped direct from England. Among the installations will be a hydraulic rivetter, an accumulator and pumps, an hydraulic flanger, a plate edger, planing machine, a cold sawing machine and a new plate furnace. In the machine shop, now running full blast, a fine lot of new and up-to-date machinery has been installed, and the present shop, 168 feet long will be lengthened by 24 feet.

Municipal Enterprises.

Yarmouth, N.S., is seeking authority to issue $80,000 for waterworks purposes.

Portage La Prairie ratepayers will be asked to vote $50,000 for waterworks purposes.

Thessalon, Ont., will spend over $9,000 on a waterworks and electric lighting system this year.

Carman ratepayers will vote on a by-law to raise $25,000 for the completion of the town waterworks system.

Gravenhurst ratepayers will probably be asked to vote on a by-law to raise $20,000 for a new waterworks system.

Estevan, Sask., ratepayers have approved by-laws to raise $30,000 for a water works system and $10,000 for a trunk sewer.

Vernon's waterworks extension is estimated to cost $58,000. A by-law for the construction of this work will be voted upon.

The Ontario Railway and Municipal Board has validated Cobalt's by-law to raise $75,000 for sewerage and waterworks system.

A by-law will be voted on at Wetaskiwin, Alta., to issue $7,000 debentures for the purpose of improving the fire fighting system.

Yellow Grass, Sask., ratepayers have passed the installation of the high pressure system at a $1,000 bonus to the electric light and power plant.

Henault & Heffernan, Montreal, have been awarded the contract for laying of a system of sewers for the town of St. Pierre, to cost $100,000.

Yarmouth Town Council decided to borrow $12,000 for the extension of the town water main and $6,000 for the completion of the Milton engine house.

The Edmonton City Council awarded the contract for the supply of the piping for the new power plant to the Babcock & Wilcox Co. at $6,770 for the piping complete and erected.

Tenders will be received until June 14 for the manufacture and installation of one or two pumping units of capacity of 3,000,000 Imperial gallons each per 24 hours, and waterworks pumps, with turbine water wheels, etc., complete for the Peterboro waterworks.

The following tenders for material required in the installation of the high pressure system at Victoria were accepted: Fine wire, Hawkins & Hayward, 18½ cents per lb.; stempipe line, Marine Iron Works Co., $350; water suction connections and valves, Marine Iron Works Co., $450; condensing equipment, tender not awarded though the apparatus offered by the Hutchinson Bros. Co., the lowest tenderers, at $1,750, is recommended.

Railway Construction.

The C.P.R. purpose to double-track its line between Montreal and Farnham.

Port Arthur is advertising for materials for the extension of its street railway system.

The Stratford Tramway Co. propose building a street railway in that town.

Construction will shortly be started upon the C.N.R. branch from Emerson to Winnipeg.

Construction work will begin at once on the G.T.P. lines north and south from Melville, Sask.

The G. T. P. has started work on the construction of a line from Wainwright to Calgary.

The Mount McKay and Kakabeka Falls Railway at Fort William will be constructed at once.

Janse & McDonnell, Lethbridge, have secured the contract for the construction of the C.N.R. cut-off at Stanley Junction, west of Port Arthur. The work is 10 miles in length and involves the moving of about 300,000 cubic yards of earth and rock.

Tenders will be called in a few days for the grading and construction of the Alberni extension of the E. & N. Ry., from French Creek to Alberni. This line is opening up a very fine country and will mean much to Vancouver Island when finished.

A by-law has been introduced in the council of the municipality of Burnaby to grant a forty-year franchise to the British Columbia Electric Railway Co. It is proposed to construct an electric line from the east boundary of Hastings townsite through the municipality.

Electrical Notes.

Lethbridge ratepayers passed by-laws totaling $200,000, of which $153,000 is for a power plant.

Victoria ratepayers have approved the by-law to raise $153,000 for the proposed power plant.

The British Columbia Electric Railway Co. will immediately begin the construction of thirteen miles of tramway extensions in the eastern end of Vancouver. They have been granted a 40-year franchise.

The Vancouver Power Co., a subsidiary concern of the British Columbia Electric Co., have been granted permission by the provincial government to raise their Coquitlam dam and thereby obtain an extra 1,000 horse power.

The Couteau Power Co. which develops energy at Shuswap Falls, twenty-six miles east of Vernon, B. C., with almost unlimited capital behind the project proposes to develop 8,000 horse power in units of 1,000 each to sell in Kamloops.

The panelboards for the St. Anne's Convent, at Lachine, Que., are being furnished by the Hill Electric Switch & Mfg. Co., Montreal. The wiring is being done by Messrs. Picard & Lalonde, of Montreal. The new factory for the Canadian Spool & Cotton Co., Montreal, is being equipped with panelboards and cabinets, manufactured by the Hill Electric Switch & Mfg. Co., 1560 St. Lawrence Boulevard, Montreal.

At the Quebec Legislature buildings the sale by auction took place recently of two water powers. The first group, the Kai Kai Ke Falls, was secured by W. McLea Walbank, the price paid being $3,001. The second, the Des Ites Rapids, was sold to Mr. O'Brien for $3,005. By the terms of the sale the water powers become the property of the highest bidder for a period of 75 years, upon condition that the owner spends $300,000 on the construction of power houses, etc., before three years.

The contracts have been awarded for the cables and conduits for Toronto's electrical distribution plant. The contract for the cables goes to the British Insulated and Helsby Cables, Prescot, England. The prices vary from twenty cents to $1.34 per foot, according to the different sizes and voltages. From 75,000 to 100,000 feet of cable will be used. The contracts for the conduits will go to the American Sewer Pipe Co., of Akron, O., the price being 4 7-10 cents per foot. The single duct conduit will be used.

The rates for house lighting in Toronto announced by the city's electrical department show that the city will probably charge three cents per kilowatt hour, with a charge of ten cents per month for each room in the house. At the present time the Toronto Electric Light Co. has a net rate of eight cents per kilowatt hour, with an additional charge of 25 cents per

month for meter rent. The city will make no charge for meter rent. Under the present rate a six-roomed house using 20 kilowatts pays $1.85 per month. Under the proposed city rate the monthly bill would be $1.20.

A meeting of representatives from Milton, Acton, Brampton and Georgetown was held in Georgetown recently to consider the cost of procuring electric power from Niagara Falls. Quotations were read from the Hydro-Electric Power Commission, the prices being for 24 hour power, based on a double circuit 110,000 volt line from Trafalgar to Georgetown, with an interswitching station at Trafalgar and a step-down station at Georgetown, from which point the power would be distributed to the four municipalities at 13,200 volts. The cost would be Georgetown for 800 h.p. $27.17; Brampton, for 600 h.p., $28.93; Milton, for 500 h.p., $28.56; Acton, for 600 h.p., $30.46. These amounts include all costs of transmission and transformation distribution at 13,200 volts and power at Niagara Falls at $9.40 which will be reduced to $9.00 as soon as the quantity used by the Commission exceeds 25,000 horse power. It is estimated that $5.00 per h.p. per annum added to the above rates would pay all expenses of installing.

Structural Steel Notes.

At a meeting of the Puslinch Council, the Stratford Bridge Company was awarded the contract for the steel superstructure at $1,307.

The Hamilton Bridge Works Co., Hamilton, have been awarded the contract for the erection of the steel structure of the main factory of the Sydenham Glass Co., at Wallaceburg, Ont.

It was decided at a joint meeting of the civic committees of Edmonton and Strathcona, to appeal to the C.P.R. to proceed with the proposed railway bridge over the Saskatchewan, which would be assisted by the two cities and by the Government.

At a recent meeting of the Vancouver Board of Works, City Engineer Clement reported that the cost of a bridge over the Ninth Avenue east ravine at Glen Drive would be $7,100, of which the B. C. Electric Railway Company was to pay $3,800. It was recommended that the work proceed.

Planing Mill News.

The Watt Milling Co., Toronto, have been granted a permit to erect a planing mill at a cost of $10,000.

Thessalon, Ont., ratepayers have approved a by-law to loan $10,000 to a saw mill concern which will expend $25,000.

Among the new enterprises shortly to be added to the industries of Revelstoke, B.C., is the Revelstoke Sash and Door Factory, which is now in process of erection.

$350,000 damage was done by a fire early on May 6 which wiped out the main buildings and sawmill of the Northern Pacific Lumber Co., Barnett, B. C. The mill was owned by McLarens, Ottawa.

The Brooks-Scanlon Lumber Company, of Minneapolis, which some time since announced its intention of erecting two or more large sawmills on the Fraser river, is seeking a site close to New Westminster for the first mill.

Fire on May 4 almost completely wiped out the little town of Westley, B. C. Only two buildings were left, office and cookhouse belonging to the Yale Columbia Lumber Co. The company's mill, valued at $50,000, a stock of lumber valued at $50,000 more, as well as all the employes' houses and other buildings belonging to the firm, were completely destroyed.

Building Operations.

The Lufkin Rule Company, of Canada, has begun work on the new 160 foot extension to their factory at Windsor.

The Tudhope Co., Orillia, will erect a large new addition to their works to manufacture motor cars and motor buggies..

The Grey & Bruce Portland Cement Co. will transfer its operations from Owen Sound to St. Marys, where a $250,000 plant will be erected.

The Western Fire Clay Products, of Weyburn, Sask., which was recently incorporated, with a capital of $600,000, will commence building operations this spring.

The East City furniture factory, Peterborough, is to be enlarged during the coming summer. An addition one-half the size of the present building will be built to the rear.

Orillia has passed a by-law to grant the E. Long Co., a free site for a new factory and plant and fixed the assessment. The company agree to increase the employes by over 50 per cent. They now employ 70.

Taylor & Taylor, Brantford, are asking for tenders for the new Sanderson-Harold Co. factory plant at Paris. There will be a main building, 300 x 62, two storeys, a boiler and engine room 40 x 60, and dry kiln and warehouse.

The Sydenham Glass Co., Wallaceburg, recently burned out, is securing from the Pittsburg Construction Co., plans for a mammoth steel structure to replace the old factory. The new building will be entirely of steel, brick and concrete. Armstrong & Dickson of Pittsburg are arranging for tanks and machinery.

General Manufacturing News.

The Keystone Engineering Co., Toronto, purpose locating at Wiarton.

Sussex, N.B., will have a new industry to manufacture the newly invented Acme steel ladder, controlled by the Acme Steel Ladder Co.

D. Perry of the Watt Hose Co., Woodstock, proposes to build a hose coupler factory at Port Hope.

The Hercules Specialty Co., of Grove City, Mich., makers of sanitary shields and toilet paper services, propose establishing a branch factory at Guelph.

The Dodd and Struthers Co., with headquarters in Des Moines, Iowa, has established a branch Canadian plant for making lightning rods at Sherbrooke.

The Expanded Metal Co., Toronto, have purchased the Oxley acetylene welding process and will employ an additional forty men in manufacturing plant for using that process.

Woodstock, Ont., has given a site for a factory to the Watt Hose Coupler Co., and it is likely a site will also be given to the Russell Harvesting Machine Co. for the building of a plant.

It is rumored that Calgary may have a nail factory in the near future. The Alberta Wire Nail Co. have been negotiating with The Gordon Nail Co., of St. John, for the purchase of their plant, and if the deal goes through the plant will be transferred to Calgary.

Purity Ware, Limited, is a new company which will erect a large factory at Peterboro to manufacture all kinds of enamelware, galvanized iron ware and range boilers. $150,000 worth of machinery will be installed and 100 men will be employed at first, which may later be increased to 500.

Thornbury, Ont., has passed without a dissenting vote a by-law to loan by way of bonus $10,000 to the Thornbury Transportation & Reduction Co. to establish works. In addition they also give a free site for twenty years with harbor and water privileges. This company, besides employing a line of steel vessels, intend operating an iron smelter.

The Manitoba Rolling Mills Co., of Winnipeg, is prepared to expend $200,000 on extensions to its property and plant. This means increasing the capacity of the plant to four times what it now is. Initial plans have been prepared which call for four furnaces. With these it will be possible to work double gangs on both the night and day shifts, giving a total output of from 75 to 100 tons of finished iron per day.

Trade Notes.

Owing to increased business, C. H. Johnson & Sons, Ltd., Montreal, are putting up an addition to their plant. They are makers of wire window guards and other wire goods.

The Detroit Foundry Supply Co., have purchased the business of the Detroit Platers and Polishers Supply Co., who have manufactured various compositions, such as Tripoli, Crocus, Vienna Lime, etc., together with the handling of platers and polishers' supplies and that they contemplate manufacturing this material in the future.

Edgar-Allen & Co., Ltd., of Sheffield, England, have moved into their own new office and wareroom at 330 St. James Street, Montreal. Mr. Thos. Hampton is their resident representative. Full ware stocks will be carried in all their standard tool steels. Their business relating to cement plants, cement machinery, manganese castings, tramway points, crossings, etc., will be transacted from this office.

New Companies Incorporated.

John Watson & Son, Montreal; capital $49,000; to manufacture iron work. Incorporators, R. T. Hencker, A. H. Duff and W. S. Johnson, Montreal.

Superior Steel Co., Toronto; capital, $250,000; to manufacture metals and products thereof. Incorporators, R. W. Hart, S. Webb and A. C. Bedford-Jones, Toronto.

Oil and Gas Producers, Hamilton; capital, $1,000,000; to sink and develop oil and gas wells. Incorporators, R. L. McIntyre, J. M. Sinclair and O. G. Carscallen, Hamilton.

Western Canada Power Co., Montreal; capital, $5,000,000; to carry on business as light, heat and power company. Incorporators, J. W. Burrill, G. P. Wilson and L. R. Warden, Montreal.

Chapman & Walker, Toronto, capital, $50,000; to manufacture all kinds of electrical, gas, steam and other machinery. Incorporators, J. S. Lovell, Wm. Bain and R. Gowans, Toronto.

La Raquette Water Works, Rigaud, Que.; capital, $45,000; to construct and operate a system of waterworks. Incorporators, J. H. Redpath, J. J. Riley and F. G. Bush, Montreal.

Steel Reesor Co., Toronto, capital, $60,000; to manufacture stoves, furnaces, engines, boilers, plumbing and hardware supplies. Incorporators, J. Reesor, C. W. Steel and Geo. Hickey, Toronto.

Canadian Sheet Steel Corporation, Morrisburg; capital, $150,000, to manufacture every description of iron, steel, tin and other metal work. Incorporators, A. White, J. F. Hollis, and T. H. Wilson, Toronto.

The Sylvester Auto Thresher and Engine Co. has been organized with capital of $500,000 to manufacture in Winnipeg threshing machines and other farm implements. It is a branch of the Sylvester Mfg. Co., Lindsay, Ont.

B. Greening Co.

The B. Greening Wire Co. have just issued an attractive series of catalogues of their various products, comprising wire cloth, perforated metals, wire lathing, wire rope, wire chains, wire guards, counter railings, etc., the whole bound in one handsome volume for the use of their agents. Not the least interesting feature of the catalogue is the historical page. The name Greening appears to have been associated with wire for many centuries, the first needle factory in France having been started by a Greening, and later in England pins and needles were made by one of the same family. Benjamin Greening came to Canada in the fifties and became one of the pioneers of the wire industry. At his death he was succeeded by his son, S. O. Greening, who built the new works, and is president of the existing company. The works of the B. Greening Wire Company are up-to-date in every respect, and cover an immense area, giving employment to about 350 hands, the pay list running up to $3,000 weekly. The catalogue comprises a handsome volume of over 400 pages, with special illustrations of the works and of the different departments, as well as of all the various articles which the firm produces. The press work and typographical details are excellent, the whole being bound in a dark green cloth, appropriately lettered in gold.

G.T.P. Shops, Winnipeg.

A number of contracts, involving the expenditure of a very large sum of money, have been let by the firm of Haney, Quinlan & Robertson, who have the general contract from the government for the erection of the Winnipeg shops of the National Transcontinental railway. The sub-contracts include all the plumbing, the direct and indirect heating, the mill work and the painting and glazing on the various buildings. All work will be done by Winnipeg contractors, who have been engaged for some time in undertakings of this character in Winnipeg.

The iron work on the buildings, is in the hands of the Manitoba Iron Works, the contract for that part of the building having been let some days ago. Other contracts are as follows:

Plumbing, direct and indirect heating, Cotter Bros.

Mill work, the Rat Portage Lumber Company.

Painting and glazing, the Taylor Painting and Decorating Company.

The following figures show the proposed extent of the buildings:

Locomotive machine and erecting shop 170 by 612 feet, 47 feet high.

Boiler tank shop, 185 by 210 feet, 47 feet high.

Stores and scrap shop, 40 by 220 feet, 47 feet high.

Forge shop, 100 by 260 feet, 47 feet high.

Grey iron foundry, 130 by 200 feet, 47 feet high.

Power house, 110 by 150 feet, 49 feet high.

Cleaning room, 48 by 80 feet, 25 feet high.

Locomotive, carpenter and pattern shop, 70 by 100 feet, 43 feet high.

Stores, 60 by 200 feet, 18 feet high.
Oil House, 40 by 60 feet, 15 feet high.
Wheel foundry, 92 by 135 feet.
Engine house, 170 feet radius, 1,068 feet circumference, with additional shop 50 by 200 feet.
Freight car shop, 200 by 600 feet.
Paint shop, 100 by 325 feet.
Coach shop, 125 by 250 feet.
Planing mill, 100 by 300 feet.
Lumber shop, 60 by 115 feet.
Dry kiln, 40 by 50 feet.

New Manufacturers' Agency.

Norman Macdonald, recently buyer for Rice Lewis & Son, Toronto, has been appointed sole sales agent for Ontario for the Carborundum Co., Niagara Falls, N.Y., manufacturers of abrasive materials. Mr. Macdonald will take on other agencies more particularly in tools and supplies for factories. He has established offices and warerooms at 30 Front Street east, Toronto.

Toronto's Filtration Plant.

Contracts for the construction of the civic filtration plant on Toronto's Island and for equipment for the filtration plant have been awarded. The following were the successful tenderers: Main contract, Messrs. Dill, Russell & Chambers, $568,128.60; cast iron pipe and specials, Canada Foundry Co., $10,891.10; gate valves, Ludlow Valve Co., Troy, N.Y., $8,772.95; sluice valves, Coffin Valve Co., Boston, $85,209; nenturi meter castings, John Inglis Co., $2,891; nenturi meter-indicating apparatus, John MacDougall, Caledonian Iron Works, Montreal, $3,318; sand washer castings, Canada Foundry Co., $871.20; steam centrifugal pump, John MacDougall, Caledonian Iron Works, $9,484; screw pumps, Allis-Chalmers-Bullock Co., $7,049; electrically-driven stage pumps, Allis-Chalmers-Bullock Co., $5,234; drainage pump, John Inglis Co., $1,600; boilers, John Inglis Co., $2,750; and manhole casting, Canada Foundry Co., $8,890.35.

Greatest Bridge in World.

The Canadian Pacific Railway is now constructing over the Belly River at Lethbridge, Southern Alberta, the largest bridge in the world. It is more than double the height of the ill-fated Quebec bridge. It will be 307 feet above the water level and 5,327 feet in length. The cost of the structure will be $1,500,000. The Lethbridge structure is not as long as the Victoria bridge in Montreal, which is nearly two miles, or the Firth of Tay bridges, but in each of these cases the headway is much less. It is nearly five times as high as the Victoria bridge at Montreal, and over twice as high as the famous Tay bridge. Other high bridges which approach the Lethbridge giant in length are the bridge over the Dnieper at Japkaterinoslav, Russia, which is 4,557 feet in length, the Alexandrowski bridge, over the Volga near Syzran, 4,871 feet; the Severn bridge, 4,162 feet, and the Empress bridge, over the river Sutlej, on the Indus Valley Railway. The structure which spans the Victoria Falls of the Zambesi River has the advantage of the new C. P. R. bridge in height, but fails in comparison in length. The concrete foundation of the structure at Lethbridge goes down to 24 feet below low water, and stands on hard shale. Twelve thousand tons of steel, 18,000 cubic yards of concrete, 20,000 barrels of cement, and 15,041 piles are being used in its construction.

Overhead Carrying Systems.

W. D. Beath & Son, 193-195 Terauley St., Toronto, installed an overhead carrying system in the works of Frank H. Fleer, Toronto. This is for the conveyance of bags of chicle from the cars to warehouse. The chicle is weighed on the track, deposited in the warehouse from which it is carried to elevators in the main factory as required. An electric carrier system has been installed in the Cosgrove Brewery for elevating and carrying barrels weighing 1,300 lbs. Other instalations include J. Fleury's Sons, Aurora, Ont., for carrying molten iron from the cupola to molding floors and Belleville Iron & Horse Shoe Co., Belleville, Ont., where a considerable saving was made. Some installations are now being made including an overhead carrying system in the works of the Ontario Wind Engine & Pump Co., and Wagstaffe Ltd., Hamilton, manufacturers of preserved fruit. A sytem has just been completed in the works of the Metal Shingle and Siding Co., Montreal, and work has been commenced on machines and tracking for the Hygienic Dairy Co., Vancouver. A system is also to be installed in Edmonton dairy.

W. D. Beath & Son are planning to enlarge their works to take care of their increasing business. Besides the electric hoists and trolleys, hand hoists in any capacity up to ten tons, switches and various kinds of tracking for factories, barns, etc., manufactured by them, they are undertaking the manufacture of parlor and barn door rollers, fire door rollers and babbit metals and solder, also a line of hardware specialties.

Electric Crane Transporters.

To facilitate the loading and discharging of ships' cargoes, two machines worked by electricity, will be introduced on the Montreal wharves when the shipping season commences. It is claimed that they will do twice as much work as cranes and, if this is so, it will be no uncommon occurrence this summer to get a boat loaded or unloaded within a few hours. F. W. Cowie, harbor engineer, is the inventor of this patent contrivance. It consists of a car and a network of machinery which supports two long arms, one of which will stretch over the hatchway of a ship while the other will reach to the centre of a cargo shed.

Each arm will be 45 feet in length and made capable of sustaining a weight of two tons. The transporter can be worked by one man who will simply have to manipulate a handle to set it in motion. An iron chain will descend from the arm over the ship, and to this will be fastened goods in the hold which, through the electrical power, will run along one arm to the other and drop in the shed. The transporter, the car of which is as broad as the railway tracks at the wharf, will run on four wheels on the railway lines. It can therefore be moved to any part of the harbor within a very short time. The C.P.R. and the Allan Steamship Company will each give a trial to the transporter this summer, and Mr. Cowie expects that the installation of the labor and time-saving machines will prove beneficial in every way to the shipping interests of the port. No charge excepting that for electrical power, will be made against the two aforesaid companies this year, but if the transporters prove that they are much quicker exporting and importing machines than cranes or other contrivances, additional ones will be built for sale next year.

Canadian Machine Tool Markets

THE METAL SITUATION.

Orders have been swinging in freely during the month, and for the most part a bright tone has been manifested in the markets. The unseasonable weather, and the slight feeling of apprehension in some quarters as to the welfare of the crops, seemed to damp consumers a little towards the end of the month, with the result that the situation became not quite so buoyant. The metal markets are easily influenced just at present, however, and while it does not take much to depress the tone, it does not take much to depress the tone, it does not take much to elevate it, and bright reports as to general trading conditions would soon put matters tight. Of course the weak tendency of the primary markets are all against a healthy position.

Tin has been fluctuating all the way through with little character to the buying. Copper made a speculative jump in London but fell away again. Spelter has been uniformly steady, and lead on the weak side. The bright feature has been the improvement in the United States iron and steel markets. Heavy tonnage was booked during the month, while prices firmed up. Bars, plates and shapes went back to the prices first made on the February reduction, while some of the pig iron interests advanced prices 25c. a ton and more.

In Canada all metals have been in demand, and prices have ruled fairly firm. Heavy consignments are entering the port of Montreal, and the stuff cannot be distributed fast enough to please customers which shows how low stocks are. There has been a very strong demand for galvanized sheets. The inquiry for tin and copper has been very good, and it is evident that with stronger primary markets a much heavier consuming demand would be tempted into the markets. The jobbing price of tin has been maintained steadily at 32½c. copper at 14c., spelter at $5.50 to $5.75 and lead at $3.65. Buying ahead has improved in pig iron and users are paying somewhat heavies prices for deliveries extending to the fall. With several Canadian furnaces out of the open market, owing to their steel orders, the situation is much stronger. The remaining furnaces are well occupied, and price have a higher tendency.

MONTREAL.

There is a decidedly better tone to the machine tool market. It is true that the large consumers are still disinclined to purchase with their old time freedom, although in this respect a welcome change seems to be coming, as one or two large orders have been placed this month, but the smaller shops are well to the fore, and are buying freely, if in small bulk. As one supply house said, trade wants plenty of hustling after, but the small orders aggregate a steadily increasing volume, and the big orders must come soon. Even the railroads are losing their cautious attitude, which is a good sign of the times.

With trade improving the markets are naturally firm for all class of tools. American lines are very steady, and have been for many months, while Canadian makes are getting firmer in price. Some home lines have advanced and the prospects point towards a further advance. Makers are steadily producing, and stocks generally are in good shape and able to cope with a strong consuming demand. At present Montreal seems to be supplying the bulk of orders, but other points in the Province of Quebec and in the Maritime Provinces are showing a welcomed improvement.

TORONTO.

The outlook for business at the present time is excellent as industries are upon a permanent basis and far more likely to expand than contract their operations and also because there is a general tendency among the managers of mines, smelters and mills to substitute new, improved and larger machinery for that installed in the various plants in the initial stages.

In spite of comparative inactivity in some mining centres and of the effect on sawmills of the uncertainty as to the immediate prospects of the lumber industry, the demand for new machinery and for repairs and improvements has been greater and more regular during the winter closing than in any preceding season since establishment.

One manufacturer of boilers has sold return tubular and portable boilers aggregating over 4,000 horse power since the first of the year. A number of these were shipped to British Columbia.

Quantities of heavy tools for both metal and wood working have been shipped to the west recently. H. W. Petrie shipped several carloads to Vancouver recently. A great number were to fill orders and the rest for the showrooms in Vancouver.

WINNIPEG.

Winnipeg is not very forward in the list of Canadian manufacturing cities. It is well known in western Canada as a gigantic distributing station for almost all manufactured goods. And in the machine line there is keen competition among Canadian manufacturers to land their goods on the western market.

As a consequence of the limited number of manufacturing concerns, the small tool market is usually very quiet, particularly in the steel tool line. The wood-working tools are increasing in demand and recently there has been an advance in prices ranging from 10 to 15 p.c.

There has been a noted expansion in the heavy tool market of late. Milling machinery is much in demand in various parts of the west, and local supply houses are busy sending out heavy tool specialties.

W. A. McLeod, manager and director of the western branch of the Stuart Machinery Co., leaves for the east in a few days to investigate the machinery market of the leading American and Canadian cities. He will visit Chicago, New York, Buffalo, Montreal, Toronto and Galt. The last named city is the home of the firm he represents.

The annual meeting of the Western Iron Works Co. was held here on May 10, at which

meeting new officers were elected and financial reports read. C. M. Simpson was elected president in succession to C. A. Baskerville, who resigned to become a director. David Trainer is vice-president and manager, and Alexander Simmers, treasurer.

The reports submitted by H. R. Eade, secretary, were exceedingly gratifying to the Board of Directors. The company one year ago did not anticipate the large volume of business that has been done during the year.

The secretary of the Board of Control of Winnipeg is calling for tenders for the supply to the Point Du Bois Hydro-Electric plant of soft copper plate of No. 16 Birmingham gauge. There are 2,700 pieces to be supplied. 1,350 pieces are to be 24" by 36" plain, and the remainder 4" by 6" each punched with two 11-16 inch holes.

The Manitoba Iron Works Co. are erecting a new structural steel and bridge building plant on their premises in this city. The building will be the second largest in Canada being superceded by the Dominion Bridge Company, Montreal. The plant will be 412 feet by 140 feet containing works and office. The front will have a double set of offices, one above for drafting and the one below devoted to business.

The building will be equipped with new machinery from the Pittsburg Construction Co., including two electric cranes of 15 tons capacity each, and several smaller cranes.

All the power used will be electrical, and it is estimated that the total cost of building and equipment will be $120,000.

The present plant is devoted to the manufacture of elevator machinery, and general foundry work with a capacity of 15,000 tons of structural steel per year and 10,000 tons of cast steel.

With the additional works the number of men employed will be increased from 250 to 500.

Among recent orders placed with the company are, 4,500 tons of structural steel for the new G.T.P. shops, and 1,200 tons of steel transmission towers for the city power plant. L. C. H.

VANCOUVER.

It is a good time of year anyway, and the prospects are particularly good just now. There is greater movement than at any time previously. Building continues active, the permits being nearly all for dwelling houses, railway construction is going on close to the city, logging is starting up, and, in short, the situation all through, is encouraging.

A large amount of work is to be done by the B. C. Electric Railway Company in the city and suburban districts, which will total an expenditure of about $2,000,000.

H. W. Petrie has brought to Vancouver several carloads of machine tools most of them for immediate delivery and the rest for stock in his warehouse here.

CATALOGUES.

BRIDGES—150 page catalogue on bond paper from the Hamilton Bridge Works Co., Hamilton. It is well prepared and well printed. Photographs are given, showing their large works in Hamilton and a large number of bridges erected by them in various parts of Canada illustrating the several types.

INDUCTION MOTORS—Bulletin 102 from the Packard Electric Co., St. Catharines, Ont., describing in detail with illustrations their induction motors and oil-immersed auto starters.

CUPOLAS—Catalogue from the Knoeppel Co., 577 East Ferry St., Buffalo, entitled "Maximum cupola efficiency made possible by the Knoeppel continuous tuyerage system." The description is very complete and contains a number of illustrations.

VISES—From Hollands Mfg. Co., Erie, Pa., a handsome catalogue of machinists' tools printed on bond paper with embossed cover. Descriptions, illustrations and prices are given of the various vises, swivel jaw, solid jaw, parallel, filers, offset jaw, woodworkers', combination pipe, chipping and pipe vises, as well as pipe cutters, taps and dies, etc.

CALENDARS—The Stephenson Mfg. Co., Albany, New York, are issuing a handsome set of twelve calendars. By sending a postal with name and address the writer will receive the series of pretty girl calendars. Above the calendar of each calendar is the portrait of a pretty girl. The design is very attractive.

David Reid, of the Reid Foundry & Machine Co., Ingersoll has been appointed superintendent of the Berg Machinery Co's foundry, Toronto. In addition to the Berg brick machinery they will manufacture engines, Reid molding machines and carry on a general foundry jobbing business.

Manufacture of Carborundum Grinding Wheels

The History of Carborundum, its Discovery, and a Description of the Process of Securing the Crystals that make Carborundum Grinding Wheels.

The word grinding when referring to carborundum is used in its popular rather than in its strict meaning. Carborundum cuts, its action being like the lathe or planer tool rather than the rubbing brick or file. This is due to the fact that carborundum is made up of the microscopic sharp-edged crystals, which break and split into smaller crystals when brought into contact with a piece of metal under heavy pressure. Each new crystal has new sharp cutting edges and thus a constantly fresh, sharp-cutting surface is maintained.

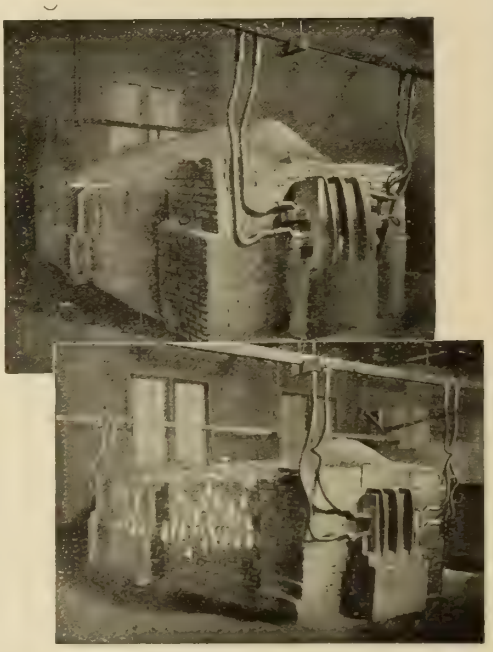

Fig. 1.—The Furnaces.

Carborundum is about fifteen years old, it being in 1893 that Edward Goodrich Acheson located in a little shop at Monongahela City, Pa., discovered the product.

Mr. Acheson was experimenting with an electric current, some clay and some coke, when he made his wonderful discovery. The clay and the coke he put in a small iron pot or bowl, such as plumbers use. Into this mixture he stuck a carbon rod from which a connection was made to one pole of a dynamo. The current was turned on and the clay and the coke became a molten mass. When the carbon rod was withdrawn from the bowl, the trained eye of Mr. Acheson discovered some minute crystals adhering to it. These crystals were found to be so hard, so sharp and so beautifully tinted that for a time the discover thought that at last a man-made diamond was possible.

The new crystals, however, lacked the transparency of the diamond, but so far as hardness and sharpness were concerned, were equal to the nature product. Just what they were the inventor or, rather, discoverer, really did not know. He collected enough of the new crystals, from other experiments, to fill a small vial, and these he took to the gem experts in New York.

The experts were, after some persuasion, induced to test the abrasive powers of the new crystals on some precious stones. The results were startlingly successful, and Mr. Acheson got his first order for the new product, which he called "Carborundum," at 40 cents a carat. He then went back to "the little shop" to make carborundum by the pound instead of the ounce or carat.

To-day the down-to-date farmer sharpens his scythe with these near diamonds, but of course not at the first jewelers' prices. The improvements in the process of manufacture, the subsequent creation of a demand for the product, which so rapidly took the place of the natural abrasives, all tended to lower the cost of production and thus bring down the market price.

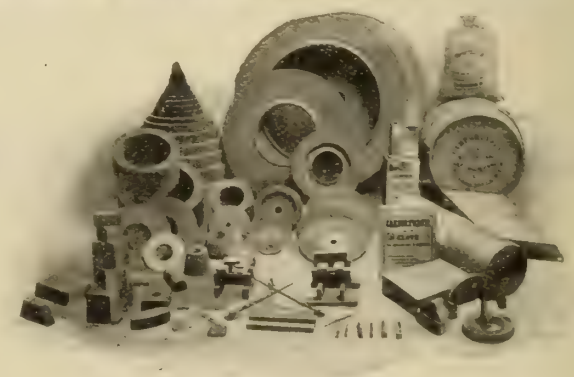

Fig. 2.—The Finished Products.

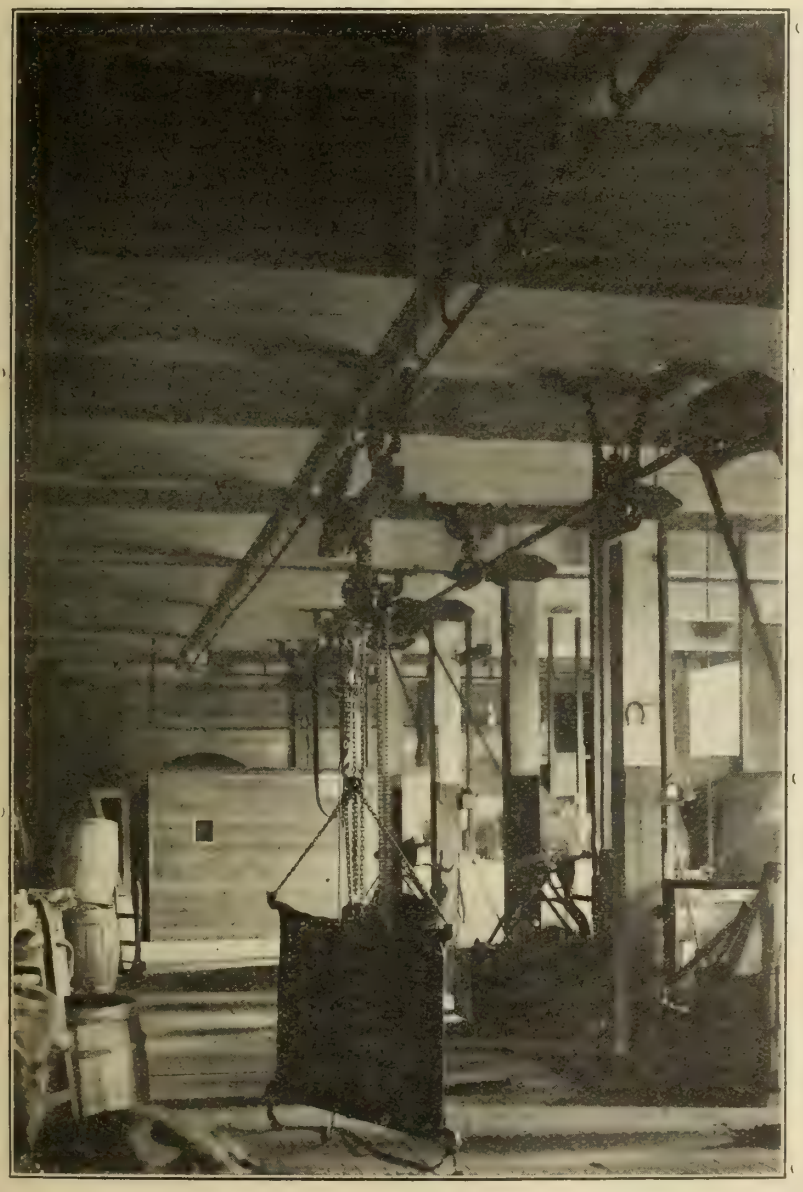
Beath's Overhead Carrying Systems

A Great Money-Saving Convenience for Use in

Foundries, Factories, Warehouses, etc.



Showing a portion of Tracks and Carrier installed in 1905 for the American Chicle Co., Toronto, Ontario. The illustration shows Chain-block Hoist attached to quadruple Carrier with Automatic Dumping Sling for handling bags of Chicle.

The following letters—a few out of many scores of similar letters that we have on file—will give you some idea of the convenience and economy effected by our Overhead Carrying Systems. Note the various classes of work on which Beath Overhead Carrying System is saving the users money. No two systems are alike, each being designed to meet the requirements of the particular case. What we have accomplished for these firms we can accomplish for you. Read the letters:

Machine Shop

The Beath Overhead Carrying System was installed in our plant about two years ago and has led to a considerable saving in labor charges, with increased facility in handling our raw material and finished products. The system once installed is comparatively cheap to maintain, and requires little trouble to operate. We consider the overhead system has advantages over surface track for average loads.

BELLEVILLE IRON & HORSESHOE CO., LIMITED

Foundry

Replying to your letter of the 10th inst, we would say that the Overhead Trolley supplied by you for use in our foundry has proven most satisfactory and has resulted in the saving of a great amount of labor in the carrying of molten iron from the cupola to the more distant floors; You may recall that after having a part of the present system in use for a short time we found it so valuable that we extended it to the utmost limit.

We have in view the installation of some other overhead tracks and when we have fully decided about the matter we shall ask you to give us a price on what we shall require.

J. FLEURY'S SONS, Aurora

Factory

We have installed the Beath Overhead Carrying System in our factory and find it saves a great deal of labor. It is giving excellent satisfaction. We wonder now how we got along without it. 1,200 feet Track, 14 Switches, 10 Carriers.

THE AMERICAN CHICLE CO.
J. PHYN, Manager

Warehouse

We wish to advise you that the Overhead Carrier System which you installed in our new factory, for the conveyance of Chicle from the warehouse to railway cars on our private siding and from the cars into the warehouse, has proven itself to be the time and money saver which we anticipated. We also find the scale attachment of great value as it not only saves handling of goods, but gives the correct weight without the loss of time.

The whole system is most complete and satisfactory and we will be pleased to recommend it to any firm wishing to have their factory equipped in a thoroughly up-to-date manner.

FRANK H. FLEER & CO., INC.

Brewery

The Electric Carrier which you installed in our Brewery about a year ago has given every satisfaction.

As a *Labor Saver* in the work it has to do in the distribution of casks to our different vaults it easily saves one half; and, furthermore, we would not now be without one. Anyone requiring a carrier for above work, we can highly recommend your make.

Its Manufacture.

To-day at the Carborundum Company, at Niagara Falls, there are twenty-four mammoth furnaces which yield 7,500,000 pounds of carborundum a year, instead of one little bowl and rod furnace which fifteen years ago gave an ounce or so of this remarkable abrasive to the world.

The process of manufacturing carborundum to-day is practically the same as it was fifteen years ago, only that everything is done with greatly improved methods and on a greatly enlarged scale.

This mixture is placed in a big rectangular brick and iron furnace in great grave-like mounds. At each end of the furnaces four heavy cables are attached, these cables connecting directly with a core of crushed coke running through the bottom of the furnace bed. These cables carry 1200 horse power of electricity generated by the waters of Niagara Falls. For thirty-six hours this tremendous power is shot into the furnace and it generates heat which has never been accurately registered, as there is yet to be invented an instrument which will withstand this heat long enough to make an actual record.

The Crystals.

At the end of thirty-six hours, the sides of the furnace are taken down and the thick, black, ugly coating is removed. Like the most humble of Portia's caskets, this ugly covering hides the jewels, for the crystal masses reflect, accentuates and glorify the radiance of gems. Now purples, now greens, now azures and golden tints are discovered in almost every crystal mass—colors which the cleverest artist would despair of truthfully reproducing.

These crystal masses are taken from the furnaces and broken and crushed to the individual crystals, beneath immense steel wheels. The grits or powders thus secured are washed and then graded and graduated by screening through silk screens of different meshes.

A goodly portion of this powder is made up into scythe stones, combination stones for the carpenter and mechanic, razor hones for the home shaver and the barber, knife sharpeners for the housewife, and the many slips, rubbing blocks and special sharpening stones for the different trades, but no matter how fine or how coarse a carborundum stone is, it always has the same most wonderful cutting properties.

These stones after being fashioned under hydraulic presses to the different shapes, are placed in immense kilns like those used by the potters and vitrified at a heat estimated at 2,500 degrees. This is the last step in the making of the wheels and stones, save the minute inspection and testing by experts

FACTORY BUILDINGS

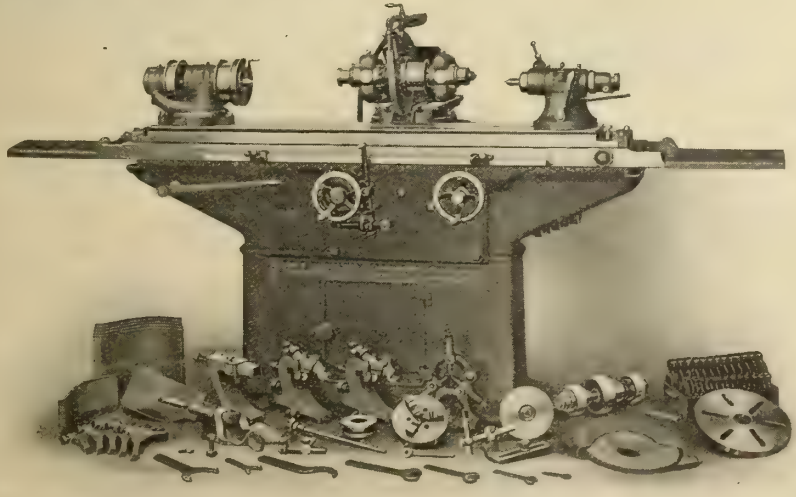
Not Only is a B. & S. Grinding Machine Accurate When You Start It, But Its Accuracy is Durable.

The importance of this point cannot be overestimated in that the Grinding Machine you want is the one that will wear well.



And nothing contributes so much towards the attainment of lasting accuracy as emphasis on Quality of Workmanship.

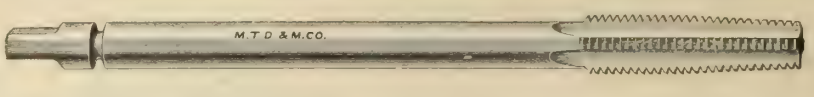
Sufficient weight that vibration may be eliminated as far as possible, each part in right relation to the whole, and correct alignments insisted upon, are all factors that establish accuracy as a permanent feature in B. & S. Grinding Machines.

A circular of any of the B. & S. Grinding Machines sent to any address. . .

"MORSE" TAPPER TAPS

as illustrated are specially adapted for use in single and multiple tapping machines. Designed and tempered for use in hot pressed or rough iron nuts. We carry in stock regular tapper taps with blank ends from ¼ inch to 1½ inch in lengths of 11, 12, 14 and 15 inches.

Prices on application for special shanks.



Send for our catalog containing a complete line of our manufactures. Free to all.

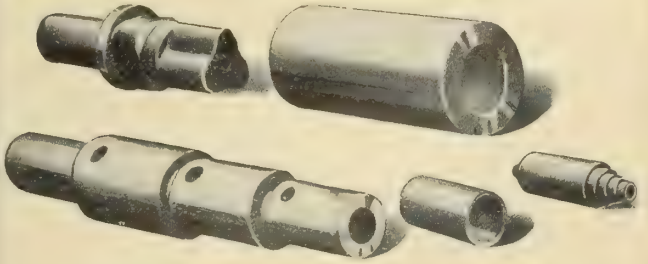
Derrer Oval Taper Drill Sockets

Give an Absolute Perfect Positive Drive



The Derrer Oval Taper Drill Socket and some of the products.

The DERRER OVAL TAPER DRILL SOCKETS solve the perplexing problem of drive for drills.

The DERRER OVAL TAPER DRILL SOCKETS are simplicity itself, and enjoy the following points of superiority over all others :

From one-third to one-half shorter.
No tangs to twist off.
No set screws or keys.
Positively no slipping or binding.
All our work interchangeable.
Absolutely true running drills.
Drill breakage reduced to a minimum.
Drill accounts reduced 25 to 50 per cent.
25 to 50 per cent. more work through your drill presses.
Chuck and socket account reduced 75 to 90 per cent.
A drill chuck or socket that is practically indestructible.
Gives an absolute perfect positive drive.

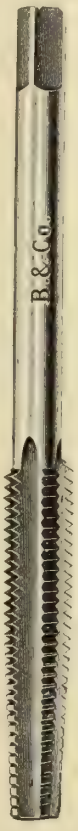
The Standard of Quality

BUTTERFIELD REAMERS TAPS & DIES



The Butterfield standard of good material, good workmanship and hairsbreadth accuracy never varies or diminishes. All the leading supply houses handle Butterfield Tools.

COMPLETE CATALOGUE SENT ON REQUEST

Butterfield & Co.

ROCK ISLAND QUEBEC

New Standard

A New Standard

The "Stantool"

SHORT TAPER SHANK WITH HEAVY TANG

Modern methods of drilling demand a stronger construction of shank and tang than the old standard. The "Stantool" shank meets this condition. It has much greater strength, offers a positive drive and overcomes the breakage which has heretofore been a serious difficulty.

"Stantool" Sockets and Sleeves

fit the new standard shank and are made to fit the taper spindle of all makes of drill presses.

Machinery Wanted and For Sale

It will pay you to watch our condensed column each month. There are many money-making propositions brought to your attention here. You may find just what you are looking for.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c. a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

GASOLENE ENGINE CASTINGS.

MARINE gasolene engine castings, with blue print and full instructions, etc.; 2½, 4, 6 h.p.; also complete finished outfits at $65 up; catalogue, Krug & Crosby, Hamilton. [10tf]

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

MACHINERY WANTED.

BOILER WANTED—40 h.p. horizontal tube. Must be in first class condition. State full particulars. Imperial Extract Co., Toronto. (6)

D. MAXWELL & SONS, St. Mary's, Ont., want second-hand air compressor in good condition. Belt driven, with capacity of about 100 cubic feet free air per minute.

SITUATIONS VACANT.

SUPERINTENDENT Wanted: Experienced in manufacturing and assembling adding machines, typewriters, or small tools. Must be educated in mechanics, experienced and qualified to lay out and direct work and to handle men. Should understand factory organization, shop production and economy. Write stating experience, place and date of birth and salary to go to Canada. Good opportunity and chance for advancement to a wide-awake, progressive man. Address Box 82, care CANADIAN MACHINERY, Toronto. (5)

WANTED—Two experienced machinery and mill supply salesmen. Applications to be made by letter only, with references, to the Canadian Fairbanks Co., Ltd., Toronto.

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

POSITION WANTED.

CIVIL ENGINEER, A.M.I.C.E., London, desires position with manufacturing firm. Specialist in machine tool design, jigs, fixtures, etc., modern methods for rapid production. Ten years in automobile and marine works. First-class mechanic and draftsman. Used to handling foremen, etc. Address Box 87, CANADIAN MACHINERY, 10 Front St. East, Toronto. (6)

OIL ENGINE FOR SALE.

NINE Horse Power New Campbell Oil Engine, Electric Lighting type. Cheap. Most economical engine for small plant. Jones & Glassco, Montreal. (tf)

MACHINERY SALESMAN WANTED.

COMPETENT man of mechanical ability to represent local machinery manufacturing firm as city salesman. State qualifications and reply to Box No. 84, CANADIAN MACHINERY, Toronto. (5)

PERIODICAL DEPT.

THE BUSY MAN'S MAGAZINE is the most popular periodical of its kind. Why? Because each issue contains a strong list of original articles of interest to every Canadian. It also reproduces the most timely, instructive and interesting articles appearing in the other magazines and periodicals of the month. The cream of the world's periodical press is too valuable to overlook. BUSY MAN'S is on sale at all news-stands. Better still, send $2 for one year's subscription. Mail it to day. The Busy Man's Magazine, Toronto.

FACTORIES FOR SALE.

IN the growing town of Welland, Foundry, Machine Shop and Carpenter Shop, with engine, boiler and line shafting; blacksmith shop, boiler shop, pattern and other storehouses. Welland has cheap electric power, natural gas, sewers, fine railways and water transportation on Welland Canal. Apply M. Beatty & Sons, Welland, Ont.

VALUABLE Manufacturing premises in the town of Galt—Building is of stone, three storeys, equipped with boiler, heating and lighting pipes. Immediate possession. Apply to C. R. H. Warnock, Galt, Ont.

MISCELLANEOUS.

AN EXTRA 1 PER CENT. PROFIT.—A National Cash Register will earn at least an extra one per cent. profit for any retail merchant. The National Cash Register Co., F. E. Mutton, Canadian Manager, cor. Yonge St. and Wilton Ave., Toronto, Ont.

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employe's time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Limited. Office and factory, 27 Alice Street, Toronto. (tf)

CUT DOWN YOUR PRINTING BILLS one half by installing a "Writerpress." Your office girl or boy can with it print your circulars, price lists, etc., at the rate of 1500 to 2000 copies per hour. Best machine ever made for printing facsimile typewritten letters. Prints from printers' type, half-tones, etc. Retail stores could greatly increase their business by using a Writerpress to run off circulars and letters, sending them out to their customers and probable customers announcing special sales, etc. Send for illustrated catalogue and samples. The Canadian Writerpress Company, 33 John St. South, Hamilton, Ont. (tf)

ELLIOTT-FISHER STANDARD Writing-Adding Machines make toil easier. Elliott-Fisher Limited, 513, No. 83, Craig Street W., Montreal, and 129 Bay Street, Toronto.

NOTICE!!—Users of Pitner Gasoline Lamps are warned against being induced to purchase parts of other makes of lamps to be used on the Pitner. The most vital part of any lamp is its generator and the Pitner Generator has been granted a patent in Canada, the United States and other countries, on the principle of its improved method of generating gasoline vapour. Supplies and parts for the Pitner Lamps can be received by return mail by applying to our representatives or direct to THE PITNER LIGHTING CO., Limited, 36-38 Lombard St., Toronto, Ont. (tf)

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling, and greatly facilitates the loading of cars, drays, etc., and for handling goods in and about the warehouse and factory reduces the cost of labor because far less warehouse help is required. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley St., Toronto. (tf)

AGENCIES WANTED.

MANUFACTURER'S Agent, covering Canada, desires to secure first class lines, suitable for the wholesale and retail hardware, railway, and mill supply trade. Strong connection, highest references. Box M, CANADIAN MACHINERY, Montreal. (5)

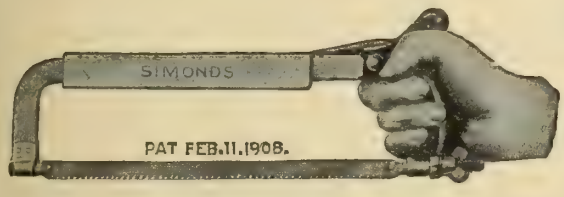
HOW MANY HACK SAWS DO YOU USE IN A YEAR?

SIMONDS FRAMES

No. 20. This illustration shows our best nickel plated rigid 8-inch frame. Blade faces in four directions. Each frame packed in a separate box.

No. 40. This frame is identical with the one illustrated excepting that it has an Extra Heavy Adjustable Back. Holds firmly any blade from 8 to 12 inches in length.



THE "STRAIGHT CUT"

The frame with a new handle that looks reasonable and is reasonable. Notice the position of the hand.

Why shouldn't a Hack Saw be used in this easy, comfortable, natural manner instead of the old way? Once a mechanic tries the Simonds Straight Cut Frame, he sticks to it.

We have this frame in two styles, 8-inch rigid and 8 to 12-inch adjustable, both nickel plated. Ask your Hardware Dealer for Simonds Frames.

If only one or two—don't worry about them.

But————

If you use as many as two dozen remember that Hack Saw Blades vary in quality from 20 to 50 per cent.

Two dozen or two gross of

SIMONDS HACK SAWS

will do the work of three dozen or three gross of other makes.

List Prices just the same as other makes, but service value greatly superior.

Give the Simonds Hack Saw Blade a generous trial.

Their tough high temper assures their good cutting qualities.

Ask any Hardware Dealer or write us direct. We have an especially good proposition to offer firms contracting for a year's supply of blades.

Just Look at This
Improved Power Hack Saw

It is better made than any tool of a similar nature you ever saw before. Only the best of material is used in its construction, and your particular attention is directed to the improved arm and saw guide which keeps the saw perfectly in line. This saw cuts either round or square bars 6x6 inches, and requires no attention after the work is in the vice. : : :
It stops automatically when the piece is cut off

"PENINSULAR" MOLDERS' TOOLS

The Tools That Are Made in Canada

FORM
Seventy three styles, over four hundred sizes.
Special tools made to order.

FINISH
Just what a half century of familiarity with molders' tastes has helped us to produce.

The Best For Over Fifty Years

TEMPER
The right one for the work.
We have the PERFECT PROCESS

DURABILITY
Our tools will outlast any other make, and you will buy ours again.

GUARANTEE

WE POSITIVELY GUARANTEE THAT EVERY TOOL WE SELL IS ABSOLUTELY PERFECT. WE WILL GLADLY EXCHANGE ANY TOOL AT ANY TIME IF NOT SATISFACTORY.

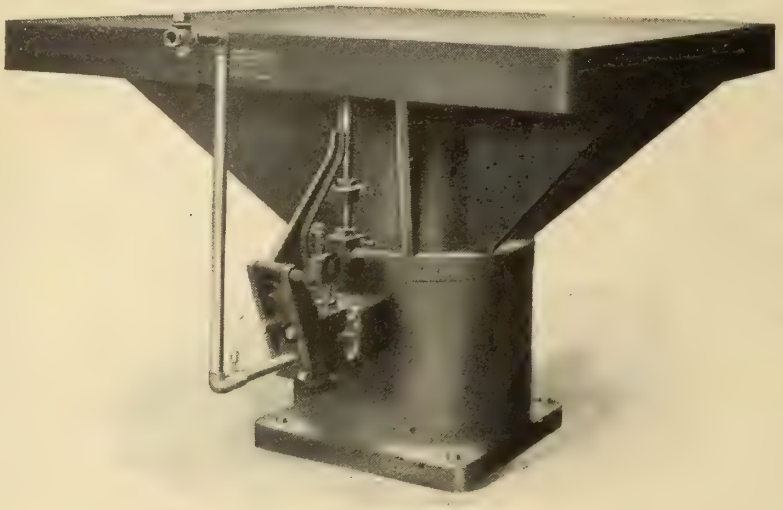
Tabor Jarring Machine

Saves nearly all the ramming time.



Tabor Jarring Machine.

The Tabor Jarring Machine consists of four parts : i.e. valve, platen and cylinder, piston and anvil.

Rams with fewer blows than any other type.

Operating valve so constructed as to eliminate air cushioning.

A blow is struck for every depression of a hand lever.

The length of stroke can be varied to suit conditions.

Built to handle flasks weighing up to TEN TONS.

Tabor Hinged Machine

Saves pattern drawing and finishing time.

The Tabor Hinged Molding Machine is designed to handle a class of work here-to-fore not adapted to machine molding on account of hanging sand.

Adapted to molding large patterns where a limited number of castings are required.

Facilitates rapid changing of pattern boards.

Is essentially a machine for drawing the pattern and saving the time usually consumed in making the parting and finishing the mold.

Tabor Hinged Molding Machine. Power Turn-Over and Power Draft.

By combining the two machines the production of complete molds can be increased from three to ten times, depending upon the nature of the work, as compared to floor work by hand. This machine is capable of handling flasks weighing up to 4,000 pounds with 80 pounds air pressure.

COKE PIG IRON COKE

Don't Lose Time

Time is the one expensive item shown in the footing of your pay roll.

You can save time, meaning money, by using my Tripoli Composition in buffing your plated castings. It's the old fashioned "pure quill."

You can save your defective castings by using STEVENS' STOPPER, in filling your "blow-holes." It's lower in price, and better in quality than the other "Cements" so elaborately advertised.

You can avoid making defective castings by using STEVENS' PURE PLUMBAGO. Altogether—we ought to get together. Have you time to write to me? It will pay you to take the time for that purpose.

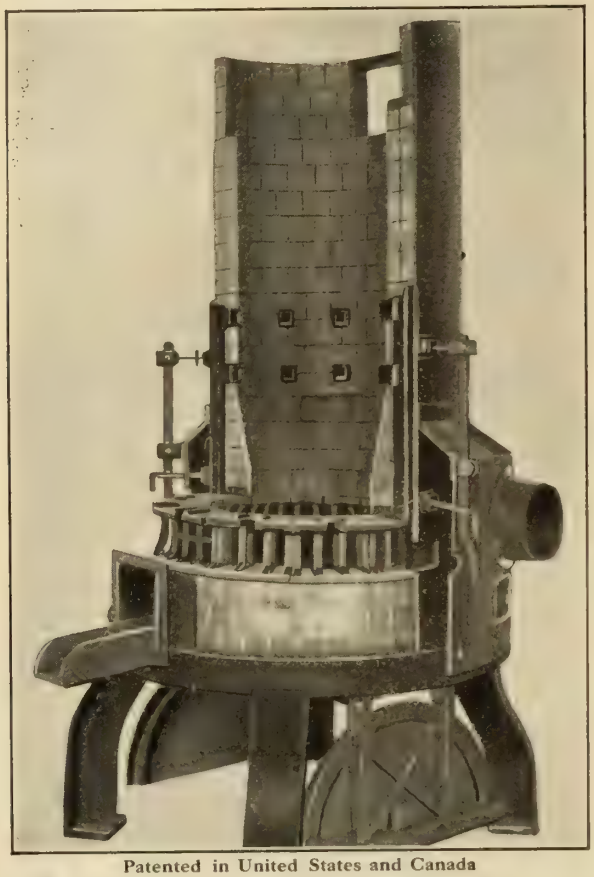
Canadian Patent for Sale

We are open to dispose of the Canadian Patent Rights of the

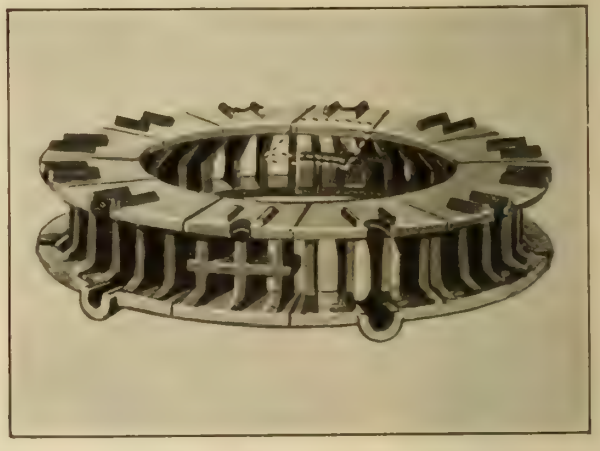
Knoeppel System of Cupola Twyers

Or we will sell Shop Rights or Rights to Manufacture and Sell in Canada



Patented in United States and Canada

THE Knoeppel system is so designed as to get the maximum of efficiency out of a cupola. It results in hotter iron of a better quality than can be obtained from a cupola not equipped with it. It promotes uniform and rapid melting, permits continuous operation of the cupola and aids the consumption of waste gases. Through the equalization of the Blast it makes perfect combustion possible, and accomplishes a saving in fuel. Where it is used there is less h.p. per ton of iron melted, less oxidization of the metaloids, less destruction of the lining.



View of Twyers Full Zone

Its principal features are: A continuous twyer; large twyer area; maximum air delivery; lower blast velocity; air belt surrounding the back of the twyers; air supply flues above the melting point; adjustment of twyer area; adjustment for small diameters of lining; separate overhang plate, twyers projecting from 2 inches to 10 inches further into the cupola than any other. Delivery of blast nearer the centre.

FOR THE PURCHASERS OF

manufacturing or shop rights we will supervise the manufacture and installation of the first one made and fully demonstrate it in your own foundry without cost to you.

For Boshed or Straight Linings

Write at once for full particulars

BLACK DIAMOND CORE COMPOUND

WILL MAKE YOU

Bubble with Satisfaction

¶ We were pleased with the success of our "Bubble" souvenir at the Cincinnati convention, and were glad to see the interest taken therein by our Canadian visitors. Perhaps those who were unable to be at the convention would like to have one, too, so we will mail one to any foundryman who sends us his address, the name of the firm and the nature of work done. A post-card will do it.

¶ These are a few of the good points of **BLACK DIAMOND CORE COMPOUND:** Does not absorb moisture, makes good paste, does not solidify in hottest weather, will not crack, swell, blow or buckle.

TRIAL LOTS SHIPPED SUBJECT TO APPROVAL.

BLACK

MILL'S DRY CORE COMPOUND

Give them a trial —

There is no reason why you should bother mixing a compound of your own when you can get a perfect compound like Mills' for less money. There are these three grades of Mills' Dry Core Compounds:—

No. 1 is for Heavy, Grey Iron Work.

No. 2, while being good for any work, is particularly adapted to smaller Grey Iron, Malleable and Steel Cores.

No. 3 is a compound which is made to fill the wants in Car Wheel Foundries, and is successfully used for making the difficult car wheel pan cores and for the hub cores. It also can be generally used for any Foundry Work.

They will mix 50 to 75 per cent. more sand than rosin or flour. When they are used the core will never stick in the box, swell or crack; and stock cores made with Mills Dry Core Compounds will not gather moisture.

"WAGO" CORE BINDER is a patent article manufactured only by the H. E. Mills Manufacturing Company. It is the only compound on the market made specially for making cores for brass foundries. No blowing possible. After shooting cores, castings are left perfectly clean.

Wherever a Liquid Core Binder is essential, OUR SYRACUSE LIQUID CORE COMPOUNDS are used with economy and the best of satisfaction by our scores of customers. For brass work, use our SYRACUSE X GRADE. For general work, our SYRACUSE XX GRADE answers every purpose. For intricate and difficult cores, our SYRACUSE XXX grade cannot be equalled. For radiator cores ask for our No. 1 Grade.

YOU MAY ORDER ON APPROVAL

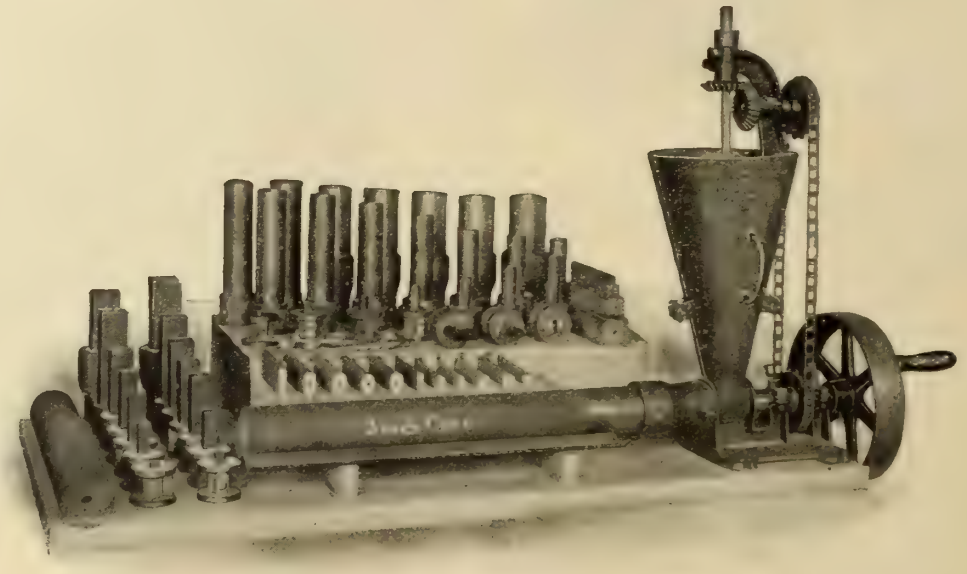
Hammer Core Machine

"Best By Test"



"The Hammer" is equipped with a patented force feed which absolutely eliminates "clogging of sand in the hopper and forces a steady supply of sand onto the screw feed, thereby insuring a *uniformly* solid core.

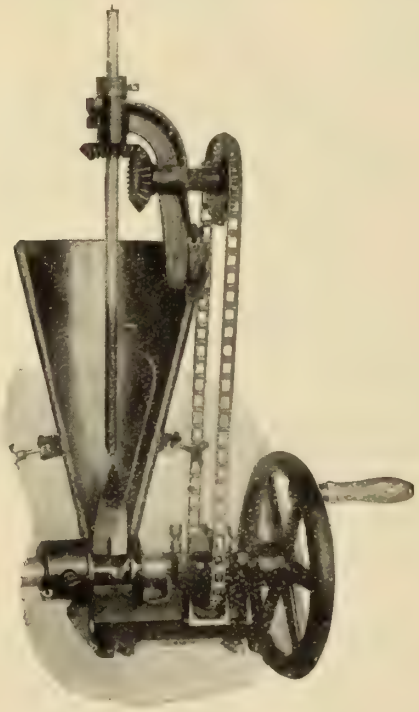


Fig. H

"The Hammer" system of venting the core (also patented) has proved to be the most successful used. We absolutely guarantee this machine to turn out a smooth, solid, perfectly vented core.

"The Hammer" tubes used are made so as to reduce friction to the smallest possible degree.

To owners of the Hammer:

If your machine is in need of repair we will gladly quote prices on broken or worn parts and guarantee to return machine as good as new.

Write for list of Canadian users and new catalog and sample core.

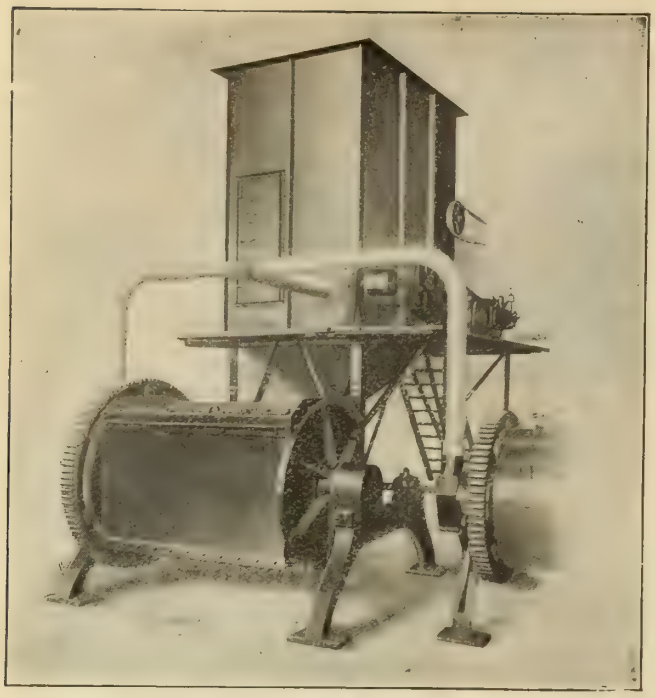
Manufacturers——Engineers——Designers

HARVEY, ILLINIOS, (Chicago Suburb)



The above cut shows two of our up-to-date mills properly piped for exhaust to our patent Dust Arrester.

Are you anxious to save money in the operation of your plant? Do you wish your castings cleaned and polished, and to have the same finished appearance as those being turned out by your competitors?

You can well afford to take out the old stave mills and scratch brushes, old type of exhaust mills, and place them on your scrap heap. Your loss will be fifty per cent. less than if you continue their operation.

Advise us as to the style of work you are making, and we will be glad to plan an outlay of improved exhaust cleaning mills that will do your work to perfection. In fact, after you have them installed you will wonder how you ever got along without them. We will clean your castings better, in less time, and use only one-half as many mills, at the expenditure of one-half the horse power.

Are you not daily confronted with the dust problem? Is it not flying about your plant, injuring your machinery, impairing the lives of your workmen, and becoming a public nuisance? How long will you evade answering these questions, and installing the proper equipment to better these conditions?

It is absolutely necessary that the dust and dirt from an exhaust mill be taken from the mill as fast as it is scratched from the castings. There is no other known method of disposing of this dust than by the installation of one of our improved Dust Arresters. This machine is so constructed that it can be placed almost anywhere about your plant, and not a particle of dust will escape from the same. All the dust and dirt is confined in the Arrester and is discharged through a hopper at the bottom of case. Not a particle of dust passes through the exhaust fan, thus extending the life of the fan indefinitely. We have made a scientific study of the cleaning room, and our experience is at your disposal simply for the asking. Plans and specifications gladly furnished.

OUR NEW FACTORY AT TRENTON, N.J.

WHERE WE MAKE THE

Crucibles of Quality

¶ We do not represent ourselves as originators of Graphite Crucibles, neither do we say that we are the oldest makers, but what we **do** say is that we offer the product of a new down-to-date equipment, backed by over **Thirty** years experience.

¶ Graphite Crucibles were made in the beginning of the 16th Century, which is an obvious reason why we do not claim the origination.

¶ Our Crucibles are as perfect as it is possible to make them, but we are not content to rest on the laurels of past achievement. We will continue our extensive researches and experiments which tend to make us

The Standard Crucible Makers of the World

¶ We also make—

Color Bowls	Brazing Specials
Stirrers	Nozzles
Retorts	Stoppers

Write for our new illustrated catalogue containing Hints on the Proper Handling of Crucibles and other information valuable to Foundrymen and Crucible Users.

LOCATE AT

St. Catharines

Ontario - Canada

Power House at Decew Falls of Dominion Power and Transmission Co., Ltd., and Lincoln E. L. and P. Co., Ltd.
2½ miles from St. Catharines, 100,000 H.P.

WHY? BECAUSE—

1. TWENTY-EIGHT PLANTS have located here for good reasons most of them Metal-working Industries.
2. ELECTRIC POWER is cheaper here – right where it is made – than elsewhere. Less than one-third the cost of steam.
3. WATER SUPPLY is from Lake Erie, with a head of about 200 feet.
4. FREIGHTS are as cheap here as if we had 100 railroads. BESIDES, you can use our port for water shipment to all great lake points and to salt water.
5. LABOR—Good supply of skilled mechanics and laborers. Most workmen own their own homes. They come to stay.
6. SITES are available for YOU to choose from, all good ones, and to be got at figures and terms which are big inducements.
7. INCIDENTALLY—We are one hour (by electric and steam railways) from Niagara Falls and Hamilton.

ALSO—St. Catharines is the market and shipping point for Canada's Greatest Fruit District——

Pattern Making

By James Ritchey

Instructor in Wood Working, Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

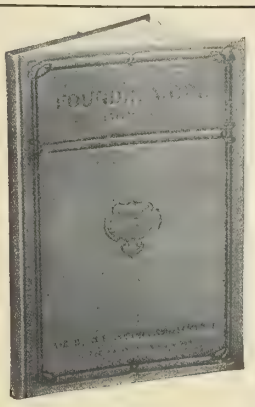
Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

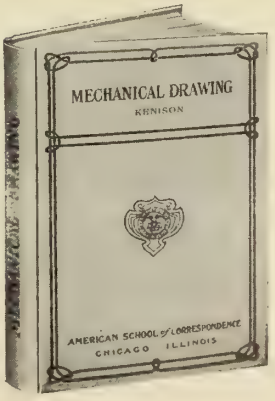
Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology



176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

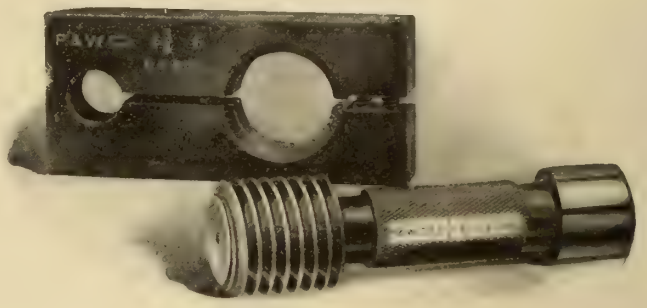
Gauges and Standards

Send for new Catalog, "Gauges and Standards," now ready,

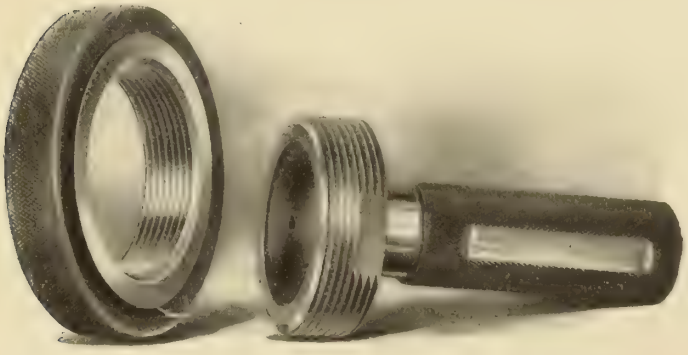
describing in detail thread gauges, plug and templet gauges, snap gauges, pipe thread gauges, taper gauges, end gauges, limit gauges, decimal gauges, star gauges, standard measuring machines, etc., etc.

P. & W. External and Internal Thread Gauges are made in the following standards: U. S., International, French, Whitworth, British Association, Acme, A. S. M. E., P. & W. "V" Thread, A. L. A. M., etc.



P. & W. Snap Gauges in sets, varying by sixteenths, from ¼ to 4 in. This type of gauge occupies a very prominent place in works of manufacturers who are desirous of maintaining a standard of interchangeability in their product.

P. & W. Standard Cylindrical Size Gauges, Plug and Templet, in British or metric standards, in sets varying by any subdivision of an inch or corresponding size.



P. & W. Brigg's Standard Pipe Thread Gauges for pipes and fittings. These gauges come in sets from ⅛ to 12 in. in different variations.

Right and Left Hand Gauges manufactured in all standard threads.

TRIMO TOOLS ARE MADE BY

Trimont Manufacturing Company, - Roxbury, Mass.

(BOSTON)

HERE IS AN UP-TO-DATE

SLOTTING MACHINE

MADE IN 8″, 12″, 14″ and 18″ SIZES

It is made in the latest design, rigid, convenient, durable, embodying every worth-while modern improvement.

The CUTTING BAR is counterbalanced and has Whitworth's quick return of about 2½ to 1. It has a relief apron by means of which ordinary cutting tools may be used without dragging on the return stroke. This apron may be clamped solid when so desired.

The SLIDE for the cutting bar may be adjusted near to, or up from the table which allows of tools of most advantageous length being used.

The FEEDS are positive, self-acting in all directions, operating at upper end of stroke. The arrangement of handles is such that the operator can command full use of them from one position and at the same time watch the cutting tool.

The TABLE is large in diameter and has compound movements. It has automatic circular transverse and longitudinal feeds. The worm operating the circular feed may be disengaged for ready adjustment of work. It is also graduated in degrees and may be clamped solid by clamps at the four corners.

The COUNTERSHAFT has two friction pulleys which with the four step cone gives eight speeds, except the 18″ machine which has two sets of fast and loose pulleys.

KEMPSMITH
MILLING MACHINES

are built to withstand continuous rough usage under severe modern manufacturing methods. The essential members are all massive for the size of the machine, and there is no weak, limiting point in the entire operative mechanism. Operation is concentrated, nothing complicated—so strong and simple that it is proof against trouble from careless or ignorant handling. Guaranteed to be built **right** to the smallest detail. The whole machine is **reliable** and **safe,** and merits close investigation.

THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

Let us send you more particulars.

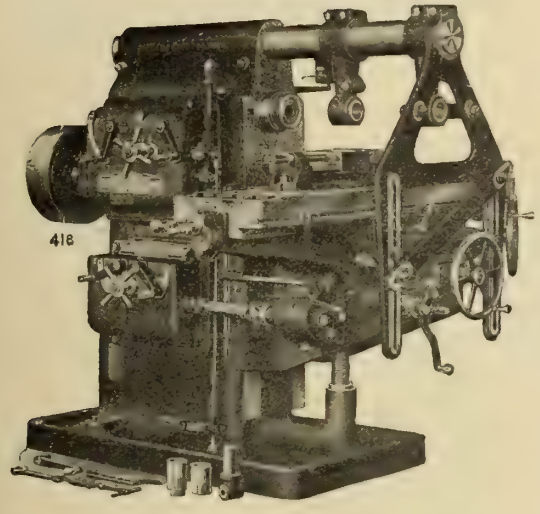
The A. R. Williams Mach'y Co., Toronto
Williams & Wilson - Montreal

Some Cincinnati High Power Features

The Newest Miller on the Market



All transmission gears of steel, with teeth of standard length and 20° pressure angle.

Never any gears in mesh except those needed to get the speed being used.

The drive is always through the face gear, which is keyed to the spindle close against the front box.

None of the main shafts subjected to combined bending and torsional strains.

Main pulley runs on independent bracket; driving shaft does not get belt pull.

Tumbler gear frame automatically clamped to the body of machine, at each of its positions.

Quick pitch feed screws—table feed screw not subjected to tortional strains throughout its length.

Single plunger trip, can reverse all feeds at all times from tripped position, without interference with dogs.

Feeds tripped in reverse box; more rapid and sensitive than when tripped by clutch on feed screw.

Direct reading, simple, feed and speed index.

Quick speed change; simple, easy lever movements and treadle.

Table feed levers reverse, and also indicate direction of table travel.

No independent reverse, to disturb control of table movement.

All feed changes made while running.

Feeds not being used are locked out.

Table and cross, or table and vertical feeds can be used alternately or in combination.

Quick return for table at front of saddle.

All levers for operating feed and speed changing are at front side of machine.

Arbor support; single piece truss form brace, designed to resist side pressure.

Sight feed oilers on all important bearings.

Tank for cutting fluid in base of machine.

Six different interchangeable drives. Change from the one in use to any other can be quickly made at any time by user in his own shop.

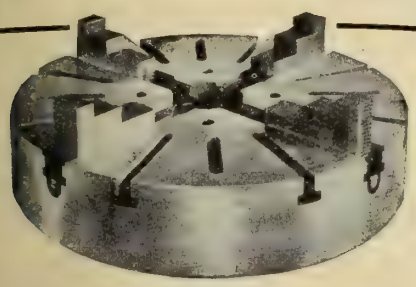
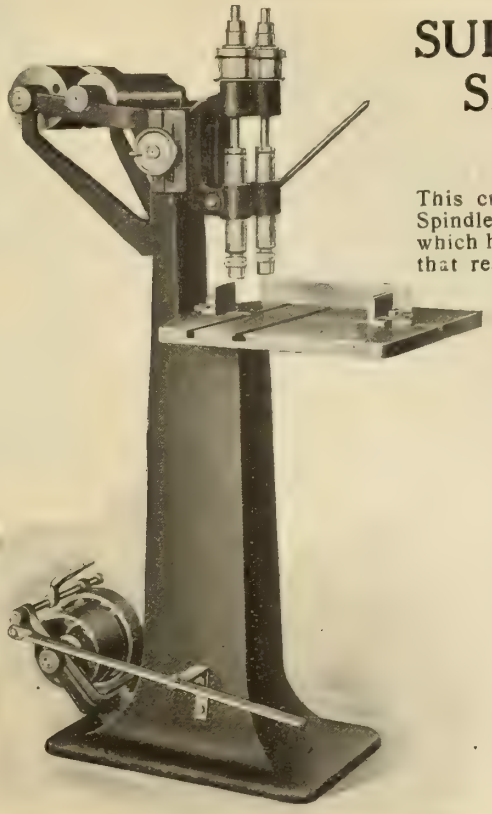
BRANTFORD, - - CANADA





SURPRISINGLY SENSITIVE and ACCURATE

This cut shows the BAWDEN Multiple Spindle, Sensitive, High Speed Drill, which has a distinctiveness of construction that readily commends itself to users of this class of tool.

The spindles are entirely relieved of driving belt strain by having the pull come directly on the ball bearings.

The natural result is that this drill retains the greatest sensitiveness and accuracy at any speed up to 4,000 r. p. m.

Spindles are adjustable to centers by means of a hand wheel. One spindle can be moved to a width of 8 inches and drills can be made wider if desired.

This is pre-eminently a high-grade tool warranted to give continuous high-grade service. It will pay you to give this drill a trial.

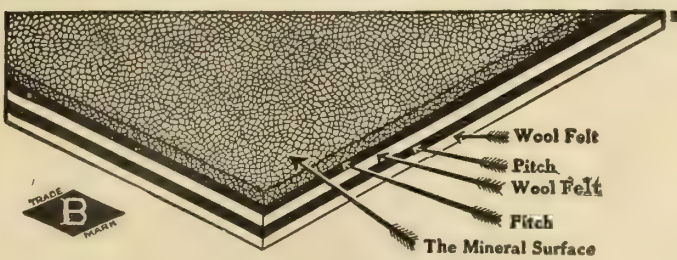
Amatite ROOFING



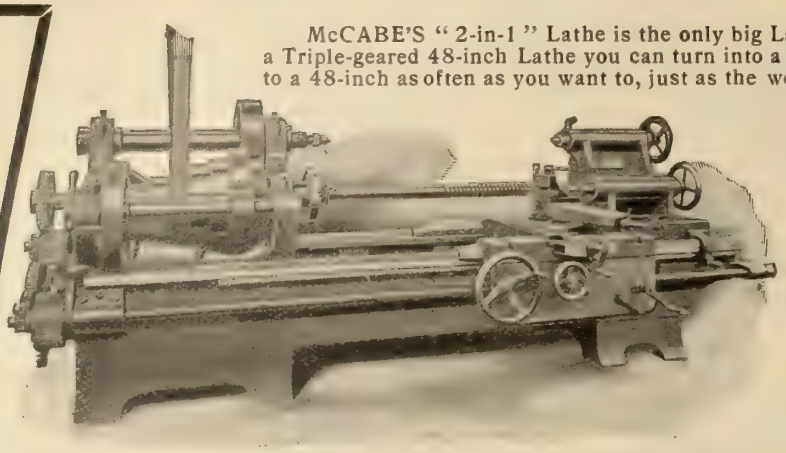
Most roofings are made of only *one layer*, but Amatite is made in *five layers*. The bottom layer is wool felt, the next is real Coal Tar Pitch, the third is wool felt, the fourth is pitch again, into which is embedded the fifth layer, namely, the *mineral surface*. If the weather should, in the course of years, wear away the mineral surface and dispose of the layer of Pitch (which is the most waterproof substance on earth), it would still have to penetrate a layer of felt *and* another layer of composition *and* another of felt before the roof would leak. It is easy to see why Amatite lasts so long when you realize how it is made. That mineral surface *requires no painting* or coating whatever, and will take the brunt of the weather without renewal or attention or care. Send for a sample of Amatite. It's free.

THE PATERSON MANUFACTURING CO., LIMITED

TORONTO MONTREAL WINNIPEG VANCOUVER ST. JOHN, N.B. HALIFAX, N.S.

Is a big Lathe worth anything if it can't do everything?

McCABE'S "2-in-1" Lathe is the only big Lathe built that will do everything. It is a Triple-geared 48-inch Lathe you can turn into a 26-inch Back-geared Lathe, and return to a 48-inch as often as you want to, just as the work comes along.



Reckon just how much a regular 48-inch Lathe would stand you in—and then compare it with McCabe's price.

The "originality" of building "2-in-1" Lathes in big lots at a time—making all the parts duplicate and interchangeable, brings the cost down to a thousand dollars less than other large Lathes.

The "success of serviceableness"—the quality of being of more use to you than any other Lathe built, should interest you further.

334 St. James Street, MONTREAL

This is the Patent "Dreadnought" Patent Milling File

Doesn't it strike you as odd to be able to use the same tool as a wood rasp (you should see how it gnaws wood) on the glass hard fin of a fresh roasted iron casting—and then to work a bit of copper or brass or horn or—WELL, a bit of just anything.

The Dreadnought Patent Milling File is just such a many sided bit of **Ever-ready** helpfulness. It will cut anything from **Phosphor Bronze** to **White Pine**, will cut that anything fully 5 times as fast as the very best file can—and then (now just ponder this well), and then: when its appetite has become a little blunted that same Dreadnought File may at trifling cost be re-sharpened (without drawing its temper) **many times.**

When it comes down to cheapness, on the basis of the work to be gotten out of it (the only one that "long headed men" ever figure on) the Dreadnought, seems to the user of ordinary files to be almost a **donation.**

Demonstrated Superiority

Any man familiar with machinery can tell from a perusal of our illustrated catalog that

Blount's Improved Wet Tool Grinder

is the best machine of its kind on the market. It embodies many new features that instantly commend themselves to the practical man who realizes the importance of constant efficiency. That Blount's Wet Tool Grinder possesses this and other desirable features in a superior degree to any other grinding machine is being demonstrated daily in hundreds of America's largest machine shops.

A Grinding Wheel is a good deal like a man—

It must make good or you don't want it.

NOT WHAT IT COSTS BUT WHAT IT EARNS

Don't judge a grinding wheel by first cost—Put it to work—Treat it same as you do the man who operates it—

If it produces more work and better work and lasts longer than any other grinding wheel—it is a **good** workman, even though it does cost a trifle more in the first place.

Carborundum Grinding Wheels cost a **little** more but they **earn** twice as much.

Export Trade
Represents the Great Future Market for American Goods

Manufacturers that cultivate the field **NOW** are assured of the largest share of this trade in the future.

Our service, the greatest single power in Export Trade, enables manufacturers to get their products prominently before the trade abroad. An efficient service, covering all export markets at minimum of expense.

The aim of the **American Exporter** is and has always been the up-building of a world-wide demand for American machinery and goods. Issued in two editions each month, one in English, and other in Spanish **(Exportador Americano.)** The two together cover all countries that import American goods.

It is the only journal of foreign circulation which regularly publishes its exact circulation every month in its editorial pages.

Stronger evidence of the AMERICAN EXPORTER'S strength in its chosen field could not be brought forward than the phenomenal growth in its advertising pages during the past three years. The AMERICAN EXPORTER in net volume of advertising business carried three years ago 52 pages of net advertising; two years ago 88 pages; one year ago 116 pages; carries to-day 122 pages. Its number of regular advertisers three years ago was 325; two years ago 400; one year ago 550; and to-day 650. It is seen that notwithstanding a "panic," there is a growth in the last 12 months.

An increasingly important feature of the **American Exporter** is the Foreign Trade Service maintained on behalf of its advertisers. This service includes the sending of our representatives into foreign markets to study conditions in the interest of our clients, the furnishing of selected names of possible customers or agents in any country, commercial ratings on prospective foreign customers, translation of foreign correspondence from and into any and all languages resulting from or pertaining to the advertiser's announcements.

Representative space regularly in the **American Exporter** gives you all the export advertising you need, for this publication covers every foreign market for your goods. This publicity. coupled with our Foreign Trade Service, provides you with the necessary facilities for conducting intelligently an export trade.

May we send more particulars?

How do you Know

that you are getting all the time for which you are paying wages ?

We are manufacturers of the

ORIGINAL DEY MACHINE

ANY system of recording the arrival and departure of employees that is dependent for its success upon the honesty and energy of a clerk, is liable to go wrong. Every timekeeper has his friends, his prejudices, and his weaknesses. He is only human.

Being a machinery man, you will appreciate the reliability of an entirely mechanical system of time recording.

For instance, consider the ***Dey Dial Time Recorder,*** shown in the cut. Its mechanism is adjusted and regulated to the highest pitch of absolute accuracy. It cannot go wrong unless tampered with. When registering "in" or "out" the workman revolves the pointer until it is opposite his number: then he presses it into the corresponding hole, and his exact time of arriving or leaving is automatically recorded. Late arrivals are automatically shown in ink of a different color to that of the prompts.

This clock is only one of many designs. We have clocks to suit every kind and size of business. Every one of them is entirely mechanical—they cannot cheat, lie or show favor.

No matter how large or small your business, we have a clock that will suit you.

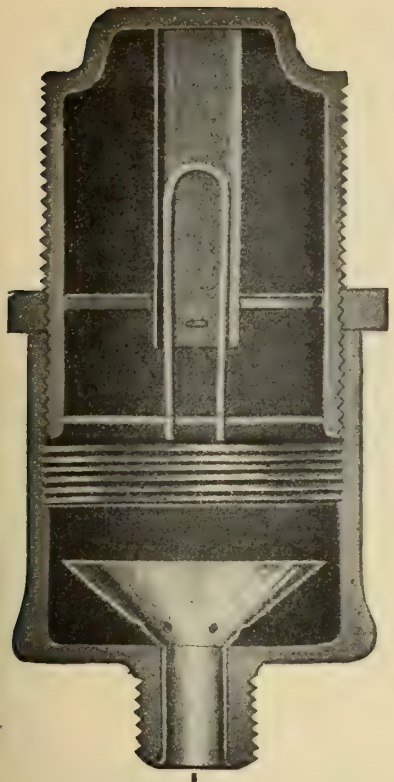
SHELDONS LIMITED

GALT, - ONTARIO



You Can Have

Perfect Lubrication

and use

50% LESS GREASE

It's merely a matter of getting the right grease cup. Feeding grease by mechanical pressure is expensive; a force-feed or spring compression cup can't lubricate properly, as the best of grease changes under pressure; it becomes thick and hard as the oil is forced out and much of it has to be thrown away.

The right way to Lubricate is by Natural Pressure, the Principle employed in the

PHILADELPHIA GREASE CUP

It is entirely free from friction. No piston or spring is used, just a thin metal disc resting lightly on the grease to keep it level. Air pressure above and the needs of the journal below are all that is required to give perfect lubrication. Grease does not change in any way while in the Philadelphia Cup; the last drop is as good as the first. There is a large unrestricted outlet and a regularity of action which permits perfect feeding of grease of any thickness.

We guarantee that the Philadelphia Grease Cup will give absolute satisfaction and save at least 50% over any other system. Moreover, you'll find it cheaper in first cost. Our booklet tells about it. A copy free on request.

Belting

VS.

Individual Electric Drives.

Recently there has been a headlong rush on the part of manufacturers towards installing individual drives for each machine in order to increase the efficiency of their shops.

We say "headlong" advisedly, because there is no question that, through a term of years, the total cost of individual motors and electric wiring coupled with the maintenance and repairs of this system, will FAR EXCEED the first cost of properly designed shafting and Belting, plus their maintenance and repairs.

The motor drive, in the end, means additional complications and expense rather than simplicity and economy.

We have been making belts for over thirty years and we have succeeded in keeping our belts a little ahead of all others in quality and endurance.

Cylindrical Grinding, Dealing With Finishing Methods*

A Practical Article Showing Advantages, giving Description of Machines Used and Method for Obtaining Best Economy in Cylindrical Grinding.

By C. H. NORTON

It is probably true that there is more misunderstanding among workmen in regard to cylindrical grinding than in the case of any of the other mechanical arts. Nearly every operator has a different theory; and each maker of grinding machines has his own method of grinding. There is confusion of ideas which can be cleared up by pursuing the investigation to the end. Do not take anything for granted. When you shall come to consider the commercial side of cylindrical grinding, no doubt the first argument you meet will be this one, which is brought forward very often by those who have not pursued the subject to the end. The argument is that "it cannot be possible that metal can be as economically removed by a grinding wheel with delicate, microscopic cutting points as with a massive steel tool. Metal ground into powder cannot be as economically removed as with a tool that cuts off great chips."

Time for Finishing by Grinding.

A shaft 6½ in. diameter, 10ft. long, rough-turned cheaply to within about 1-32 in. of the required finish size, can be finished straight, round to a limit of 0.0005 in. plus or minus by the grinding method, with a modern grinding machine, in from one to two hours according to the ambition of the operator. Here is a case where the cutting of the material to a powder with microscopic cutting points is very economical.

To be sure, the cutting points of the grinding wheel are small, but in this case there are approximately 1,086,171 cutting points, that cut 1000 times per minute, making approximately 1,086,171,000 chips per minute.

The statement that it requires enormous power to grind steel to a powder, while cutting it into larger chips does not, should have careful thought. In the case of the 10 ft. bar we use an average of approximately 8 H.P. from 1½ to 2 hours when grinding the finish cut. The production of a good grade of work when removing 1-32 in. more or less, shows a great economy by the grinding method. When, however, the surface can be rough and the diameter may vary within certain limits, a steel tool cutting deeply will remove the same amount of metal in shorter time. If the object is simply to remove a certain number of pounds of metal, turning it off with a steel tool is cheapest. As we know, nearly all round work must have an accurate, or approximately accurate, diameter, and from an approximately smooth to a very smooth surface. The great majority of round work must finally have a good surface and accurate dimensions and for this the grinding method is very economical.

Cost of Grinding.

There are some cases where grinding can be used economically. A case that illustrates this is that of bridge pins which are from 12 ins. to 8 ft. long and from 3 to 18 ins. diameter. Grinding is accomplished by a number of rapid cuts and during the final or light cuts, the grinding wheel does not wear at all, so that work is produced of uniform diameter regardless of length. Work may be ground up to 22 ft. long to a limit of 0.0005 plus or minus.

While practically all round work is turned before grinding, there is a portion of such work that is most economically ground without turning. Owing to certain shapes, or structural weakness, it sometimes becomes difficult to turn. An extreme case of this kind is that of a shaft, or bar of steel, 9-16 in. diameter and 10 ft. long, with 1-16 in. to be removed from the diameter to produce an accurate ½ in. bar within a limit of 0.0005 in. plus or minus. It is easy to understand how difficult it would be to turn this bar. We, however, find it very easy to grind such a bar to the limits, and in short time. The roughing cuts that take the place of the turning easily remove the stock to within a few thousandths in about ten minutes, while hours would be consumed in turning such a bar to even coarse limits.

Grinding Slender Work.

We are enabled to grind the pins and short bearings of automobiles accurately, direct from the drop forging, and we secure excellent work. The long, frail crankshafts for agricultural machines are also very rapidly and accurately ground. Many of these shafts are 7 ft. long by 1⅝ in. diameter of stock, with bearings and pins reduced to 1 5-16 in. diameter. We find it most economical to grind all short bearings and pins without turning, while we find it best first to turn the long part at one end, grinding it afterwards.

In the case of slender work that springs badly when it is turned, we can many times grind the same work more quickly than it can be turned and ground; because, when grinding off the material, the spring is ground out as it occurs, owing to the many cuts or passes of the grinding wheel; while, when it is turned, with one cut over, it must be straightened before the finishing cut is taken. It is true, however, that the majority of work should be turned before grinding. I have been quoted as saying that we "grind without turning." I never said so. I did say, as I have done here, that sometimes we grind without turning, but usually we do not.

Poole Form of Cylindrical Grinding Machine.

The earlier attempts at cylindrical grinding were made by mounting grinding wheels on the carriages of engine lathes. This was thirty years ago but does not secure the most perfect work. Mr. J. Morton Poole, of Wilmington, Delaware, discovered that it was impossible to secure perfect cylinders by grinding wheels on engine lathes, and, as a result of his study of the problem, the J. Morton Poole grinding machine was invented in the year 1867.

Mr. Poole's invention was unique in that it enabled him to grind rolls of perfectly uniform diameter from end to end, regardless of the imperfections of the traversing carriage ways. His invention came at a time when the art of scraping to master plates, and master straight-edges, was practically unknown, and when mechanics had little if any idea that such perfection could be obtained, much less maintained for any considerable time; also when few could appreciate the results he obtained. The Poole machine, however, depends for success upon the use of two grinding wheels, one on either side of the work; it has therefore, limited application. It has always been used for roll grinding.

The modern grinding machine has ways that secure perfect work with a single wheel, thus giving the machine a wide field, covering all work that revolves on its axis, whether rolls, small or large, shafts, spindles, piston rods,

* Extract of lecture prepared for mechanical engineering class, Columbia University.

work long or short, large or small, and having one single diameter, or many sizes, on the same piece. The Poole machine gave accuracy. The modern machine, if rightly constructed, gives both accuracy and large production. Having but one wheel, and being open toward the operator, it is conveniently operated, and work is quickly placed or removed. I make this comparison not to depreciate the Poole machine, for I consider it one of the most important inventions in the development of the art. I wish, however, to have you realize that the development of the art of scraping and straight-edge making has made possible the use of very massive, long grinding ways that are really straight, and will remain straight for years. Such a thing was unknown when Mr. Poole made his very valuable and original invention to obtain perfect cylinders without perfect guiding ways.

One of the most important facts in connection with cylindrical grinding for the young engineer to get clear in his mind is that all perfection in this world is relative, and that this is most certainly true of cylindrical grinding. This being true, to what in the mechanical world should he turn to fix the relation when deciding upon the quality of cylindrical grinding for the various uses it is inteded? Why, most certainly to the lathe; because the grinding machine is no more and no less than a grinding lathe. Now, if its product is an improvement on the product of the ordinary lathe, then it has proved its right to the field. The lathe was never a polishing and buffing machine; neither was it a lapping machine. We used its centres and spindle on which to revolve work while we filed and polished or lapped it; but there was nothing about the lathe that contributed in any way to the quality of the filing, lapping, or polishing; that was a matter of hand-work entirely. Therefore, when we wish to judge as to the merits of grinding, we must compare it with turning alone, not with turning, filing, and lapping.

Now, if we can with the grinding machine take the finishing cut of the lathe in less time than the lathe, and at the same time produce a better surface and nearer absolute cylindrical perfection, then are we warranted in adopting the grinding machine in place of the lathe for all finishing cuts or sizing operations. If occasionally we require an absolutely perfect cylinder, we must lap it in addition; and a grinding machine, if well designed and constructed, is a perfect lapping machine also. We should not, however, expect perfect lapped work from any grinding wheel. We can, by taking time enough produce a polished surface with a grinding wheel, but the same time spent with a genuine lapping wheel would produce more perfect work. Glossy surface by grinding wheels means imperfect cylinders. We can secure the closest approach to perfection by the use of grinding wheels that cut without perceptible pressure; thus they must be soft or free-cutting, and therefore produce a surface without much gloss. He who desires really round work with uniformly distributed contact over its entire area should use free-cutting wheels of broad face; and the truest work will show, not a bright, glossy surface, but a good surface and broad feed lines, when rubbed strongly through a round, straight hole, but no feed lines before such rubbing.

All cylindrical grinding, by whatever method, will show lines of cut and feed when rubbed in a round hole or when lapped in any other way. There is a difference between a cylinder with uniformily distributed contact, when tested in a perfectly round hole, and a really perfect cylinder. A really perfect cylinder is one whose surface molecules are every one the same radius, or all touch the inner surface of a perfectly round ring when it is passed over the entire length of the cylinder. Such perfection can be obtained, approximately, by some form of lapping. Anyone who shall look for such perfection from grinding will be forever disappointed. Grinding, however, does give us vastly more points of contact than turning, or even careful filing to a micrometer and polishing with emery cloth—the method used by those who do not grind.

Broad Cuts Produce Most Accurate Surfaces.

Feed lines are caused by the "lap" of the wheel cutting twice on that portion of the surface—i.e., we do not traverse quite the exact width of the wheel at each revolution, but as near as safe, and avoid ridges. The wheel cutting twice over this narrow place leaves a different grain, therefore a different color, even though the measurable diameter there be no different from that elsewhere. In my apprentice days we used to plane all work with a very fine feed, and considered the best work that which showed no feed lines. But William Sellers showed us that the surfaces we produced that way were not perfectly flat surfaces, while he produced a more uniformly distributed contact, tested with perfect surface plate, by using a wide tool and a broad feed line. The surface he produced was not so smooth, but it was nearer a perfectly flat surface. No one disputes his theory to-day; all plane with a coarse feed.

Rough Turning Desirable for Economy in Grinding.

Another fact in connection with cylintrical grinding is this: With well-constructed grinding machines, the coarser the turning the quicker the grinding can be done. It is no longer necessary to turn either smoothly or correctly to size. A variation of 1-32 in. more or less on large work is of no moment, and on small work a variation of 1-64 in. more or less is permissible, and the surface may be very rough in all cases.

There are not enough good operators to run machines now installed, and the success of these machines is held back owing to the large amount of ignorance of grinding machines and grinding operations on the part of foremen, superintendents, and managers. The art is yet new, and invites the aid of young engineers in placing it in a still more useful position in the world's service. Cylindrical grinding is, however, firmly entrenched in America, and in many lines of manufacture all-round work is ground. All first-class automobiles have every round part ground; all sewing machines, typewriters, phonographs. Large machinery is also ground to a considerable extent.

HIGH-SPEED STEEL IMPROVEMENTS.

The announcement that S. Osborn & Co. are making a new and improved water hardening steel, points to the activity existing among steel makers in improving their products. One or two other leading firms have also new steels on the market, and the progressive movement in tool steel may certainly be regarded as general, and not confined to one or two makers. The new steels will not have the effect of ousting ordinary "high speed" from use, but are intended merely for special cases where the material dealt with is extremely hard, and in circumstances which make it desirable to run a tool for a long period without removing for grinding. Less stress is now being laid on the cutting speeds of these steels than on their durability. Machinery has generally been remodelled in the direction of weight and power, but when speeded up to the highest limit it still fails to exhaust the cutting capacity of ordinary high speed steel. Hence an engineer is not greatly attracted by the news of steel which will merely cut faster than heretofore. The end of improvements in fine steels has not even yet been seen, but whatever progress is made there is no reason to suppose that the present high-speed steel will become a mere back number, to quote a famous but somewhat unfortunate phrase.

W. H. Reynolds, who for the past five years has been connected with the Canadian General Electric as sales agent has resigned to take up a like position with the Eugene F. Phillips Electrical Works, Montreal.

Evolution of Philadelphia Compressed Air Grease Cup

The Peterborough Lubricator Manufacturing Company, Hunter Street, Peterborough, Have Installed Up-to-date Machinery for the Manufacture of Grease Cups — Method of Manufacture—Feeding the Grease.

The Philadelphia Grease Cup, the invention of John F. Lewis, Philadelphia, feeds solidified oil to bearings by compressed air. The evolution of the cups from sheet steel until they are polished ready for use, is very interesting. They are manufactured by the Peterborough Mfg. Co., who in February, 1909, bought a factory in Peterborough and immediately began installing modern machinery for their manufacture. This shop is now running in full swing turning out about 10,000 per month. By the addition of two more threading machines this output will be trebled.

Fig. 1 gives an idea of the layout of the shop which faces the south. The photograph shows the north end of the shop. The machines are arranged along the west side facing the light. In the background is shown the large press on which the heavy work in compressing the cups is accomplished.

Fig. 1.—General View of Shop.

The presses are shown in Fig. 2. These consist of a sixty ton press manufactured by the Ferracute Machine Co., Bridgeton, N.J. The small fifteen press was made by E. W. Bliss, Brooklyn, N.Y.

The threading machine is illustrated in Fig. 3. The machine is manufactured by the Loew Mfg. Co., Cleveland, and is known as their "Victor" type. It will thread sizes from ½ to 93 and has a capacity of over 10,000 cups per month. The dies are adjustable, the heads being known as "collapseable," screw cutting die heads, manufactured by the Geometric Tool Co., New Haven, Conn. A different size of head is used for each size of cup.

Other machines are a 20 in. drill from Bawden Machine Tool Co., Orillia St., Toronto; turret lathe from Foster, Kimball Machine Co., Elkhardt, Ind.; 14 in. lathe from Fay & Scott, Dexter, Me.; 10 in. x 15 in. shaper from McGregor, Gourlay, Galt; No. 1 wet grinder from Diamond Machine Co., Providence, R.I.; forge from London Foundry Co., London; 30 in. shears from Niagara Machine and Tool Co., Buffalo; and powerhack saw from D. McKenzie, Guelph. There are also polishing machines, etc. The blower for the forge is belt driven from the drill and can be used whether the drill is being used or not.

Fig. 4 shows the evolution of the funnel cup and top. In the manufacture of a funnel there are eight operations as follows: (1) pressing out of sheet, (2, 3, 4, 5) drawing the funnel, (6) swaying, (7) trimming and (8) punching holes and knocking out bottom. Each operation takes a very small fraction of time

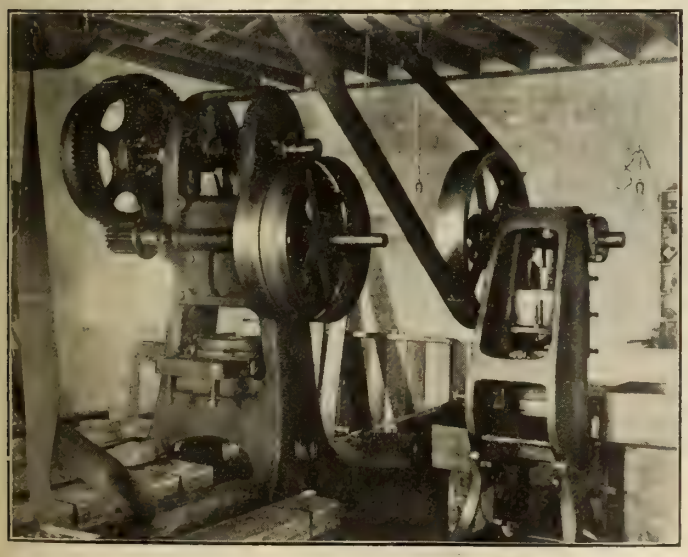

Fig. 2.—The Two Presses.

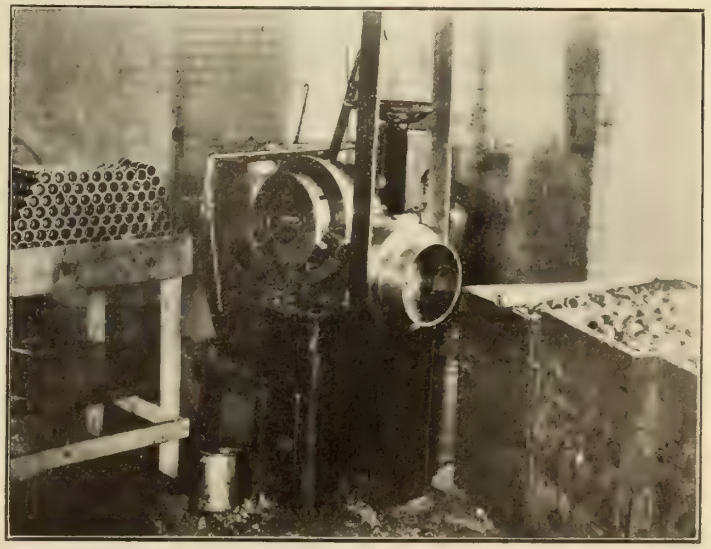

Fig; 3.—Loew Victor Threading Machine.

so that a great many cups may be turned out in a day.

There are six operations on the top, (1) blanking and half forming, (2, 3, 4) drawing, (5) putting on hexagon and (6) threading.

There are eleven operations on the cup, (1) blanking and half forming, (2, 3) drawing, (4) trimming, (5, 6, 7, 8) shank drawing, (9) putting on hexagon, (10) threading shank and (11) threading inside.

The hexagon is put on the cup by hydraulic pressure. The cup is put in a die in two parts with a hexagon shape in it, the cup is filled with water and the plunger is brought down. The pressure, presses the steel into the hexagon shaped die thus forming a hexagon on the cup.

Fig. 4.—Evolution of Funnel, Cups and Tops.

The loose disc is made in one operation, the cup disc is also made in one operation. The staples are made in one operation in adjustable dies, adjustable to suit the different sizes of cups. The tube is made in two operations, (1) cut out and fold and (2) bend ends over. Fig. 5 shows the parts of the cup and Fig. 6 is a sectional view showing the assembled parts. The hexagon nut is made in two operations, (1) punching, (2) tapping. There is no loss of material as the centre of the large one is used for the hexagon nut of the size smaller, etc.

A number of instalations have been made in Canada, including elevators, engines, machine tools, line shafting, etc. The bearings and machine tools of the Peterborough Lubricator Mfg. Co., are equipped with them and a large number of elevators in Toronto. The East City Furniture Factory, Peterborough, use them on a sander, planer and carver. The carver runs 10,000 r.p.m. and runs ten hours a day, the 1 oz. cup requiring only adjustment each morning. The others do not require attention as often.

The cups are made in five sizes, ½, 1, 3, 6 and 9 oz. The feed is controlled by compressed air. The cup is filled when convenient. By giving a partial turn of the grease cup top the grease will feed without further attention.

The President of the Canadian company is Wm. Harstone, merchant, Peterborough; Vice-President, A. Cornwell, retired merchant, Toronto; Sec.-Treas., R. A. Elliott, merchant, Peterborough, and managing director, Cyrial Currier, formerly manager of the Ontario Coal Co., Peterborough. The other three directors are: W. H. Denham, manager Quaker Oats Co., Peterborough; J. H. Larmouth, manager Peterborough St. Ry. and Power Co., Peterborough, and A. A. Bowman, sales manager for the Canadian Rand Drill Co., Toronto. The superintendent is W. C. Pennington, formerly of the Doty Engine Works, Goderich. Fred T. Daville is the salesman, Toronto.

Fig. 5.—Parts of Cup

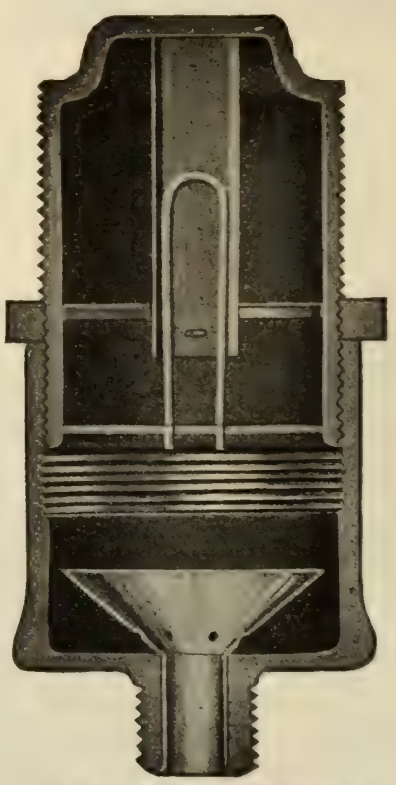

Fig. 6.—Interior View of Grease Cup.

The company was organized by M. W. Boerema who holds the controlling right for all foreign countries outside of the United States, to manufacture the Philadelphia grease cup. Mr. Boerema is visiting England to establish a factory there to supply England and all foreign countries.

THREAD FOR TAPS AND DIES.

By. Wm. H. Tims.*

Should the "V" standard thread be dropped and the U.S. standard be substituted?

Having had fifteen years' experience in the manufacture of threading tools of various standards, I feel qualified to express an opinion on the above question. In the first place the so-called "V" thread, as produced by the various manufacturers is only approximate as regards being standard for the reason that it is an impossibility to produce a theoretically correct "V." Should we supply a tap with a theoretical V thread, that is angle diameter only, the outside diameter of this tap would be reduced .002 to .005 by hardening, and this without taking into account the reduction in O.D. from threading down to the theoretical angle diameter. Consequently the difficulty experienced in procuring from the different makers a standard V thread. For to overcome the above mentioned reduction in diameter the various manufacturers of V threading tools have added an amount to the angle diameter in order to produce a flat top on the thread. Of course this is hardly perceptible, but nevertheless it is there. This addition strengthens the cutting points of the thread and the tool retains its cutting size longer. And it is in this very addition that the difficulty lies, because no two small tool makers produce the same sizes strictly speaking, in angle, or make the same allowance of flat. Hence the impossibility of procuring a standard V. What is standard with one firm is not standard with another, and any manufacturer can tell you of loose nuts and tight bolts, or vice versa. And this is especially true if he taps his own nuts and buys his bolts in the open market.

In addition to this the strength of the V thread as compared with U. S. standard or Whitworth is almost one quarter less. One of the strongest arguments in favor of the adoption of the

* Superintendent Pratt & Whitney, Dundas.

U.S. standard is that the A.S.M.E. have adopted same for their new machine screw sizes. In the face of these facts why should manufacturers be loathe to part with the V standard thread. Some will tell you that the initial expense of changing is too great, but if they will keep account of the expense incurred in cutting down bolts or rethreading nuts for one year, I have no doubt but that the change would be quickly made. And they must also bear in mind that all nuts with the exception of a few sizes in V thread can be tapped out U.S. standard and that all bolts can be practically used. Of course the fit will not be as it should but it will be as near as they have been getting with the V thread.

Besides this, a set of U.S. standard threading tools for nut and bolt work will outlast four sets of V tools, because of the lasting qualities of the flat top and bottom. It is a well known fact that after cutting a few bolt or nuts with a V tool that the thread commences to round over and that by the time they are worn out the last nuts tapped will not fit the first bolts and that the last bolts cut will not fit the first nuts for the reason that both bolts and nuts have a round bottom and this condition reverses when a fit is sought.

Re the Whitworth thread which is admittedly the strongest of the three standards. This thread is almost as difficult to produce on an interchangeable basis, as the V thread because of the difficulty experienced in producing the correct form of thread. To get and keep the correct form of this thread necessitates a very expensive series of operations, which only the larger manufacturers can afford. It costs from three to five times as much to maintain the Whitworth as the U. S. standard and the advantage gained is a little extra strength in cross section over the U.S. form. Does this pay?

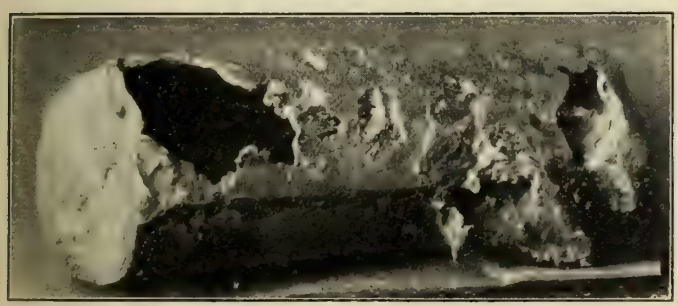
The Brown and Sharp Mfg. Co. makes gauges for grinding the correct U.S. Flat on forged tools. The gauges list at $2.00 each and in my opinion every tool room should be equipped with one or two of these. They enable any workman to produce a U. S. standard thread in a few minutes. There is no workman living who can grind a true Whitworth form which if necessity must be produced by tool makers of long experience in the production of forming toools.

MELTING OF STEEL FROM THE INTERIOR.

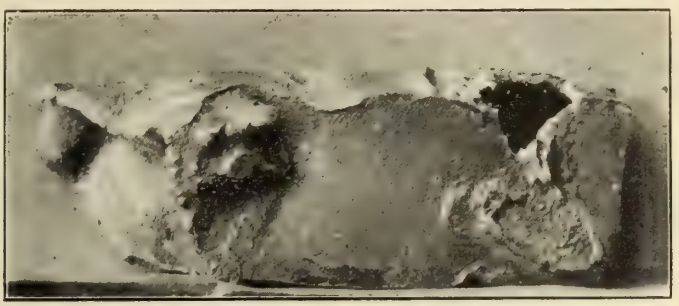
By G. P. Blackiston.

The real true meaning of that saying of Lemierre "It is a profound error to presume that everything has been discovered; it is to take the horizon which bounds the dye for the limit of the world" was never more forcibly illustrated than by the recent discovery by the writer that steel, contrary to the general belief, invariably melts from the interior.

Such a statement no doubt, appears somewhat absurd or unreasonable to the novice or even those better informed upon the subject of steel in general, but who have never had the pleasure of closely examining this strange phenomenon. In view of the doubt which may exist in the minds of some, the writer reproduces herewith two photographs, one showing a flat, while the other an octagan bar—both hammered bars of crucible steel—extracted from the furnace at the proper moment.



Octagon Bar of Tool Steel Showing Outer Shell in Perfect condition and Interior Missing.



Bar of Hammered Crucible Steel Showing Outer Shell and Hole in Interior.

Close examination of these reveal the fact that both are hollow on the interior while the outside surface still retains in general, the original shape of the bars.

The fact was first discovered by the writer some years ago while experimenting with a new type of the Kirkwood Oil Furnace. The charge, composed of steel and iron scrap, having been placed in the melting furnace and subjected to an intense heat, was examined at regular intervals to ascertain the effect upon the charge.

A desire to examine a portion of the charge at closer range, before it had become fully molten, a portion of same was removed from the furnace and permitted to become cool. As the pieces composing the mass, had become closely adhered to one another, it was necessary to break the several pieces of scrap apart. It was here that the bars of iron and steel were found to consist of mere outer shells—the interiors having evidently become molten and escaped through holes (weak spots) in the surface to the bottom of the furnace.

Examination of the different bars revealed the fact that the thickness of the shells varied in ratio to the composition of the product—the high carbon bars being thinner than those of the lower or softer character.

Fearing that this phenomenon might be occasioned by the oil fuel as used in the Kirkwood furnace, the writer, immediately started extensive experiments in other style furnaces and with all grades of scrap and fuels. The final results were the same as regards the melting of the interior before the exterior. In these tests, crucible, open hearth and special furnaces were tried with the same satisfaction.

It was therefore, not a mechanical but a chemical result. With this in view, a complete series of experiments or tests were made with the final solution that it was due to nothing other than the oxidazation of the surface which naturally melted first, the melted metal forcing its way through a weak section of the outer wall. When the heat reached the necessary degree for the complete liquidation of the entire bar, the outer surface also lost its shape. The high carbon steels naturally melted first while the low carbons followed and the wrought iron being the last to succumb to the flames.

At just what degree the several carbons began to melt upon the inside has not yet been definitely determined by the writer, due to the lack of proper facilities for the satisfactory solution of these points.

Whether such a chemical action is true with the Bessemer process, the writer doubts very much, not having however, fully tested the same to his entire satisfaction. It is possible that the force of the blast and the rapidity of action which is peculiarly characteristic of this operation, would somewhat obviate this strange formation.

Some Little Things in a Machine Shop that Count

Many Economies may be Obtained in the Machine Shop by Looking after the Little Things—Carelessness is a Source of Much Loss.

By K. CAMPBELL

I have had occasion to visit a number of machine shops recently and I found that a number of of machine shop foremen and superintendents were paying a great deal of attention to details and were eliminating a great source of loss. In some of them, however, there were a great number of improvements that could be made with a very small outlay, that would give 100 per cent. returns on the investment.

Where a Motor Would Pay.

In one shop a long line of shafting was continued to a small outbuilding. Here a small forge was used probably once a week to forge tools. The shop was run by motors, "group drive" being the system adopted. Instead of having a small motor for this forge, however, the long line of shafting was continued out through to the forge, using up power in friction.

A Friction Clutch Solved the Problem.

In another small shop, belt drive was adopted but a number of machines were not needed during part of each day. The shafting and loose belts were consuming a large amount of power until a friend suggested a friction clutch.

In another shop, the lighting generator was connected up by belt each evening. This was found to be disastrous to the belt which needed constant repairs. By installing a friction clutch this trouble was eliminated.

Oily Waste.

In some shops oil waste and other rubbish is allowed to accumulate in odd corners. If a spark in any way touches it, the labor of years is lost in an hour. The use of waste tins is not only encouraged by insurance companies but made necessary.

Waste receptacles are simple and inexpensive devices to install in various parts of the shop. A machinist can throw the oily waste in these. Each evening it must be collected and taken outside the building. It will prevent any chances of fire from oily waste.

Friction Losses.

Many a bearing is daily losing money for its owner in needless friction. This may be due to the failure of someone to keep it properly lubricated, proper oil or grease may not be used or the shafting may not be properly aligned. That is not as it should be and the small daily waste in friction amounts to large aggregate in a year. This would make a large profit if properly looked after.

The Tool Room.

One shop in Toronto was taken over by a new company who immediately made an inventory of the tools and machinery. No care had been taken to keep track of tools and hundreds of dollars had been spent in duplicate tools, many of them very expensive.

Now a new state of affairs exists. A central tool room has been established, tools of all kinds, wrenches, drills, reamers, and special tools all find a place. When a mechanic wants a tool he knows where to find it. "A place for everything, and everything in its place," is now a maxim and it means a large amount in the annual factory cost. The time saved by mechanics, alone, represents a big saving.

A Comparison.

It looks reasonable that if a workman wants a wrench, for instance, and knows where to find it, he saves time. As an example Jones wants a wrench. There is no central tool room, he walks along the bench asking other workmen if they know where to find the wrench. Nobody knows and he loses probably half an hour before locating it.

In another case in a shop with a central tool-room, Brown goes to the tool-room for a wrench. No. 16 is using it. A list hanging in the tool-room shows No. 16 to be McGee. Brown goes to McGee, secures the wrench by substituting his check for McGee's, and is back at his bench in less than five minutes.

The above are a few of many little economies that may be effected in the machine shop. Any attention given the little things will well reward efforts put forth in that direction. The saving will not show directly but at the end of the year a big saving will be seen in the general expense.

PERSONAL NOTES.

C. M. Strange, Lewis Bros., Montreal, has been made vice-president of the Montreal Engineers' Club.

Arnold M. Bennett, of the Montreal Steel Works, was among those elected to membership in the Iron and Steel Institute at the recent annual meeting in London.

J. G. Glassco has accepted the position of electrical engineer of the Winnipeg power plant, and will begin his duties on July 15.

William W. Cox, vice-president of the Whitman & Barnes Mfg. Co., St. Catharines, manager of the local branch, died suddenly on June 3.

P. B. Yates, assistant engineer or the Hydro-Electric Power Commission, will address public meetings on hydro-electric power during the summer months.

Arnold M. Bennett, of the Montreal Steel Works, has been elected a member of the Iron and Steel Institute, at a recent meeting held in London, Eng.

Charles D. Warren, Toronto, has been elected president of the re-organized Lake Superior Corporation, and T. J. Drummond, of Drummond, McCall & Co., Montreal, has been elected second vice-president of the same corporation.

Jas. E. Hutcheson, general manager of the Ottawa Electric Street Railway, has been elected a member of the executive of the Canadian Street Railway Association, which has just concluded its annual convention at Winnipeg.

George Caverhill, of Caverhill, Learmont & Co., Montreal, has been elected a director of the Montreal Light, Heat and Power Co. Mr. Caverhill is a director of the Montreal Street Railway, Richelieu & Ontario, Dominion Steel Co., Royal Victoria Life, Montreal Loan and Mortgage, and several other concerns.

The Smith's Falls Electric Power Co. is re-organizing its staff. John Davidson, who has given such splendid service for years as superintendent, has to give all his time to his planing mill and has resigned. Succeeding him there will be two superintendents, A. S. Fraser, at present in charge of the power plant of the Frost & Wood works, and Wm. Henderson, who is now superintendent of the town's system of waterworks.

Often rust on iron that cannot be removed in any other way is soluble in a saturated solution of chloride of tin. Care should be taken to have no free acid in the solution, and upon removal the iron should be rinsed in water; then in ammonia and quickly dried. The length of time which is necessary to keep the iron in the chloride solution depends upon the thickness of the rust, and will generally be from 12 to 24 hours. After this treatment the iron will have the appearance of dull silver, but a simple polishing operation gives it its natural color. Rust is removed from steel by brushing it thoroughly with a paste composed of one-half ounce of cyanide of potassium, one-half ounce of castile soap, one ounce whiting and enough water to make a paste. After the application of this paste, wash the steel in a solution of one-half ounce cyanide of potassium in two ounces of water.

The Practical Side of Work at a Canadian University

Besides Book Learning, Students have Instruction and Practice in Construction and Erection of Power Machinery, etc.—A Description of the Thermodynamic and Electrical Laboratories.

By F. C. D. WILKES, B.Sc.

In view of the increasing attention that is being given to technical education as an adjunct to practical work in manufacturing plants it will be interesting to note briefly what is being done regarding practical work as an adjunct to our large technical institutions.

It is not all grind and book learning at our Canadian universities; the men that are turned out from the engineering courses have other knowledge of their friends, the engines, dynamos and accessories, beyond that which they take from books and lectures. Much money has been spent in fitting up workshops and laboratories with practical, up-to-date machinery, tools and equipment for making practical and commercially useful tests. As a good example of the progress this work is attaining a description of the workshops and laboratories at McGill University, Montreal, should prove interesting.

The Macdonald Engineering Building.

The engineering building is a fine example of modern construction, being made as absolutely fire-proof as is possible. Throughout there is not an ounce of inflammable material where it has been at all possible to eliminate it. The floors and stairways are all of reinforced concrete and steel; the lockers are all steel; the automatic fire-doors are of metal, and the whole interior is subdivided by heavy fire-proof walls.

The mechanical and electrical laboratories are on the ground floor of this building, and average 23 feet in height. The Workman building adjoins the engineering building, and therein are the pattern, carpenter, machine and smith shops and the foundry.

Thermodynamic Laboratories.

In the steam laboratory, Fig. 1, tests of engines, air compressors, etc., are made, and the student gets a good training in the working of prime movers. The largest unit is the one seen at the back of Fig. 1. This is a 120 h.p. vertical engine, especially designed for investigating the behavior of steam under various conditions. The cylinders are 6½, 9, 13 and 18 inches in diameter, by 15-inch stroke. These are so connected as to allow of working as a simple, compound, triple or quadruple expansion engine, either condensing or non-condensing, and with any rate of expansion desired. The jackets are so fitted as to permit of measuring independently the water condensed in the cover, barrel or bottom jacket of each cylinder. The engine can be worked with any desired initial pressure up to 200 pounds per square inch. The measurements of heat are made by means of large tanks which receive the cooling water and the condensed steam. There is an independent

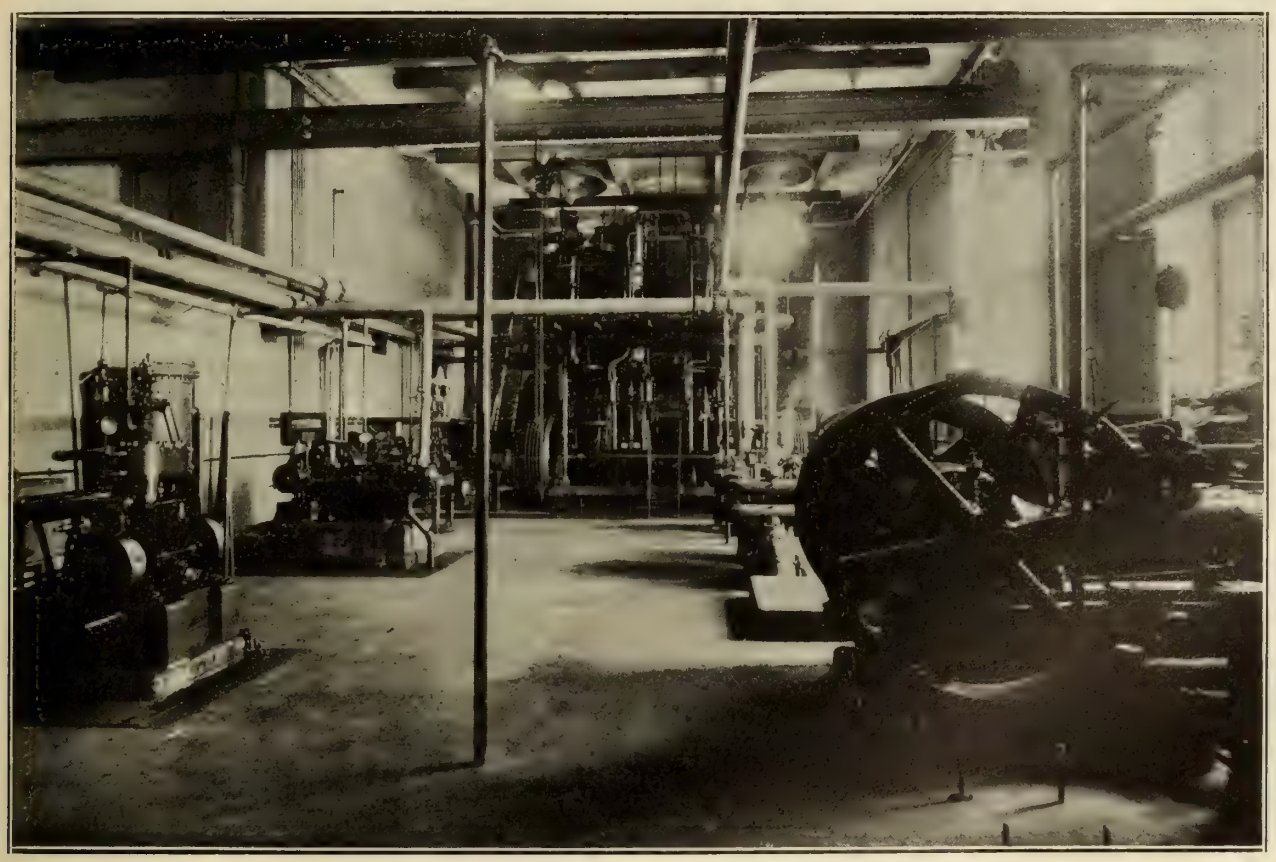


Fig. 1.—Thermodynamic Laboratory, Macdonald Engineering Building.

surface condenser and air pump and the arrangement of tanks and scales is very convenient, permitting very accurate work to be done. The power of the engine is absorbed and measured by means of two Froude hydraulic absorption brakes and an alternative friction brake.

The other machinery in the laboratory includes the following: A Robb automatic cut-off engine, having a cylinder 10½x12 inches. This engine is especially fitted up for the measurement of cylinder temperatures and can be run at speeds up to 200 r.p.m., the power being absorbed by a friction brake. Connected to this engine is a Wheeler condenser having a surface of 200 square feet. This is also fitted up for special work.

A McIntosh-Seymour high-speed automatic engine, 12x12½ inches, is connected to an air compressor through a chain drive. This engine is fitted with an automatic recording apparatus for registering the load on the brake. The compressor, which was designed and built in the University workshops by third and fourth year students, is a two-stage machine, taking 40 h.p. and having cylinders 10 and 17x15 inches. The compressor discharges into reservoirs placed under the floor of the machine shop and is provided with an intercooler, whose capacity can be varied as desired.

There is an 8x9-inch Leonard horizontal engine especially fitted for instructional work in valve setting, provided with an independent surface condenser; a standard 9½-inch Westinghouse air brake pump, fitted for testing and for supplying compressed air for experimental and other purposes; a Blake non-rotative steam pump with cylinders 4½ and 2¾x4½ inches,; a vertical compound engine, 3 and 5½ x 3¾ inches (seen in the left foreground of Fig. 1), which was also designed and built in the workshops by the students.

Gas Engine Laboratory.

This is provided with apparatus that is especially arranged for exhaustive tests in the working of gas engines and accessories. The equipment includes: A horizontal gas engine of 40 h.p., supplied by the National Gas Engine Co., having a cylinder 12x20 inches; a suction-type producer for the above, with all the necessary scrubbers and cleaning apparatus; a down-draft producer, designed for working with lignite and bituminous coal; a standard 4-inch gas meter, gasometer and exhauster; an Atkinson gas engine of 6 h.p. working on city gas; an Otto type gas engine, cylinder 8½x12 inches, built in the University workshops for city gas; a two-cylinder 4 cycle gasolene automobile engine of 8 h.p., also built in the University workshops.

The smaller apparatus belonging to the laboratories includes the necessary equipment of weighing machines, brakes, calorimeters, thermometers, gauges, pyrometers, fuel testers. indicators, planimeters and a Moscrop recorder.

Fig. 2.—The Alter nating Current Laboratory, Macdonald Engineering Building.

Boiler Instalation.

This is the one that supplies steam for heating and power purposes and is so arranged as to be available for experimental work and tests in connection with the work in the thermodynamic laboratories. The students run off about four complete 12-hour tests and get good instruction in boiler work. The equipment includes one Cornish boiler for heating service, rated at 50 h.p.; one loco-boiler of the Belpaire type, rated 100 h.p.; one Robb-Mumford internally fired tubular boiler, rated 120 h.p.; two

Babcock-Wilcox water tube boilers, each rated 60 h.p.; one Yarrow water tube marine boiler, fitted in a closed stokehole, for working under forced draft, rated at 150 h.p. These boilers are all provided with the necessary tanks, weighing machines and apparatus for carrying out evaporative tests.

Alternating Current Laboratory.

In this laboratory (Fig. 2), which is situated on the ground floor of the engineering building, all dynamos are motor-driven. Speed regulation is attained either by varying the voltage supply to the motor or by varying the motor field current. Power is obtained from three independent sources of supply, two 75 k. w. d.c. direct connected units in the main service plant and one 300 k.w. hour storage battery. All generators special switchboards are provided for current distribution. The starting resistances are placed in concrete compartments. Special testing tables fitted with switches, circuit breakers, etc., facilitate the work.

Sixteen alternating current machines, including single, two. and three-phase generators, synchronous motors, synchronous converters, together with stationary and rotary induction apparatus, are provided for alternating current work. Large variation of wave form may be obtained by use of specially shaped inductors and field poles. Induction motors with wire wound rotors serve as induction generators and frequency changers. The laboratory is likewise provided with about 100 volt meters, ammeters and watt meters of standard

Fig. 3.—Direct Current Laboratory, Macdonald Engineering Building.

and motors are mounted on strong testing benches of different heights, with plotted floors, so that any machine when placed on a bench, may be quickly secured in any desired position. These benches are supported on longitudinal slotted rails and may be removed to any position in the laboratory and there bolted to the rail. An overhead 3-motor electric traveling crane permits of rapid and easy transference of machines. All wiring is done below the floor level in passages provided for the purpose and make and of different ranges; also speed indicators, condensors, rheostats, standard resistances, etc.

This laboratory (Fig. 3), situated on the second floor of the Workman building, is similar in design to the alternating current laboratory, all generators being motor-driven and mounted on convenient benches and similarly supplied with power. Two hand-operated traveling cranes serve these machines. The laboratory is equipped with 28 or 30 commutating machines; constant potential generators of various types; shunt, series and compound wound motors; variable speed interpolar motors, boosters, dynamotors, closed and open coil constant current machines of many different makes varying in capacity to 40 kilowatts. Some 75 voltmeters and ammeters are also provided, as well as the usual accompaniments of starting boxes, controllers, rheostats for absorbing power, etc.

Shopwork.

The course in shopwork is intended to afford some preparation for that study of workshop practice on a commercial scale which every engineer has to carry out for himself. It is a physical impossibility for the university to turn out a technical man and have him at the same time a journeyman machinist, carpenter or the like. What it does do however, is to give the student such instruction in the ground work of different shop practices that he obtains some knowledge of the nature and properties of the various materials he employs; he receives systematic instruction in the use and care of hand and machine tools —so that he will, at least, know the difference between a right and left-hand monkey-wrench—and he also acquires some manual skill.

Fig. 4.—The New Macdonald Engineering Building at McGill University.

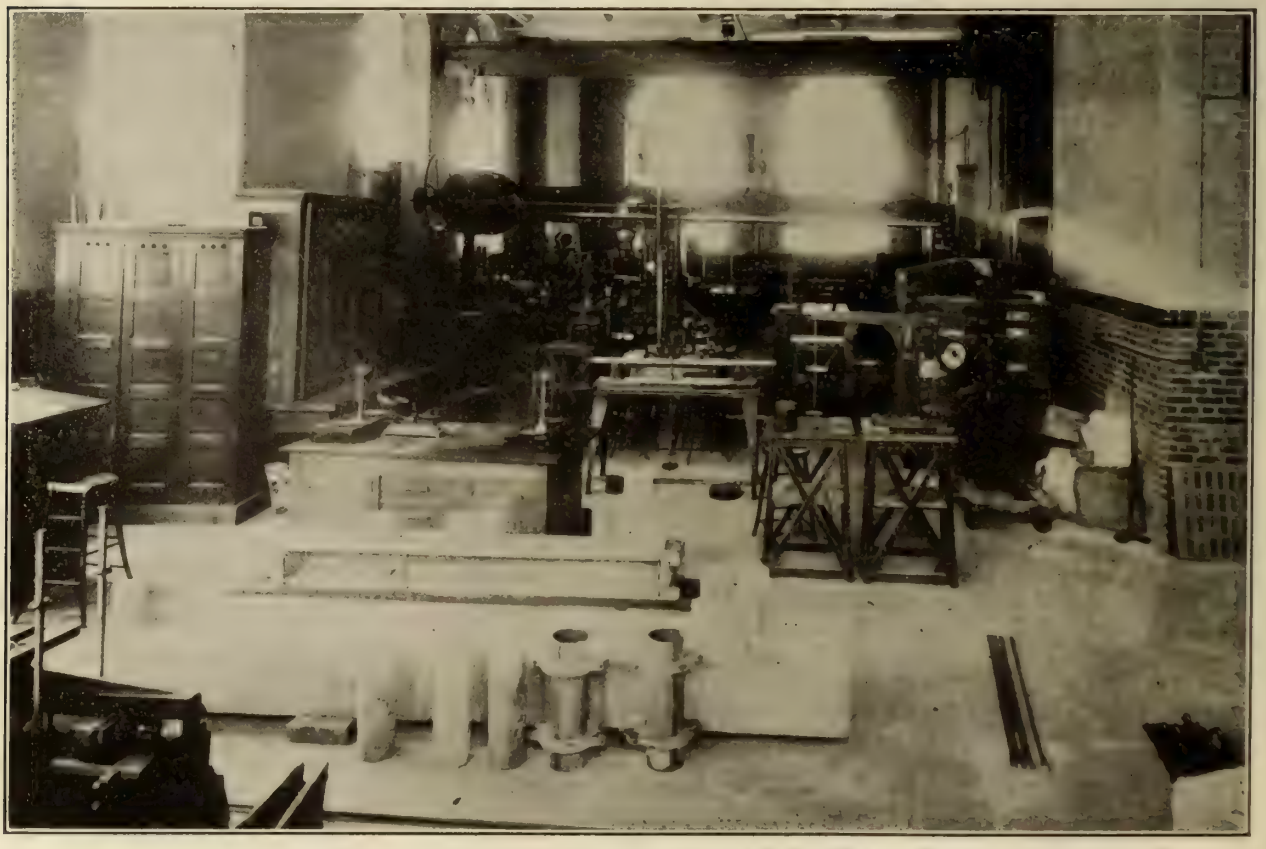

Fig. 5.—Testing Laboratory in the New Engineering Building.

The instruction thus obtained must, however, be continued and supplemented. For this reason each student is expected to spend the greater portion of each summer vacation in the employ of engineering workshops outside of the university.

Throughout the course advanced students are, as far as possible, entrusted with the construction and erection of machinery and apparatus which are to form part of the equipment of the department. As an example of this work, besides the compressor and engines mentioned above, there is a duplex feed pump, a boring bar, a belt testing machine and other apparatus. The students are expected to assist in the repairs to the boilers, engines, machine tools, etc., required in the department.

The book part of the shop work consists in the keeping of note books. These are filled with portions of certain text books, relating to shop work, extracts from technical pournals, etc. Each student is also required to keep a record of his work, which are made in standard forms. These are handed in to the shop instructor and form part of the basis upon which credit for shop work is given.

The course in shop work consists of practical work in each of the five following courses: Carpentry and joiner work, pattern making, smith work, foundry work and machine shop work.

The Machine Shop.

The main machine shop at McGill is situated on the ground floor of the Workman building and is well lighted, heated and ventilated. The equipment consists of twelve 18-inch engine lathes, one 18-inch turret lathe, fitted for stud and screw making, one 27-inch engine lathe, one 72-inch surfacing lathe, one brass-finishing lathe, one 36-inch vertical drilling machine with compound table, one universal milling machine with vertical milling attachment and dividing headstock, one planer capable of taking work up to 24x24 ins. x 5 ft., one 9-inch slotting machine, one 16-inch shaper, one universal grinding machine, centering machine, a cutter grinder, a tool grinder and a buffing and emery grinding machine. There are vise benches for eighteen students, with the necessary hand-tools, and a marking-off table. The tool room contains a full equipment of drills, reamers, milling cutters, and accessories, gauges, calipers, and other measuring instruments.

It will be seen that the equipment is adequate for the performance of a wide range of work. This work consists of exercises in chipping, preparation of flat surfaces, filing to straight edge and surface plate, scraping, screwing and tapping, use of scribing block and surface gauge, marking off work for lathes and other machines, turning and boring cylindrical work to gauge, surfacing, screw-cutting and preparation of screw-cutting tools, use of turret lathe, taper turning, machining flat and curved surfaces on the planing and shaping machines, plain and circular milling with vertical and horizontal spindles, gear-cutting, cutter-grinding, drilling and boring, use of jigs, grinding flat and cylindrical surfaces, cutting tools for hand and machine, their cutting angles and speeds, dressing and grinding tools.

Carpenter and Pattern Shop.

The carpenter shop and the pattern shop contain thirty-eight carpenters' and pattern-makers' benches, complete with the necessary sets of hand tools, twenty-two wood-turning lathes with their turning tools, a large pattern-makers' lathe for face-plate work, one circular saw bench, a jig saw, a band saw, two wood trimmers, a surface planer, a thickness planer, a mortising machine, a saw-sharpener, and one universal wood-working machine.

With these tools the student is given a good course in carpetnry and joiner work with the following exercises:—Sharpening and care of wood-working tools, sawing, planing and paring to size, preparation of flat surfaces, parallel strips, and rectangular blocks, construction of the principal joints employed in carpentry and joiner work, such as end and middle lap joints, end and middle mortise and tenon joints, mitres, and

Fig. 6.—The Smith Shop, Workman Building.

dado and sash joints, dovetailing, scarfing, joints used in roof and girder work, wood-turning, use of wood-turning tools.

The exercises in the pattern shop consist in learning the use of pattern-makers' tools, elements of pattern-making, allowances to be made for draught and for contraction in molding and casting, use of contraction rule, preparation of prints and plain core-boxes, exercises in paring and turning, construction of patterns and core boxes for pipes, flanges, elbows, tees, and valves, more difficult exercises in pattern-making, including built-up patterns and face-plate work, gear and wheel patterns.

The Foundry.

The foundry, (Fig. 7), like the rest of the shops, is up-to-date in every particular, and contains benches, tools and apparatus for bench and floor molding and core-making, and is able to accommodate twenty students. A gas-fired brass melting furnace, a cupola for melting iron, and the necessary core-ovens and core-benches give facilities for undertaking iron foundry work in green and dry sand, and for brass molding, The shop is served by a hand traveling crane of one ton capacity.

Students are taught the how and why of molders' tools and materials used in foundry work, the cupola, the brass furnace, preparation of molding sand, boxes and flasks, core-making, use of core-irons, bench molding, blackening, coring and finishing molds, vents, gates and risers, special methods required in brass molding, floor molding, open sand work, advanced examples of molders' work, melting and pouring metal, mixtures for iron and brass casting.

All the power for these shops is taken from the central station of the university, each shop having its own system of motors.

The above description will serve to show that the student gets a good deal more than book learning at a university, and finishes with a good ground knowledge, at any rate, of the different types of machines and their uses.

For the photographs we are indebted to the courtesy of the Montreal Standard.

There is no prospect that the hammer, chisel, and file will ever be banished from our fitting and erecting shops; but it is likely that they will find a very useful auxiliary in the portable grinding machine arranged so that a man can hold the frame carrying the emery or other suitable wheel in his hands, and direct it over the surface to be trimmed,

Fig. 7.—The Foundry, Workman Building.

The Smith Shop.

The smith shop, (Fig. 6) is provided with sixteen Sturtevant forges, which are power-driven and are connected with an exhaust fan. There is a power hammer, and the necessary equipment of anvils, swage blocks, sets, flatteners and other tools. Provision is made for instruction in soldering and brazing.

The work consists in learning the use and care of smiths' tools, management of fire, use of anvil and swage-block, drawing taper, square and parallel work, bending, up-setting, twisting, punching, and cutting, welding and scarfing, forging, hardening and tempering tools for forge and machine work, tempering drills, dies, taps and springs.

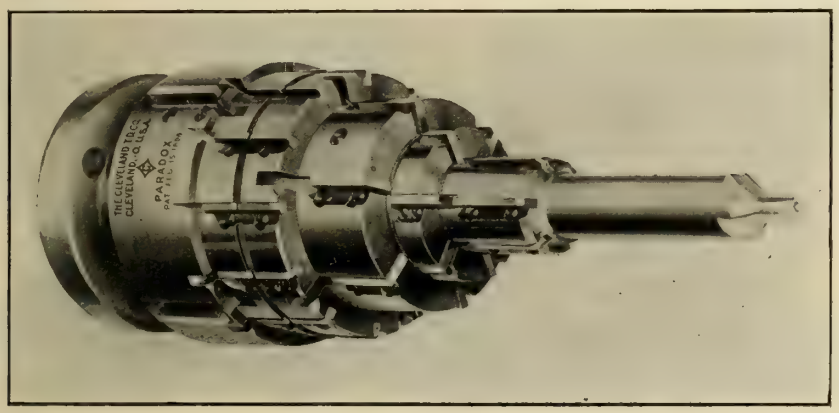
machined, or polished. There are already two or three types of these machines on the market, but they hardly make the progress that one would expect. In no small degree this is due to conservatism, but it is also due probably to a failure on the part of makers to adapt their machines for the rapid trimming of castings. A great deal of this sort of work is done by hand with hammer and chisel which could be much more quickly done by means of a light, easily adjustable, and portable grinder. The importance of these last two qualities is very great, for, of course, the time required to do a piece of work properly includes the time taken in finding and setting up any tools or appliances which may be necessary.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

SPECIAL FINISHING TOOL.

The accompanying illustration shows a special tool made recently by the Cleveland Twist Drill Co. for a cream separator company in Cleveland. The tool was designed to rough-finish, ream and face all the holes in the casting, there being no less than eight cutting diameters necessary. It is 6½ in. in diameter and 21 in. long, weighing close to 100 lbs., and consists of a countersink, five reamers of different diameters, each made of inserted adjustable high speed steel blades, and finally a formed facing tool for facing and rounding the top rim. In all, there



Special Finishing Tool.

are 34 inserted blades, 12 of them being of a combination double cutting type, making with the four countersink lips a total of 50 cutting edges.

The body is made up of a cylindrical casting, holding the upper two sets of blades, into which is fitted a second and smaller body of machinery steel, turned and slotted to hold the next three sets of blades, and this body in turn holds the countersink which is made of hardened tool steel. The tool is bolted on the boring head of a large horizontal boring machine.

The multiplicity of operations accomplished by this tool makes it a great labor and time saver, the high speed steel blades reduce the regrinding necessary to a minimum; but in the long run, the chief economy of the tool will be found in the adjustable blade feature. A built up tool of like character with solid reamers would scarcely pay in service for the large initial cost involved, for when one of the reamers was worn below size, the usefulness of the tool, as a whole would be destroyed. The blades, on the other hand, can be adjusted to size again and again, and when finally worn out can be replaced at small cost with new blades while the reamer body remains as good as ever. Last, but not least, the cost of the reamer was considerably less than that of a set of individual high speed tools necessary to perform the various operations.

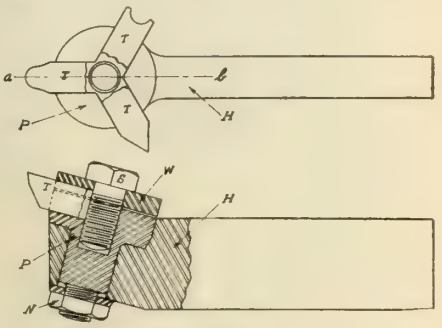
SOME HANDY DEVICES.

By J. H. R., Hamilton.

One of these shows a very handy tool holder to use up the small pieces of steel usually discarded by the ordinary tool holder. H is the tool holder bored out to receive the piece P, which is shaped out on the end to take three of the small pieces of tools T T T.

The tools are clamped in position by the washer W and the screw S. The tools can be moved to any desired position by the use of the nut N. This tool is only for use on light cutting such as corners, fillets and small forming tools, as the arrangement will not stand very heavy service.

The other sketch shows a sectional milling cutter used for cutting small racks used in lamp burners. One end



Tool Holder.

of the arbor, A, is fitted to the spindle of the milling machine, and the other is turned to receive the cutters C and liners L.

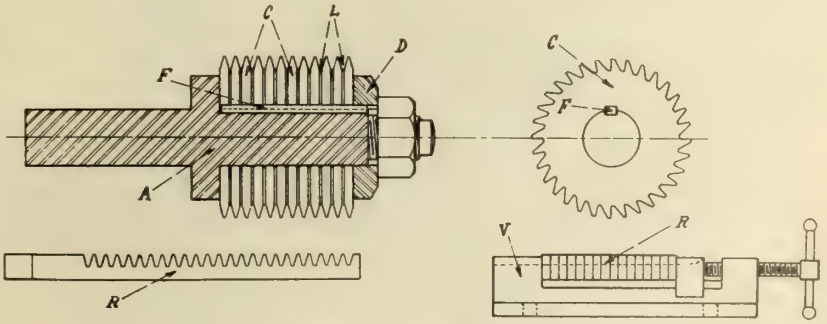
The cutters C are made from sheet steel while the liners L, are made from sheet tin, the gauge necessary to get the desired pitch of the rack R.

The cutters are securely clamped together with nut and washer and the feather F. A number of the racks are fastened in a small vise V and milled together.

FINISHING DUPLICATE PARTS.

A simple and compact time-saving device for finishing duplicate parts requiring slabbing, milling or slotting across the piece, has recently been designed for use on the "Acme" automatic multiple spindle screw machine.

The attachment as shown in illustrations one and two, is fastened to the top of the tool slide, carrying the cutting-off tool, and operates on the piece in the third position, while the thread is being cut. Two milling cutters set at a given distance apart on a vertical arbor driven by beveled gears, form a shaft



Sectional Milling Cutter.

carrying a pulley, which receives its power through a belt from a "Simpul" countershaft. The feed of the cutters is controlled by the cutting-off cam, its throw being increased by an auxiliary lever, which is shown in Fig. 1.

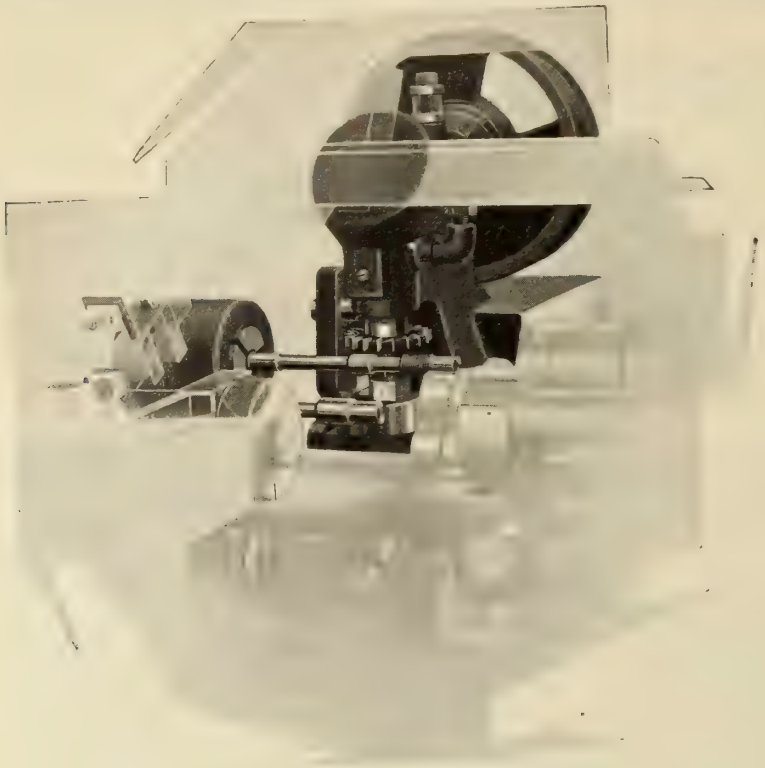


Fig. 1.—Attachment.

The operation takes place during the time required for the forming and box milling operations in the first position, and while the stock is being held stationary in the third position for the threading operation. (For this reason, this attachment is adaptable only to "Acme" machines). As may readily be seen, a block rests on the cutting-off slide, the slide above the block being adjustable for location of the cut. The fixture above the slide is dove-tailed into slide and fed forward by lever, shown at the back of pulley, Fig. 2.

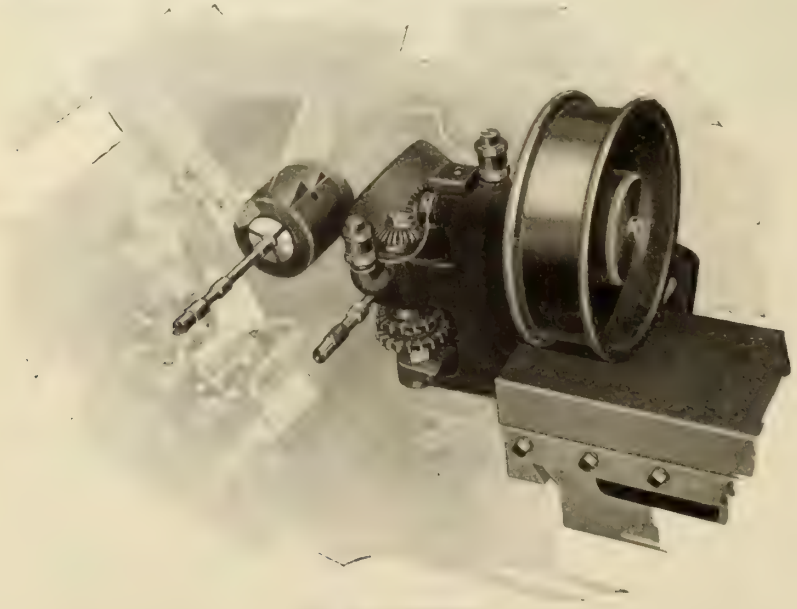

Fig. 2.—Attachment.

In attaching this device to a regular machine, it is only necessary to drill and tap two holes in the top of the cutting-off slide.

This attachment was put on a No. 53 "Acme" automatic (a 1-in. machine) for the purpose of slabbing the piece shown in illustration No. 3, for the Cadillac Motor Car Co., Detroit. This piece is being made in the Cadillac factory from cold rolled steel at a rate of 53 pieces per hour, this being as many as could be obtained without the slabbing. The previous method of making these pieces produced less than one-third as many per hour without the slabbing, which was handled as a second operation. The entire cost of rehandling for this operation is saved by the use of this attachment.

This is one of a number recently designed for the machine for eliminating rehandling of duplicate parts by drilling, milling, slotting, slabbing and counter-singing parts on the machine, which previously required second operations.

It is possible to drive these attachments without the special countershaft by directly connecting them to the die spindle gears in the main tool slide, a telescoping shaft, knuckle joints and beveled gears being used. This makes it possible to drive the machine with the single belt or motor without any special over-head arrangement for the attachment.

Fig. 3.—Piece Machined.

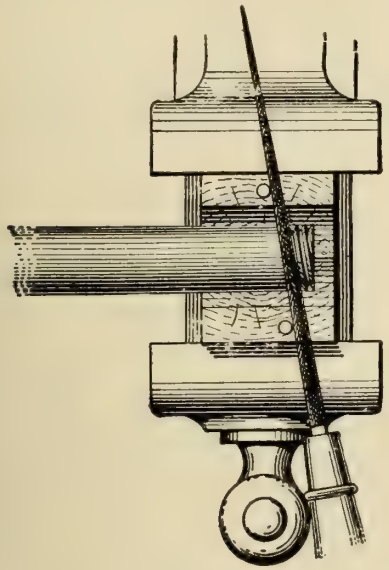
THREAD CUTTING WITHOUT A DIE.

By J. A. Bergstrom.

It sometimes happens that the threads of a bolt or a pipe break off and must be cut without the aid of a screw-cutting die. This can be accomplished very easily with the aid of an ordinary half-round file and a little patience.

Take a block of wood and fasten it in a vise. Make a V groove in the block deep enough for the center of the pipe to come a little below the surface. If the pipe is long, it will be better to make two of these blocks, so as to keep it steady. Now into this groove place a pipe with thread same as wanted, and on one side of the block drive in a nail. Place the flat side of a half-round file against this nail and see that it forms the same angle with the pipe as the thread does. Then drive in another nail on the opposite side of the block, so that it will touch the flat side of the

file. Now remove the pipe and replace with the one to be threaded. Hold the file with the smooth side against the nails and while filing keep turning the



Thread Cutting Without a Die.

pipe. The pipe should be rocked backward and forward. That is to say, on the forward stroke of the file turn the pipe in the opposite direction, thereby insuring a much better thread.—Scientific American.

PLANING CAST-IRON PLATES.

By Arthur Jacques.

We recently had to plane 36 cast-iron plates 3 ft. 6 in. by 3 ft. by ¾ in. thick. These plates (A in Fig. 1) were cast fairly straight, and had two lugs at each end which were cramped to the planing-machine table as shown in Fig. 1, the lugs being cut off after the plates had been planed. These plates were wanted fairly straight and smooth.

We planed the first plate in the orthodox way—that is, we first packed the plate under the lugs till it was straight enough to clean up, and then packed the edges all round about every 6 in. with metal shims. We took a roughing-cut over, using two tools at ⅛ in traverse. When these were over we tried the plate with a straightedge, and found the centre to be 1-16 round. Of course, this ment planing the plate over again. Then we finished it with a broad goose-neck tool. When tried again with a straightedge it was 1-32 in. round. This was more than we were allowed, so we decided to risk this plate, and then looked round for some method of holding the plates down solidly at the centre. Eventually we designed the following apparatus and found it worked splendidly, stopping all chatter and leaving a straight surface.

We first got a bar of iron 2 in. wide, and the same thickness as the slots in the planing-machine table, the slots of our machine being ¾ in. wide. We cut off three pieces 4 in. long, and planed them taper as shown at B in Fig. 2. We then got another bar of iron of the same thickness but only 1 in. wide, and cut off three pieces 2 ft. 3 in. long. We then planed the ends to the same taper as the blocks B as shown at C. This is all the apparatus needed.

The method of using it was as follows:—Three wedges were first driven in the slots in the centre of the planer table. Our table having five slots, we used the centre slot and the two outside ones. The wedges are shown at D in Fig. 3. When these are driven in, sufficient room must be left underneath in case the bars C project under the block B. When the wedges were driven in the pieces B were put beside them, as shown in Fig. 3. The plate was then put on the table, taking care that the blocks B came somewhere near the centre. After the plate was levelled in the usaul way the bars C were slid in and pushed so that the taper part raised the blocks B till they came in contact with the plate A, the blocks B being kept from sliding forward by the wedges D. If the plate was now rapped it sounded solid all over. When the bars C had been pushed in, the cramps were fastened on the lugs of the plate in the usaul way, taking care that the holding-down bolts were pushed up against the bars C. If the ends of any of the bars C came underneath the lugs a piece of packing was put in to make up.

We found this method gave a good, straight, clean job, stopping all groaning and chatter, and the average time to finish a plate completely was lowered from five to three hours, which included setting, roughing, and levelling. Our planer has a cutting speed of 40 ft. per minute, and returns at 80 ft., using A.W. steel. It will be noted that the corners of the blocks B and bars C are rounded so that the bars will go under the blocks easily.

When finishing with the goose-neck tool the man got tired of holding the clapper box up when the table was reversing, so we made a lifter as shown in Figs. 4, 5, and 6. This consists of a shank A made from 1 in. square iron to which we fastened a link B having a roller C at the end. The lifter was fixed in the clapper D with the tool, the roller C being slightly lower than the edge of the tool. When the tool was cutting, the roller just ran on the plate idly as in Fig. 4, but when the planer table wes reversed the link B lifted up the clapper by the pin E, and so the tool cleared the plate as shown in Fig. 5. Fig. 6 is a front view showing the lifter fitted in the clapper, the tool being at the other end.

When the goose-neck tool was ground and fastened in the clapper we lapped the edge in the following way. We had a brass lapping plate charged with fine emery powder which we put behind the tool on the planer table. We lowered the tool till it was slightly below the lapping plate; then by sliding the plate under the tool we could lap the edge of the tool, so that when used it left a fine polished surface, the separate tool marks scarcely showing. The tool cutting edge being below the lapping plate, was lifted away slightly, which gave the necessary clearance. The brass plate was charged by putting fine emery on the top, then rolling in with a piece of 2 in. shafting.—Mechanical World.

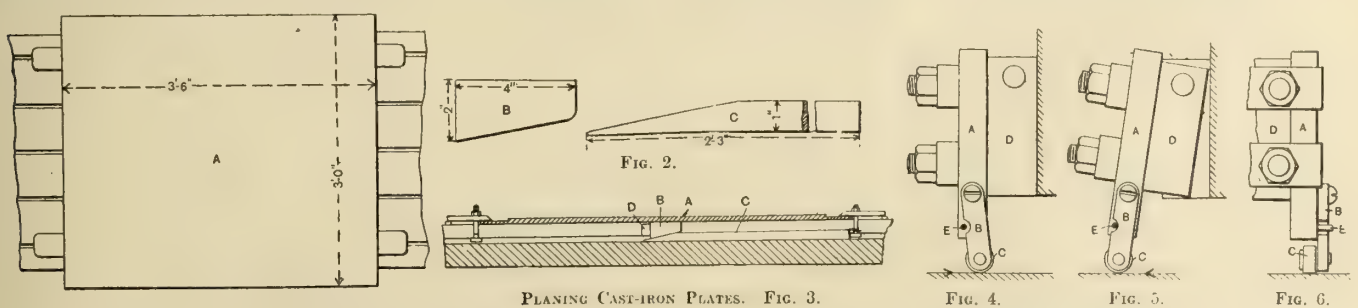


Fig. 2.

Planing Cast-iron Plates. Fig. 3.

Fig. 4. Fig. 5. Fig. 6.

One of the points of advantage in tempering high speed steel tools with the assistance of barium chloride is that when the hot tool is withdrawn from the bath a thin coating of barium chloride entirely covers it, and it may be quenched in oil or cooled in a draft of air without oxidation. Oil-quenching is recommended. It is also well to preheat all tools larger than ⅜ of an inch in section before placing them in the barium bath.

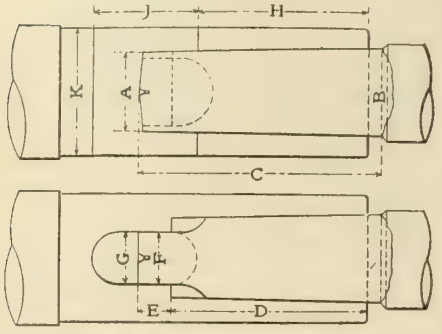
DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

A NEW STANDARD.

Taper shank twist drills with broken or badly distorted tangs have always been a source of trouble and expense. The cost of turning a new shank on them is considerable, and if this was not possible, they have been consigned to the scrap heap.

The Standard Tool Company, of Cleveland, Ohio, is putting on the market



Stantool Shanks and Tapers.

drills, sockets and sleeves, having short taper shank. This overcomes the trouble by means of a tang of much greater strength.

Sizes of Standard Shanks and Tapers.

Sockets and sleeves are furnished, made with the outside taper to fit the old taper of spindles of drill presses; the inner taper being suitable for the new shanks and also made with both outside and inside taper, conforming to the new standard, and these latter interchange or nest into each other.

The tables give the exact dimensions of all sizes of these new taper shanks, known by the trade name, "Stantool."

The Standard Tool Co. are also manufacturing a gauge that, placed over the regular taper shank, shows size and location of the tang for the "Stantool" shank. This enables drills on hand to be converted into the new type at little cost and trouble, also enables old drills from which the original tang has been broken, to be utilized.

BROWN & SHARPE GRINDER.

Brown & Sharpe Mfg. Co., Providence, R.I., have placed on the market a new size of their No. 12 plain grinding machine, which swings 8 ins. and takes 36 ins. between centres. It is equipped with automatic feeds, and contains the typical features of the company's cylindrical grinders, together with a number of important improvements. It is designed for grinding spindles, shafts, rolls and all other work, either straight or taper, revolving on two dead centres, and is essentially a commercial machine. The work speeds and table feeds are completely separated, an arrangement deemed very important in the class of work it performs, because it is possible to obtain a correct table feed for any work speed and when it is desired to remove stock rapidly a slow speed and fast feed are available.

Among the new mechanical features of the machine is a lever replacing a shipper arm, putting in convenient position the control of the table traverse and of the revolution of the work. Another lever at the front of the bed changes the speed of the table feed from fast to slow or vice versa. A very important new adjunct is the mechanism which, by the pushing in of a knob, places the hand wheel in connection with the table traverse, and at the same time makes operative a clutch device which stops the feed at the end of the table traverse, so that the table comes to a standstill when the wheel is off the work at the footstock or when it is up to a shoulder at the headstock end. The cross feed is arranged so that the automatic feed of the grinding wheel slide may be disengaged, permitting it to be moved quickly by a hand wheel. Provision has been made for the rapid substitution of one wheel for another, the wheel being mounted in a sleeve on the spindle and the spindle in special spherical bearings which are self-aligning. The back of the machine has been widened out, making the tool more rigid, and the tank and pump have been inclosed.

Fig. 1 is a front view of the machine and Fig. 2 a rear view. Fig. 3 illus-

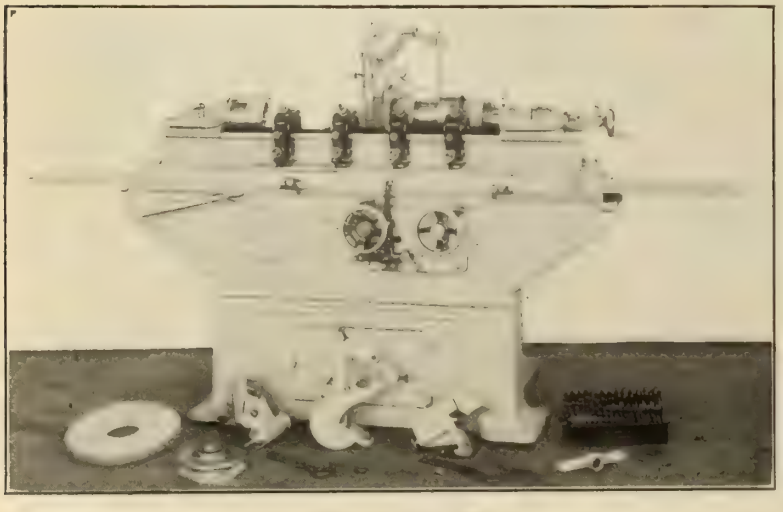

Fig. 1.—Front View.

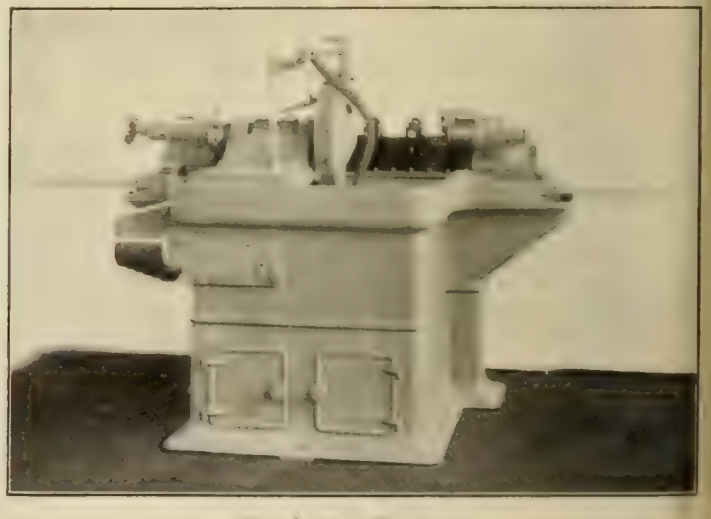

Fig. 2.—Rear View.

trates the overhead works and their new lever control. Fig. 4 is a detail of the reversing mechanism, and Fig. 5 is a section through the grinding wheel spindle, revealing the gearing for feeding the wheel toward the work.

The lever a, for starting and stopping that portion of the overhead works which feeds the table and drives the work driving pulley on the headstock,

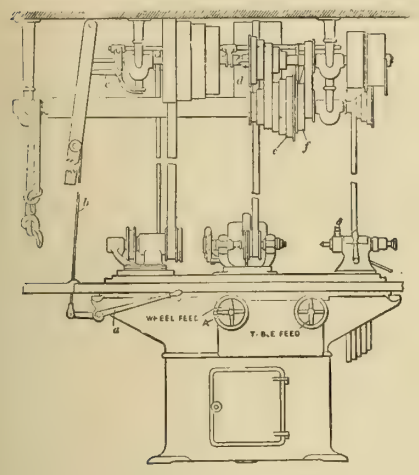

Fig. 3.—Countershaft and Control.

is shown at the left of the bed in Fig. 1 and also in Fig 3. It connects through a piece of wrought iron piping b with the bell crank lever c, which operates the clutch d. This clutch controls the pulley which is belted to the cone pulleys e and f, the former driving the drum and headstock, the latter the table feed, the reverse being procured by means of the clutches g and h, Fig. 4.

The automatic cross feed is of the type usually employed on Brown & Sharpe grinding machines, but with improved features. The hand wheel A, seen in Fig. 3, is connected to worm through shaft and gears, and meshes worm wheel C, Fig. 5. The worm wheel connects with the shaft D, Fig. 5, through the clutch teeth E. This shaft has teeth cut in its upper end, meshing with the rack F on the under side of the slide G, which supports the grinding wheel. The special new feature is that the lever under the hand wheel connects with the cam I, Fig. 5, through a shaft, the office of the cam being to raise the shaft D to which is pinned the clutch E. Raising the shaft by means of the lever operating the cam releases shaft D from the worm wheel and leaves the grinding wheel slide free to be moved quickly from one position to another through the agency of the hand wheel J, Fig. 5, a pinion fastened to it meshing the rack. The quick motion is of great value in depositing oil thoroughly on the sliding surfaces of the wheel carrying slide, and also serves to bring the wheel in position to grind when changing from one size work to another.

The system of gibbing the wheel carrying slide to its ways in shown at K. The gib is carefully fitted to its position and is not adjustable. If after years of service it is necessary to compensate for wear of the sliding surfaces, the gib can be removed and metal scraped from its upper surface, which would allow the bolts to draw it up higher in its seat, taking up any slack from wear without the danger of the operator clamping it so tight as to prevent the free movement of the wheel slide. The spindle carrying the grinding wheel is of one size throughout, and is exceptionally heavy for this size of machine. The oil chamber L leads around the bearing to the felt M, which provides an abundant lubrication for these very important bearings. The thrust of the spindle is taken by two convex washers, N, which insures correct alignment. The headstock is exceptionally heavy and rigid, and an extremely wide belt is used for driving it. The machine rests on three bearings on the floor.

The spindle is of tool steel, hardened, ground and lapped, and has phosphor bronze boxes, self-aligning and with means of compensation for wear. It takes wheels 16 in. diameter and 1½-in. face. The transverse movement is controlled by hand wheel, and a dial is graduated to thousandths of an inch on diameter of the work. The automatic cross feed ranges from 0.00025 to 0.004 in. at each reversal of table, is easily and quickly set, and is thrown out automatically when work is to size. The swivel table turns on a large central stud, hardened and ground, with bronze bushing, providing means of compensation for wear. It can be set at an angle

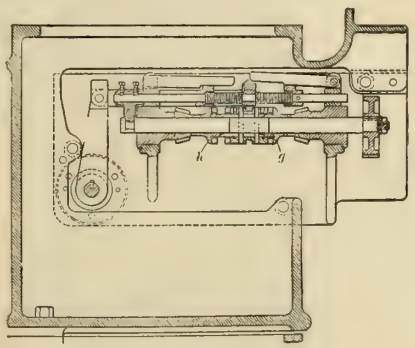

Fig. 4.—Detail of Reversing Mechanism.

to the table ways, the scale reading to 3½ degrees and 8 in. taper per foot.

The speeds of the wheel and work and of the feed of the table are entirely independent of one another. There are six changes of spindle speed ranging from 1,200 to 2,400 per minute, and 12 changes of work speed varying from 42 to 312 rev. per min., together with 12 changes of table feed, from 8 to 100 in. per minute, in two series available for any work speed. The change from one series to another is through a simple lever movement without changing of belts. The tight and loose pulleys of the countershaft are 14 in. diameter, with 4-in. belt, the speeds being from 395 to 405 rev. per min. The floor space of the machine is 51x144 in., and net weight 5,050 lbs.

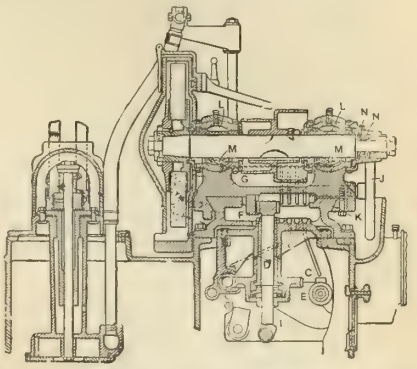

Fig. 5.—Section Through Grinding Wheel Spindle, Showing Gearing Feeding the Wheel to the Work.

ABRASIVE METAL-CUTTING MACHINE.

The Slack Mfg. Co., of Springfield, Vt., have perfected and will market a machine for rapid and accurate cutting of metal.

The advantages claimed for the abrasive metal-cutting machine are, that it is a rapid method of cutting metals. It will do all the cutting-off ordinarily done with hack saws, lathes, or milling machines and leave a perfectly square polished finish. It will cut air hardened steel, which has heretofore had to be notched and broken and in addition to cutting regular brass, copper or other tubing, it will also cut flexible tubing of any description, whether filled with rubber, webbing or woven wire, and make a smooth cut without burrs. It can also be used for notching and grooving work.

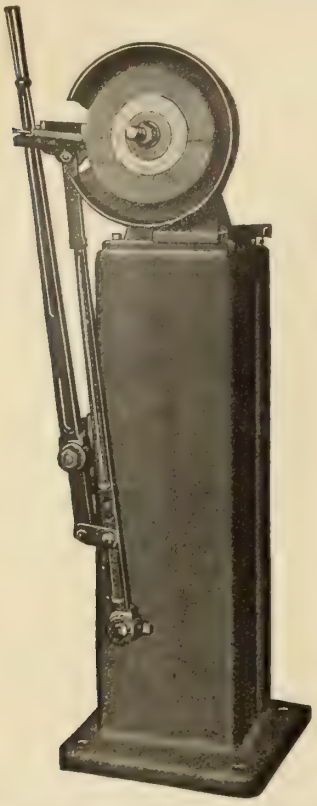
The base and head are very similar to many of the small tool grinders now on the market. The cutting is done by a specially prepared abrasive wheel composed of a patent combination of carborundum and other abrasive materials, 12 in. in diameter and 3-32-in. in thickness, running at a speed of 4,000 revolutions per minute. The arbor is made of crucible steel and all the bearings are dust proof.

The stock is brought into contact with the wheel by means of a patented swinging table, operated by a lever. This table is fitted with a cam, which holds the stock securely in place, and is also equipped with an adjustable stop, which gauges the length and depth of cut accurately.

This abrasive metal-cutting machine is designed to cut air-hardened, high-

speed, carbon or cold rolled steel, brass, bronze or any other metal whether round, square, flat, tubing or other form.

Tests of these machines have demonstrated that they will cut high-speed and



Cutting off Machine With an Abrasive Wheel.

carbon steel, 5-16-in. square bars in five seconds, ½-in. square bars in ten seconds, without drawing the temper. Steel, nickel and brass tubing, ½-in. in diameter, can be cut off in two seconds, leaving a true finish with no burr, and other sizes as fast proportionately.

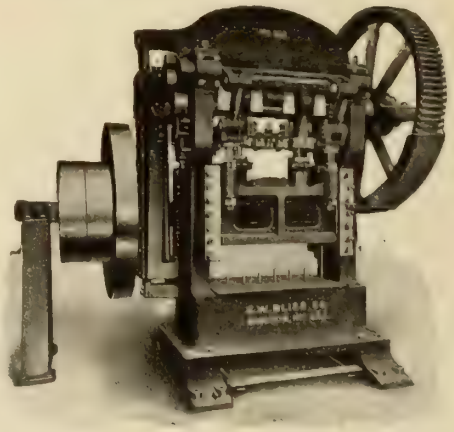
The machine weighs 250 pounds. The dimentions are 16 in. by 16 in. by 39 in., and it will cut stock up to 2 in. in diameter. The machine is designed for use in all branches of the metal trades and will be especially valuable for use in automobile plants, machinery, electrical and railroad shops.

DOUBLE CRANK TOGGLE DRAWING PRESS.

The E. W. Bliss Co., of 20 Adams Street, Brooklyn, N. Y., has designed a new type of press, known as the double-crank toggle drawing press, which is built in ten sizes. The original design of this type press was made some three years ago. The press shown, however, has been redesigned to embody such changes and improvements in detail of construction as recent experience has demonstrated to be of advantage. The frame of this press is of large proportions and is cast in one piece, giving a maximum amount of strength and rigidity. The punch slide has a stroke of 8 inches, and is actuated by a high carbon-hammered steel double crank shaft of large diameter. The pressure on this slide is distributed over two points, by screw connections, and work in unison when adjusting the slide, insuring perfect alignment at all times. This adjustment is accomplished by oscillating a ratchet lever.

The blank holder slide which has a stroke of 6 inches, encases the punch slide, and the pressure on it is distributed over four points by heavy steel screws. This slide is actuated by the Bliss patented toggle motion. The toggles made of steel, receive their motion from the crank shaft through an outside slide, which is operated by a crank connection on the end of crank shaft. The blank holder slide mechanism is balanced to avoid undue strain upon it, The construction insures all stress borne by the blank holder slide being taken by the press frame. At the beginning of the stroke the blank holder slide first moves down, while the punch slide first moves upward a trifle, and then downward with the blank holder slide, but somewhat behind it. When the blank slide dwells the punch slide continues its downward movement and forces the blank into the die, causing it to slip between the lower side of the form and even holding pressure. The punch slide then moves upward together with the blank holder slide, and the drawn and stamped shell is pushed out of and to the top of the die by a knock-out actuated by the blank holder slide.

The press shown will handle a 42x23-in. blank of No. 14 gauge steel, or



Bliss Double Crank Toggle Drawing Press.

smaller blank of heavier stock in proportion. It will take a drawing punch 12x36½ ins. A patented jaw clutch, entirely of steel, is used on this press, and all gears are cut. The main gear is 73 ins. in diameter, with an 8-in. face. The fly-wheel is 62 ins. in diameter with 6-in. face and weighs 1,800 lbs. The press makes 30 strokes per minute, and the driving shaft 205 revolutions per minute. Total height of the press is 10 ft. 9 ins., and the floor space over all is 10 ft. 9 ins. by 7 ft. 3 ins. The weight complete is approximately 42,000 lbs. It is for use in drawing and stamping large forms of irregular shape, such as trays, stove tops, seamless roasters, etc., where the drawing and stamping is down in one operation.

NEW CAR AXLE.

J. E. T. Powers, Nanaimo, has two models of a car axle, which it is claimed will work a revolution in railway haulage. The new axle is the discovery of Mr. Seabrooke, a British Columbia engineer. It has not yet been adopted by any railway, but it is being tested on some of the American lines, and so far has not been found wanting. With present axles on railway trucks, the two wheels are rigid on them. The result is grinding friction at every curve, and besides increasing the probability of a wreck, the life of the axle is lessened, the flanges are worn out and the life of the rail reduced. With all this, the load on the locomotive is increased, with a general increase of wear and tear. In Seabrooke's differential axle, the wheels are independent of each other. The axle is cut in two in the centre, and fitted into a box or jacket. There is no friction in turning curves, the wear and tear is reduced, in short there is economy all round. The new axles have been tested on a car over 100 miles of stiff track on the Santa Fe railway. One manager claimed that the new axle would increase the breaking strain of a car. When he fitted the wheels on a car and took it out, it was the conviction that a wrecking train would shortly follow. Instead, every test was met. A chalk mark on the flanges was not even erased. A company is being floated to put the axle on the market.

W. J. Clokey, founder of the Farmers' Co-operative Harvesting Machinery Co., of Whitby, died at his residence, 64 Beatty Avenue, Toronto, on Saturday, June 19, in his fifty-third year, after a long illness.

Arthur H. Milroy, of the Milroy Co., 196 King St. West, Toronto, dealers in machine shop supplies, was married on Wednesday, June 9th, to Miss Lyna McCullough, of London. After the wedding, Mr. and Mrs. Milroy spent a few days in Detroit and other western points before returning to Toronto, where they will reside.

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical. Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

TRANSMISSION OF POWER BY ROPES.*

With the aid of guide pulleys, rope transmission may be carried forward to enormous distances. But how far centres may be placed from each other without intermediate support, is largely a matter of pulley dimensions and driving direction. Naturally with large pulleys the under and over traveling portions of the rope are kept well apart, and again there

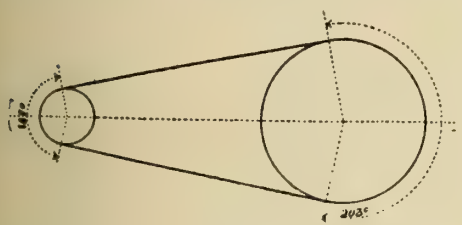


Fig. 1.—Long Centres.

is always an amount of sag on the working side of a long distance drive which helps to prevent contact even with the

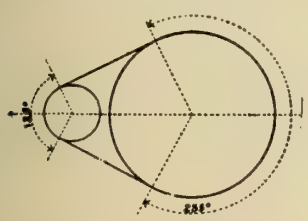

Fig. 2.—Short Centres.

slack above the pulleys. There are numerous unsupported drives with centres varying from 70 to overside 100 feet but these for the most part are working with the slack of the rope below the pulleys.

Short Centres.

A swing of the metaphorical pendulum brings us to the opposite extreme, and suggests contiguity. The transformation

Fig. 3.—Awkward Conditions.

of a spur gear drive to ropes at a Belfast factory brought the pulleys into close proximity. In this case the pulleys are both 8 feet in diameter, with centres 9 feet apart, thus allowing a clearance of 12 inches between the rims.

When the two pulleys are equal in size, it is not necessary to make allowances for loss of contact, but should

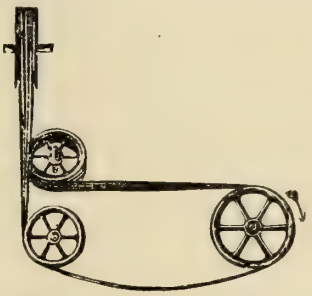

Fig. 4.—Right Angle Drive.

they vary, more rope must be employed to make up the deficiency.

Awkward Conditions.

Rope drive lends itself readily to awkward conditions. It is so flexible that with the aid of guide pulleys, any angle may be negotiated or corner turned.

Fig. 5.—Shafts Slightly Out of Parallel.

Perhaps there is not a case where the difficulties arising out of awkward conditions have been more successfully tackled than at a large timber works in Dundee. Here 225 h.p. is transmitted from a pair of engines, through an underground tunnel to a distant shaft by means of rope. From Fig. 3 it will be seen that guide pulleys are employed to deflect or sustain the ropes in their passage along the tunnel. These are placed at unequal distances, the centres for the whole range reading as follows: 16 ft., 15 ft. 6 in., 29 ft., and 22 ft. respectively.

Centres at Unequal Distances.

The unequal distribution of centres along the driving track has the advantage of breaking up the measure of any oscillation which may be set up in the ropes. Strong wane-like vibrations are sometimes observable between the engines and the first guide pulley where the load is suddenly removed or when starting which, as they cannot synchronize along the entire length, quickly diminish the mere rippling disturbances.

Right Angle Driving.

Shafts fixed at right angles may be successfully driven by the aid of guide

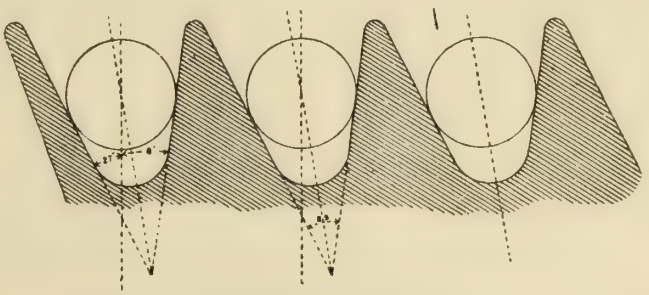

Fig. 6.—Tilted Grooves.

pulleys as shown in Fig. 4. It will be seen that the pulling side of the rope is deflected by the guider resting at the necessary angle, while the "idle" side is directed by the pulley having the horizontal axis.

Right angle driving may also be accomplished by the introduction of guide pulleys running freely (in opposite directions, of course) upon a vertical shaft. Deep grooves require to be cut into the guiders, and it is necessary for the ropes to be kept moderately tight.

Guide Pulleys Generally Too Small.

In the majority of cases guide pulleys are made sadly too small, and on this account the ropes are worn out much sooner than they would be, if a similar rule to that which governs the relative diameter of ropes and pulleys in ordinary driving were adopted. True, the arc of contact is less, but this is no relief to the strain put upon a rope in passing sharp curves.

The quicker rate at which small pulleys have to revolve, coupled with indifferent lubrication, frequently proves a hindrance to crane driving, hence the reason why sustaining pulleys are often discarded and substituted with grooved

* Second of a series of articles describing the system of rope drive used by William Kenyon & Sons.

slippers of hardwood such as lignum vitae, over which the ropes slide with far less damage.

Shafts Slightly Out of Parallel.

When shafts are only slightly out of parallel, ropes will direct themselves

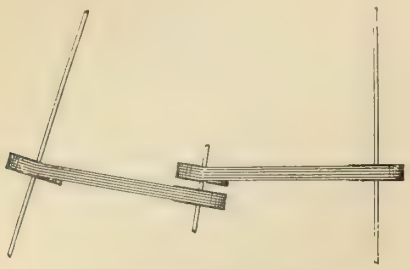

Fig. 7.—Shafts Out of Parallel.

without the help of guiders. The limit of deflection at which this may be accomplished, governed as it is by centre distances, cannot be definitely fixed to meet all cases, and it is better to rely upon experiments in each particular drive than upon any data suggested by past experience.

What is generally recommended is to arrange the drive so that the ropes will run parallel with the driven pulley from the centre of the driver, the latter being the smallest in Fig. 5. From this position the pulley may readily be moved

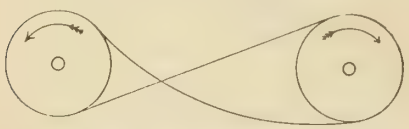

Fig. 8.—Cross Driving.

a trifle one way or the other if long keyways are cut in both shafts.

Tilted Grooves.

In some cases a tilted groove, like that shown in Fig. 6, is brought into requisition, which, it will be seen, gives more slope to one side than the other, with the intention of saving space and of allowing the ropes to roll with greater ease into their driving positions. A reference to Fig. 5, which gives a somewhat exagerated definition, reveals the fact that immediately the rope attains its working position in the groove the pressure exerted is at right angles with the face of the pulley, and is therefore

Fig. 9.—Cross Driving.

equal to both sides, whereas, in the tilted groove the pressure is greater on one side than the other.

The best groove for this purpose is undoubtedly an obtuse, well-polished one; the polishing should be extended to the terminals over which the rope must pass before it enters.

When the angle of deflection is too great for one set of pulleys and space will permit intermediate shafts are introduced (sometimes two or three) and the angle divided between them.

The drive shown in Fig. 7 is one where the shafts are 15 degrees out of parallel. Dividing this by an intermediate shaft, and running the ropes in grooves of 50 degrees has most effectually overcome degrees has most effectually overcome the difficulty. It should be well understood that in all such arrangements, it is necessary to allow extra rope upon the usual estimate, and indeed this rule should be enforced whenever awkward conditions are imposed.

Cross Driving.

Cross driving, shown in Fig. 8, is readily effected by ropes, and although

Fig. 10.—Half-crossed Driving.

there must of necessity be a greater amount of friction upon them than when driving under ordinary conditions, the wear and tear at the crossing point is not as terrific in actual practice as might naturally be expected, because the strain upon the driving portion permits the slack to pass by without exerting much pressure; and if the crossing is alter-

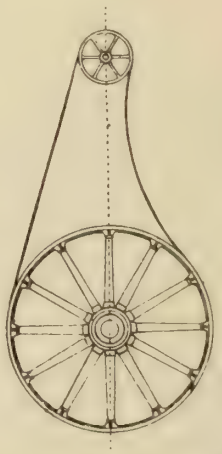

Fig. 11.—Vertical Driving.

nated as in Fig. 9, which shows a drive of four crossed ropes with two central grooves empty to give greater freedom, the tight and slack sides run in couplets, thus further reducing the friction.

Half-Crossed Driving.

Fig. 10 illustrates the application of ropes to right angled, or half-crossed drives, which may be either vertical or horizontal as circumstances dictate. In the last mentioned position ropes are often used to convey power from the vertical spindles of turbines to horizontal shafts.

The method of adjustment is practically the same as that adopted for belts, and allows the slack of the rope to fall direct into its appointed groove, while the tight side is pulled away at an angle. As the intensity of this angular wrench is decided by the distance of centres in relation to size of pulleys, it is never advisable to bring the shafts nearer together than five times the diameter of the largest pulley. The remarks re long key-ways and well-polished grooves also app'y in this style of driving.

Vertical Driving.

Power may be successfully transmitted to shafts upon the same vertical line. grooves of not more than 30 degrees, backed up with good ropes are the best influences to counteract the retarding effect of gravitation. When the drive Fig. 11, was constructed, it was deemed necessary to transmit the power obliquely to and from an intermediate pulley, but afterwards this pulley was removed and good driving ropes attached direct from driving to driven pulley with beneficial results.

A large spinning mill has adopted vertical driving and is working satisfactorily with centres at about 42 ft. and pulleys 12 ft. and 4 ft. diameter respectively.

NEW PROCESS OF TEMPERING STEEL.

Martin S. Kolman controls a process which, he claims, will convert finished iron into steel. Speaking of what is claimed for the new process, Mr. Kolman says:

"We can work up a fine razor blade out of iron, shaping and grinding it to the required form, and after this is all done we put the blade through our steeling process and convert it into the hardest kind. Steel blades produced in this way are equal in every respect to the finest makes. The method of making is simple. Iron is treated with a chemical composition, being subjected to heat at the same time. The chemical fumes have a peculiar property, converting iron into steel and tempering it to wonderful hardness. It is extremely likely that the English rights for our process will be sold to Vickers, Son & Maxim, and other big firms of similar character are negotiating for the rights in other countries."

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

CYLINDRICAL GRINDING.

The advantages of cylindrical grinding are being recognized by Canadians and there has been a demand for information in regard to this class of work. We have on several occasions published in Canadian Machinery, well illustrated articles on the subject, contributed by such authorities as F. N. Gardner, president of the Gardner Machine Co., Beloit, Wis. These received some very favorable comments. In this issue we are publishing a lecture prepared for the Mechanical Engineering Class, Columbia University, by C. H. Norton, another well-known authority on Cylindrical Grinding.

The cylindrical grinder is designed to assist the lathe, increasing its efficiency besides giving an excellent quality of output. As Mr. Norton puts it, "sometimes we grind without turning, usually we do not." As an adjunct to the lathe in engine manufacturing plants, automobile works, etc., the cylindrical grinder will be found almost indispensable. An accuracy can be attained by this machine that cannot be obtained by any other method. For slender work especially the cylindrical grinding has been found to give good satisfaction. The accuracy of the grinding machine is the commendable feature and in view of the interest taken in this subject the article, "Cylindrical Grinding," dealing with finishing methods, will no doubt be read with a great deal of interest.

CANADA'S TRADE REPORTS.

Trade figures for the month of May show most gratifying increases in both imports and exports, and indicate that the trade of the Dominion has practically recovered from the depression which set in during the fall of 1907, and is now almost equal in volume to the high record set two years ago.

Imports for the month totalled $28,060,076, an increase of $5,183,547 over May of last year. For the first two months of the fiscal year the imports totalled $50,592,549, an increase of $7,792,625 over the corresponding period of last year. The customs revenue for the month shows an increase of $670,000.

Exports of domestic produce for the month totalled $15,810,207, an increase of nearly two millions. For April and May the exports totalled $27,673 004, an increase of $2,471,704. The total trade last month, including coin and bullion, amounted to $44,911,726, an increase of $7,029,650. For the first two months of the fiscal year the increase in the total trade has been $11,457,926.

BRITISH PATENT ACT.

The new patent law is being interpreted in a broad, intelligent manner and not as a purely routine affair. This is indicated by the refusal of the Comptroller-General to revoke patents on the ground of inadequate manufacture in this country unless applicants can show conclusively that the law is not complied with.

An abstract from the Sheffield Daily Independent gives figures showing the extent to which England claims to have benefited by the new patents act.

"Since this act came into operation, in August, 1907, the country has benefited by foreign capital to the extent of $1,518,978, made up as follows: Value of rent and premises acquired by foreign manufacturers in England, $570,690; amount expended on erection of buildings, housing of work people, etc., $522,450; amount expended on plant, machinery and equipment of factories, $425,838. The value of the annual assessment on which local authorities will receive rates (i.e., taxes) will be $86,309 per annum."

Up to the present time nine patents in all have been revoked by the Comptroller-General, for good and sufficient reasons, the last one just announced being Patent No. 14,948 of 1900, concerning steam generators, which has been revoked on the application of the S. M. Car Syndicate.

These revocations are exceedingly important, says a firm of agents in London who has negotiated the sales of many of the sites, for they show that the conditions of the act are being enforced, when there is no intention of complying with the act. This firm is now in negotiation with foreign firms for the erection of works in this country (Great Britain), the trade including engineering, chemical works, electrical plants, rubber making, pottery works and steel foundries. The districts which have so far benefited most by the advent of new industries from abroad are Enfield, Flintshire, Hayes, Leicester, Liverpool, London, Manchester and Warrington. At all of the factories English workmen for the most part are employed. In one or two instances the firms have brought over their own overseers to instruct the work people, and in some cases they have taken English hands abroad so as to initiate them into their methods.

TOO MUCH AVERAGE MAN.

Did you ever look through a magnifying glass? Things look larger than they really are, don't they? Did you ever come to work in the morning and find work piled around your machine so you didn't know where to start? Or around your desk? You felt like sitting back and letting things take care of themselves, but if you start at one thing finished it and then started at the next and so on, what a difference it makes. The trouble is some people will not start. They are forever gazing at a molehill through a magnifying glass. The man who is above the average is the man who does things. They never acknowledge defeat. They never give up. The quitter is a failure. This is the law of life. The man who lets his work conquor him is a quitter.

There are men who have surprised their employers by a change of method, which is due to putting into practice things they have learned by keeping their eyes open. The Foreman, Superintendent, Master Mechanic, Mechanic, Cashier, Manager who gets in a rut will be numbered among the average men. You cannot change your course if you are in a rut; it allows no development or expansion. Progress requires changes occasionally. A "good enough" method isn't "good enough." What everyone wants is the best. You cannot develop a man with one food; neither can a man be a hundred point man by walking in a rut. If something works well, try again. You will find something that will work better. The whole development in the mechanical world has been because men who were above the average worked for something better.

The hundred point man may look like all other men or dress like them, or talk like them, but whatever position they hold they are true to their trust, they keep their word and are true to their company. Do your work and do it well. There are too many self-satisfied average men. Aim to be more than the average; be a one hundred point man.

EMPLOYMENT OF MINORS.

The Canadian Manufacturers' Association are drawing the attention of manufacturers to Section 3 of the Ontario Factories Act, reading: "No child (i.e. persons under the age of fourteen years) shall be employed in any factory except in the business of canning or desiccating fruits and vegetables and the work incidental thereto."

TRADE WITH GERMANY.

Reference was made in the May issue of Canadian Machinery to the agitation in Germany for more friendly feelings between Germany and Canada. A German-Canadian Association has accordingly been formed in Berlin with the object of securing the abolition of the Canadian surtax in return for the extension of the continental tariff to Canadian products

The German Government, it is understood, is considering the best means of rendering the Canadian and German markets more accessible to one another. To this the Canadian Government is apparently favorably disposed. The Berlin Association has decided to send to Canada a deputation of representative business men. Meanwhile the association is organizing public lectures and publishing pamphlets extolling the excellence of Canadian products and the immense resources of Canada, and pointing out the advantages of the country as a field for German emigration. This propaganda is being carried on in the hope that Canada will display gratitude towards the nation which shows a preference for the produce of the Dominion.

TOPICS OF THE MONTH.

Canadian customs revenue continues to respond to the stimulus of good times. During the month of May the collections totalled $4,296,660, which is $728,968 more than was collected in May, 1908. For the first two months of the fiscal year the collections totalled $8,258,338, an increase of $1,250,000 over the corresponding period last year.

* * *

Queen's University, Kingston will have a new chemistry building erected with the Legislative grant of $20,000 a year for five years. They will also erect a building for mining and metallurgy. This will make fourteen buildings and will be an imposing collection. William Nicol, professor in Mineralogy at the School of Mining generously donated $40,000 for the new mining building. His example is worthy of being followed by others.

* * *

Some appreciative letters have been received recently by the Editors of Canadian Machinery, of which the following, from the Hamilton Bridge Works is a sample: "We have received the June issue of Canadian Machinery in which is included an article on the manufacture of steel bridges at the Hamilton Bridge Works Company's Plant, Hamilton, Ont. It is a source of much pleasure to us to congratulate you on the excellence of this article and we are sure the same will prove very interesting to your readers generally."

* * *

United States Consul McWilliam reports from Sarnia, Ontario, that notwithstanding the depression in trade last year in both Canada and the United States, the total imports for consumption into Canada from the United States for the fiscal year 1908 amounted to $210,652,825, as compared with $208,721,601 in the previous year. Over 60 per cent. of Canada's imports come from the United States. Canada exported to the United States in 1908, $113,520,500, as compared with $109,772,944 in the fiscal year 1907. Thus, notwithstanding differential rates in favor of Great Britain and her colonies, the trade with the United States continues to increase.

* * *

The effort to secure reciprocity in bituminous coal between United States and Canada is unfortunately for both countries shelved. The Finance Committee through Mr. Aldrich reported an amendment to the United States Senate, fixing the duty on bituminous coal and shale at sixty cents per ton; on coal slack or culm, at fifteen cents per ton; coke and compositions used for fuel at twenty per cent. ad valorem. A drawback equal to the duty is allowed vessels in the foreign trade. The amendment left out the house reciprocity provision. Numerous attempts were made to reduce the rate, and there was one effort to obtain free coal, but all were voted down and the committee's scale retained. By a vote of fifty to twenty-eight, the amendment placing a duty of $1.50 a thousand feet on sawed lumber, with differentials on finished lumber was carried. This is fifty cents below the Dingley rates. The duty on clapboards was increased from $1 to $1.50 per thousand; on laths from 20 to 25 cents per 1,000 pieces and on shingles from 30 to 50 cents.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

CONVENTION SOUVENIRS.

A number of interesting souvenirs were given away by the exhibitors at the American Foundrymen's Association Convention held in Cincinnati in May. The accompanying photograph shows a few of the many that attracted attention at the convention.

1.—Member's Badge.
2.—Arcade Mfg. Co., Freeport, Ill.
3.—Millers' Products Co., Chicago, Ill.
4.—Excursion Badge.
5.—Guest's Badge.
6.—Millers' Products Co., Chicago, Ill.
7.—Joseph Dixon Crucible, Jersey City, N. J.
8.—S. Obermayer Co., Chicago, Ill.
9.—Cleveland Wire Spring Co., Cleveland.
10.—Pickands, Brown & Co., Chicago and Baird & West, Detroit.

A few of the Souvenirs of the A.F.A. Convention, Cincinnati.

11.—Taunton Crucible Co., Taunton, Mass.
12.—Jonathan Bartley Crucible Co., Trenton, N. J.
13.—Newport Sand Bank Co., Newport, Ky.
14.—Interstate Sand Co., Cleveland.
15.—Globe Metal Co., represented by S. Birkenstein & Sons, Chicago.
16.—Hawley Down-Draft Furnace Co., Chicago.
17.—J. W. Paxton Co., Philadelphia.
18.—J. S. McCormick Co., Pittsburg.

The Nipissing Central Railway Co., have let the contract for the construction of the electric road between Cobalt and Haileybury to the Nova Scotia Construction Co., of Sidney, C. B.

CONTINUOUS MELTING.*

By Richard H. Probert, Louisville, Ky.

In the continuous melting of iron in our foundry we operate two cupolas alternately. They are situated side by side, midway and at one end of the molding floors. They were made in our own shops, are drop bottom and of the same size and type. Their dimensions are as follows:

Height over all 30 ft. 6 ins.

Inside diameter, 30 ins., (lined).

Size of charging door, 1 ft. 6 ins. by 2 ft. 4 ins.

Five tuyers 4x5 ins. each.

From bottom of slagging hole 12 ins.

From bottom of tuyers 20 ins.

Outside diameter of stack 42 ins.

Outside diameter from charging door to top of air (or blast) box 56 ins.

Outside diameter from top of air (or blast) box to base 68 ins.

The stack is lined with regular stock fire brick and from the charging door to the bottom is lined with cupola blocks 4-in. thick, 6-in. wide, 6⅞-in. inside radius and 9-in. outside radius. These blocks and the fire clay used with they are of the best make. From which we get excellent results. They are guaranteed to stand over 3,000 degrees F., are dense, hard, tough and very refractory, made from flint clay high in alumina. It is economy to use high grade material for lining from bottom to charging door, especially on continuous melting, as previously, the repairs were very considerable over and above what it now costs—in fact, over double. The space between the shell and the lining is filled with grout. The last lining put in from the charging door to bottom was

Air or blast box 6 ft. by 2 ft. 4 ins. high.

Melting zone is 8 ins. above the tuyers and extends up for 20 ins.

From the bottom to charging door 9 feet.

From the top of charging door to top of stack 19 feet.

---

* This paper is presented and read before the Ohio Society of Mechanical Electrical & Steam Engineers, at Canton, Ohio, and the American Foundrymen's Association at Cincinnati, Ohio, at their meetings in May, 1909.

on November 2nd, 1907, and it is still in good condition.

Cupola Charging.

In addition to our continuous melting we make grey iron castings for machine, structural and other lines of work, which is put up on the regular sand floor. These castings are poured each morning before the continuous work is begun, The night watchman lights the cupola at 6 o'clock a.m., everything being got in readiness the previous evening. The first iron is tapped out at 7.20 to 7.30 a.m. The first charge of coke to heat up and form the bed amounts to 500 lbs.; we previously charged 900 lbs., but successfully reduced it to 500 lbs. Our charges are small in comparison to those of general foundry practice, but owing to the nature of the work and the continuous melting, the chaging of the cupola and frequency of the metal tapped out, all requires nice adjustment to prevent loss.

Melting.

The charge consists of 100 lbs. of coke and 500 lgs. of iron (about as follows: 100 lbs. machinery scrap, 250 lbs. pig and 150 lbs. remelt). The last three coke charges are usually 50 lbs., 50 lbs., and 25 lbs. Limestone will average about 2¼ per cent. to the total iron charged. On a day's run of 20 charges, limerock is commenced with the 5th heat and stopped off on the 15th. This has been closely followed up and no difficulty is experienced. Loss in melting is about 2½ per cent., deducting the finished castings and scrap cleaned up from total iron charged. Slagging commences regularly on or about 11 a.m. each day.

Cupola Repairs.

We daub up the cupola with swamp or blue clay mixed with fire-clay. The melting zone and bosh is repaired with one part swamp clay and two parts fire-clay, with small crumbs of fire brick.

Sand Bottom.

Sand bottom is made up from the siftings of the previous bottom, tempered with three shovels of new molding sand, slightly dampened and riddled. The bottom is stamped and rammed close with a close point of fire-clay around the edges. We make up the bottom as dry as possible, which is the best practice for small heats, as it does not chill the iron when first melted. The thickness is 3½ ins. at the level of the tap hole and slopes to 4¾ ins. thick at the back, this will give a slope of ½-in. to the foot. Figuring inside measurements, the slag hole is 8 ins. above the sand bottom, from the slag hole to the bottom of tuyers is 9 ins. and from the top of tuyers to the bottom of melting zone is 8 ins. with melting zone extending up about 20 ins.

Breast.

The breast is made with a fire brick, chipped, grooved, and beveled on the inside to one inch in thickness at the bottom side. The groove forms the tap hole, this brick is set in place with fire-clay. The spout is lined with two fire bricks end to end and grooved or channeled out, fitted, and daubed smooth with fire-clay.

Blast.

The blast pressure equals 6 ozs. and is regulated with a swing valve. The wind intake is 10x10½ ins.=105 sq. in., which exceeds the tuyers 5 sq. ins.,

Coke.

All our coke is kept perfectly dry being unloaded direct from the cars into storage bins built inside the foundry at the foot of runway to the cupola. Coke analysis:

Volatile matter	0.67
Fixed carbon	87.05
Ash	10.60
Sulphur	0.74
Phosphorus	0.016

Frame Running.

It is very important that the molding frames and molds be kept up to the highest state of efficiency so as not to cause delay in the pouring and the holding back of the iron in the cupola. The frame and mold capacity should always be greater than the pouring capacity, which will permit of continuous work. The cupola tender must strictly watch his charges. He must not melt down too fast. The blast must be regulated so the heat is at all times fully known to him. He should keep in close touch with the work on the foundry floor and be ready to give or slack his metal as it is required by the men. Good common sense and strict attention to his duties are required to prevent chilled heats, over heating, and other losses. Slagging commences regularly each day about 11 a.m. The slag is allowed to accumulate until just below the tuyers. Our experience is that by leaving the slag to this height we get cleaner iron and better results from the blast. We open the slag hole just enough to let the slag run and by letting this gather in a crust on the outside of the slag hole, it acts as a trough and prevents the blast escaping out with the slag.

Molding Frames.

The molding frames for the permanent molds are either square or rectangular in form, but should always be carefully designed so the molds can be arranged on the frames to the best advantage for the work to be done. They can be made with flat bar iron cross and intermediate bars fastened to cast iron frame with solid cast iron trunions on each side, or a frame work of angle iron with cast iron trunions bolted to the sides with flat bar iron cross pieces to angle of frame work. This makes a much stronger frame. The molding frames are supported on cast iron stanchions set securely in an upright position in the molding floor, the top of each stanchion is made with an open bearing or journal fitted up to take in the trunnions on the ends of the molding frames. This allows the molding frames to revolve freely on the trunnions, as in operating a number of molds on one frame the pouring of the molten iron cannot always be done from the same side of the molds, the gates do not run in the same direction, consequently, some of the molds must be poured from the opposite sides to the others. The revolving frames can be turned to the best position and quickly fastened in place with a plain steel pin set into holes drilled in the end of one of the trunnions, to a lug or bracket on the stanchion below the bearing. For some work the molds on one side of the molding frame are much heavier and larger than those on the other side, which causes the frame to be top heavy and difficult to handle. This can be easily overcome by an arrangement of counter weights, adjusted so as to properly balance the frame. A circular revolving molding frame is very convenient and can be worked to advantage on standard lines of duplicate work, in which the molds are self-contained and separate unto themselves. Such an arrangement would permit of the iron pourer getting around his work quickly besides leaving sufficient room for more than one man to pour iron on the job at the same time.

Permanent Molds.

Our permanent molds are largely ornamental, some of them are made to hinge and are provided with a swivel clamp set into a lug on the side of mold for fastening the two halves together, others are not hinged and are fastened together with screw clamps or gib and key. Any arrangement made for the fastening of the mold together should be made so the same can be taken apart easily and quickly, as it is necessary to open up the molds as soon as poured, in fact while the casting is at a very bright red heat.

Castings that are unequally proportioned and uneven in their different parts will crack open and chip if allowed to cool in the molds. The molds are machined on the faces that close together so as to make a tight even joint, they are also machined on the bottom side that is bolted to the mold-

ing frame. They are drilled and tapped with the hinge pin properly fitted, so it is necessary to have them soft enough to permit of this machine work and fitting being done and still be tough enough and of the right grade of iron to stand up to the molten metal continuously poured into them. If they fail to do this and burn out quickly it is quite a loss of time and expense, delay in producing the work and the expense of remaking the molds. After some experimenting the writer found that molds with the following analysis gave fair results:

Sil	Sul.	Phos.	Mang.	Com. carbon	Graphite
2.15	.086	1.26	0.41	0.13	3.17

Molds made from iron with this analysis were worthless:

Sil	Sul.	Phos.	Mang.	Com. carbon	Graphite
3.30	.057	0.67	0.12	0.19	2.98

Molds that gave the best results were made from two special brands of No. 2 foundry pig (see their analysis marked No. 1 and No. 2.) Heavy machinery scrap and our regular No. 2 foundry pig.

No. 1—

Sil.	Sul.	Phos.	Mang.
1.50 to 1.75	.015 to .03	.18 to .20	.60 to .90

Strong iron.

No. 2—

Sil.	Sul.	Phos.	Mang.
2.25 to 2.75	.015 to .03	.40	.45

Fluid iron.

The charges were made up from:

Lbs.
150 No. 1 (analysis No. 1)
75 No. 2 (analysis No. 2).
100 our regular No. 2 foundry pig.
200 heavy machinery scrap.

525 pounds charge.

The analysis of the molds cast from this mix was:

Sil.	Sul.	Phos.	Mang.	Com. graphite carbon	Car.
2.02	0.07	0.89	0.29	0.84	2.76

These cast molds are easily machined and do not burn for a reasonable length of time. Extra care is taken in molding them. We have success in using a molding sand made up from:

8 parts of old floor sand.
3 parts of new floor sand.
1 part of sea coal facing.
1½ parts of sharp sugar sand.

This with plumbago, a good parting and setting in the pattern again together, with careful melting by cupola tender, has given us the best permanent molds to date.

High Carbon Steel Mixed With Molten Iron.

Iron was taken from the above given charge, and 7 per cent, of tool steel turnings (fine lathe turnings) were mixed with the ladle and well agitated before being poured. The cast permanent molds from this are standing up well but have not had sufficient time to thoroughly test this mixture.

Quick Operation.

Continuous melting can be easily arranged for and with an equipment of over-head runways and hoists, the frames can be quickly changed. The molds on all frames can be previously gotten ready by the mold makers, so that very little time is lost in changing frames. It is advisable to have a few extra sets of stanchions for all preparatory work to be set up on them, thereby preventing delay.

Sticking of Iron in Molds.

A mixture of linseed oil and powdered soap stone or oil and graphite swabbed on the molds and gates each heat will prevent the castings sticking and prolong the life of the molds. The molds should be kept clean and when not in use stored away on shelves convenient to the molding frames. All our molds are classified and indexed in a mold book just as a well-arranged pattern storage loft.

Steel Molds.

We use high carbon steel molds that have sharp, thin edges on their inside. In constant use the steel in these molds roughs up, but does not eat away and burn off as the cast iron molds.

Casting Specialties.

By this process, with the proper mixture of metals carefully melted, and well made permanent molds that will stand up to the work required of them, with instant effective pressure on the molds as soon as the molten metal is poured into them, cast specialties can be made with increased strength. The pressure will make them non-porous, more dense in structure, which the annealing would not weaken but rather toughen. Subjecting some cast specialties to pressure would make them more suitable for the finer line of machine parts, as they would be pressed into better shape, be cleaner, and with their parts more clearly defined. An equipment for such added pressure can be easily made, and after first cost would be a slight expense in operation.

LARGE BRONZE CASTING

The Lumen Bearing Co., Toronto, have on several occasions made some very large castings in bronze but the propellor illustrated in Fig. 1 molded recently by them is probably the largest bronze casting made in Canada. The size of the propellors may be judged by the man who is standing beside them. They are right and left hand propellors,

Fig. 1.—Relative Size of Man and Propellors.

Fig. 2.—Pouring the Bronze into the Mold.

Fig. 1.—Murphy Roll-over, With Patterns in Place.

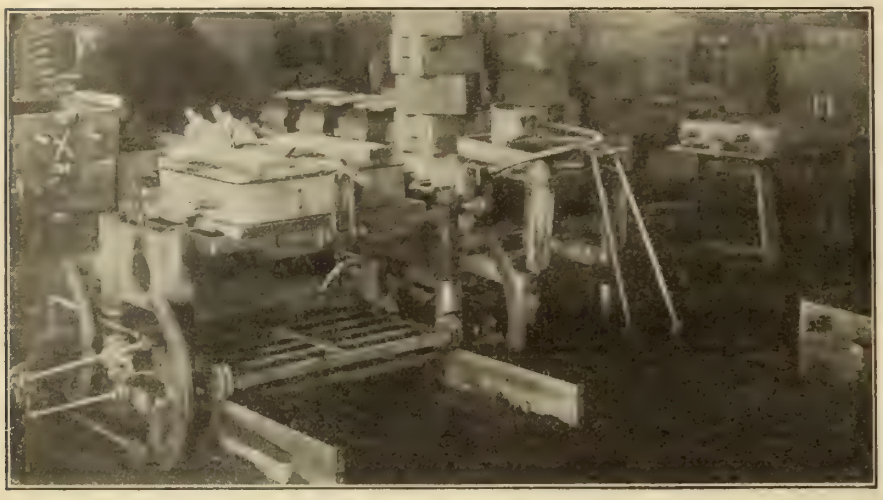

Fig. 2.—Drag in Place, Rammed up.

Fig. 3.—Mold Drawn Forward Ready For Lifting Off.

one weighing 1,587 lbs. and the other 1,595 lbs.

Fig. 2 shows the mold with everything in readiness for pouring. The cope of the mold weighed 7,200 lbs.

The propellors were for the Dominion Government Steamer Vigilant which was being repaired at Polson's Iron Works, Toronto. The Vigilant had the tips broken off both right and left propellors. Bronze propellors had to be obtained, bronze being lighter yet stronger than steel for a given weight.

The patterns for the propellors were made of aluminum and were cast by the Lumen Bearing Co. Each pattern complete weighed about 350 lbs. The blades and hugs were cast in separate pieces, each blade weighing about 103 lbs. A recess was formed in the hub and an iron ring was shrunk on, holding the blades to the hub. The steel ring fitted into the recess and formed a perfect part of the pattern.

A NEW ROLL-OVER MACHINE.

The accompanying illustrations show a new type of roll-over machine which has been developed by Mr. James A. Murphy, the foundry superintendent of the Hooven-Owens-Rentscheler Co., of Hamilton, Ohio.

This machine embodies a number of new and interesting features. In Fig. 1 the machine is shown with a gate of patterns attached ready to receive the drag. It will be noticed that the roll-over table is carried on trunnions at the ends and that those trunnions are supported by two iron yokes, each of which rests on two pistons. The roll-over device is located at the right of the machine and is not very clearly seen in Fig. 1, but it is shown more clearly in Fig. 3. In Fig. 2 the machine is shown with the drag flash in place rammed up and the bottom board clamped on ready for rolling over. After the flask has has been rolled over it is supported upon blocks as shown in Fig. 3.

This is accomplished by raising the roll-over table slightly, inserting the blocks, and then bringing the bottom board to rest upon these supports. For an adjusting device Mr. Murphy uses four pads made of sheepskin filled with curled hair, and he has found that these work very well indeed. One of the most interesting features of the machine is the fact that the pattern drawing device is operated first by hand and then by compressed air.

When drawing the patterns the lever shown at the left of the machine in Fig. 1 and Fig. 2 is lifted slightly and this starts the pattern and at the same time opens an air valve, admitting air through the stationary plungers into cylinders formed in the yokes on the ends of the machine. This air completes the lift and makes it possible to draw a heavy pattern very easily indeed. The mold is received on a small carriage which can be run forward from under the machine to facilitate the removal of the same.

In the case of the particular pattern shown on the machine in the illustration the cope is a small flat back which is rammed up by hand on a plate or buck, as shown at the right in Figs. 1 and 2.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

The Deseronto Iron Co., at Deseronto, Ont., is again in operation.

The Riviere du Loup Electric and Iron Works at Fraserville, Que., is in liquidation.

Copper smelting works are promised for the Point Wolfe Copper mine at Newcastle, N.B., this summer.

A by-law has been carried at Pembroke to loan the Lee Mfg. Co. $30,000 for the purpose of building a foundry.

Negotiations have been closed by Industrial Commissioner Dowling for the establishment of a new foundry at Brantford.

About 1,000 men are employed by McClary's in London making gas ranges and about 250 in their different warehouses throughout Canada.

The Sydney Foundry & Machine Co., Sydney, N.S., have ordered a Force Feed Pump from the Smart-Turner Machine Co., Hamilton, Ont.

The Nova Scotia Steel Co. propose to make improvements to their plant, but what these will be have not yet been definitely decided upon.

The contract for building the new machine shops for the C.P.R., at West Toronto, has been awarded to Bishop & Buchanan, Peterborough.

The Grand Trunk are at the present time handling between 90 and 100 cars of ore on an average every day between Point Edward and Hamilton.

The proposed rolling mill enterprise at Sydney will be underwritten by F. B. McCurdy, Halifax, who has launched a number of other industries.

The foundry at Wiarton, Ont., owned by G. S. Sinclair & Sons, was destroyed by fire on June 13. The loss is very heavy, with only $1,500 insurance.

The Dixon Bridge Works Co. are looking for a suitable place in the west for the location of a branch of their business. Port Arthur has appealed to them.

The Pictou Foundry & Machine Co., Pictou, N. S., have recently ordered from the Smart-Turner Machine Co., Hamilton, a Combined Air and Circulating Pump.

The Dominion Iron and Steel Company's output for April was as follows: pig iron, 22,402 gross tons; steel, 25,050 gross tons; total shipments, 19,000 gross tons.

The staff of the rod mill of the Dominion Iron and Steel Co., at Sydney, has been put on double shifts. This means that the output for the summer months is to be doubled.

Woodside Bros.' foundry at Port Arthur, is working day and night to get out the work coming in. The firm has a contract for building 36 tram cars for G.T.P. construction at the head of Lake Nepigon.

The R. Watt Machine Works, Ridgetown, Ont., are getting out two carloads of machinery to go to the Northwest as a result of Mr. Watt's recent trip there. Many extensions and improvements have been made to the works.

The by-law fixing an assessment of $5,000 for a period of twenty years upon the proposed plant of the Waterloo Mfg. Co., manufacturers of threshing machinery, of Waterloo, Ont., has been passed by Portage la Prairie citizens.

E. F. Bonsall is laying his plans to install a first class foundry plant and machine shop at Cobalt in addition to the present Bonsall Machine Shop. Every modern detail of equipment and a thoroughly up to date shop will be put in.

The Drummonds have accepted the offer of a free site from the town of Newcastle, N.B., and will commence shortly to build docks there for shipping their ore. A branch line is to be built from the mines to the Intercolonial at Black's Cut, about four miles south of Bathurst.

The industrial committee of the St. Thomas council are considering the prospects of securing an industry manufacturing an attachment to reaping machines. The company is not asking for a bonus, simply a sufficiency of land on which to place their buildings and a few other concessions.

The annealing furnaces of the Canadian Sheet Metal Corporation at Morrisburg, are being dimantled and larger ones substituted. Two additional rolling mills are being set up. The galvanizing plant is to be rebuilt with a larger capacity, and a roofing plant will be added to the equipment.

The machine shops of the Dominion Coal Co. are busy at present, and a large staff are kept continually at work. There are several engines in for general repairs and a very large amount of general repair work on colliery machinery, etc. The busy season in all departments of the company's works has now actually commenced.

The town council of North Sydney, has granted a free site, free water and exemption from taxation for a period of thirty years to J. H. Brown, of Montreal, a mining engineer, and his associates, to erect a reduction and smelting plant for the smelting of ores, the plant to cost in the vicinity of one million and a half dollars.

The Burrill Foundry Co. has reorganized under the name of the Brantford Foundry and Development Co., with a capital stock of $40,000. The members of the firm are H. G. Burrill, J. B. Rouse and W. R. Burrill. Besides foundry work, a machine shop will be added, and the plant at Grey Street will be remodeled and enlarged.

The Edmonton Iron Works of Edmonton, Alta., are building a new and much enlarged plant 200 x 66. The company found it necessary to do this in order to take care of the structural steel work which they had to do. The new building will be entirely fire proof and of steel construction. They are general machinists, iron and brass founders, and also do boiler work and will make a specialty of structural steel work.

Londonderry, N.S., is to have a steel plant, and preparations for their erection have begun. The site has been selected and work on the foundation will be started at once. It is the intention of the company to build a small steel casting plant of about five tons capacity, for a beginning, this to be increased later should the demand for the output warrant it. For this purpose a brick building with steel frame will be erected, 100 feet in length and 50 feet in width, with an addition or lean-to thirty feet wide. The company also intend to put in an electric lighting plant, with sufficient power to light all their works, and with a view to extending the benefit to the rest of the town as soon as needed. A large amount of capital has been invested in the property.

Municipal Enterprises.

A waterworks system is proposed for Oxbow, Sask.

Owen Sound ratepayers carried the waterworks by-law.

The extensions to Hull's waterworks system are estimated to cost $18,000.

Galt & Smith, Toronto, have been engaged to report on a sewage disposal scheme for Nanton, Alta.

By a majority of 84 the by-law to raise $20,000 for a system of waterworks at Gravenhurst was carried.

The B. C. Government and the G.T.P. are arranging to instal a new waterworks system at Prince Rupert.

Battleford, Sask., business men are asking for a fire protection system. Such a one would cost about $30,000.

The Barrie Council have reported in favor of submitting a by-law to raise $30,000 for sidewalks and sewers.

Tenders are invited by the Peterboro Water Commissioners for extensive work in connection with the waterworks.

The by-law to raise $25,000 to repair and complete the Carman, Man., waterworks system was carried by a large majority.

James Heatley's tender for the construction of extensions to the Brampton water works system was accepted, it being the lowest.

Fernie, B.C., ratepayers have approved a by-law to raise $100,000 for the purchase of the present waterworks system and extensions thereto.

The contract of Carriere & Wilson for the extension of the Hull waterworks to cost about $7,000, was confirmed at a recent meeting of the city council.

The plans submitted for a waterworks system at Markdale will be passed by the Provincial Board of Health after a few amendments have been made.

Engineer Childs, of Calgary, Alta., has completed his report on proposed gravity water system and estimates the cost at $290,090, exclusive of reservoir.

The by-law to raise $10,000 for water extensions at Kamloops received its preliminary readings. On motion of Ald. Brown the amount was increased to $15,000.

The Victoria city engineer's department is now preparing plans for a new incinerator to cost about $2,000 and capable of consuming twenty tons of material per day.

The report and plans prepared by T. Aird Murray, C.E., Toronto, for a sewerage disposal system for North Toronto, were recently accepted by the Provincial Board of Health.

The John McDougall Caledonian Iron Works, Montreal, was awarded the contract for the steam centrifugal pump for the filtration plant by the Toronto Board of Control at $9,428.

A trunk sewer will be built on Pacific Avenue, Eighteenth Street and Rosser Avenue, Brandon. Work will commence on it at once and when it is completed $47,000 will have been expended.

The Montreal roads committee have sent in requisitions for $2,500,000 for public work, to be completed this summer. Included in this amount are sewers, $133,000; pumping plant, $55,000.

Aylmer is willing to pay one-third of the cost for the installation of septic tanks in connection with her sewerage system, provided that Ottawa and Hull bear the remaining two-thirds of the amount.

A new waterworks system to supply Prince Rupert will shortly be installed. Negotiations at present are proceeding between the provincial government and the G.T.P. with regard to the financial arrangements.

At a recent meeting of the Moose Jaw council, a by-law was introduced to raise $40,000 for the construction of a reservoir at Snowy Springs, and for improving the means of bringing the water to the city.

A New York syndicate has bought a water power on the Matabitchouan River to supply the mines in the vicinity as well as the electric railway which is to run from Cobalt to the head of Lake Temiskaming.

As a result of the negotietions which have been carried on during the past month between the city and the Esquimalt Water Works Co., the city will make an offer to the company for its undertaking at Goldstream.

The contract for the instalation of the Yorkton, Man., waterworks system has been awarded to the Municipal Construction Co., of Regina. The Municipal Construction Co. has also been awarded the contract for the Estevan waterworks, amounting to $11,455.

Work has again been commenced on Montreal's big new waterworks conduit, which runs from Lachine to Montreal. As soon as the work is completed the Water Committee will call for for tenders for the laying of the "intake" pipe at Lachine, away out into the middle of the St. Lawrence.

The contract for supplying Kamloops with water pipe has been awarded to an English firm, the agents of whom are the Burton Saw Co., Vancouver. There were many tenderers for the pipe, the price of the English firm being $45.10 per ton of 2240 pounds f.o.b., Kamloops. The contracts for the hydrants, valves and boxes will be awarded later.

Engineer Dutcher and Superintendent Wain, of Kamloops, decided to award the contract for the engine and dynamos for the power plant to the Canadian Westinghouse Co. and for the boiler and condensor to the Canadian Fairbanks Co. The work of installing the new machinery will be undertaken very shortly and it is hoped to have the new plant ready in the course of three months.

Following were the successful tenderers on Toronto's filtration plant: Main contract, Messrs. Dill, Russell & Chambers, $568,128.60; cast iron

pipe and specials, Canada Foundry Co., $10,-891.70 ; gate valves, Ludlow Valve Co., Troy, N. Y., $8,772.95 ; sluice valves, Coffin Valve Co., Boston, $85,209 ; Nenturi meter castings, John Inglis Co., $2,891 ; Nenturi meter indicating apparatus, John MacDougall Caledonian Iron Works, Montreal, $3,318 ; sand washer castings, Canada Foundry Co., $871.20 ; steam centrifugal pump, John MacDougall Caledonian Iron Works, $9,484 ; screw pumps, Allis-Chalmers-Bullock Co., $7,049 ; electrically-driven stage pump, Allis-Chalmers-Bullock Co., $5,234 ; drainage pump, John Inglis Co., $1,600 ; boilers, John Inglis Co., $2,750 ; manhole casting, Canada Foundry Co., $8,890.35.

Railway Construction.

The C.N.R. propose laying 600 miles of new track this season in the west.

Construction work has begun on the electric line that will connect Cobalt and Haileybury.

The Niagara, St. Catharines and Toronto electric road propose extending their line from Welland to Port Colborne.

The Grand Trunk Railway has bought 700 tons of steel rails from the Pennsylvania Steel Co., for its United States lines.

Extensions of the C.W. & L.E. electric line now connecting Chatham with Wallaceburg, on the north, and Lake Erie on the south are contemplated.

Contracts will be let soon by the Dunnville, Wellandport & Beamsville Electric Railway, which propose to build a 22 mile electric railway to connect these three towns. It is proposed to begin work at once.

In connection with construction work on the Saskatoon to Calgary branch of the C.N.R., the grading gang have begun operations southwest of the former city and it is expected that steel-laying will be started very soon.

It is estimated that $85,000,000 will be spent on actual railway construction work in Western Canada this year. Of this amount the C.P.R. plans to spend $20,000,000 ; the J. J. Hill lines, $15,000,000 ; the C.N.R., $11,000,000 ; and the G.T.P., $10,000,000. There are a number of newer lines also under charter, which propose to build.

General Superintendent Price, of the Canadian Pacific, states that contracts have been let for work on six branch lines in the western division, involving the construction of about 270 miles of new track. The lines include that running east from Hardisty, one east from Stettler, one north from Cheadle to Alix, one from Kipt to High River, all in Alberta, and one west from Weyburn, Sask.

The C.P.R. is laying about 17 miles of new rails on the Atlantic division, replacing those of lighter weight. The new rails, which are the product of the Dominion Iron & Steel Co., are 5 pounds heavier than the ones formerly used, being 85 pounds to the yard. The rails removed from the main line are being used on the branches, and in all 53 miles of track will be laid this year and about 30 or 40 miles of ballasting will be done.

The most important of the new C.N.R. lines to be built this season is an extension from Vegreville to Calgary, 235 miles. Other new branches are : An extension from Maryfield, Sask., southwesterly one hundred miles ; extension from Russell westward twenty-five miles ; from Prince Albert, thirty miles west ; from Ochre River, through St. Rose du Lac, a distance of twelve miles, a branch line twenty miles north ; and from Oak Point, a branch twenty miles north from Morinville.

Structural Steel.

Tenders will be received for a steel bridge with concrete piers and abutments at Arnprior.

Over $20,000 will be spent in improving roads and bridges in Waterloo county, Ont., this season.

The C.P.R. have started operations on the Wellington Street viaduct at Ottawa. It is to cost $75,000.

The contract for the Edmonton power house structural steel was given to the Edmonton Iron Works for $16,460.

Tenders will be received for erection of a one span steel bridge, 115 feet in length, over the Bayfield river at Clinton.

The contract for spans for the new Beaudette and Island bridges near Cornwall was awarded to the Hamilton Bridge Works Co.

Tenders have been awarded by the Aylmer, Ont., town council for the new bridge at Myrtle Street to Stratford Bridge Co.

A contact has just been closed with the Hamilton Bridge works for a steel and concrete bridge across the Neebing river, near Fort William.

The Manitoba Bridge Works, Winnipeg, will supply the iron work used in the construction of the Transcontinental Railway shops at that city.

The Dysart Township council have let the contract for a steel bridge to be placed over the river at Stewart's narrows, near Lindsay, to Jenkins & Dresden, Sarnia. The cost will be in the neighborhood of $3,000.

The contract for the construction of a new steel bridge across the Salmon river at Chipman, N. B., has been awarded by the Department of Public Works to the Dominion Bridge Co., Montreal. Estimated total cost, between $27,500 and $30,000.

The Manitoba Bridge and Iron Works, Winnipeg, have been awarded the contract for the structural steel for the Great West Life Assurance Co.'s building at Winnipeg, amounting to 650 tons. This building will be a large one of steel construction designed for five additional stories. This is the second largest contract for steel building construction in Winnipeg awarded this year.

Contracts for the construction of five new bridges in northern Ontario have been let by the Provincial Public Works Dept. They represent an expenditure of about $40,000, and must be completed by Oct. 1. The names of the contractors and cost of the work are as follows : Bridge over the Vermilion River at Whitefish, on the new Sudbury-Sault Ste. Marie road, to cost about $15,000, Dixon Bridge Co., Campbellford ; bridge across the Spanish River at Nairn, Algoma District, cost $12,000, contractors for steel superstructure, Dixon Bridge Co. ; Murdoch River bridge, Nipissing District, $3,-500, M. A. Pigott & Sons, of Hamilton ; Courchasse Bay bridge, about $3,500, William Doust, Cosby Township ; bridge over Wabigoon River at Dryden, cost $6,300, Morrow and Beatty, Peterborough.

Planing Mill News.

A veneer mill is to be erected at Mansonville, Que.

C. Jobin & Co. will erect sawmills at St. Augustine, Que.

C. H. Dickie, of Duncans, will build a lumber mill on Quamichan Lake, B.C.

Donald Fraser & Sons' lumber mill at St. Frances, P.Q., was burned recently.

Gignac, Beland & Co.'s sash and door factory at Quebec was burned recently.

The Mundy Lumber Co.'s mill at Vancouver, was burned lately at a loss of $200,000.

A $20,000 addition will be put up at the Arrowhead Lumber Mills, Kamloops, B.C.

The Yale Columbia Lumber Co.'s sawmill at Title, B.C., was destroyed by fire last month.

The Prince Albert saw mills have started operations. Seven hundred men are given employment.

Geo. Wood & Son's planing mill at Dundalk, Ont., was damaged by fire about the middle of June.

E. D. Rorison & Son, are building a saw and shingle mill near Eburne, B.C., at a cost of $100,000.

R. J. Watson, formerly of Burke's Falls, Ont., is building a sash and door factory at Revelstoke, B.C.

J. H. Lavelle and W. J. Hickey, are about to start work on a new box factory at Welland, Ont.

The Frader River Lumber Mills are constructing a logging railway in Vancouver that will cost $150,000.

Shepard & Morse's sawmill, Ottawa, which has been closed for some time, has resumed operations at full capacity.

The Maycock, B.C., Lumber Co.'s plant at Cranbrook, was recently destroyed by fire at a total estimated loss of $100,000.

The Lewis Furniture Co. has purchased the old Royal Furniture Block at Winnipeg, and will make extensive alterations to same.

L. B. Smith's saw mill at Baillie station, three miles from Fredericton, was destroyed by fire last week at an estimated loss of $4,000.

J. H. Preston is increasing the capacity of the planing mill at Medicine Hat, recently taken over from the Medicine Hat Lumber and Mfg. Co.

Plans are being made by Frank Huston for the construction of a sawmill and planing mill in Vancouver. Both mills will be operated by electricity.

In a disastrous bush fire which occurred recently the Carlin & Carrigan sawmills on the Salmon River, B.C., were destroyed by fire. The former was valued at $75,000 and the latter at $35,00.

The Beveridge pulp mill in Lower Derby, N. B., which already employs one hundred and fifty men is being extended by the addition of a couple of wings.

The Nordin Co. will build a large up-to-date woodworking factory and lumber mills at Tide Head, near Campbellton, N.B. A large quantity of machinery has been ordered from Sweden.

The Great West Lumber Co. started their night shift at the Red Deer mill lately, but are still a little short of men. A new 75 horsepower engine will supply power in the planing department.

R. J. Watson, Dominion Government Timber Agent, is erecting a sash and door factory in Revelstoke, B.C. The management of the factory will be in the hands of his son, Gordon Watson and O. West.

The James Smart Mfg. Co., Brockville, has purchased the planing mill of John Briggs & Sons, in that town and will run it in connection with their own. The business will be reorganized and enlarged.

Dickie & McGrath's big lumber mills at Tusket, N.S., together with two million feet of lumber, were completely destroyed by fire recently. The cause of the fire is unknown. The loss is fifty thousand dollars, on which there is $25,000 insurance.

A. MacLaren, president of the North Pacific Lumber Co., whose mills at Barnet, B.C., were recently destroyed by fire, states that the erection of a more modern mill will be begun immediately. The new mill will cost about $350,-000.

The Northumberland Pulp Co., Campbellford, are asking the Seymour Township Council for a fixed assessment of $2,000 on a pulp mill which it is stated they will erect near Ronney Falls. The company ask for a fixed assessment for 10 years, and it is said will undertake to erect buildings and works at a cost of $10,000.

A large lumber and shingle mill is to be erected at Esquimalt. A very good location has been secured and a spur line will connect the mill with the E. & N. Ry., which passes close to the site. The first outlay will be somewhere between one and two hundred thousand dollars. Another mill is also to be built by C. H. Dickie on Quamichan Lake and will tap a very large timber country.

The lumber mills of Vancouver Island are now finding it necessary to operate their plants continuously to their full capacity. The Genoa Bay Mill, owned by the International Lumber Co. is preparing to open up after being shut down for twelve years. Much the same condition of affairs is apparent elsewhere. At Shawinigan and Cowichan Lakes the mills are exceedingly busy, much more so than has been the case for many months.

Building Operations.

The Brantford Emery Mfg. Co. proposes to erect a new plant.

A. E. Wry Co., of Sackville, N. B., propose erecting a boot and shoe factory.

Construction will soon commence on the new D. W. Black cleaning elevator at Fort William.

The new Consolidated Elevator at Fort William will be erected by the Canadian Stewart Co.

Permits has been issued to the Twin City Co., Edmonton, for a $15,000 factory and warehouse.

The construction of the Dain Mfg. Co.'s plant at Welland will be begun at once and completed this year.

W. A. Edwards has been granted a permit for additions to the premises of the Frost Wire Fence Co., Hamilton, at a cost of $10,000.

The by-law to loan John A. Minchner and others $20,000 for 20 years for the erection of another furniture factory was submitted to the ratepayers of Strathroy and carried by a large majority.

The Ogilvie Co., have made a contract with the Barnett McQueen Co., of Fort William for the construction of a 300,000 bushel grain elevator to be built next the company's mill at Winnipeg.

The contract for the new Harold-Sanderson refrigerator and screen door factory at Paris has been awarded to J. D. Tindale, Ingersoll, and the work of construction will be commenced immediately. The cost of the new buildings is between twenty-five and thirty thousand dollars.

A big elevator company has been organized in Calgary with a capital of $600,000. The company will build a large elevator capable of holding a million bushels, and the company expects to have 250,000 of this storage ready for use this fall. Work has already been started on the elevator.

The Canadian Stewart Co., one of the most recent of the big contracting companies in the U. S. to come to Canada, are employing over 700 men on the G.T.P. elevator at Port Arthur. Amongst other elevators which are contemplated by the Stewart Company is the construction of the Ogilvie Milling Co., who intend building another large elevator to add to their Fort William plant.

Nineteen new grain elevators are to be built in Alberta this summer, and work is to commence in about two weeks' time. The elevators will be built by the National Elevator Co., of Buffalo, which is extending its operations into Western Canana. The points decided upon are Macleod, Granum, Claresholm, Staveley, Nanton, Cayley, High River, Crossfield, Carstairs, Red Deer, Alix, Erskine, Stettler, Camrose, Bawlf, Daysland, Killam, Strome and Sedgewick.

Fort William, already famous for its elevators, seems destined to become still more famous for in addition to the large elevators already in course of erection by the Grand Trunk Railway Co. the Consolidated Elevator Co. are making preparations for the erection of another house in the vicinity of the present one at Westfort and a company headed by Mr. D. W. Black is negotiating for a site on which to erect a cleaning house. A little to the west of the Consolidated elevator the walls of the Western Elevator are beginning to show above the ground.

General Manufacturing Notes.

The Otis-Fensom Elevator Co., will enlarge its plant at Hamilton, to give employment to 600 men.

Fire caused $7,000 damage in the furniture factory of Isodore Pauin, at Hull. The building was gutted.

The Western Dry Dock and Shipbuilding Co., have decided to locate at Port Arthur. They will employ 300 men.

The Canadian Stonewood Flooring Co. is opening up a factory in Winnipeg for the manufacture of plastic flooring.

Schultz Bros., Brantford, will enlarge their plant and add to their lines the making of motor and portable houses.

The mill and basket factory of Merritt Bros., at Abingdon, Ont., was destroyed by fire last month at a total loss of $12,000.

Geo. Clare, M.P., is at the head of a company which proposes to operate a plant at Preston for building automobiles.

James W. Woods, Ottawa, has made arrangements for establishing a plant in this city for manufacturing tents and builders' supplies. Mr. Woods states that the factory will employ 500 hands.

The St. John Board of Trade are negotiating with Bonnel & Hardy, of London, Eng., who are looking for a site for the erection of a large paper mill.

H. Stead and B. W. Sparks have purchased a Vancouver waterfront lot from that city with the intention of starting a shipbuilding yard in the near future.

The English company which has bought the oil wells at Memramcook, N. B., are working their property at Legere's Corner, McGinley's Corner, and Guildville.

Inside of two months time Port Arthur expects to have the biggest stone cutting plant in Canada. The Stanworth, Martin Co. will greatly enlarge its present plant.

With a large local demand for pipe for irrigation purposes, E. T. Bogart, of Vancouver, will establish a factory to manufacture all kinds of wood pipe at Kelowna.

The Winnipeg Excelsior Mills is a new company just formed for the manufacture of excelsior or wood fibre for packing. It will erect a plant with a capacity of six tons daily.

One of the most costly fires in the history of Winnipeg was that of the Great West Saddlery Co. which destroyed property valued at about $375,000, less than half of which is insured.

Architect Darrach is preparing plans for a cement roller mill for S. V. Wilson, of Union, Ont., to be erected on the former site. The mill will be modern in every respect, and will be operated by water power.

A number of Pittsburg capitalists are considering London as the possible site of a large manufacturing concern. The plant when established will be a large one, employing 600 men. The authorities refuse to divulge the name of the company.

Alexander Morris has purchased from the National Mfg. Co., Pembroke, the site of their factory which was destroyed by fire last November. Mr. Morris has in contemplation the starting of a new industry which will employ quite a number of hands.

The Palmer piano factory at Uxbridge erected a little over a year ago, and which has been unoccupied since the failure of that company, has been sold by the town to a company being formed in Toronto with a capital of $25,000 to manufacture caskets.

E. W. Backus, who is interested in the establishment of a pulp mill at Fort Frances, Ont., stated that a company, which formerly operated a large flour mill at Montevideo, Minn., and which had lost everything by fire, were thinking of locating in Fort Frances.

Brantford's industrial commissioner has entered into communication with the Stanford Steel Range Co., of Norfolk, Virginia, which is desirous of establishing a Canadian plant. Prospects seem bright for its location here, where there are already several similar factories.

Electrical Notes.

Regina will spend $78,000 for electric light purposes.

Bridgetown, N. S., will instal a new system of lighting.

The municipality of Albert, Man., has voted in favor of a municipal telephone system.

The Dominion Coal Co. will equip its colliery at Glace Bay, N.S., with an electric plant.

The ratepayers of Claresholm, Alta., have passed a by-law to raise $20,000 for a lighting plant.

The Foster Rural Telephone Co., Abernethy, Sask., has been incorporated with a capital of $5,000.

The Central Ontario Power Co.'s offer of power at $7.50 per h.p. to Peterboro will likely be accepted.

Engineer P. W. Southam recommends the purchasing by the Waterloo, Ont., council of the local lighting plant.

The ratepayers of Shelburne, N.S., have decided to instal an electric lighting and power plant at a cost of $30,000.

Hamilton ratepayers carried the Hydro-Electric by-law by a majority of 610 and turned down the Cataract agreement by a majority of 185.

The rural municipality of Wallace, Man., has passed a by-law to raise $20,000 for the construction of telephone lines within the municipality.

The Great Falls Power Co. desires to make a contract with Portage la Prairie for the supply of power at $21 per h.p. for a period of 30 years.

M. Conroy, of Aylmer, Que., representing a power development company on the Gatineau river, has offered to supply Brockville with 20,000 h.p.

McGill University, Montreal, is to instal a large power plant, to furnish steam heat and electric power to all of its buildings. The plant will cost $150,000.

The Seymour Power & Electric Co. want to sell power wholesale to Peterboro. They will be able to develop 4,000 h.p. in August and ultimately 20,000 h.p.

Hamilton city council has accepted the offer of the Hamilton Electric Light & Power Co. to furnish electricity for the illumination of Gore Park until September 30 for $550.

The Toronto Board of Control has awarded the contract for lighting the newly annexed district of Wychwood to the Toronto Electric Light Co. at a rate of $69 per lamp per year.

The Thamesville Telephone Co. has been incorporated with a capital of $10,000. The provisional directors are: W. J. Mitton, Camden; T. Marven, J. Coutts, Thamesville, Ont.

The Canada Mining Co., a company capitalized at 250,000 recently organized by P. H. Moore, of Bridgewater, for the purpose of developing power for mining purposes from the Salmon Falls on the Medway river, N. S.

Fernie city council has accepted tenders for the construction of pole line distribution and machinery, also for the removal of the machinery from Coal Creek and its installation in Fernie, in connection with the municipal electric light system.

Provision is made for additional construction and enlargements, amounting to $4,000,000, to the Canadian Niagara Power Co.'s plant by a bond issue of $25,000,000 authorized by the stockholders of the Niagara Power Co., the parent company of the Canadian Niagara Co.

The Alberta Government has entered into an agreement with the Automatic Telephone Co., Chicago, Ill., to instal automatic telephone systems in East Calgary and Lethbridge. It is understood that similar equipment will be placed in other cities in the province during the summer.

The first units of the great hydraulic power plant at Fort Frances, will likely be turned on early in August next. Orders have been placed for a quarter of a million dollars' worth of machinery, and in addition to this $150,000 worth of electrical apparatus has been contracted for.

The Western Canada Power Co. is the title of the corporation which has taken over the works and assets of the Stave Lake Power Co., Vancouver. The company will have a capitalization of $5,000,000. It is backed by Montreal men among whom are a number of the strongest capitalists in Canada.

The Great Falls Power Co. plans to distribute electrical power to the amount of 180,000 horsepower in Manitoba. They have acquired falls on the Winnipeg River that give a total head of 50 feet. The company has backing to the extent of $600,000. The transmission lines already plotted cover 63 towns.

The Goat River Power & Light Co., Creston, B. C., proposes to construct a power plant on the Goat River Canyon and will furnish electricity for lamps and motors and other purposes. The company also plans to construct an electric railway to extend from Creston to the Goat River, ten miles in length, work on which will commence within a year. R. S. Lennie, of Nelson, B.C., is president.

It is given out on good authority that the settlement out of court in the action against the Electrical Development Co. brought by the Niagara Construction Co. for flooding of its plant at Niagara Falls, consisted of a payment by the Electrical Development people of $15,000. The Construction Co. claimed $109,000, and the Electrical Development Co. offered $10,000, and finally $15,000, which was accepted.

Rodolphe Forget, M.P., who is the moving spirit in a big Quebec merger scheme, which will include electric, gas and street railway companies of that city, with a capital of $6,000,000, when asked for further details as to the new merger, said that it was the intention of the gentlemen in control of the Quebec Street, Power & Light Co. to make it one of the best corporations of its kind in the country.

The electric light superintendent has intimated to the Regina council that unless the new generators which it is proposed to instal are in position by September, it will be necessary to consider refusing to make new connections with the city's lighting system, or else to curtail the street lighting during the early evening hours in the fall, when the load upon the power house plant is heaviest. At the present time the plant is working in excess of its capacity.

D. W. Yates, Hydro-electric Commission's engineer has submitted to the city council of St. Thomas the estimates of the cost of constructing a plant for the distribution of Niagara power. For an entire new plant for all purposes his figures were $83,620, with alternate propositions which would mean the remodelling of the present plant for $82,810. The council decided to accept the former proposition, and will ask the ratepayers to sanction the expenditure.

The directors of the Northumberland-Durham Power Co., have announced that the Minister of Railways and Canals has agreed to grant a lease to the company of the remaining portion of the Healey Falls waterpower controlled by the Federal Government. Development of the power will proceed concurrently with the construction of the Trent Valley canal which passes through the Company's property, and will also facilitate the early construction of the Cobourg, Port Hope and Havelock Electric Railway.

The Manitoba telephone commissioners have completed plans for the season's programme of building and extensions which will mean the expenditure of $750,000 and the addition of 5,000 subscribers to the system in Manitoba. $250,000 will be spent in Winnipeg upon a new exchange for the western part of the city; for the extension of aerial and underground cables, and also the necessary extensions to be provided for the Main Street and Fort Rouge exchanges. There will be $250,000 expended on rural lines, and $250,000 on long distance lines.

Contracts for the construction of the municipal electric light plant at Lethbridge have been awarded as follows: For mechanical draft and economizer to the Polson Iron Works, Toronto, Ont., $6,890; complete piping, Drummond, McCall & Co., Montreal, Que., $14,365; for crane to Mussens, Limited, for $1,700; boilers and accessories to the Babcock & Wilcox Co., Montreal, $25,410; feed pumps to the Canada Foundry Co., Toronto, $730; transformers to the Northwest Electric Co., Calgary, $1,320; electrical equipment to the Canadian Westinghouse Co., Hamilton, $1,449, and to Laurie & Lamb, Montreal, for engine and condensing sets for $18,575.

New Companies.

Canadian National Carbon Co., Toronto; capital, $20,000; to manufacture carbon in all its various forms. Incorporators, B. Osler, A. G. Ross and J. F. H. McCarthy, Toronto.

Bruce Mines Saw Mill Co., Bruce Mines; capital, $60,000; to engage in sawmilling business. Incorporators, F. H. Lawrence, J. L. O'Flynn and G. W. Goodwin, Sault Ste. Marie.

Blangas Co. of Canada, Montreal; capital, $5,000,000; to manufacture gas, electricity and illuminants for light, heat and power. Incorporators, J. A. Jacobs, S. W. Jacobs, and A. R. Hall, Montreal.

Canadian Ensign Co., Hamilton; capital, $100,000; to manufacture the "Ensign Electrical Calculating Machine." Incorporators, E. S. Ensign, and F. R. Hardenberg, Boston, and R. Rocher, Waltham, Mass.

The Northern Light Power & Coal Co., Dawson, Y. T.; capital, $3,000,000; to carry on business as light, heat and power company. Incorporators, E. H. Thurston, London, Eng.; A. Haydon, and W. C. Greig, Ottawa.

The Erindale Power Co., Toronto; capital, $20,000; to carry on business as contractors, and hydraulic and electric engineers. Incorporators, E. S. Edmonson, and H. Waddington, Toronto; and Chas. Holt, London, Eng.

The Sault Ste. Marie Dry Dock and Shipbuilding Co., Sault Ste. Marie; capital $1,000,000; to construct and operate dry docks, marine railways, etc. Incorporators, Jno. O. Boyle, W. H. Plummer and Wm. O'Brien, Sault Ste. Marie.

Gas Items.

The Gas Traction Co., will erect a plant to manufacture gasoline engines in Elmwood, Winnipeg. Cost $75,000.

Glencoe, Ont., is installing a 100-horse-power Hornsby-Stockport suction gas engine unit for street and domestic lighting.

The City Gas Co. is prepared to deliver natural gas in London, just as soon as a proposition that would meet with the citizens' indorsation is presented.

The Calgary Natural Gas Co. has decided to begin work immediately on a second well near their present well, and the order has already been given for the machinery.

The Goold, Shapley & Muir Co., Brantford, installed an 8 horse power gasoline engine at that city's waterworks to replace the windmill wrecked in the storm a few weeks ago.

A number of Detroit capitalists recently visited Sarnia and had a consultation with representatives of the Gas & Electric Light Co., relative to supplying the town with natural gas. It is the intention of the promoters of the scheme to pipe natural gas to Sarnia from the oil and gas fields near Tilbury and deliver it to the local company for distribution to patrons. The cost of bringing the gas to the town would be in the neighborhood of three or four hundred thousand dollars.

Trade Notes.

The Kerr Engine Co., Walkerville, have been awarded the contract for the iron gate valve for the Cobalt Hydraulic Power Co., Cobalt.

Fifteen carloads of engines and threshers, valued at $20,000, were sent out one day recently from the John Goodison Thresher Works, Sarnia.

The Smart-Turner Machine Co., Ltd., Hamilton, have recently supplied the Corporation of Owen Sound, with one of their Centrifugal Pumps.

The Seymour Power & Electric Co., Campbellford, are installing a pair of direct connected motor driven Centrifugal pumps built by the Smart-Turner Machine Co., Ltd., of Hamilton, Ont.

The Banwell-Hoxie Wire Fence Co., Hamilton, have contracted with the Canadian Northern Railway for over 300 miles of wire fencing to be erected along their lines in Alberta and Saskatchewan.

Frederick B. Stevens, manufacturer of foundry facings, foundry supplies, buffing compositions and platers' supplies, Detroit, Mich., and Windsor, Ont., has opened up a warehouse at 256 MacDonnell Ave., Toronto. Rupert C. Bruce, located in Toronto, is Canadian sales agent.

The contract for the engine and dynamo for Kamloops power scheme was awarded to the Canadian Westinghouse Co. and for the boiler and condensor to the Canadian Fairbanks Co. Thirteen companies tendered. It is expected that the new plant will be ready in three months.

The Dominion Foundry Supply Co., of Toronto and Montreal have been appointed exclusive Canadian agents for the Brown Specialty-Machinery Co., Chicago, Ill. This latter company manufactures the Hammer Core machine, several instalations of which have been made in Canada.

Messrs. Edmund Wragge, of Toronto, and C. Beresford Fox have entered into partnership as Civil and Consulting Engineers under the name of Wragge & Fox, at 613 Traders Bank Building, Toronto, and are acting as correspondents of Messrs. Sir Douglas Fox & Partners, London, England.

The cargo ferry barge, Sidney No. 2 brought from New Westminster several cars laden with machinery for the two Grand Trunk Pacific sternwheel steamers being built at Victoria. The machinery was built by the Polson Ironworks, Toronto. There were four large cars laden with machinery, and a flat car carrying a big boiler.

The Falls Hollow Staybolt Co., Cuyahoga Falls, Ohio, established agencies in Canada for the sale of its products in the territory west of Lake Superior with the Brydges Engineering & Supply Co., 249 Notre Dame Avenue, Winnipeg, and with Mussens, Ltd., 299 St. James Street, Montreal, for the sale of its staybolt material in the territory east of Lake Superior. The company has appointed H. J. Skelton & Co., Royal London House, Finsbury Square, London, E.C., England, as its representative for the British Isles and India.

Peat for Gas.

A contract has been awarded for the construction of an experimental plant at Ottawa to be used by the Mines Branch, under Dr. Haanel, for the purpose of ascertaining the value of peat in making producer gas. It is held that peat can be made for smelting and other fuel purposes. The station will cost about $13,000. The contract has been given to Doran & Devlin, Ottawa.

Bearing the World's Load.

This is the title given to a book issued by the Chapman Double Ball Bearing Co., Toronto, describing the various applications of the Chapman double ball bearing. The development of the principle of double ball bearings and the uses are well illustrated. Among the machinery where double ball bearings are used to reduce friction are line-shaft and counter-shaft bearings, motors, waggons, machine tools, street cars, shop trucks, mine trucks, automobiles, etc. The story is told in a way that should interest every proprietor superintendent, foreman and master mechanic.

Algoma Steel Co. Enlarge.

The Algoma Steel Co., Sault Ste. Marie, Ont., have placed a contract with Mackintosh, Hemphill & Co., Pittsburgh, for an 18-in. and 12-in. combination structural and merchant mill. The equipment consists of continuous heating furnaces with gas producers, coal and ash handling machinery, an 18-in. and a 12-in. three-high mill (to be driven by electric motors), tables, cooling beds with transfer machinery, straightening machine, saws and shears. There will be electric overhead traveling cranes in the main building, and every provision is to be made for the economical handling of the varied products which it will be necessary to manufacture in order to meet the demands of the Canadian market.

Advertising Welland.

The following from the Welland Telegraph of June 11 shows how the advertising in Canadian machinery is read:

"The Advertising Committee of the Board of Trade began work this week on the finest publication that has yet been issued by the town.

"Wm. Fitzsimmons, Industrial Commissioner of the Grand Trunk Railway, and R. W. Long, District Freight Agent, were in town on Tuesday to call on B. J. McCormick. Both gentlemen expressed themselves as being well pleased with the publicity campaign that had been carried on by Welland and agreed to place the services of their department at the disposal of the Board of Trade. They will be back again shortly to spend a day in town. In the meantime they have directed that the photographer of their department be sent to Welland to take views of industrial interest.

"A Chicago steel manufacturer who was in town a few days ago, spoke very highly of the advertisement carried by the Board of Trade in Canadian Machinery. It was at the big convention in Cincinnati that the two page yellow insert caught his eye."

Cobalt Power Development.

Mining in Cobalt will be simplified to a great extent when the Cobalt Hydraulic Power Co. is able to drive drills, with air pressure from Ragged Chutes, on the Montreal River.

Nine miles of 26 inch pipe will be required to bring this air flow into camp and 12 inch loop line will start at the La Rose bridge, circle the entire town and join the main piping. In addition to the loop there will be branch lines, by way of the Colonial and Nova Scotia and another line will run to Kerr Lake. At Cobalt there will be about 110 lbs. pressure and will be charged for per that pressure.

To the larger consumers the air will be supplied by meter, the terms of which will be 25 cents per thousand cubic feet of compressed air at 100 lbs. pressure, which will be measured by the meter similar to the system used by gas companies in the big cities.

To the small consumers, who will pay for pipe connection from premises to main pipes, the following rates will be charged, per drill per 10-hours shift: 1 drill, $5; 2 drills, $4; 3 drills, $3.50; 4 drills, $3.13; 5 drills, $2.80; thus varying from $5 per shift per drill to $2.80 per shift per drill for five drills or more.

Five million pounds of pipes, bolts and other material will be required to carry out the scheme. A great deal of this material was received from Germany.

The transmission line for the electric power from Fountain Falls will be ready for use shortly. The rates charged will be under 25 h.p. 3c. per kilowatt hour, as figured by Watts meter.

For 25 h.p. and under 50 h.p., 2c.
Over 50 h.p. and under 200 h.p., 1¾c.
Over 100 h.p. and under 200 h.p., 1 5-10c.
Over 200 h.p. and under 300 h.p., 1 4-10.
Over 300 h.p. and under 400 h.p., 1 3-10.
Over 400 h.p. and under 500 h.p., 1 2-10c.
Over 500 h.p. will be 5c. per kilowatt hour and in addition to these rates there will be a charge of $1 per month per horse power on the rated capacity of the installed motors. The bills to be reduced by a discount, having a maximum of 13 per cent. based on the load factor.

Point du Bois Generating Station.

Sealed tenders on prescribed forms addressed to the Chairman of the Board of Control, Winnipeg, Canada will be received at the office of the undersigned up to 11 a.m. on Monday, August 2nd, 1909, and Monday, August 16th, 1909, as below, for the manufacture, delivery and erection of the hydraulic, electric and auxiliary equipment of the Municipal Generating Station on the Winnipeg River.

The specifications and plans will be on exhibit after June 15th at the office of the following:—Engineering, London, Eng., Engineering News, New York City, Smith, Kerry & Chace, Toronto, Wm. Kennedy, Jr., Y.M.C.A. Building, Montreal, and Smith, Kerry & Chace, Winnipeg.

Copies of the instructions to bidders, of the plans, specifications and form of tender, may be obtained from the Power Engineer's office, Carnegie Library Building, Winnipeg, and at the office of "Engineering", London, Eng., after June 15th, but the application for these must be accompanied by deposit, as listed below, for each section applied for. This deposit will be returned to the applicant only upon the return to the Power Engineer's Office of the plans and specifications in good order.

Each tender must be accompanied by a certified cheque payable to the city treasurer for the sum called for in the corresponding instructions to bidders, which cheque will become forfeit to the corporation in the event of the successful tenderer refusing or neglecting to execute a satisfactory contract when called upon so to do.

Tenders will be received upon the following sections:—

*A.—Specifications Nos. 5 and 6 respectively for 5200 h.p. turbines (5), 450 h.p. turbines (2), deposit $250. *This tender returnable August 2nd, 1909.

B.—Specifications Nos. 7, 8 and 11, respectively, for 3000 K.W. Generators (5), 250 K.W. Generators (2), switching and accessory apparatus. Deposit $250.

C—Specification No. 10 for Step up Transformers (6). Deposit $100.

D.—Specification No. 12 for light, heat and power systems. Deposit $50.

E.—Specification No. 23 for protective apparatus. Deposit $50.

F.—Specification No. 25 for electric travelling cranes (3). Deposit $50.

G.—Specification No. 27 for auxiliary apparatus. Deposit $100.

As an alternative, tenderers may include or group together one or more of the above section providing that they have also tendered for the individual sections of such grouping.

An Appropriate Hanger.

The Lincoln-Williams Twist Drill Co., Taunton, Mass., have issued a pretty hanger, which they are mailing to their friends. Above an arm clothed in the army blue, holding a glass, floats the United States flag with the words "July 4th.: A Toast—Gentlemen: 'Our Country.'" The whole idea is cleverly worked out and very appropriate.

Big Shipbuilding Plant.

The Polson Iron Works Co., have applied to the city of Toronto for a lease of fifty acres of land at the east end of the bay, near Keating's cut, and it is their intention to enlarge and improve their plant, which is now situated at the foot of Frederick Street. A general shipbuilding plant will be installed on a large scale, and in connection with it there will be a floating drydock capable of taking in the largest of the lake-going vessels. The drydock is to be built in sections, and when the Welland Canal is deepened, which is shortly to be done, the drydock is to be further enlarged.

Canadian Westinghouse Busy.

The Canadian Westinghouse Co., Hamilton, are preparing to supply their part of the Hydro-Electric power scheme equipment, the contract for which was devided between the Canadian General Electric and the Canadian Westinghouse. The latter company will completely equip the main station at Niagara Falls, the main switching station at Dundas, the sub-stations and protective apparatus. Work on the apparatus is being started at once and will extend over ten months. The Canadian Westinghouse expect to increase their staff at an early date to take care of this contract and others that are on hand.

Manchester Civic Gas Plant.

Municipal ownership of the city gas plant has been proven to be not only a profitable undertaking for Manchester, England, but economical for the consumer as well. The city's profits since the works were taken over 25 years ago, have been $6,750,375, while the price of gas in Manchester district at present is only 55 cents per thousand cubic feet, according to a report to the Bureau of Manufactures, from United States Consul Howe. To illustrate the growth of the business, it is stated that the producing capacity of the works is 26,900,000 cubic feet per 24 hours, against 13,000,000 in 1883. An investment of $13,382,875 capital is represented. Manchester has a population of about 600,000, being about the size of Boston and St. Louis.

Another Big B.C. Power Concern.

At last it appears as if there will be something done with the proposition of the Stave Lake Power Company on Stave river, about thirty miles from Vancouver. For some years past, development of this waterpower has gone on slowly, but it is now announced that work will be active since eastern Canadians are to put up $2,500,000. C. H. Cahan, a leading lawyer of Montreal and Halifax, A. R. Doble and A. M. Aitkens, of Montreal, are spending a couple of days at Stave river, looking over the property. Just what this will ultimately mean to the lower mainland of British Columbia is difficult to prophesy. With other and cheaper power producing methods coming into vogue, by the time this is ready for operation, waterpowers may have taken second place. This, however, is only supposition. Still, the situation in Vancouver and vicinity will be an interesting one with two companies in the field. The B. C. Electric Company now controls lines of railway in Vancouver and New Westminster, and suburban and interurban lines, including the one under construction to Chilliwack. It controls the electric lighting and gas franchise in Vancouver, and the electric lighting in and around both cities. It also supplies power, all of which comes from the large plant at Lake Buntzen, which is to be so improved as to give much more power. With such a hold on the communities, it will be a hard job for another company to get into the game. It has been stated that the Stave Lake Power Company will make a specialty of supplying power for industrial purposes, and in this line there will be considerable room with the number of large and small enterprises that are being established. With more companies in the field, the better it should be for the manufacturer, who can stand all the cheap power he can get.

Canadian Machine Tool Markets

THE METAL SITUATION.

Fluctuating movements have characterised the primary markets. Tin has gained and lost ground, and it cannot be said that the speculative movement in London has inspired confidence. Consuming conditions in America are not favorable to a staple market, and it all depends upon the bull operators in London whether tin keeps up. The speculative copper movement in the Old Country is not helping New York quotations, and the weakness apparent in London has caused figures to decline across the border. Consumption is on the dull side, and the larger interests seem to be well provided with metal for the time being. Lead has been on the quiet side with a tendency to weakness. There is plenty of metal on the market. Spelter is still very firm both in London and St. Louis. Consumption is good, and heavy Continental business is reported. Heavy shipments of galvanized sheets from the Old Country to South America and other places have taken place. The iron and steel markets in the Old Country are reported to be somewhat more active. Cleveland warrants are quoted at 48 shillings and threepence. Production in iron and steel in the States continues to increase steadily. A lot of the material is going into stocks, but there is no doubt as to the improving consumption. Prices generally are firm, with an advancing tendency.—F.J.A.

TORONTO.

The demand for machine tools during the past month has not been as brisk as was expected though trade generally is on the increase as evidenced by the trade reports and customs returns. The steady expansion of May led the dealers to believe that the growth would continue. The smallness of the orders placed during the month of June is only a lull before renewed buying. The railroads are proceeding with construction work and orders for machine tools are sure to follow. Some of the car shops and railroad supply shops, especially those in Eastern Canada are very busy filling orders but the increased mileage of tracks being laid this summer will require more rolling stock than is being manufactured at the present time. When the railroads place expected orders there will be increased demand for machine tools.

The demand for power machinery is satisfactory, the volume of business for all lines being quite heavy. There is a growing demand among municipalities for water pumping and lighting plants, which has stimulated the trade in power lines. The large electrical manufacturing companies of Ontario are busy and anticipate a still greater briskness which will necessitate increasing the working staff.

There is a fair volume of orders for light gray iron castings and nearly all the jobbing foundries are very busy. The brass foundries, likewise, report a good demand for brass and bronze castings.

WINNIPEG.

The local supply houses are receiving large orders for the heavy machine tools. In various parts of the West machine repair shop are opening up, and this has stimulated the trade in smaller machine tools. The extensive building being done in the city has greatly benefited the machine trade, and strengthened the smaller tool market. The general improvement in the trade has made the market firmer in all lines. Wood working tools, which advanced a few weeks ago, continue firm, and it is expected that the small steel tool market will gradually develop, and be put on the same basis as that of larger manufacturing centres. A good market, however, may be always depended upon for heavy tool specialties.

Tenders are being called by the secretary of the public works department for the supply and consttuction of balanced self-operating hydraulic sluice valves and connected machinery for the St. Andrew Lock at Lockport, Manitoba. Plans and specifications may be seen in the office of A. R. Dufresne, Winnipeg, and in the government engineer's office at Lockport. Tenders close on June 28.

The contract for supplying and installing the electric lighting fixtures in the Fort Garry depot has just been let to the Robert Mitchell Co., Ltd., of Montreal and Winnipeg, and is believed to be the largest contract of this kind ever secured by a Canadian firm. It covers all chandeliers and lights, exclusive of the wiring, which is covered by a separate contract, and involves a sum in the neighbothood of $30,000.

A number of machine men were in conference at the Royal Alexandra recently. Among the firms represented at the meeting were the Sawyer and Massey Company, the American Abell Company and the George White Sons, Company, Limited, of London, Ontario. It was stated that the questions discussed were matters of quite minor importance in connection with the machine business in the west.

The Manitoba Rolling Mills Co. may remove their plant from this city. A new site at St. Boniface may be selected and the company will proceed at once with the work of transferring the plant, which will be quadrupled in size and capacity.

The improvements planned by the company not only include the extensions to the present plant to four times its capacity, but they also contemplate the addition of a steel mill and possibly a puddling plant. Mr. McElroy is president of one of the largest horseshoe manufacturing concerns in New York State and when the western Canada business warrants such a step a horseshoe plant will also be put in. The present extensions will give accommodation for at least 400 men, a large number of whom are highly paid, for it is designed to run day and night, with double shifts on each, working the two trains of rolls to their full capacity. The work will cost about $250,000. The steel mill and other additions will more than double the number of men required.

The mineral resources of Riding Mountain, Manitoba, are about to be developed by a syndicate which has purchased the mineral rights of many of the settlers. Samples taken at a depth of 300 feet have been reported on favorably by the head office of the syndicate and it is the intention to sink a shaft 1,000 feet when it is confidently expected that oil and coal in paying quantities will be found.—L.C.H.

VANCOUVER.

An industry of direct importance to the iron trade of Vancouver is the establishment of the drydock in the east end on Burrard Inlet, on the property owned by the Ross & Howard Iron Works. Nicol Thompson, who has had this matter in hand for some years, has returned from Ottawa and announces that his interview with the government was successful and that a subsidy is to be granted of three per cent. on the total cost of the dock for twenty years. As the estimated cost of construction will be one and three quarter million dollars, this means something like $37,500 per annum. Mr. Thompson states that construction will proceed as soon as the working out of the necessary details will allow, and that he will visit England shortly to float the scheme. The dock will be one of the first of its kind on the Pacific coast to be a pontoon floating dock of steel, 500 feet long and capable of accommodating vessels of 10,000 tons. The terms of the subsidy necessitates the construction within two years, and the promoters are certain the time limit will not be exceeded. The dock is a necessity with the increase of shipping, for all the ways are full and vessels have to wait their turn.

H. K. Dutcher, civil engineer of this city, has returned from Kamloops, where he spent several days in connection with the power scheme being instituted there, and when the tenders for the supply of the machinery were opened. The contract for the engine and dynamo was awarded to the Canadian Westinghouse Company and for the boiler and condensor to the Canadian Fairbanks Company. Thirteen companies tendered. It is expected that the new plant will be ready in three months.

At the last meeting of the Fire and Police Committee, tenders were opened for 5,500 feet of rubber hose for the fire department. The tenderers were the Canadian the Durham, the Dunlop and the Vancouver Rubber Companies, the prices being very even, running from $1.10 ans $1.05 for the first grade, to 95c. for the second. Five minutes were allowed a representative of each company to address the committee. The chief of the fire department recommended the Eureka at $1.10. The awards were: Vancouver Rubber Company, 3,000 feet Eureka; Dunlop Company, 1,000 feet Dunlop; Canadian Rubber Company, 1,000 feet Keystone; the Durham Rubber Company, 500 feet Magnet. The tender of the Vancouver Rubber Company to supply couplings at $2.44 per set was accepted.

Six carloads of machinery arrived in town this week consigned to the Victoria Machinery Depot, Victoria, B.C., to be installed in the Skena river steamer being built by this ship building firm.

CATALOGUES.

OILDAG—From Acheson Oildag Co., Niagara Falls, N.Y., catalogue and price list of oildag paste for engines.

EXHAUST FANS—From Crocker-Wheeler Co., Ampere, N.Y., bulletin 112 describing their ventilating fans with motor attached. These are for use in offices, churches, factories, etc.

INSTRUCTION SHEET.—From Gisholt Machine Co., Madison, Wis., illustrating and describing the method of finishing street car motor pistons on a Gisholt lathe.

INDUCTION MOTORS—Bulletin No. 102 from the Packard Electric Co., St. Catharines, Ont., describes in detail the Packard Electric induction motor adopted for all classes of industrial drive.

MICROMETERS.—From Elliott Bros., 36 Leicester Sq., London, W.C., England, booklet describing their line of micrometers. This line has a special arrangement of figures around the measuring head so that each division is numbered.

VALVE STEMS.—A neat little booklet from the Electric Welding Products Co., Cleveland, Ohio, illustrating and describing the electrical welded nickel steel alloy valves, and carbon steel stems. It also includes reference to other electrically welded products.

FINISHED STEEL BOLTS AND SCREWS.—Booklet from the Electrical Welding Products Co., Cleveland, describing the making of bolts and screws by electric welding and the welding of brass heads on a steel body for electrical work or ornamental fixtures.

CASE-HARDENING.—A twenty page booklet from W. H. Palfreyman & Co., 17 Goree-Piazzas, Liverpool, gives some valuable hints about case-hardening, what to use and how to do it. The book contains an advertisement for Palfreyman's hydro carbonated bone black for case-hardening.

MILLING MACHINES—Catalogue, Edition D, 96 pages printed in English, French and German, containing descriptions of milling machines, cutter and tool grinders, vertical, horizontal and tapping machines, drill lathes, gang drills, etc. The methods of doing work on the tool grinder are fully illustrated and instructions given.

PIPE CUTTING AND THREADING MACHINERY.—A 36 page catalogue from Curtis & Curtis Co., corner Railroad Ave. and Gordon St., Bridgeport Conn., manufacturers of the Forbes' Patent Die Stock. The pipe cutting and threading machinery is described and illustrated and prices are given for the various sizes of hand and power machines.

GRAVITY MOULDER.—Catalogue, M—9, from A. Buck's Sons Co., Elizabethtown, Pa., describes fully the operation of Buch's No. 2 Gravity Moulding Machine. The operation of this machine is fully described and illustrated. Buch's jar and squeeze moulding machine is also described and illustrated. These machines are manufactured in Canada by Ontario Wind Engine & Pump Co., Toronto.

TOOLS AND TOOL HOLDERS.—Catalogue No. 17 from Armstrong Bros., Tool Co., 104-124 N. Francisco Ave., Chicago. Tools are described and illustrated for turning, boring, planing, slotting, threading, etc. Among the new tools are a drill drift, Packer ratchet drills, improved drop forged "C" clamps with long hub for screw, short ratchet drill and quick action drill vise.

GRINDING WHEELS AND MACHINERY—The Norton Co., Worcester, Mass., have just issued a handsome and complete catalogue of alundum grinding wheels, grinding machinery, India oil stones, rubbing and sharpening stones, etc. It contains 167 pages, is printed on coated paper and illustrates various sizes and shapes of wheels for different grinding machines on the market.

MILLING MACHINES.—Catalogue No. 17 from Ingersoll Milling Machine Co., Rockford, Ill., well bound, 132 pages on coated paper. Their lines of milling machines are fully described and illustrated. Illustrations are also given of numerous instalations and of methods for milling different classes of work on the machine. The Ingersoll Grinder is described and details of operations are shown.

A MODEL FOUNDRY.—Booklet from the Whiting Foundry Equipment Co., Harvey, Ill., containing two plans of foundries. An outline is given of the general scheme followed in planning foundries, which of necessity will be modified to meet local conditions of ground space. Illustrations and brief descriptions are given of the latest designs and installations of equipment covering almost the entire line of Whiting products.

FIREBRICK—From Harbison-Walker Refractories Co., Pittsburg, Pa., illustrated catalogue for 1909, 158 pages, coated paper, gilt edges, leather bound. Silica, magnesia, chrome and fire clay brick and various refractories are fully described. The catalogue is well illustrated and the construction of fire brick linings in cupolas, boiler settings and various furnaces is shown. The catalogue will be sent to foundry foremen applying for it.

LATHES.—Catalogue from New Haven Mfg. Co., New Haven, Conn., manufacturers of standard and improved lathes from 18 in. to 65 in. swing, in lengths from 8 ft. to 36 ft.; planers 24 in. to 60 in. square, up to 20 ft. in length and slotters with 10 in. stroke. The catalogue is tastily gotten up, well illustrated and shows the details of construction of their lathes. The catalogue is an excellent treatise on the New Haven machinery.

DRILLS AND SOCKETS—Catalogue of "drills and sockets that are different," from the American Specialty Co., Chicago. The drills and sockets described are radically different from those in common use for the past few years. The Collis line of high speed drills, flat and flat twisted drills are described. This latter drill has been fitted with a Morse taper shank and requires only an ordinary chuck. The "Use-Em-Up" drill sockets are described and prices are given for the different drills.

CRUCIBLES.—Catalogue on coated paper from Jonathan Bartley Crucible Co., Trenton, N. J., showing various types and sizes of graphite crucibles and specials used in foundry use. There are other products described such as graphite phosphorizers, crucible covers, stirrers, skimmers, etc. The second part of the catalogue is devoted to instructions for the proper handling of crucibles. The third part is devoted to graphite and mining in Ceylon. The catalogue is interesting and instructive reading.

BOOK REVIEWS.

THE SLY PATHFINDER.—Published by W. W. Sly Mfg. Co., Cleveland.

This is the first issue of this publication and was distributed among foundrymen previous to the convention. It is full of information in regard to foundry practice and contains some witticisms that at once engage the attention of the reader.

MILLWRIGHTING—By James F. Hobart. 401 pages 6 x 9 inches. 141 illustrations, published by the Hill Publishing Co., 503 Pearl St., New York. Price $3.00 net.

Millwrighting includes the laying out of new buildings or extensions, the putting in of foundations for machinery, the use of the transit for locating definite points, putting up shafting and aligning it, setting up new engines or machinery and other work of a similar nature.

The need of a man in a shop who could attend to the work mentioned has often been keenly felt in many manufacturing establishments. This work covers the work thoroughly and should be included in the library of every superintendent or master mechanic who has work of this nature to oversee. All points are carefully explained, the mixing of concrete for foundations, ways of testing it, framing of buildings, making of molds and batters for concrete foundations, strength of materials needed and used, laying out of shafting, use of belts and the power they should give, handling heavy machinery by tackle and skids, setting of steam boilers, engines, etc.

AUTOMATIC SCREW MACHINES AND THEIR TOOLS.—By C. L. Goodrich and F. A. Stanley. Hill Publishing Company, New York. Cloth, 255 pages, 6x9; 284 illustrations, 21 tables. Price, $2 net.

This book is intended as as a treatise for the use of toolmakers, screw-machine operators, tool designers and others connected with the construction and manipulation of automatic screw machines and turret lathes. It is arranged in two parts: Section 1 illustrating the various types of automatic screw machines and their tool equipments, and section 2 dealing in detail with the construction and use of screw-machine tools. In addition to detailed descriptions of the different types of "automatics" and "semi-automatics," section 1 explains fully the methods of laying out cams for the Pratt & Whitney and Brown & Sharpe machines, the cam adjustments on the Cleveland automatics, etc. The chapters on camming contain, besides diagrams, numerous tables for facilitating the operation of laying out the cams. A chapter on speeds and feeds is included in the book and should be of service when laying out cams and setting up machines, as the tables in this chapter cover speed and feed rates for all kinds of screw machine tools operating on the ordinary classes of material. Including single-spindle, double and multiple-spindle, magazine and semi-automatic machines, nineteen machines of the following makes are illustrated in eighteen chapters of section 1: Acme, Alfred Herbert, Brown & Sharpe, Cleveland, Gridley, Potter & Johnston, Pratt & Whitney, Prentice, Spencer, Universal. The illustrations show in addition to the machines themselves, turret and cross-slide tools, special attachments, countershaft diagrams, etc.

TAPER GAUGE FOR CROSSHEAD KEYS.

By Nene.

Locomotive crosshead keys are generally supposed to be of a standard taper (1 in. in 16 in. or 1 in. in 20 in.) but owing to subsequent fitting of keys, for repairs, etc., they lose their original

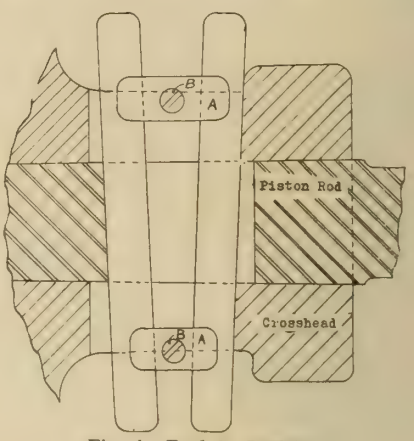

Fig. 1.—Tool in Position.

taper, and ultimately the only way to ascertain the correct taper, is by careful measurement of each head and piston rod after the head has been drawn on fairly tight with the old key.

The purpose of this tool is to accurately measure the taper, and furnish dimensions for shaping down the new key. Fig. 1 shows the tool in position in crosshead and piston rod. it also shows the general construction of the tool, and manner of using it.

The side pieces are held by friction, between the four straps AAAA, the pressure being regulated by the screws BB, and the tool is adjusted by simply tapping it, same as for adjusting common stiff joint calipers.

After tool has been properly adjusted to fit taper as shown in Fig. 1, tool is

Fig. 2.—End View.

removed and will furnish correct dimensions, as to taper and width, for roughing out new key on shaper or forge, and which should require very little fitting afterwards.

Mechanics accustomed to this line of work will readily appreciate the simplicity and the adaptability of this tool.

Fig. 2 is an end view of this tool, to more clearly show the construction of the tool.

Material for tool is about 5-32 in. thick.

Elevating and Conveying Machinery

WE ARE PREPARED

to furnish an economical and efficient system for every requirement for handling brick and package materials.

Automatic Gear Cutting Machine

CAPACITY

Spur and bevel gears to 18″ diameter, 4″ face, 4 diametral pitch in cast iron, 5 diametral pitch in steel.

ACCURACY OF FINISHED WORK, ECONOMICAL OPERATION and CONVENIENCE OF CONTROL are pronounced features of this machine.

Careful attention is given to the design and construction of each part in order that the machine may be well adapted to the most severe service.

Changing of work is quickly and easily accomplished, thereby facilitating a large economical production.

The various levers, handwheels and dogs are conveniently located where the operator is enabled to have full control from the front of the machine.

THREE CLEVELAND TOOLS POINTING TOWARDS ECONOMY

Paradox Adjustable Reamers

The Life of a Paradox Reamer is Nine Times that of an ordinary reamer. (A fact proven by actual statistics covering a long period of trial.)

Compare its price with that of your nine solid reamers and there can be no doubt of

ECONOMY No. 1

Perfect Double-Tang Sockets

A simple, strong and absolutely effective cure for tang trouble in taper shank driving. Uses up your broken tang drills. Doubles the life of your new drills.

Compare its cost with that of your drills thrown away because of broken tangs.

ECONOMY No. 2

Peerless High-Speed Reamers

Peerless Reamers can be run two or three times as fast as carbon steel reamers.

They are tougher and outlive a Solid High-Speed Reamer.

Figure up the labor and time saved on any big job, and you have

ECONOMY No. 3

Be sure you get the "P" it means Economy

"BUTTERFIELD" TAPS DIES and REAMERS

Catalog mailed on request.

Butterfield & Co.,

ROCK ISLAND, QUEBEC.

New Standard

A New Standard

Old Standard

The "Stantool"

SHORT TAPER SHANK WITH HEAVY TANG

Modern methods of drilling demand a stronger construction of shank and tang than the old standard. The "Stantool" shank meets this condition. It has much greater strength, offers a positive drive and overcomes the breakage which has heretofore been a serious difficulty.

"Stantool" Sockets and Sleeves

fit the new standard shank and are made to fit the taper spindle of all makes of drill presses.

THE STANDARD TOOL CO.

Cleveland, Ohio 94 Reade St., New York

"Atlas" Worm Gear Chain Blocks

With Automatic Brake

ESSENTIAL FEATURES:

1st. High return in efficiency for power expended.

2nd. Safety in supporting the load at any height.

3rd. The principal parts are constructed of steel and wrought iron, thus reducing the possibility of breakages to a minimum.

The "Atlas" is a High-Grade Block at a Moderate Price

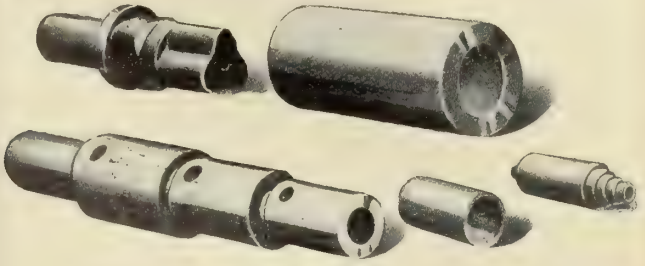
Derrer Oval Taper Drill Sockets

Give an Absolute Perfect Positive Drive



The Derrer Oval Taper Drill Socket and some of the products.

The DERRER OVAL TAPER DRILL SOCKETS solve the perplexing problem of drive for drills.

The DERRER OVAL TAPER DRILL SOCKETS are simplicity itself, and enjoy the following points of superiority over all others :

From one-third to one-half shorter.
No tangs to twist off.
No set screws or keys.
Positively no slipping or binding.
All our work interchangeable.
Absolutely true running drills.
Drill breakage reduced to a minimum.
Drill accounts reduced 25 to 50 per cent.
25 to 50 per cent. more work through your drill presses.
Chuck and socket account reduced 75 to 90 per cent.
A drill chuck or socket that is practically indestructible.
Gives an absolute perfect positive drive.

Machinery Wanted and For Sale

It will pay you to watch our condensed column each month. There are many money-making propositions brought to your attention here. You may find just what you are looking for.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c. a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

AGENTS WANTED.

TO MACHINE TOOL AGENTS — DRILLING Machines — British firm, specialising entirely upon manufacture of Drilling and Boring Machines of highest class for high speed duty, is open to appoint sole agent for Canada. Agents of good standing, preferably having showrooms, are invited to correspond. Must be sound salesman, able to sell profit-making tools on their merits as higher productivity machines, as being best class and superior materials they cannot be sold purely on price. Address to William Asquith, Ltd., Machine Tool Makers, Halifax, England. (8)

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

MACHINERY WANTED.

BOILER WANTED—40 h.p. horizontal tube. Must be in first class condition. State full particulars. Imperial Extract Co., Toronto. (6)

D. MAXWELL & SONS, St. Mary's, Ont., want second-hand air compressor in good condition. Belt driven, with capacity of about 100 cubic feet free air per minute.

SITUATIONS VACANT.

WANTED—Two experienced machinery and mill supply salesmen. Applications to be made by letter only, with references, to the Canadian Fairbanks Co., Ltd., Toronto.

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

MACHINERY FOR SALE.

FOR SALE—One new Jacques & Son 45-inch paper cutter, latest improved pattern. Reasonable price for cash or short credit to responsible party. Tolton Bros., Ltd., Guelph, Ont. (6)

POSITION WANTED.

CIVIL ENGINEER, A.M.I.C.E., London, desires position with manufacturing firm. Specialist in machine tool design, jigs, fixtures, etc., modern methods for rapid production. Ten years in automobile and marine works. First-class mechanic and draftsman. Used to handling foremen, etc. Address Box 87, CANADIAN MACHINERY, 10 Front St. East, Toronto. (6)

OIL ENGINE FOR SALE.

NINE Horse Power New Campbell Oil Engine, Electric Lighting type. Cheap. Most economical engine for small plant. Jones & Glassco, Montreal. (tf)

FACTORIES FOR SALE.

IN the growing town of Welland, Foundry, Machine Shop and Carpenter Shop, with engine, boiler and line shafting; blacksmith shop, boiler shop, pattern and other storehouses. Welland has cheap electric power, natural gas, sewers, fine railways and water transportation on Welland Canal. Apply M. Beatty & Sons, Welland, Ont.

VALUABLE Manufacturing premises in the town of Galt—Building is of stone, three storeys, equipped with boiler, heating and lighting pipes. Immediate possession. Apply to C. R. H. Warnock, Galt, Ont.

MISCELLANEOMS.

LIVE BUSINESS MEN insist that their business correspondence be typewritten. Keen, progressive merchants find personal typewritten letters bring the best advertising results. They are secret, individual, powerful business getters. The Light Touch. MONARCH is especially attractive to the merchant Write for interesting literature. The Monarch Typewriter Company, Limited, 98 King Street West, Toronto, Ont.

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employee's time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Limited. Office and factory, 27 Alice Street, Toronto. (tf)

ELLIOTT-FISHER STANDARD Writing-Adding Machines make toil easier. Elliott Fisher Limited, 513, No. 83, Craig Street W., Montreal, and 129 Bay Street, Toronto.

CUT DOWN YOUR PRINTING BILLS one half by installing a "Writerpress." Your office girl or boy can with it print your circulars, price lists, etc., at the rate of 1500 to 2000 copies per hour. Best machine ever made for printing facsimile typewritten letters. Prints from printers' type, half-tones, etc. Retail stores could greatly increase their business by using a Writerpress to run off circulars and letters, sending them out to their customers and probable customers announcing special sales, etc. Send for illustrated catalogue and samples. The Canadian Writerpress Company, 33 John St. South, Hamilton, Ont. (tf)

NOTICE!!—Users of Pitner Gasoline Lamps are warned against being induced to purchase parts of other makes of lamps to be used on the Pitner. The most vital part of any lamp is its generator and the Pitner Generator has been granted a patent in Canada, the United States and other countries, on the principle of its improved method of generating gasoline vapour. Supplies and parts for the Pitner Lamps can be received by return mail by applying to our representatives or direct to THE PITNER LIGHTING CO., Limited, 36-38 Lombard St., Toronto, Ont. (tf)

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling, and greatly facilitates the loading of cars, drays, etc., and for handling goods in and about the warehouse and factory reduces the cost of labor because far less warehouse help is required. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley St., Toronto. (tf)

BABBITT METALS

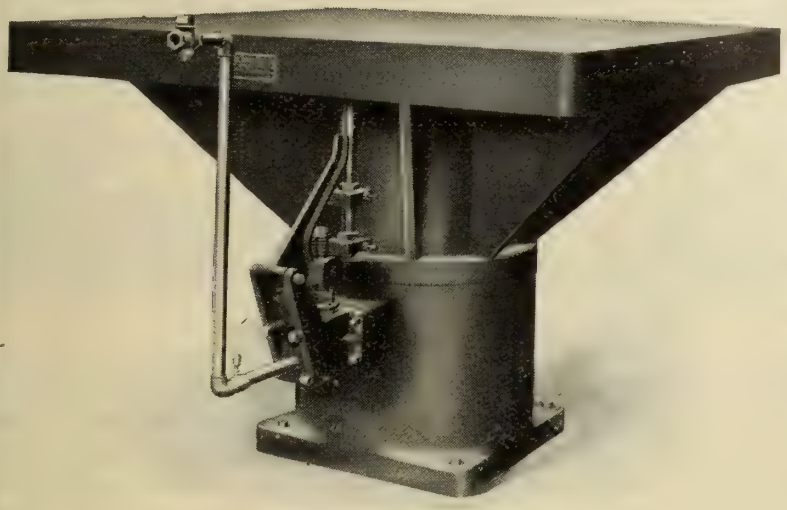
FOR ALL PURPOSES

LUMEN BEARING COMPANY

BUFFALO TORONTO

Tabor Jarring Machine

Saves nearly all the ramming time.



Tabor Jarring Machine.

The Tabor Jarring Machine consists of four parts : i.e. valve, platen and cylinder, piston and anvil.

Rams with fewer blows than any other type.

Operating valve so constructed as to eliminate air cushioning.

A blow is struck for every depression of a hand lever.

The length of stroke can be varied to suit conditions.

Built to handle flasks weighing up to TEN TONS.

Tabor Hinged Machine

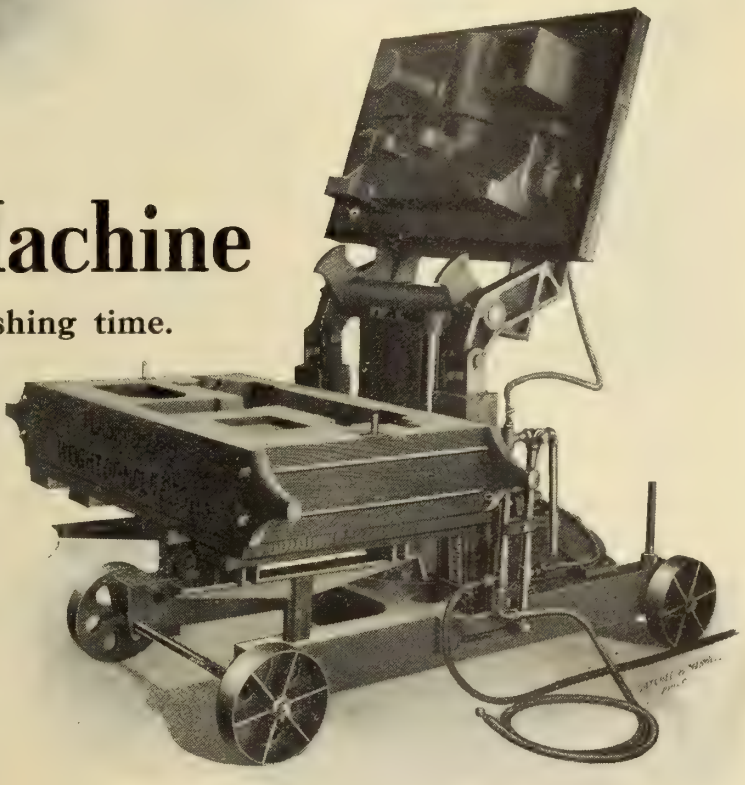
Saves pattern drawing and finishing time.

The Tabor Hinged Molding Machine is designed to handle a class of work here-to-fore not adapted to machine molding on account of hanging sand.

Adapted to molding large patterns where a limited number of castings are required.

Facilitates rapid changing of pattern boards.

Is essentially a machine for drawing the pattern and saving the time usually consumed in making the parting and finishing the mold.



Tabor Hinged Molding Machine. Power Turn-Over and Power Draft.

By combining the two machines the production of complete molds can be increased from three to ten times, depending upon the nature of the work, as compared to floor work by hand. This machine is capable of handling flasks weighing up to 4,000 pounds with 80 pounds air pressure.

Order on "Trial and Approval"

An actual Saving of 50% over old methods in Fuel, Labor, output and Crucibles is accomplished by MONARCH, MODERN, ORIGINAL MELTING FURNACES.

Melting Position

Cuts show the "STEEL-HARVEY" Crucible Original Tilting Furnace for use in Railroad Shops, Steel, Iron and Brass Foundries, Boiler and Bridge Shops, etc. It is the best and most economical furnace on the market for melting Copper, Brass, Bronze, Nickel, Silver, Gold, "Cyanide Precipitate," Ferro-Alloys, Iron, Steel. This furnace is so simple that one man in a foundry can easily operate several of them after watching our demonstrator. The fuel used may be either oil or gas and air. No coke, coal or ashes. No loss of metal in the pit as heretofore. Less handling of the Crucible. Furnace can be instantaneously started and shut off.

Platers' and Polishers' Supplies

I Am Looking For Men

with their eyes wide open to the fact that where others have made a success, there is more than a fighting chance for them if they follow plans already proven successful.

Nearly every foundryman, everywhere, makes cores. I am supplying some of the most successful foundries in the entire country with STEVENS' CARBON BLACKING, used as a core wash, and they wouldn't buy it if it was not the best. They tried a barrel or two first, and now they buy in carloads.

It gives any hollow casting a smooth inside. It requires only common everyday water when mixed—you need not use molasses; that expense is saved. If you prefer to continue with molasses awhile, or with clay wash, it's all the same, but it is not necessary. Any foundryman who is fully alive to opportunities should try a barrel at my risk—Satisfaction, or no charge.

I manufacture everything for a foundry, and for a polishing and plating room. "Everything" is a good roomy word, but that's what I mean.

MR. RUPERT G. BRUCE, 256 MacDonnell Ave., is in charge of my branch at TORONTO, Ontario, and can supply Toronto trade at short notice.

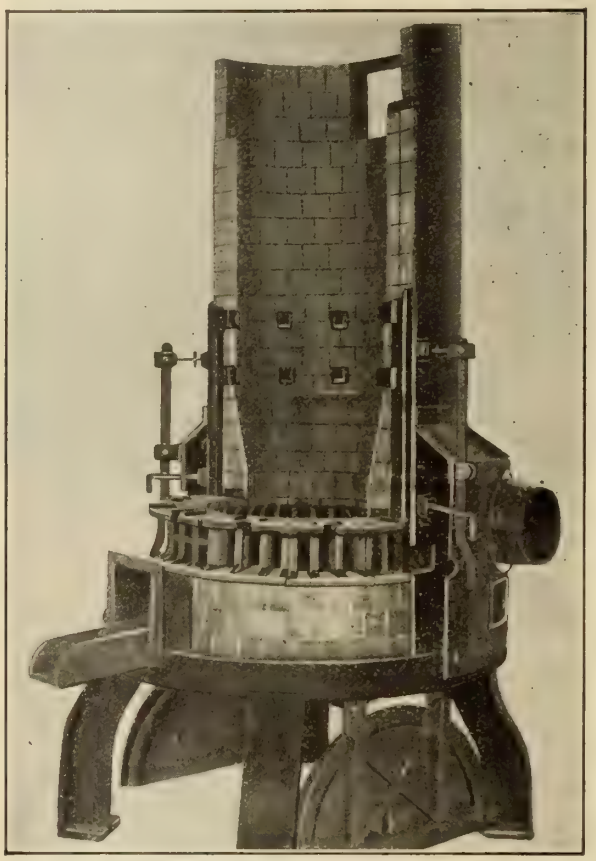
"EVERYTHING YOU NEED IN YOUR FOUNDRY"

FOR SALE

The Canadian Patent Rights

OF THE

Knoeppel System of Cupola Twyers



Patented in United States and Canada

Or we are open to dispose of Shop Rights or the Right to Manufacture and Sell in Canada.

The principal features of The Knoeppel System are:—
A continuous twyer; large twyer area; maximum air delivery; lower blast velocity; air belt surrounding the back of the twyers; air supply flues above the melting point; adjustment of twyer area; adjustment for small diameters of lining; separate overhang plate; twyers projecting from 2 to 10 inches further into the cupola than any other; delivery of blast nearer the centre; can be applied to any Cupola in use.

There is a splendid opportunity for a pushful man with this greatly improved twyer system. For the purchasers of manufacturing or shop rights we will supervise the manufacture and installation of the first one made free of cost.

FULL PARTICULARS ON REQUEST.

The Knoeppel Company

577 East Ferry Street - - Buffalo, N.Y.

BLACK DIAMOND

CORE COMPOUND

IS THE MODERN

CORE BINDER

It Will Make You Bubble with Satisfaction

Here are a few of the reasons why YOU should use Black Diamond in making YOUR cores.

It positively does not solidify even in the hottest weather and cores made from it will not absorb moisture and will not crack, swell, blow or buckle.

It would be ruinous for us

to make these statements unless the actual merits of our compound fully confirmed them.
Prove it yourself by allowing us to ship you a trial lot subject to approval.

DO IT TO-DAY

This cut shows the novel "BUBBLE" SOUVENIR which we gave to our friends at the Cincinnati Convention. We have a few of them left for our friends who weren't there. Just write us a postcard giving name, address and the firm you are with and we will mail you one.

THE

Millers' Products Co.

39th and WALLACE STREETS

Money Saving

MILLS DRY CORE COMPOUNDS

Satisfaction Giving

Time was, when foundrymen knew nothing of core compounds. That was before the formulæ for Mills' Core Compounds were worked out. Nowadays, you foundrymen can get more value for your money by using Mills' Core Compounds than you can by mixing up your own compound or by using ordinary ready-made compounds. Just try it! You'll be very agreeably surprised at the results. Mills' Dry Core Compounds are made in these three grades:

No. 1 is for Heavy, Grey, Iron Work.

No. 2, while being good for any work, is particularly adapted to smaller Grey Iron, Malleable and Steel Cores.

No. 3 is a compound which is made to fill the wants in Car Wheel Foundries, and is successfully used for making the difficult car wheel pan cores and for the hub cores. It also can be generally used for any Foundry Work.

And then we have **Wago Core Binder**—a specialty for brass foundries,

and our celebrated

Syracuse Liquid Core Compounds

in three grades—X, XX, XXX — **Order some on approval**

MAKES PERFECT CORES

"IF a man can write a better book, preach a better sermon, or make a better mouse trap than his neighbor, though he build his house in the woods, the world will make a beaten path to his door."

—EMERSON.

THERE IS A BEATEN PATH TO THE DOOR OF THE

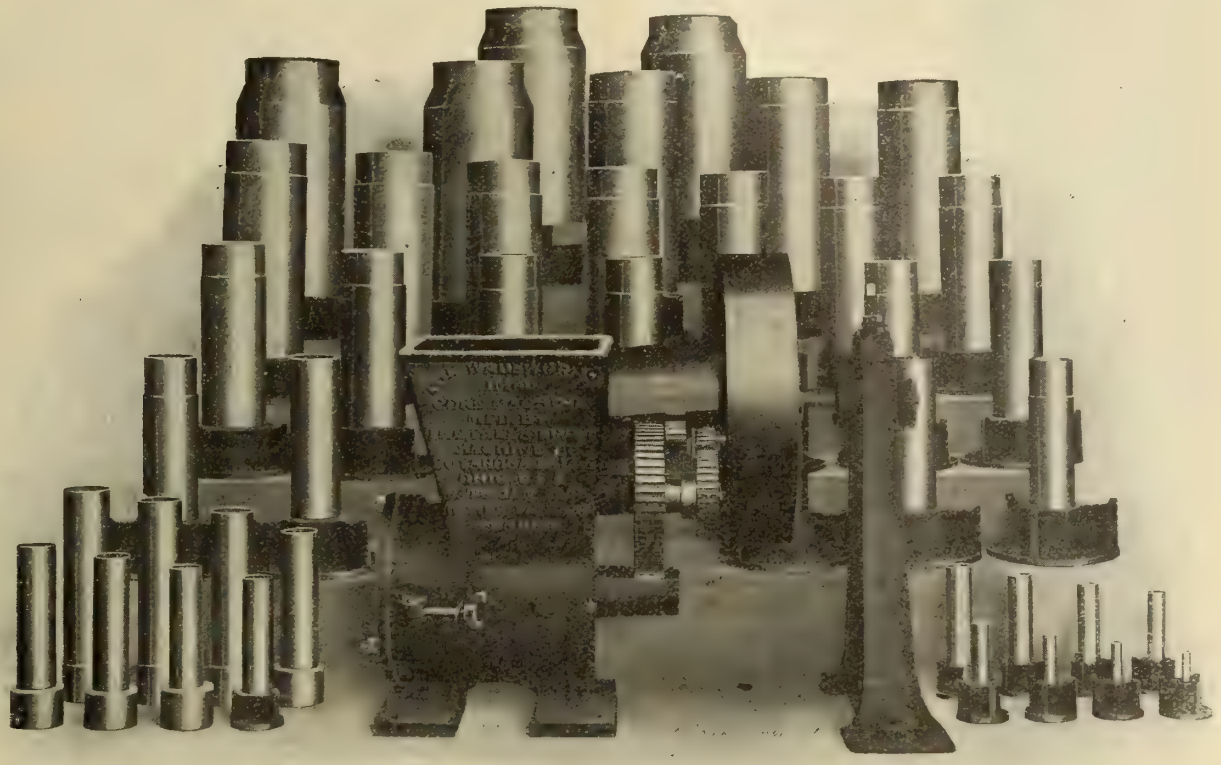
JONATHAN BARTLEY CRUCIBLE CO.

TRENTON, N. J., U. S. A.

There is a reason.

THE WADSWORTH
IMPROVED CORE MACHINES

The only Core Machine manufacturers in the world manufacturing a complete line of Core Making Machinery—5 separate and distinct Core Making Machines, Portable Core Ovens to bake the cores in after making, Core Cutting Off and Coning Machines and manufacturers of a Standard Core Print.



The only Core Machine manufactured that can make a Rodded Core. Any size rod can be used. Hand or Power driven, makes round Cores from ⅜ in. to 7 in. Also irregular shapes. 40 sizes of Cores, all made on one machine.

We are Core Machine Specialists

Compare your time with that of THE WADSWORTH Machine.

One 6" Core, 24" long, by hand power in 12 seconds.
One 7" Core, 5' 3" long, by hand power in 80 seconds.

The great strength and accuracy of cores, together with the wide range of shapes possible, make them a valuable foundry investment.

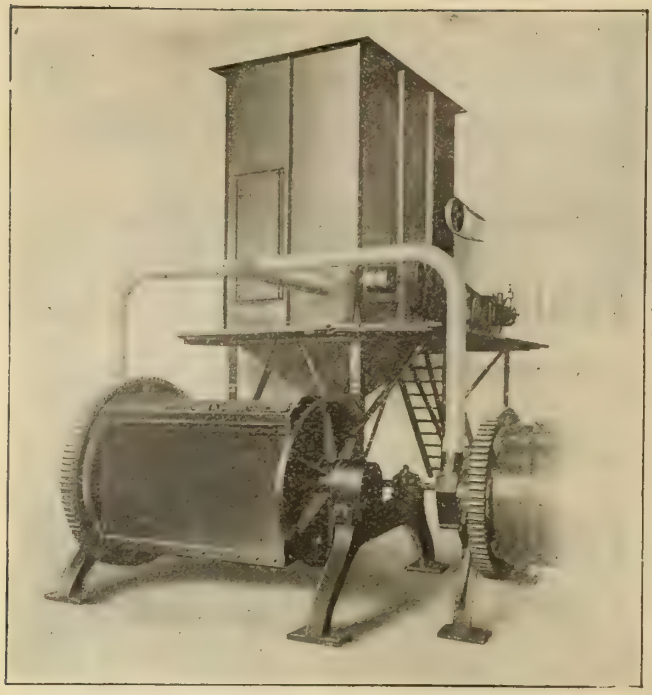
Manufacturers——Engineers——Designers

HARVEY, ILLINIOS, (Chicago Suburb)



The above cut shows two of our up-to-date mills properly piped for exhaust to our patent Dust Arrester.

Are you anxious to save money in the operation of your plant? Do you wish your castings cleaned and polished, and to have the same finished appearance as those being turned out by your competitors?

You can well afford to take out the old stave mills and scratch brushes, old type of exhaust mills, and place them on your scrap heap. Your loss will be fifty per cent. less than if you continue their operation.

Advise us as to the style of work you are making, and we will be glad to plan an outlay of improved exhaust cleaning mills that will do your work to perfection. In fact, after you have them installed you will wonder how you ever got along without them. We will clean your castings better, in less time, and use only one-half as many mills, at the expenditure of one-half the horse power.

Are you not daily confronted with the dust problem? Is it not flying about your plant, injuring your machinery, impairing the lives of your workmen, and becoming a public nuisance? How long will you evade answering these questions, and installing the proper equipment to better these conditions?

It is absolutely necessary that the dust and dirt from an exhaust mill be taken from the mill as fast as it is scratched from the castings. There is no other known method of disposing of this dust than by the installation of one of our improved Dust Arresters. This machine is so constructed that it can be placed almost anywhere about your plant, and not a particle of dust will escape from the same. All the dust and dirt is confined in the Arrester and is discharged through a hopper at the bottom of case. Not a particle of dust passes through the exhaust fan, thus extending the life of the fan indefinitely. We have made a scientific study of the cleaning room, and our experience is at your disposal simply for the asking. Plans and specifications gladly furnished.

Pattern Making

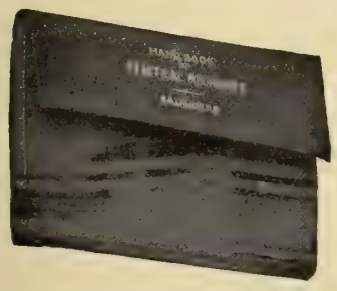
By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions



Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions

Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

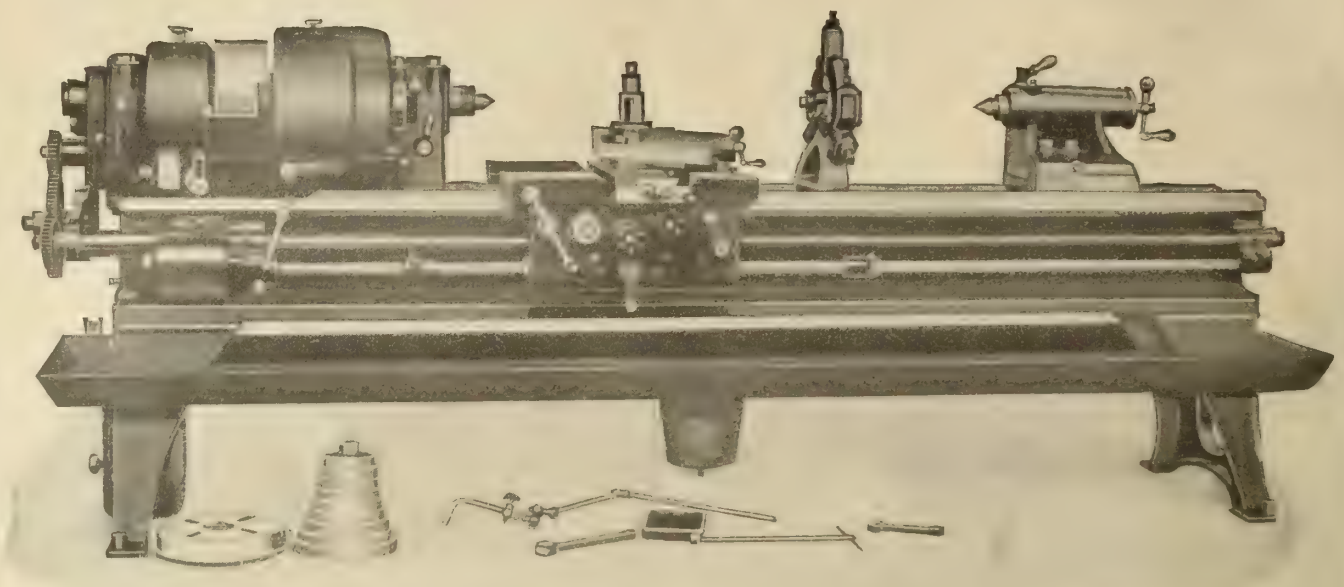
Published Monthly at **$1.00** per year. **Address Subscription Dept.**

CANADIAN MACHINERY, 10 Front St. E., Toronto



The Springfield High Power Rapid Reduction Lathe

might be used as a model of modern lathe construction. It is one of the most powerful and rigid machines ever put on the market. The operator has full control at all times. Six variations of speed are instantly obtainable. The compound rest is of new design, countershaft particularly simple and every convenience for operating incorporated in the general plan. Try it when accuracy means money.

This Lathe under severe test has proven to be remarkably steady under the heaviest cuts—the carriage traveling steadily along, due to its most excellent design, and the proper distribution of metal—thus doing away with chattering, and jerky motion, so often found in so-called Rapid or High Speed Lathes.

With the number of speeds and feeds possible, together with its high power, accuracy and ease of operating, we confidently place this Lathe on the market, as representing the highest type of design, excellence, and accurate and careful manufacturing.

We also supply for Prompt Shipment:—Engine Lathes, Turret Lathes, Brass Finishers' Lathes, Automatic Machines, Horizontal or Vertical Boring and Turning Mills, Planers, Shapers, Slotters, Bolt and Nut Machinery, Cutting-off Machines, Drilling Machines, High Speed Cold Saws, Velos High Speed Steel and Twist Drills, Special Steel for all Purposes, Pneumatic Tools, Woodworking Machinery, Chain Hoists, Electric Travelling Cranes, Etc.

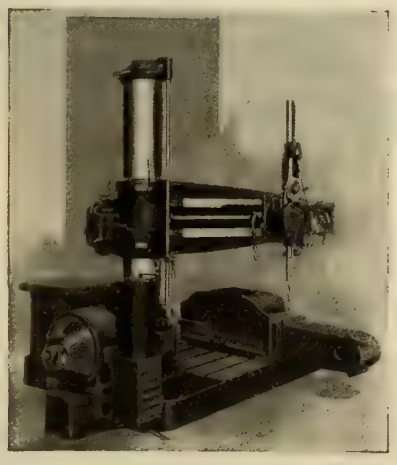
Westinghouse Motors



Westinghouse Motor Driving Radial Drill.

With every machine tool individually driven by a Westinghouse Motor

there is no waste of power, as is the case when driving a large amount of shafting and a large number of machines that are doing no work. With individual-motor drive, when a machine is not working it is not running, and when working consumes only the power sufficient to run it. Furthermore you can place your machines exactly where wanted.

Automatic Forging Drop 3,000-lb. Hammer

FOR THE FORGE SHOP

Automatic Board Lift Drop Hammers
Hot Trimming Presses with Side Shear

The endurance and effectiveness of Automatic Drops depend in no small degree on a proper ratio between the weight of the base and the weight of the hammer. The additional cost with all parts made of proper proportions is more than compensated for by the larger quantity and better quality of the finished product, and by the comparative freedom from breakdowns obtained from their use.

The hammers are made of steel forgings. **The bases are cast in a single piece.**

Line of Eleven Patterns with Hammers from 200 lbs. to 3,000 lbs. Trimming Presses of Various Designs

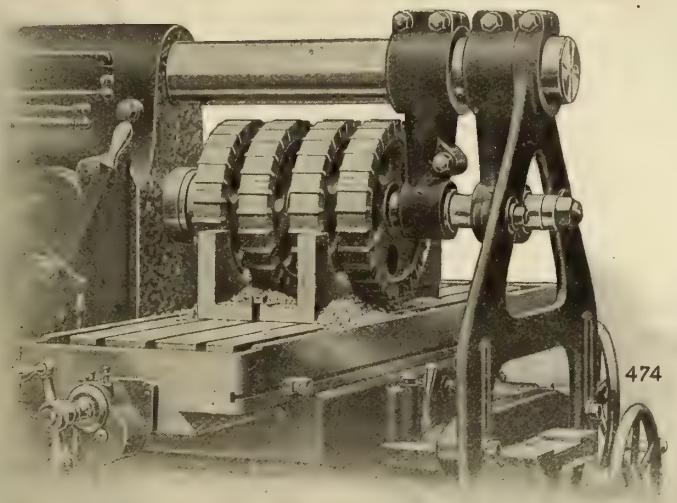
Forge Trimming Presses with Side Shears

The No. 4 Plain High Power Cincinnati Miller



direct connected to a 10 H. P. variable speed motor, milling grey iron castings.

The cutters are 13½" diameter, high speed steel, run 13½ rev., taking a cut ⅛" deep across eight surfaces, having a total width of 23" at a feed of 4" per minute. This amounts to 11½ cubic inches of iron removed per minute, and even this is not the limit of the capacity of the machine, but is all that the cutters will stand.

This is evidence of the tremendous capacity of this new line of millers. We make four sizes: No. 2, No. 3, No. 4 and No. 5.

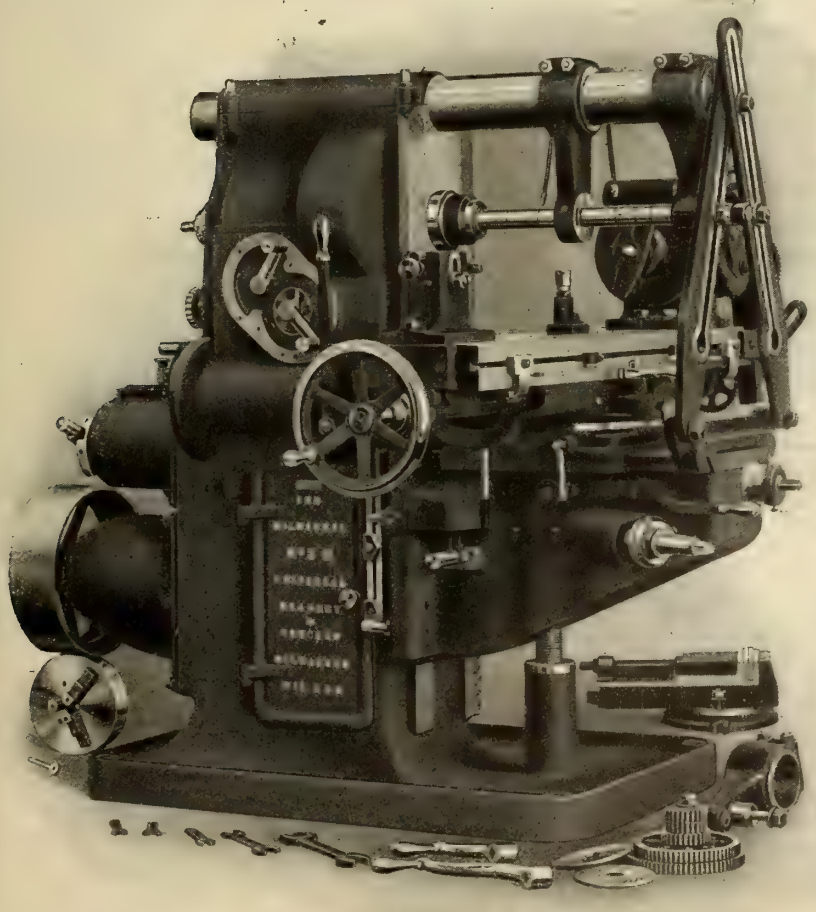
Ask for our High Power Miller Catalogue.

The Cincinnati Milling Machine Co.

CINCINNATI, U.S.A.

Canada Agent: H. W. PETRIE, LIMITED

TORONTO, MONTREAL AND VANCOUVER



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

It is better made than any tool of a similar nature you ever saw before. Only the best of material is used in its construction, and your particular attention is directed to the improved arm and saw guide which keeps the saw perfectly in line. This saw cuts either round or square bars 6x6 inches, and requires no attention after the work is in the vice. : : :

It stops automatically when the piece is cut off.

NEW HIGH-SPEED STEEL

Engineers now have the opportunity of using a much more durable Steel than the best High-Speed Steel hitherto used, and this they will find in our

"STAG **BRAND SPECIAL"**

"STAG" BRAND

which may be either air-hardened, oil-hardened or water-hardened.

This Stag Brand Special Steel will cut much harder materials than can be cut with Tools made of ordinary best High-Speed Steel, and heavier cuts may be taken, or Machines may be driven at accelerated speeds when (in either case) it is found economical to do so. Stag Brand Special will also wear much longer than ordinary best High-Speed Steel before requiring to be re-ground.

IF YOU WANT A BETTER QUALITY OF STEEL than that you now use, we shall be glad to receive your orders for our

This is the Patent "Dreadnought" Patent Milling File

Doesn't it strike you as odd to be able to use the same tool as a wood rasp (you should see how it gnaws wood) on the glass hard fin of a fresh roasted iron casting—and then to work a bit of copper or brass or horn or—WELL, a bit of just anything.

The Dreadnought Patent Milling File is just such a many sided bit of **Ever-ready** helpfulness. It will cut anything from **Phosphor Bronze** to **White Pine,** will cut that anything fully 5 times as fast as the very best file can—and then (now just ponder this well), and then: when its appetite has become a little blunted that same Dreadnought File may at trifling cost be re-sharpened (without drawing its temper) **many times.**

When it comes down to cheapness, on the basis of the work to be gotten out of it (the only one that "long headed men" ever figure on) the Dreadnought, seems to the user of ordinary files to be almost a **donation.**

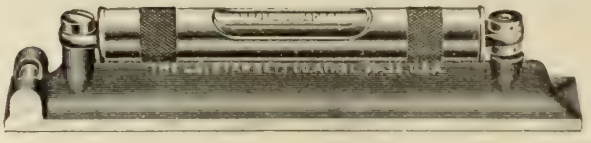
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

Improved Levels for Testing Shafting, etc.



In addition to the regular parallel vial, the bases have a cross level which enables one to place or hold the base on a shaft level in its cross section, not canted sidewise; for the shape of a level glass is such that, though true as adjusted on a flat surface, it will not be reliable when canted sidewise. Hence the value of the cross level, not only to test the truth of shafting, but other surfaces which tend to throw the level base into a canting position.

The base of this level has our improved concaved groove running through the length of its base, leaving a flat margin each side, which improves its seat for flat work, while forming an absolutely true and reliable seat for shafting, etc. and it is better than a V groove. Made in 6, 8, 12 and 18-in. sizes with plain vials and with plain and graduated vials.

The ONE Chuck for Automatic Machines

NO KEY, WRENCH OR SPANNER!

A twist of the wrist is the only thing necessary to adjust or release a drill from the

Russell Anti-Friction Drill Chuck

The Chuck With a Grip It will not Slip.

It is self-tightening and entirely automatic in its action—the ball bearings eliminating all friction. It has interchangeable jaws—perfectly accurate; and is positively the only drill chuck on the market that will hold straight shank drills without slipping. It saves time in adjusting and releasing drills, and saves money by reason of the difference in cost of Taper Shank Drills over Straight Shank Drills, and by holding the drill securely, thus saving the drill.

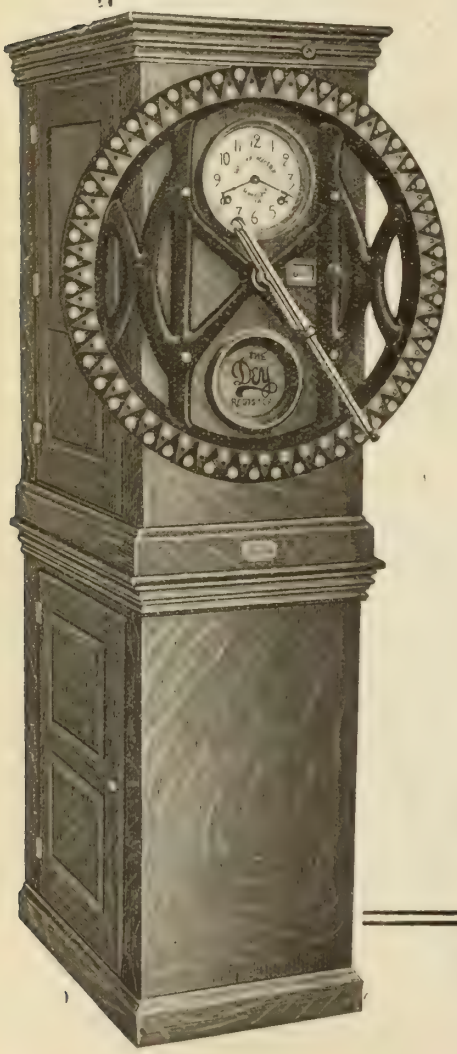
How do you Know

that you are getting all the time for which you are paying wages ?

We are manufacturers of the

ORIGINAL
DEY
MACHINE



ANY system of recording the arrival and departure of employees that is dependent for its success upon the honesty and energy of a clerk, is liable to go wrong. Every timekeeper has his friends, his prejudices, and his weaknesses. He is only human.

Being a machinery man, you will appreciate the reliability of an entirely mechanical system of time recording.

For instance, consider the ***Dey Dial Time Recorder,*** shown in the cut. Its mechanism is adjusted and regulated to the highest pitch of absolute accuracy. It cannot go wrong unless tampered with. When registering "in" or "out" the workman revolves the pointer until it is opposite his number: then he presses it into the corresponding hole, and his exact time of arriving or leaving is automatically recorded. Late arrivals are automatically shown in ink of a different color to that of the prompts.

This clock is only one of many designs. We have clocks to suit every kind and size of business. Every one of them is entirely mechanical—they cannot cheat, lie or show favor.

No matter how large or small your business, we have a clock that will suit you.

Write us for illustrated literature.

TALK (1) ON

BELTING
vs.
INDIVIDUAL ELECTRIC DRIVES

¶ For the next few issues we are going to use this space to bring forth a few facts concerning belting as compared with individual electric driving for machine shops and the like.

¶ We are doing this because we believe that many are making a grave mistake in rushing towards the illusive goal of individual electric drives.

¶ A motor driven shop is attractive just as a racing stable is attractive with every horse in his $500 stall, with his special attendants—far more attractive than a stable of a thousand work horses or the free and easy feeding and housing of contractors' mules.

¶ A racing stable is magnificent as a luxury, but it is not business. The individual motor is luxurious magnificence, but it is not business.

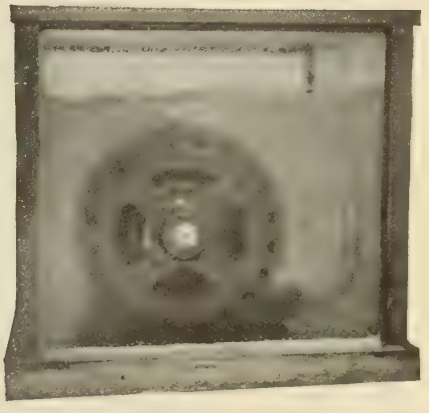
THE WATER TEST

Packard

Type "D" Motor



Reproduction from an actual photograph, showing the "Water Test" as applied to a Packard Type "D" Motor.

shown in the picture, proves one of the many points about the PACKARD Type "D" Motors, that combines to make them peculiarly adaptable for severe operating conditions.

The test consisted of a submersion of the motor in a tank. Connection being made to the circuit, he motor was allowed to run—completely under water – for several hours at a time—and, after repeated tests, the insulation was found to be in no-wise affected.

Could you ask better proof of the **ruggedness of design** and **careful construction** of the motor; or of the success of our Vacuum process of insulation?

MONTREAL ST. JOHN, N.B. TORONTO WINNIPEG CALGARY VANCOUVER

Works of the Robb Engineering Co., Amherst, N. S.

Canadian Birth Place of Engines of World Wide Reputation

The Robb Engineering Co., Amherst, Nova Scotia—A Brief Outline of the Company's History—A Description of the Plant, including that of a Practical System of Premium Work.

Sixty-odd years ago a Nova Scotian, one Alexander Robb, looked into the future and figured that the stove business had immense opportunities before it. As a consequence he began the importing of cast iron stoves into Canada from the United States, and became one of the pioneers of the stove trade in this country. The profits on these importations were all that could be desired, when along came the American Civil war, which, after the smoke had cleared away, left the market in such a condition that these profits were not large enough to warrant carrying on the business in this fashion.

It did not take Mr. Robb very long to adjust himself to these new conditions of affairs and in 1865 he erected a small foundry of his own at Amherst, Nova Scotia, and began the manufacture of stoves in this country. He may and he may not have had dreams of the huge scope his little business was to acquire, but that small foundry was the nucleus of one of Canada's large industrial plants whose product is known all over the world.

Besides the mere making of stoves, Mr. Robb used to do some machine work for the nearby lumber mills and other enterprises. This was slowly but steadily expanded until it embraced the manufacture of engines, boilers and other mill machinery. In the beginning their field was very limited on account of the lack of proper facilities for shipping their product, and consisted of that territory on the Bay of Fundy, the north shore of Nova Scotia, Prince Edward Island and the east shore of New Brunswick, all of which could be reached by water.

The manufacture of these varied lines (stoves and steam engines) continued until 1890-1, at which times two very disastrous fires occurred which nearly wiped the company out of existence. Upon the erection of new buildings the manufacture of stoves was completely dropped and all the energies of the company were concentrated on the building of engines and boilers, on account of their being in increasing demand throughout the whole Dominion, whereas the stove business did not show much more than local possibilities.

The inclinations of the present head of the company, Mr. D. W. Robb, no doubt, had a very strong influence on the change in policy of the firm, for he had a natural inclination for applied mechanics, and favored the making of

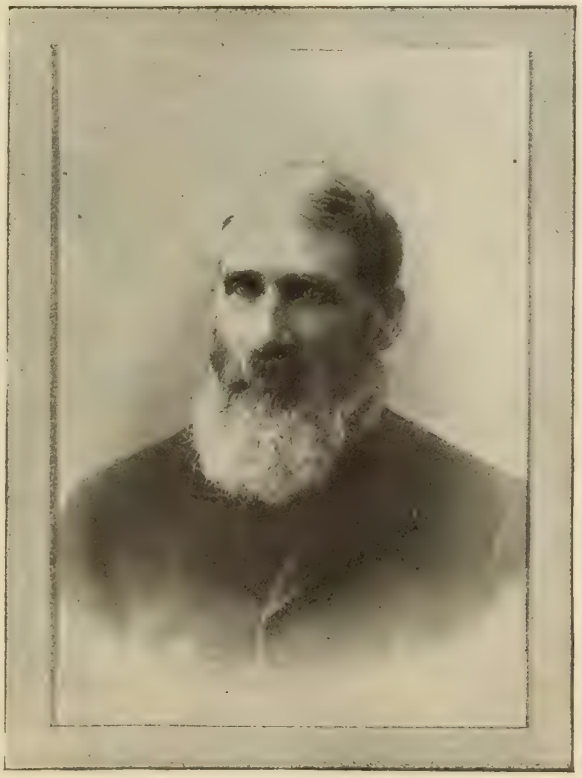

Fig. 1.—ALEXANDER ROBB,
Founder of Robb Engineering Co.

animate steam engines rather than mere inanimate stoves. This natural ability of his has been amply and continuously demonstrated in the development of the Robb-Armstrong engine, over which he has always exercised a careful surveillance.

The presence of the name Armstrong in the name of the engine is explained by the fact that a New Yorker, Mr. E. J. Armstrong, M.E., has given much assistance in its development and design.

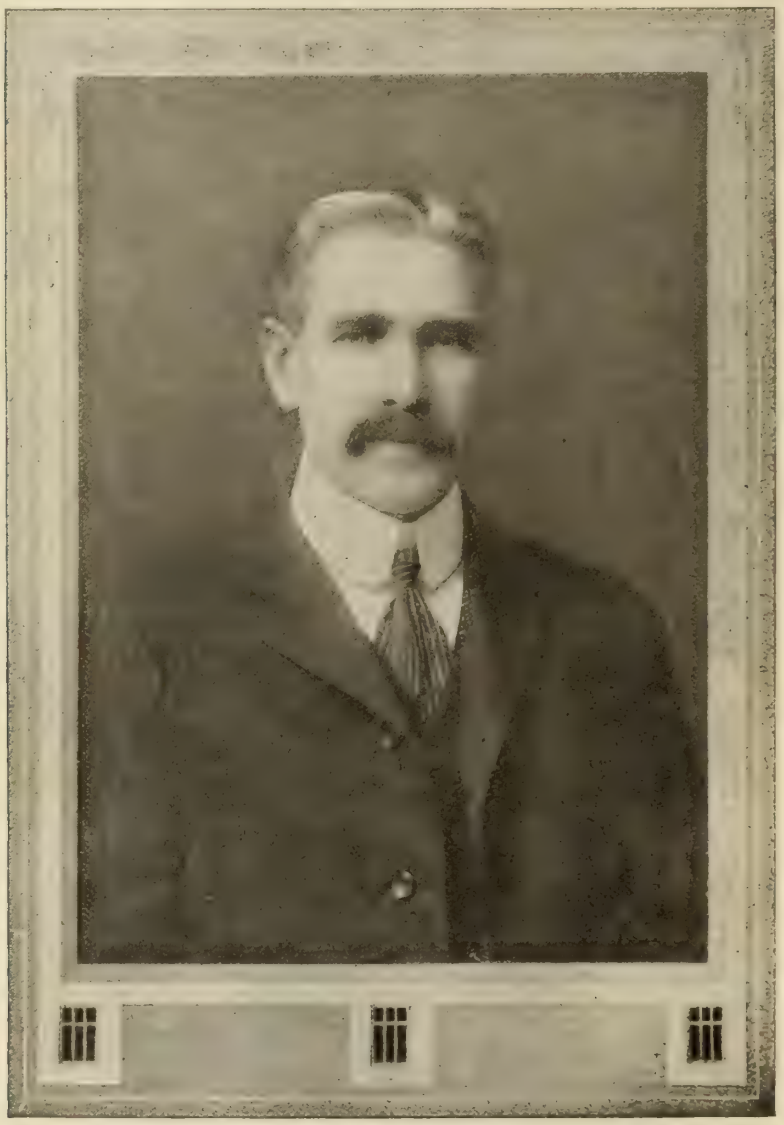

Fig. 2.—D. W. ROBB.

The Present Head of the Company.

The Buildings.

Reference to Fig. 3, the plan of the shops' layout, will show the arrangement of the buildings. The flanging shop is the old original foundry built by Alexander Robb, and which is shown in Fig. 8. Grown-up all around it are the larger modern shops, each one arranged so that extensions can be easily added as they may be needed. After the fires of 1890 and 1891 the new buildings were the boiler, machine, pattern, blacksmith shops and the foundry. These were not so large then as shown, but were added to as the rapidly increasing volume of business demanded.

The Main Building.

Until 1904 the long, narrow building marked machine shop and pattern shop was used both for the building of engines and the miscellaneous mill and repair work that the company still handles to some extent. The pattern shop was, at that time, a small corner in the foundry. In this year was erected the spacious main machine shop, which is 100 feet wide by 250 feet long. This is of brick and wood, the roof trusses being made of heavy timbers. Along one side a gallery runs the whole length, and the front end of this, for about fifty feet, is given over to the executive offices. This position places them close to the producing departments, and as all the heavy machinery is on the ground floor and near the further end little or no vibration is felt. Soundproof walls insure quietness.

The main bay, which is given over to the erection and assembling of the engines, is served with a twenty-five-ton Niles electric crane. The heavier machines are ranged along one side of the bay, so that they, too, may be served by this crane.

The gallery is used for machines handling the small engine parts, and at one end is an annex, so to speak, of the general stores department. This can be seen in the background of Fig. 9. To the inspection department, part of which is shown in this photo, every piece is brought and subjected to a rigid inspection before being allowed to go to the stores. Every drawing comes with the pieces and the number of the drawing is stamped on every piece, no matter how small it may be. This greatly facilitates the preparation and shipment of duplicate parts. Every piece has a separate drawing of a standard size. These drawings (shop blue prints) are all kept in the tool room in drawers, in a vertical position, like a card index, and when one is taken from the drawer the receiver gives a check for it like he would for any tool. The tool room is on the gallery and serves the ground floor by means of a small hoist, which is raised and lowered by power. This power is supplied by an arrangement of countershafts, from the line shafting.

On this gallery are also the grinding machines. Every circular part of the engines is ground to an absolute perfect finish to gauges and templates, which insures interchangeability for all parts. The flat surfaces are also all scraped and ground on this floor to perfect, interchangeable fits. The company make most of their own standard gauges and have a very complete set. The Sweet measuring machine used in making these is shown at the right-hand side of Fig. 9.

On the ground floor are two interesting machines. One of these is a special machine used to turn up the face and bore out the hub of a pulley simultaneously, and the other is a special machine for boring the guides and journals and facing the cylinder end of an engine bed simultaneously. This building is heated by a hot air system installed by the Robb Company themselves, the air being drawn through the steam coils by a Buffalo fan driven by a small Robb-Armstrong engine. This system also serves the foundry and the blacksmith shop, the other shops being served by their own systems.

The Foundry and Blacksmith Shops.

These buildings, the foundry 100 by 200 feet, and the blacksmith shop 50 by 150 feet, are situated on and immedi-

ately adjacent to the north side of the machine shop, and are well-lighted, roomy shops. The foundry is built with a brick base and iron-clad wood above, the blacksmith shop being brick and wood. Both buildings have wooden roof construction. The main bay of the foundry is served with a Whiting electric crane of 15 tons capacity. The smaller bays are equipped with hand-controlled cranes supplied with air hoists, the cranes being built in the Robb shops.

The cupola house is right north of the foundry, and contains two cupolas built by the Robb Company, one having an hourly capacity of 15 tons and the other 4 tons. The supplies for the cupolas come into a basement arrangement at the back of the cupola house and are weighed and loaded on the hoist very handily.

Boiler Shop.

This is a wooden iron-clad building, 100 by 250 feet, with brick base. It is very high and roomy, with plenty of light at all seasons. The shop is served with a 15-ton Whiting electric crane, and contains an up-to-date equipment of boiler making tools, including rotary shears, beam drills, for rivet holes, etc. One of the features of the company's progressiveness is the fact that very few of the machines are old machines. The policy of the firm is to keep the shops supplied with new, up-to-the-minute machines, and as a consequence generally replace a machine every five or six years.

The "bull" riveter is a 10-ft. gap machine, allowing triple presslres to be used ranging 33, 66 and 100 tons on the rivet. Hydraulic power is supplied by a Northey three-plunger outside-packed pump, geared to a 50 h.p. motor, and supplies water at a pressure of 1,500 pounds per square inch. The electric power required for the air compressor, is taken form an outside source and is the only instance in the plant, all other power being supplied by the central plant mentioned later.

The air for the rivetting hammers, etc., is furnished by an Ingersoll-Sergent two-stage compressor, belt-driven from a motor.

The plates are all stored according to sizes in a bay of the boiler shop and are so arranged as to be easily gotten at and swung to the laying-out table. The boiler shop has been well systematized, and the store of standards and templates is such that the largest boiler can be placed on a car in a very few days after the order has reached the office.

Pattern Shop.

This is now in what was the old machine shop and contains all new and up-to-date tools. One of the newest and most useful tools is a Universal saw table made by Baker Bros. This can be used for so many varieties of work that it is very seldom idle, including in its category mitres and angles ready for the glue pot, as well as core boxes of almost any diameter. A sanding wheel made here in this shop, band-saws, planers, surfacers, etc., complete the equipment.

Second Machine Shop.

This is under the same roof as the pattern shop and is part of what was the old machine and erecting shop. Here it is that repairs are handled for other manufacturers, mills, etc., in the surrounding country, and other machine building to order is carried on.

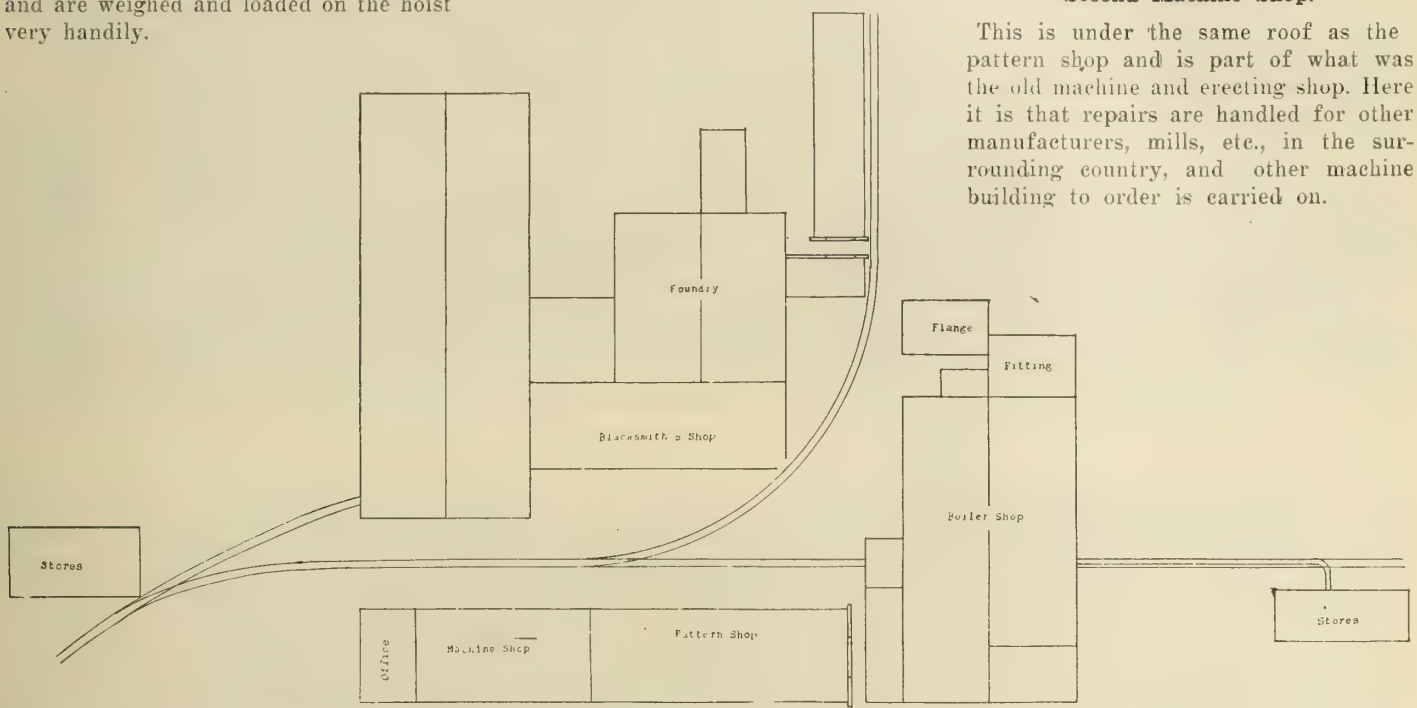

Fig. 3.—Layout Robb Engineering Works, Amherst. Large Building at the Upper Left Side is Machine Department.

The brass foundry and core ovens are conventiently located under the same roof as the foundry.

The blacksmith shop has a full complement, consisting of the usual quota of forges, steam hammer, etc. Air is supplied by a fan driven by a 15 h.p. Westinghouse motor. The steam hammer is adequate for any of the forging required on the heaviest engines the company builds.

The Flange Shop.

This is the original building of the Robb engineering building and which came through both fires unscathed. It was formerly the foundry, but it rapidly became too small for this work. It was then used as a store house, but different arrangements in the shops necessitated the stores being elsewhere, so it is now used as a flange shop.

Stores Department.

The boiler shop has its own separate stores building (see plan). This is two storeys in height and contains the stock of boiler tubes, nozzles, hand-hole covers, etc., etc., that it is necessary to keep on hand.

The main stores is quite separate from the other buildings, being across the street from the main shops. It is a very capacious building of dimensions 40 by 180 feet. It is served by a floor-controlled electric crane. This is also a retail store for steam supplies, such as power plants would need, although no attempt is made to stock anything outside of the ordinary lines such as they use themselves.

The Power Plant.

This is centrally located between the machine shop and the foundry and con-

Fig. 4.—Exterior of Main Machine and Erecting Shop.

Fig. 5.—Interior of Machine and Erecting Shop.

tains one 300 h.p. Robb-Armstrong simple Corliss engine direct connected to a General Electric generator, running 150 r.p.m. Steam is supplied by two Robb-Mumford internally fired boilers at 150 pounds pressure. In the shops the machines are grouped with their own motors, while the larger machines are individually driven. The motors used are Westinghouse and Allis-Chalmers-Bullock in about equal numbers.

Fig. 6.—Interior View of the Machine Shop.

The various shops are all connected by a narrow-gauge industrial railway, and the I.C.R. switches are conveniently placed, so that all the loading can be done with the aid of the cranes. A telephone system connects each foreman's desk with the superintendent and a half-hour mail system for memos and orders has been in vogue for some time.

The work is all well systematized, but such care has been exercised in the establishing of these systems that they are almost automatic in their workings, requiring little if any additional clerical help.

The Time System.

The ideal shop system, as an assistant to the cost system, is a piece-work or piece-work and premium system, but the varied sorts of work that are carried on in the manufacture of engines and boilers of different designs and many sizes make it difficult to satisfactorily establish either one of these systems direct. It might so happen, in a premium system, that one man's rate would be low and another's high. The result that this state of affairs would tend to bring about would be the low man losing interest in his work merely finishing it without regard to time and the high man would naturally favor that job on which his premium was highest.

The Robb people tried both piece-work and premium system with unsatisfactory results. The management then set about to devise some scheme which would increase output, accuracy, quality, and at the same time allow the men better pay according as they did better and more work.

The result was that a short time ago a start was made on the system which is now in vogue. This has been gradually adjusting itself to embrace all conditions that might arise, and is now at the stage that may be said to represent a complete practical system of ascertaining the proper payment to the men for work done. It is in a way a premium system, but it also applies to that work upon which no time rate could be accurately placed.

In the Robb shops the engine work is all standard, but there are so many different sizes and styles made that there is not a large number of the same size parts going through at any one time. The way they work it is this: Suppose a man was given a certain number—say a dozen—of the same things to finish—connecting rods, for instance—a time rate could be placed on these, and if he finishes them inside the time limit he is credited with the time saved. This does not appear, however, in his next envelope, for reasons explained later.

Now, supposing he was given a job that was unusual, or that there was only one long bit of work on, such as boring out the guides and facing the cylinder end of an engine bed. He would not be given a set rate, but after the job is finished the foreman gives him a "percentage" If, in his opinion, the time was fast, the machinist would be allowed 105, 110 or up to 120 per cent., according to time taken. If the time was average, he would get 100 ; if slow, he might only get 90, or even 80, per cent. Then, if it had taken him ten hours, and he was allowed 120 per cent., the premium or time saved is reckoned as though

Fig. 7.—Gallery of Main Shop.

there had been a time rate set on the job of $10 \times \frac{120}{100}$ or 12 hours, and the machinist is credited with two hours. The man is also given a percentage for quality of work and for attendance.

At the end of every three months the number of hours saved is totaled and from this is deducted the number of hours lost, and the net saving is multiplied by the man's rate per hour, which shows the value of the time saved during the three months. His rate is then raised, so that in the next three months he will get in wages the amount saved.

This is fair to both men and company. In the old premium system, if a man took 15 hours on a 10-hour job the company would be the loser, while on the time saved the man would only get half his rate. Now the man gets his full rate on time saved and the company gets credit for time lost. This system is working out very satisfactorily and dovetails nicely with the simple cost system in vogue, which is explained in detail elsewhere. The men all "ring in" their own cards, both time and job, on clocks furnished by the International Time Recording Company.

Fig. 8.—Original Foundry. Built in 1865.

James R. Kinghorn has resigned his position of assistant general manager of the Montreal Rolling Mills, and is leaving for British Columbia. He was formerly connected with the sales department. Mr. Kinghorn's departure will necessitate the election of a successor to fill his place as vice-chairman of the Transportation Bureau of the Montreal Board of Trade, with which body he has been connected for the past ten years.

L. B. Orchard has been appointed chemist to the Atikokan Iron Co., Port Arthur, Ont.

Limit Gauges; Their Relation to Cost of Production

A Practical Article on the Use of Gauges in the Machine Department, Reviewing Classes of Gauges, Gauge Limits and Gauge Standards.

By ARTHUR S. ELLERTON, A.M.I.C.E.

The use of limit gauges in engineering works is apt to be regarded with something of suspicion and awe by those who have not had the opportunity of judging their real ability. In industries involving a rapid and cheap production of a large number of interchangeable parts that have to be assembled to form a machine, the cost of each operation must be accurately known and reduced

Fig. 1.

to the minimum amount if commercial success is to be obtained; and undue share of costs is often absorbed in the final fitting and assembling operations.

If the output of the factory is strained to its limit owing to brisk demand and limited plant or space, it will usually be found that one particular department is working at a higher pressure than the others, particularly the beforementioned fitting and assembling departments.

On careful enquiry into the causes, the superintendent will often find that these departments are working overtime and also grumbling at the amount of fitting and unnecessary operations that certain parts require.

The fine work is done in the machine shop, modern machine tools are designed with this end in view and to use them for rough work is sheer waste of money. It will be found that work can be done to almost any degree of exactitude on a good machine tool; and it only remains

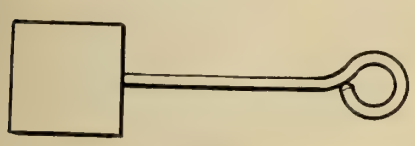

Fig. 2.

to fix for the work in hand, the minimum degree of fineness that will suffice for the rapid handling and erecting of the several parts of the machine under construction.

Cost of machining must be balanced against cost of fitting and it will require no great amount of persuasion to convince the economist that metal can be removed quicker and more accurately on a machine than in the vice. No work however fine can be produced without an error either great or small, and the object at which we aim is to produce a dimension that will be sufficiently near the theoretical size shown on the drawing for practical purposes.

The drafting room is always ready to put an exact size on the drawing after giving the diameter of a shaft or hole to the ten thousandth part of an inch, i.e., four places of decimals. But we do not accuse them of expecting the machine shop to work to them. The cost would of course be prohibitive. We must on this account fix a limit of error on all our work and the inspection department must be made to rigidly enforce the adherence to those limits. Objections will be raised to this, the machine shop foreman will probably complain, saying why reject a job for the sake of .002 inch, etc. This brings us to the importance of selecting proper

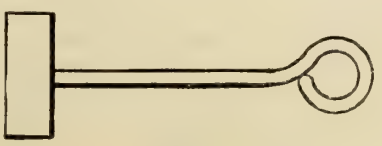

Fig. 3.

limits for our work; it will be seen at once that most of the dimensions are comparatively unimportant with regard to the few whereon we impose fine limits. Automobile work affords a typical example of the advantageous use of limits and the limit gauge. Take for example an automobile cylinder; the chief dimension is the diameter of the bore; here we can limit the error on the diameter to a total of only .003 and not be asking too much of our machine shop.

We can however impose a limit of say .025 inch on the thickness of the bottom flange and no one will complain that it is too far from correct size. If we do not tell our workman that he is to work to limits we only say "This flange does not matter, it's not important," and he forms his own opinion to the meaning of the phrase. He goes ahead and produces a few flanges dead on size, the rest varying from say—.050" to +.050" and one will come out say —.125" and all he will say in explanation is, that "the foreman said it was not important" and you can say nothing to the man because he is right for all that. Give him a limit of +or—.010 and he can quite easily produce them all to this and just as quickly. In adjusting limits, the salient point is to make them as large as possible consistent with practical requirements.

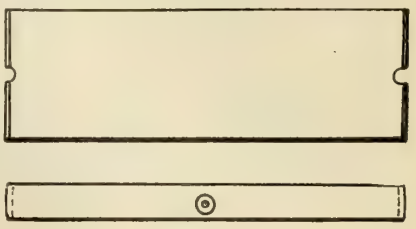

Fig. 4.

Standards

Limit gauges can be divided into 2 classes. Those made on "hole basis" and those made on shaft basis. This latter although advocated by good authorities as the standard basis, may however, be immediately dismissed as practical experience proves the former to be better. By "hole basis" is meant that all holes are to be regarded as standard size and all shafts are to be adjusted to fit the hole according to the duty required of the combination. Take as an example a journal bearing, this is bored to the standard size (the method of producing this standard is explained hereafter) and the journal is turned to a "run fit," that is is smaller than hole by an amount and absence of undue shake. It will be previously determined as a suitable allowance for lubrication, ease of rotation,

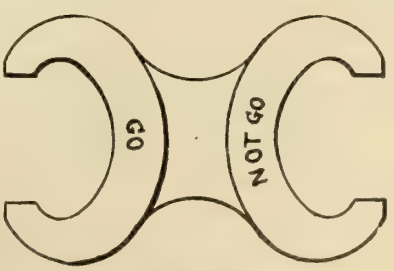

Fig. 5.

obvious that it is commercially a far simpler matter to make a shaft fit a hole than to make the hole fit the shaft, hence the adoption of the "hole basis." We produce the hole either by means of a reamer or an abrasive wheel to stand-

ard size. This standard is a size limited in its error from the normal dimension by an amount proportional to this latter size and commercial possibilities of production, which in its turn can only be found from practical experience.

Usually two "hole basis" may be formed one for fine work such as tools and jigs, sewing machines, gun, pistol and torpedo work and may be designated as Class A. Another for rougher work such as automobiles, engines, agricultural machinery, etc. This may be designated as Class B. For sizes up to six inches limit gauges may conveniently be made of the double ended plug form as shown in Fig. 1 or the method of separate gauges for high and low limits mounted on slender wire handles, as shown in Figs. 2 and 3. For holes above 6 inches bar gauges are suitable, such as Fig. 4. The gauge in Fig. 1 is made with one end A to the low limit, and no standard hole must be smaller than this, and the other end B is made to the high limit, than which no standard hole must be

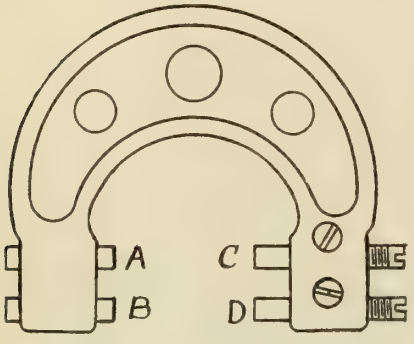

Fig. 6.

larger. The small end A is known as the "go" and the other end B as the "not go" end. Too great a stress cannot be laid on the fact that, however loosely the "go" end fits the hole, provided the "not go" end will not enter then the hole is standard size.

The adoption of the wise handled gauges (before mentioned) has been rendered necessary to prevent the habit of forcing the "go end" into a hole that is just too small to receive it, and thus causing undue wear on the gauge. Plug limit gauges made on this plan will outlast three or four solid gauges that can be firmly grasped and forced into the hole.

If the limits selected prove themselves too fine, make them bigger until the correct balance is reached, and to hold to these as the basis of your system. We will presume now that all holes can be produced to the commercial standard of accuracy fixed by our plug limit gauges. Now we can proceed with the manufacture of shafts and spindles to fit these holes in accordance with the duty required of them. Broadly speaking, shafts are divided into two classes. (1) the run fit, (2) the drive fit, but here again practical requirements demand finer subdividing.

The drive fits can be divided into three sections, viz.:

Force fits..... .... Class "f"
Driving fits .... Class "d"
Push fits .... Class "p"

In like manner the running fits may be divided into three grades. Classes X.Y.Z.

Fig. 7.

The table "A" shows a suitable range of limits for holes up to 6 inches dia. The difference between the top and bottom limits is the bolerance or working allowance. For sizes alone 6 inches the limits may be calculated from the table "B".

The sizing of the shaft is done by selecting the class required and using the limits called for by the same; e.g., supposing we have to fit a shaft to a two inch hole, and the drawing calls for a "run fit"Class X. We select a snap limit gauge having the "go end" two inches —.00175; this represents the high limit and the "not go" end or low limit will be two inches —.0035. We now reduce our shaft until it is small enough for the high limit end of the gauge to pass over but not so small as to allow the low limit end to do so. This shaft will not fit any two inch hole made to limit gauge. The importance of the interchangeability thus acquired needs no recommendation in producing repetition work.

Two forms of snap limit gauge are in general use, viz.: the fixed gauge as shown in Fig. 5 and the adjustable as shown in Fig. 6. Fig. 5 is self explanatory. In the adjustable gauge we have frame of horse shoe type, carrying two fixed anvils A and B and two adjustable C and D. The space between B and D is adjusted to the high limit and between

Fig. 8.

A and C to the low limit. To effect this a setting bar (as shown on Fig. 7) is used. In using this gauge we reduce the shaft until the gap B-D will pass over but the gap a-c will not pass over.

Use of Limit Gauges.

Limit gauges can be used with advantage in checking machine screws, bolts and nuts. Of gauging the size of threads, the ordinary plug and ring screw gauges are of very little real use owing to the very wide degree of variation caused by the user's idea of direction in the matter of fits. The gauge shown in Fig. 8 will however keep the tapped holes within definite prearranged limits. Here as in ordinary plug gauges we have a double ended gauge made to high and low limit. Fig. 9, an improved form of female gauge. The end "A" is a simple snap limit gauge for sizing the stock to be screwed. The other end "B" is formed with one jaw stepped, the lower step differing from the higher by the amount equal to the tolerance to be allowed on the diameter of the screw. The other jaw is formed with parallel grooves milled to the thread form, so that the screw being gauged, will pass along the jaw as far as the step and no farther, and not only will the diameter be gauged, but also the form of the thread itself. Screwed work can be gauged in this manner in one tenth of the time required to screw a ring gauge on or off.

In the inspection room, itself a non-productive department, a large amount of

Fig. 9.

time may be saved by examining work to the limits called for and not calipering every job to the 1-1000 of an inch. Actual examples have shown that 30 per cent. can be saved in time in the inspection room by the use of limit gauges.

Favorable reports in making high-speed steels, according to a writer in "Stahl and Eisen," were obtained with powdered ferro-tungsten produced by Chemische Fabrik Fuerth. Analyses show that it contains 85 per cent. of tungsten, 0.30 carbon, 0.45 silicon, 0.45 manganese, 0.25 aluminum, calcium and magnesium, and 0.01 of sulphur. Tin, phosphorus, copper and arsenic could not be detected. Ferro-tungsten melts at consideraqly lower temperature than tungsten metal, and it is far less subject to oxidation than the pure metal. Slagging of the tungsten is low, so that the loss of this dear metal is almost nil. The powdered ferro-tungsten alloys more readily. The segregation is less and the steel is not so much subject to piping.

It is said that there are people who believe that you can make money selling below cost provided you sell large enough quantities.

A Number of Applications of Double Ball - Bearings

Chapman Double Ball Bearing Co., Toronto, Have Improved their Standard Lines and Increased the Number of Applications of Double Ball-Bearings

Primarily the use of ball bearings was confined to bicycles and other light forms of transmitting power. Within the last few years however, the design and method of manufacturing has undergone a complete change, which makes their application to general power transmission a valuable achievement of modern engineering by doing one of two things or a combination of the two, viz.:

(1) Reducing the amount of power consumed by eliminating friction, and this frection represents power loss during the transmission from the engine or other source of power developed by the use of the method of revolving a shaft in anti-friction-metal lined supports; (2) By the actual delivery to the machine or machines practically all of the power delivered from the source of supply.

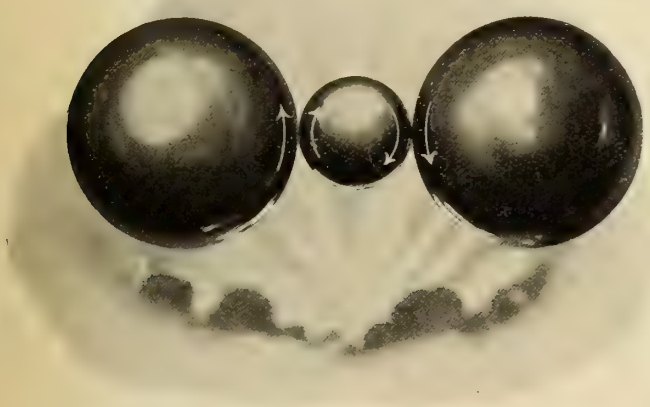

Fig. 1.—Double Ball-bearing.

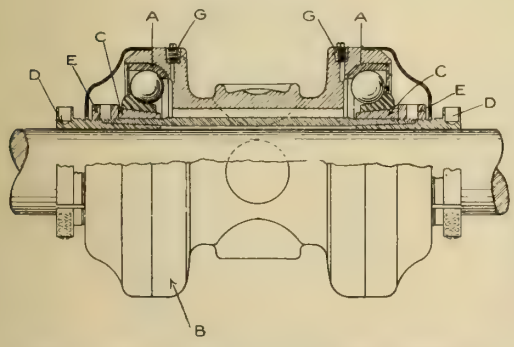

Fig. 2.—New Standard Double Ball Shafting Bearing.

Ball bearings can and are being constantly applied to all classes of service from light loads to the heaviest loads, and from slow speeds to the highest speeds used in engineering practice, and are giving good results both in point of durability and power saving. These results of course can only be attained throught the ball bearing manufacturers receiving all of the necessary data regarding the conditions under which they will be required to operate.

It is just as necessary for the ball bearing manufacturer to know the conditions under which the ball bearings are to operate (enabling him to supply the proper type of bearing) as it is for the machine designer to know the stresses and strains which will be developed in the machine under consideration.

In designing a machine which has rotating parts attention is always paid to the speed of rotaation and the pressure on the part supporting the rotating part, and the proper allowances are made for surface supports, and lubrication. For instance if the load is extremely light, the part is supported on a pivot point. if the load is very heavy the part is supported on as large a surface as possible, giving due regard to keeping the surface speed of the contacting parts as low as possible, and at the same time maintaining the necessary stiffness in the rotating parts. These fundamental principles also apply to the application of ball bearings (to a certain extent) viz: it is always necessary to know the load and speed under which the bearing is to operate to insure its durability, and its efficiency as a power saver, for the following reasons:—

(1) The diameter of the ball (as has been reported upon and accepted by eminent engineers and since been proven in practice controls the sustaining power of the bearing.

(2) It is always necessary to keep the surface speed of the balls or rotating raceway as low as possible giving due regard to the number of balls employed.

The actual strength of a ball bearing is not in the ball itself as much as in the stationary race (that is if both ball and race are constructed of the same material and of the same strength) the stationary race is the weak point inasmuch as it is subjected to the load at least (in general practice) five times as often as the ball, as the suporting part is subjected to the load every time a ball under load comes in contact with it. This, of course, causes fatigue in the stationary race first, as it gives the ball more time to recuperate from the effects of the load.

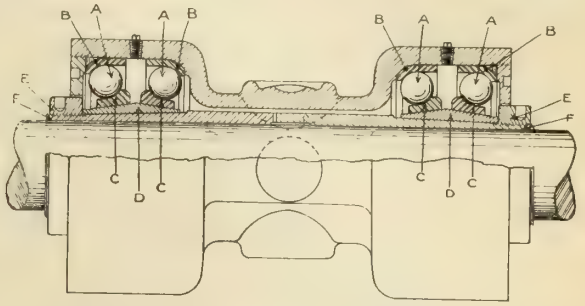

Fig. 3.—Double Ball-bearing for Extra Heavy Duty.

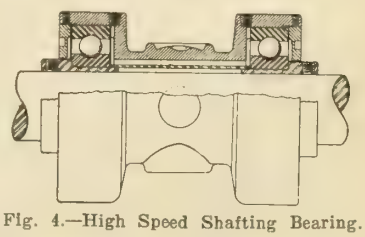

Fig. 4.—High Speed Shafting Bearing.

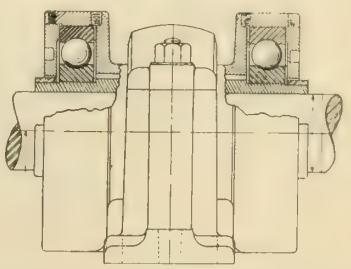

Fig. 5.—Double Annular Bearing in Ball and Socket Pillow Block.

The main reason that the ball controls the sustaining power of the bearing is because the increased diameter neces-

sarily produces a greater contact and consequently a less liability to indentation in both ball and race, and a measurable amount of permanent indentation is fatal to the bearing, but a race or ball

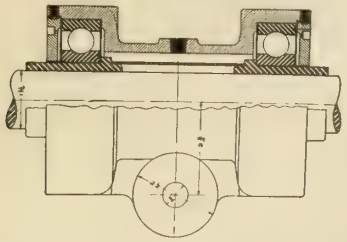

Fig. 6.—Double Annular Bearing for Pressure Blowers and Exhaust Fans.

may be indented to a certain extent, providing that the material has enough elasticity and time to recuperate without fatigue.

In regard to lubrication of ball bearings this is absolutely necessary, although they do not need as much lubrication as the ordinary bearing still they need enough to tend to isolate the contacting parts which rub against one another. Lubrication is necessary for the following reasons:

(1) In the ordinary ball bearing without a cage or ball separator the balls

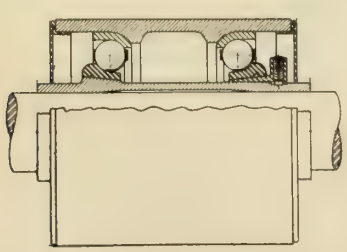

Fig. 8.—Double Ball-bearing Loose Pulley.

when in motion will come in contact with one another, and if a lubricant is not present a certain amount of wear will take place on the balls.

(2) In the ball bearing containing a separator or cage, the cage will wear if there is no lubricant between the balls and cage or separator.

(3) It is always necessary to ensure the bearing against dampness, which means rusting and consequent deterioration.

It is always necessary to use a lubricant that contains no acid that will in any way attack the surfaces of the balls or raceways, and to always protect them in every way possible to ensure their durability.

In regard to installation, although a ball bearing may run free and appear all right in its hanger, or other holding device, care should be taken to see that it is free to align itself to any position the shaft may take, due to deflection by the belt pull, or sag of supporting floors, or any change whatever, that would cause it to be out of ts proper relative

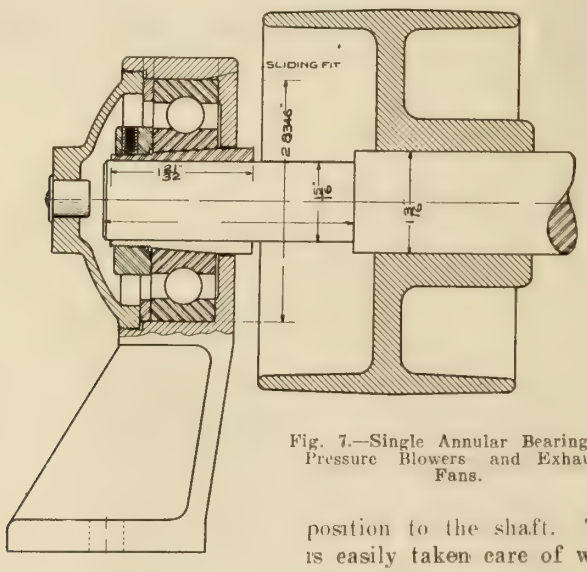

Fig. 7.—Single Annular Bearing for Pressure Blowers and Exhaust Fans.

position to the shaft. This of course is easily taken care of with the use of self aligning hangers or supports, several of which are on the market. Of course in machine construction it is not necessary to provide for the self alignment feature, provinding the supporting parts and shaft are stiff enough to overcome any tendency to spring.

Ball bearing are now in use and have been operating for nearly six years in Canada on head shafts, line shafting, counter shafts, loose pulleys, friction clutches, cut off clutches, fans, polishing machines, mule stands, grinders, flour mill rolls, travelling and stationery cranes, all types of fans, vehicles, mine cars, gas and gasoline engines, motors, generators, saw mandrels; in fact almost every type of appliance consisting of rotating parts, and making large savings of its power loss due to friction.

The shafting bearing for ordinary purposes is shown in Fig. 2. In this bearing there are two rows of balls, one row in each end. The outer races A are held in position by the housing B, the inner races are held in position by the wedge C, and the bearing proper is adapted to different sizes of shaft by using different bushings of a suitable bore at D. These bushings are screwed

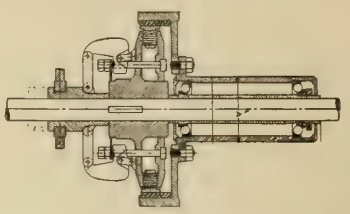

Fig. 9.—New Double Ball Friction Clutch Pulley.

into each end of the sleeves at E and being split and tapered on the outside and the sleeve F being bored a corresponding taper by screwing them in, they are collapsed to fit the shaft. Lubrication holes are provided at G.

The head shaft bearing is shown at Fig. 3. In this bearing there are four rows of balls A, two rows in each end.

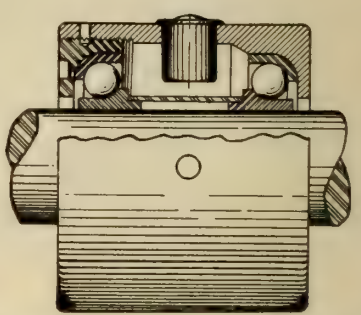

Fig. 10.—Light Shafting Bearing for Power Tables, Sewing Machines, etc.

The outer races B are held as in the ordinary type, the inner races C are forced onto the bushing D having two opposed tapers, and the inner races are fastened to the shaft by screwing up the ring nuts E on each end, thereby drawing out the sleeve F in each end, and they, being

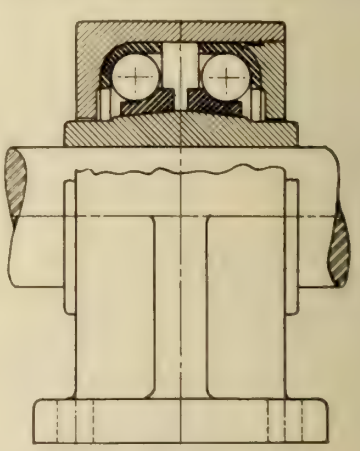

Fig. 11.—Rigid Pillow Block.

tapered and split, cause them to collapse and permanently contact with the shaft. Both of these bearings are built in different styles of housings to adapt

them to the different makes of hangers now on the market.

Fig. 4 shows the so-called annular type of bearing adapted to heavy work under high speeds. The method of fastening the inner race to the shaft is somewhat similar to that used in the head shaft bearing.

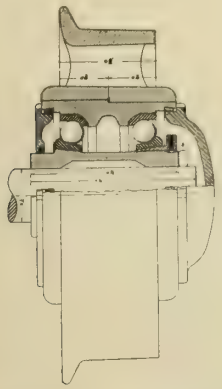

Fig. 12.—Mining, Shop and Light Car Wheels.

Fig. 5 shows the same bearing adapted to a ball and socket pillow block. Fig. 6 shows the same type of bearing adapted to double exhaust fans. Fig. 7 shows the same bearing adapted to pressure blowers. A combination of Figs. 6 and 7 is used on single exhaust fans of all types.

Fig. 8 shows a ball bearing loose pulley bushing. This bushing is simply slipped on the shaft and the pulley clamped on to it. This type is also used for mule stand pulleys.

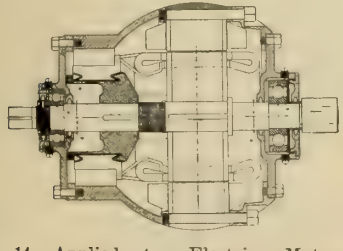

Fig. 14.—Applied to Electric Motors and Dynamos.

Fig. 9 shows a ball bearing sleeve attached to a friction clutch. These sleeves are made to fit any standard clutch. The liability of friction clutch sleeves to stick and seize to the shaft or else become so badly worn that they lose the greater part of their driving power has until now been the bugbear of these clutches, but now by the use of properly designed ball bearing sleeves these difficulties have all been eliminated. This is a new application of double ball bearings.

Fig. 10 shows a bearing for light shafting purposes used in whitewear, knitting and shoe factories. Fig. 11 shows a rigid pillow block bearing used on heavy slow speed machine work. Fig. 12 shows a mine or ore car wheel which has come into very prominent favor with mining concerns. Fig. 13 shows a ball bearing trolley base for street cars. This has eliminated the trolley wire breakages due to stiff swinging poles. Fig. 14 shows a ball bearing motor or generator. This construction allows for the lateral movement of the commutater.

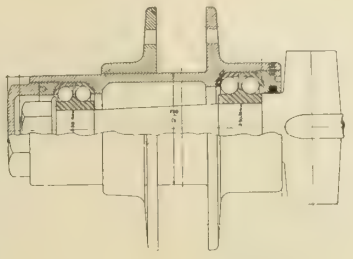

Fig. 15.—Fitted to Metal Hub.

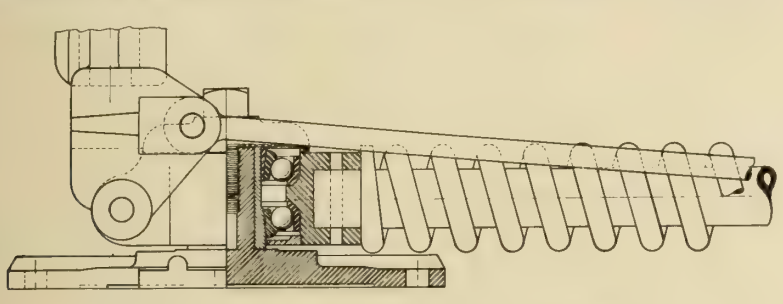

Fig. 13.—Double Ball-bearing Adapted to Trolley Bases.

Fig. 15 show a ball bearing artillery hub for vehicles, and Fig. 16 shows the same bearing fitted to a patent hub, and in use on automobile front wheels. Fig. 17 shows the application of a ball bearing for thrust purposes as used on vertical shafts, clay grinders, etc. Fig. 18 shows the same bearing for use in motor boats and general thrust purposes on horizontal shafts.

In all of the above types of ball bearing no provision is made for adjustment for wear, as the makers supply these bearings of a sufficient strength to ensure their life being at least as long as the life of the machine or other appliance they are supplied for.

Ball bearings to-day consist of three classes or types, i.e., the so-called cup and cone type as shown in Figs. 1, 2, 7, 8, 9, 10, 12, 13, 15, and 16. The annular type as shown in Figs. 3, 4, 5, 6, 14, 20 and the thrust type as shown in Figs. 17 and 18. All of these types of bearings illustrated have raceways having a curvature very nearly approaching that of the ball. This feature alone, has given ball bearings a durability easily three times that resulting from the older type of a point contact between the balls and race.

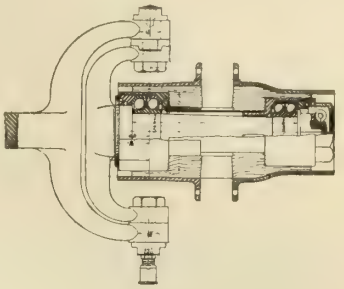

Fig. 16.—Automobile Steering Knuckle and Hub.

In both types the manufacturers aim toward producing bearings having two only contrasting lines between the ball and race, the centres of these contacting lines to be at right angles to the rotating shaft so as to reduce the tendency of the balls to twist and cause a boring effect in one of the races due to the difference in the surface speed caused by any angular contact other than a right angle contact.

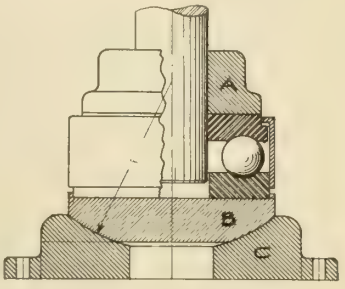

Fig. 17.—Step-bearing.

In Figs. 1, 2, 7, 8, 9, 10, 12, 13, 15, and 16 there is an apparent means for adjustment, but this is only intended to be used at the time of assembling to take care of any variation in the manufacture of the parts governing the distance between the rows of balls. It is not intended, nor is it used as a means of taking care of the difference in the diameter of the races or balls. These are all made to gauge sizes and must

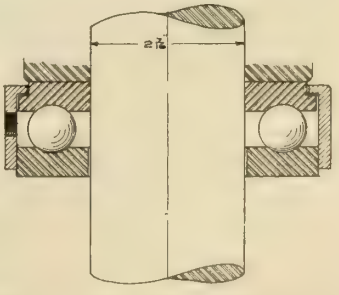

Fig. 18.—Thrust-bearing for Worm Gear.

be duplicated to within 1-10,000 part of an inch. If these bearings are adjusted in an attempt to overcome the result of wear they are made worse than ever, (1) because the stationary race will be worn on about one-fifth of its surface only, making it impossible to adjust the bearing to a circular race. (2) The revolving race will be worn so as to cause the ball to ride on it at an angle that will not be at a right angle to the shaft. There is only one cure, viz: a bearing suitable for the purpose.

During the installation of ball bearings, care should be taken to see that the place on the shaft where the ball bearing fits, is up to full size and parallel, otherwise there will be a local action between the sleeve and the shaft eventually causing a hammering action, which will either reduce the size of the shaft or increase the bore of the sleeve, possibly both. This has happened in a number of cases, and of course the ball bearings were to blame (in the opinion of the customer) even though the balls and races did not show the least sign of wear. It should always be borne in mind that a proper lubricant should be used on ball bearings. Ball bearings have operating with so-called lubricants that were not as good as the lowest grade of axle grease. Outside of acid effects on the balls and races, this is extremely detrimental to the bearings, as these so-called lubricants clog up the rotatory parts to such an extent as to cause them to lose all of their power saving ability, and are consequently worse than useless. There are some cases where the bearings have been running for over four years without any lubricant or attention whatever. To say the least these people have not much respect for the money invested.

In all ball bearings there is some means provided for lubrication and due to the fact that a large quantity of bearings are handled through dealers, it is often the case that the manufacturer's instructions do not reach the customer, consequently he is not advised regarding the instalation and care of the bearings. It will always pay the customer to enquire of the manufacturer in regard to the proper treatment to be given the bearings before instaling them.

In regard to lubrication holes, there are some cases where the lubrication holes have been drilled straight in part way and then cross-drilled to lead the lubricant to the proper place, and where the man in charge tried to see the balls and failing that, tried to feel them with a wire. Not being able to get in touch with them, he thought they were blind holes and failed to give them any more attention, even though the lubricant kept on going in as long as he supplied it. It is not necessary to keep the ball bearings so flooded with lubricant as to cause it to flow all over, but it is absolutely necessary to make sure that the balls and other parts are thoroughly coated.

Notes on Manufacture and Upkeep of Milling Cutters*

Quality of Steel, Method of Hardening, Care and Accuracy in Making New Cutters, and Facility and Correctness in Grinding the Cutters.

By DR. H. T. ASHTON

Although the system of manufacture of milling cutters detailed in this paper is suitable for general application, it has been developed more particularly to meet the difficulties of extending the use of high-speed steel to milling cutters of complicated shape, required when cutting to give an accurate finish and a good surface. It is believed that these difficulties have been commonly met with, and that owing to them the general introduction of high-speed steels of the Taylor-White class has, so far, generally proved of less benefit to engineers for milling cutters than for any other form of cutting tool used in engineering workshops.

Perhaps the advantages to be obtained by the use of high-speed steels for such cutters are also not so obvious as they are for the heavy lathe or planer tools, where the almost red-hot chips, that they can be made to produce, appeal to the least observant onlooker. When, however, it is considered that this class of steel not only has the property of keeping a cutting edge for a reasonable time when taking very heavy cuts at a previously unattainable speed, but also keeps its cutting edge when used with a moderate cut and speed for a far longer period than was previously obtainable, its advantages, if applicable to complicated milling cutters, are clearly just as great as for the simpler tools taking the heavy cuts. For, although the nature of the work upon which the cut is taken and the finish required from the cut may not allow, in the case of the milling cutter, any great increase of speed or feed by the use of high-speed steel, and consequently little direct sav-

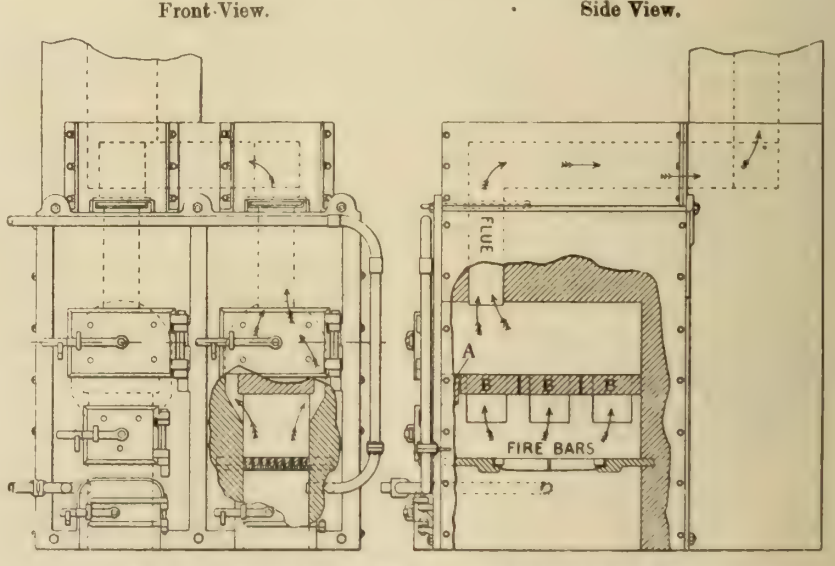

Fig. 1.—Hardening Furnace for Cutters of High Speed Steel.

* Paper read before the British Institution of Mechanical Engineers.

Several foremen in Canadian shops have intimated to the editor of Canadian Machinery that mechanics are not as familiar as they might be, with the making of cutting tools. We trust mechanics will peruse this article with interest as it contains valuable information—Editor.

ing upon the time occupied in doing the work, as in the cases of the other classes of tools, yet an equally important saving is effected upon the cost of supply of the tools themselves. The milling cutter is the most expensive of all the tools used by engineers in cutting metals. In the simplest milling cutter the cost of workmanship so largely exceeds the cost of material that a moderate increase of life obtained by improvements in the raw material far outweighs a considerable increase in its original cost, provided that there is sufficient work in sight for the cutter to ensure its being fully employed for its maximum possible life. Perhaps it is this ruling condition which has led to somewhat less attention being paid to the application of these steels to milling cutters in general engineering workshops than to other cutting tools. For in these, with the exception of a few simple cutters generally useful for roughing out or for finishing simple profiles likely to recur, it has perhaps generally been more economical to make the cutters from ordinary qualities of tool steel, or even in some cases from case-hardened mild steel; hence the preparation of an elaborate milling cutter from high-speed steel has not received quite the same general attention as the preparation of other cutting tools of maximum endurance.

The case, however, is different in a number of workshops where the interchangeable parts of many classes of apparatus and fittings depend very largely upon the use of formed milling cutters, and where the accuracy of the work so produced is directly dependent upon the accuracy with which the form of the cutter can be maintained for a prolonged period. It is desirable also that the cutters should have as long a life as possible in actual service, not only to minimize the first cost and upkeep, but also to keep the output of the machines as continuous as possible, by reason of freedom from delays in changing the cutters. These points depend chiefly upon:

(1) The quality of steel from which they are made.

(2) The method of hardening adopted.

(3) The care and accuracy with which the new cutters are made.

(4) The facility and correctness with which the cutters can be ground up when they have become dull or lost their accuracy.

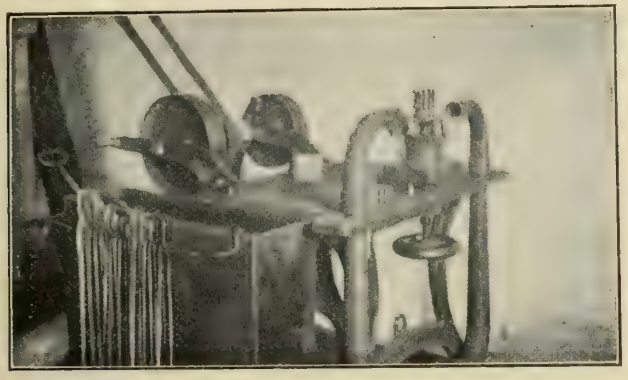

Fig. 2.—Air Hardening Table.

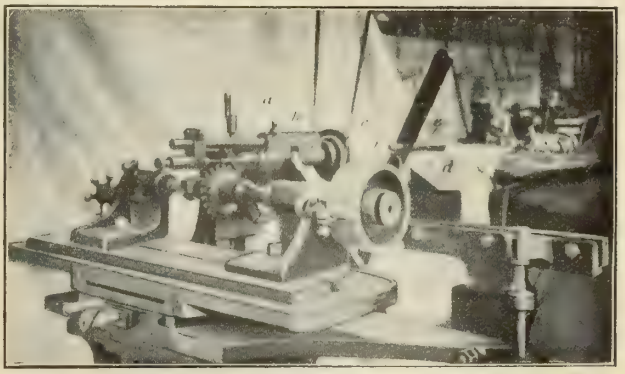

Fig. 3.—Backing-off Cutter-teeth With Tracing-pin and Former.

Fig. 4.—Back View of 3.

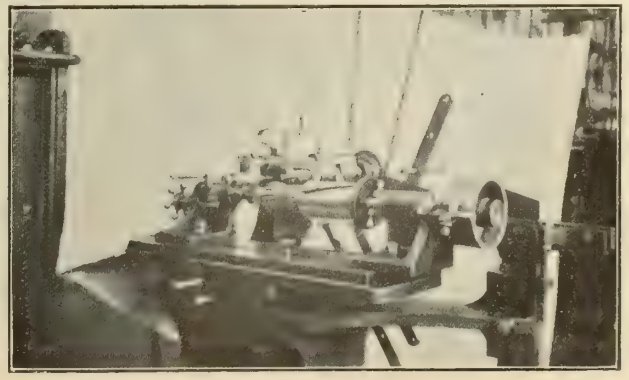

Fig. 5.—Backing-off Cutter-teeth, Using a Spiral Slot.

The Steel Used.

There is, of course, nothing to compare with the recently-developed high-speed steels as a material for cutters which are required to work at a high cutting speed and have the maximum possible life; and no difficulty is now experienced in obtaining work with a sufficiently satisfactory finish, provided care is exercised in the grinding and finishing of the cuters, in a manner which will be described, and also if the cutting speeds and feeds are suitably arranged. Any of the best known makes of this class of steel can be used in conjunction with the system to be described.

The milling cuters are annealed, packed in spend powdered charcoal and steel turnings in cast iron pans with covers which are luted down. These are placed in the annealing furnace first thing in a morning and are gradually heated up to 700 degrees C. to 750 degrees C., this heat is reached by one o'clock and is maintained until about 5 o'clock, when the dampers are closed and the furnace is allowed to cool gradually for 48 hours. It is found that some makes of high-speed steel are satisfactorily annealed by the makers, but it is not the universal practice. Annealing in this manner is found to give thoroughly satisfactory results.

The furnace used for hardening cutters is shown in Fig. 1 and Fig. 2, and it has been found especially adapted for obtaining a soaking heat, together with the high temperature necessary in treating this class of steel and freedom from oxidation. The furnace is cooke-fired and has a forced draught and temperatures up to 2,300 degrees F. can be obtained.

In using the furnace the cutters are packed closely in powdered charcoal in sheet steel boxes about 6 inches by 6 inches by 3 inches. These boxes take

from 2¾ to 3 hours to reach the necessary hardening temperature, the time taken varying with the weight of metal to be heated. The hardening temperature varies somewhat according to the class of steel being used, but may be said to be between 2,000 degrees F. and 2,100 degrees F. The exact temperature necessary for satisfactorily hardening any particular class of steel is previously determined in the laboratory by exact experiments, and the temperatures obtained in the furnace are checked by means of a Fery radiation pyrometer—also shown in Fig. 2. This pyrometer is itself tested against a standardized Callendar pyrometer, and has so far been found to give extremely reliable results.

The cutters when sufficiently heated are quickly removed from the charcoal in which they have been packed, and are at once placed upon the hardening table shown in Fig. 3. This table is of a type frequently used in workshops for heating tools by gas, but when used for hardening cutters, air only is supplied through the two nozzles. These can be moved as required about vertical pivots so as to cause the air-blast to impinge upon the periphery of the cutters at any required points and simultaneously upon the vanes of the spindle upon which the cutter is placed, causing the whole arrangement to rotate and thus equalizing the cooling and hardening effect. The air delivered upon the cutter is drawn from an old culvert, which passes under the floor of the workshop and through which a stream of water continually flows; hence at all times of the year a supply of cold, damp air of maximum cooling effect is available. The temperatures used in hardening are such that the edges of the cutters are almost fused, and although different makes of steel have been found to vary somewhat in this respect, the general statement remains true of all of them. At the same time it is found that this fusing effect for a given heat is considerably minimized by the method of heating in closed boxes as compared with the ordinary method of heating tools, either in a muffle or in a direct gas-flame, and even the scaling, which, with the latter systems is frequently very marked, is, with the mehod now described, so slight that the cutters can be wholly freed from scale by placing momentarily under a revolving scratch brush.

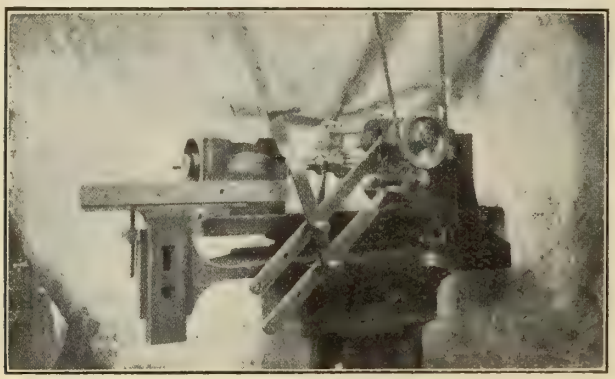

Fig. 6.—Back View of 5.

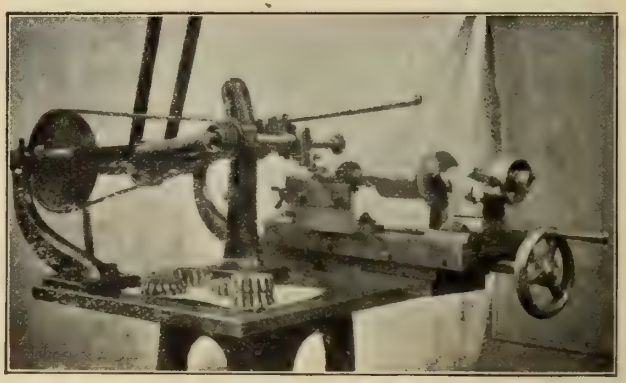

Fig. 7.—Grinding Cutters.

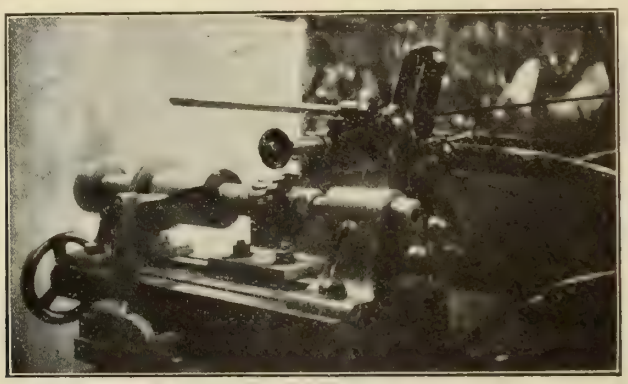

Fig. 8.—Grinding Cutters.

All difficulties as regards the expansion of the hole through the cuters in hardening are met initially, leaving the bore slightly smaller than is ultimately required—on the average about 0.01-in. less than the finished diameter; the expansion is usually about 0.003-in. to 0.005-in., the average diameter of the mandril being 1 in. After hardening, the milling cuters are first chucked truly with the outside diameter in a self-centring chuck, and the internal bore is ground up truly to the finished diameter. After this the hardened cutters are chucked upon mandrils and the teeth are finished upon the special machines to be described.

Forming Cutter Teeth.

Accuracy of form of the cutters is secured, both when being cut in the first place and also subsequently reformed by turning the blanks and milling out the teeth in the ordinary manner, and then backing them off in the machine shown in Figs. 4 to 7. In this machine the cutter to be formed is carried on a dividing head, so that one tooth at a time can be presented to the small milling cutter a, Fig. 4. This is mounted upon the cutter spindle b driven by a pulley c, from which cat-gut cord runs through on overhead gear, allowing the spindle to be moved within the necessary limits. The small cutter spindle-frame forms part of a system of adjustable pantograph links, so that its movement is an exact reproduction in miniature of the movement of the tracing pin upon the former d fixed in front of the machine. The operator, by means of the handle e, moves the pin f lightly along the former, and consequently also moves the cutter over the tops of the teeth to a similar but smaller shape. The small cutter is enlarged in diameter towards one end, so that it cuts away the back of each tooth upon the cutter to the necessary extent. Commonly a conical backing-off cutter is used, the angle of the cone being 20 degrees and the setting being such as to give an angle of relief of 10 degrees, that is, the axis of the cone is at right angles to the radial face of the tooth being backed off. It will be seen that this characteristic enables the machine to produce teeth of any form, upon a cutter backed off in every direction from the cutting edge, so that a clean cut can be taken with the sides as well as with the tops of the teeth.

In the case of those milling cutters in which grinding back the faces of the teeth so backed off might cause serious inaccuracy, owing to its throwing back

the radial cutting edges of the teeth, the cutters are built up of annular sections which are either clutched together or clamped together upon plain faces, from which, after a particular grinding or series of grinding operations, the same amount is ground off as that by which the radial cutting edge has receded. Where the edges of the teeth are parallel or nearly parallel to the axis of the cutter, the profile is, of course, not appreciably affected by grinding back the faces of the teeth. A further means of avoiding such errors is also to be found in grinding the tops of the teeth in the manner subsequently described.

As it is found advantageous, in order to obtain a fine finish, to use helical teeth upon milling cutters, a fitting consisting of a sleeve with spiral slot (See Figs. 6 and 7) can be mounted on the same spindle as the milling cutter. A pin on a hinged arm centred above the backing-off cutter spindle is arranged to slide in the slot in this sleeve so that, as the frame carrying the copy and the cutter spindle is moved backwards and forwards along the axis of the cutter being backed off, the helical teeth are maintained in correct relation to the backing-off cutter; while at the same time they are backed off to the correct profile. Theoretically, of course, in such cases the axis of the cutter being operated upon could be inclined to the axis of the backing-off cutter spindle at an angle equal to that of the spiral of the cutter being produced, but in actual practice it is found that this adjustment is very seldom necessary, as the cone angle of the backing-off cutter, and also the amount of material which can be removed from the cutting edge of the cutter being produced, are both, comparatively speaking, small.

This machine has thus been found not only capable of backing off satisfactorily cutters of a shape which could not be backed off along the whole length of their profile in an ordinary relieving lathe in one operation, but it has been found possible to do the backing-off in, approximately, one-third of the time required on a relieving lathe, and the finish of the teeth is found to be better.

Grinding Cutters.

Figs. 8 and 9, show the machine used for sharpening the cutting edges of the hardest milling cutters and subsequently regrinding their faces or edges as required from time to time.

This machine has a grinding wheel mounted upon a spindle suspended on a swinging frame and follows the work by the use of a former, the profile of which is of the same magnitude as the one to be ground. In an ordinary way this former would not have the exact outline of the shape desired on the finished cutter, corrections having to be applied for the diameters of the tracing roller and also of the grinding wheel, the latter item being, of course, itself variable. This difficulty is overcome by using grinding wheels of special fast-cutting artificial stone which will perform a considerable amount of useful work before being appreciably reduced in diameter, and by making the diameter of the tracing roller equal to the diameter of the grinding wheel; there is in addition, of course, an adjustment for raising or lowering the former.

The milling cutter being ground is, as before, mounted upon a dividing head in the case of straight cutters, or upon a dividing head provided with helical sleeve in addition in the case of helical teeth cutters, and all the teeth are first ground along the tops to profile and afterwards in the usual manner down their faces, the grinding wheel being, of course, set over to the angle of the spiral. The cutter thus finished has edges both of the maximum keenness and also of the maximum endurance due to correctly hardened high-speed steel, as only the thin skin partially oxidized in heating before hardening is removed.

Hitherto the apparatus employed upon sharpening profile cutters for milling machines in repetition work, such as is produced in small arms factories and elsewhere, has required the handling and attention of men with considerable training and skill, liable to error and consequently well paid to avoid it. The provision of simple machines such as those described now enables a mechanic to regrind correctly all cutters brought to him with considerable rapidity and the minimum possibility of error. By standardization of the pitches of the teeth and their angles, and by the provision of suitable templates for each of the cutters commonly required, the use of these machines has been found to result in distinct economy, both in the upkeep of cutters and also in the quality of the work turned out.

Considerable advantages result from being able to reform accurately the contour of the teeth in addition to grinding the face. In ordinary use the teeth of milling cutters are damaged not only on the face, but to an even greater extent on the top, and it has frequently been found that removing, say, 0.002 in. from the top has as beneficial an effect as removing 0.006 inch. from the face, and with this additional advantage that, when a tooth has been ground to its fullest extent from the face, it can be further sharpened on the top whilst still retaining its correct figure, until the tooth is too short through not allowing the necessary clearance; and this consideration will in many cases lengthen the life of a cutter by 10 per cent.

The life of some milling cutters prepared by the methods indicated above has been extraordinary; for example, a cutter working in a self-acting cross milling machine and operating upon the bodies of the service rifle at an average cutting speed of 69 feet per minute, with a feed of 1¾ inches per minute and a depth of 0.08 inch, and taking a cut of an average width of 1-11-16 inch and ⅞ inch long, has produced, at the time of writing, 39,170 bodies and is still good for about half as many more. This particular cutter has been reground across its face twenty-five times. The composition of the steel upon which it operates is 0.5 to 0.6 carbon with an ultimate tensile strength of not less than 35 tons per square inch.

NEW HIGH SPEED TOOL STEEL.

A great deal has been said and written recently regarding the new high speed steel that is now being placed on the market; and the manufacturers of tool steel have been of late commanding the attention of the steel using world in their endeaver to produce an even more superior article than that which is in use at the present day.

Messrs. Walter Spencer & Co., of Sheffield, Eng., have been conducting exhaustive experiments for a considerable time with a view of producing a superior article to that which is known to the consumers; and they have now announced that they are able to place on the market a "water hardening" high speed steel which gives excellent results. This brings it into universal use, as the smallest possible works can use the water hardening steel. The new steel will keep its cutting edge for a long period and take a very heavy cut.

High speed drills have also been commanding the attention of Messrs. Walter Spencer & Co., and they are now manufacturing a high speed drill that is made from special registered section steel. These drills have a long life, and do very rapid work.

K. M. Trigge, who for many years has been a traveler for the Allith Mfg. Co., Hamilton, covering eastern territory, has made a change. He has joined the selling staff of the Reddaway Belting Co. and will cover the States of Vermont, New Hampshire and Maine as well as the Asbestos districts of Quebec province and the Maritime Provinces. Mr. Trigge will be familiar with this trade having been with the Reddaway company for years formerly. He made many friends in his own field and no doubt will prove an acquisition to his old firm.

Ralph P. Bell, formerly of Halifax, is in charge of the Canadian Fairbanks Company's business between Winnipeg and the coast. Mr. Bell is a member of a well known Halifax family. He graduated from Mount Allison University in 1907.

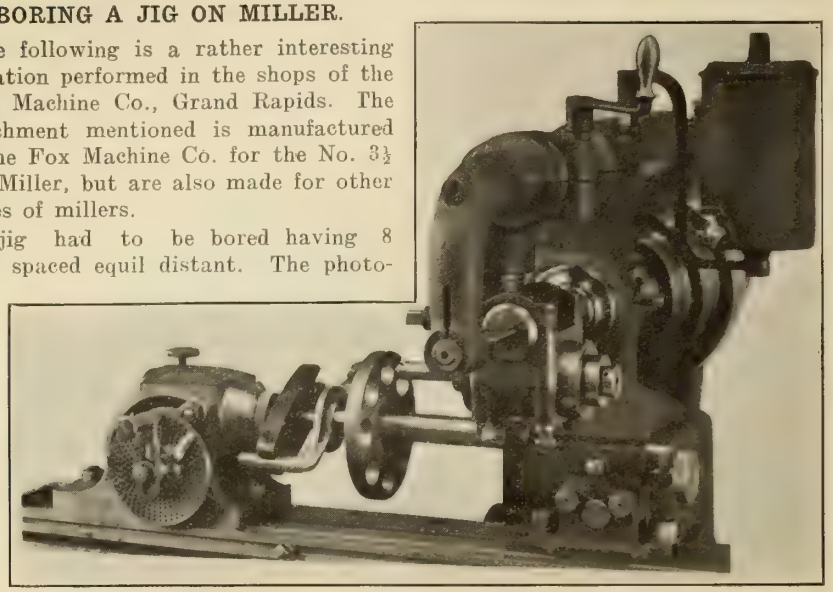
Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

BORING A JIG ON MILLER.

The following is a rather interesting operation performed in the shops of the Fox Machine Co., Grand Rapids. The attachment mentioned is manufactured by the Fox Machine Co. for the No. 3½ Fox Miller, but are also made for other makes of millers.

A jig had to be bored having 8 holes spaced equil distant. The photo-



An Interesting Operation on Miller—Fox Machine Co.

graph shows how the job was done on a No. 3½ Fox Miller with universal dividing head and vertical attachment. The plate to be bored is mounted on a mandrel supported by universal dividing head and tail stock on the top of the milling machine. The vertical attachment which may be swung from vertical to horizontal or any intermediate position was adjusted to horizontal position and in it was mounted a short boring bar. This arrangement enables the regular table feed to be used and the plate to be indexed for the different holes thus rendering a quick operation and a very accurate jig, as the error in spacing was found to average not aver .0005.

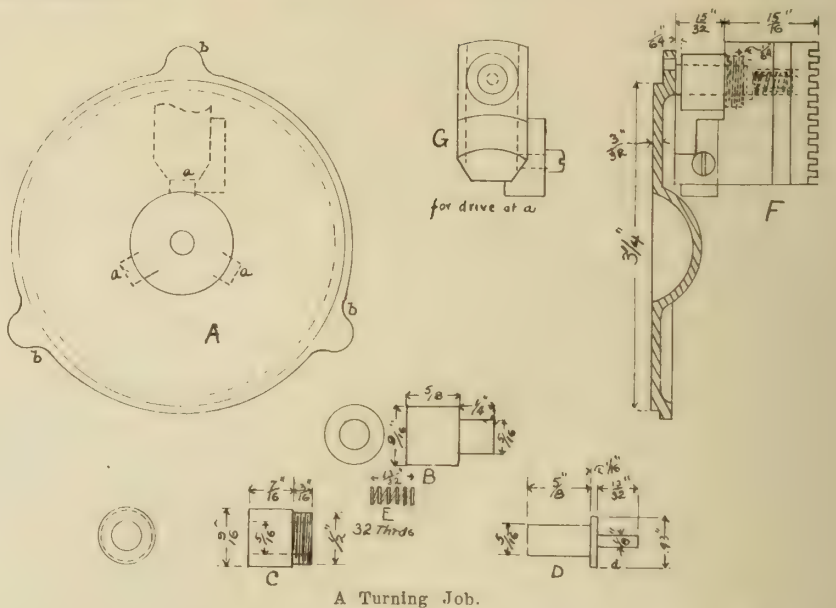
A TURNING JOB.

By S. A. Francis.

A job came into the shop not long ago for a large number of brass composition plates such as is shown at (A) in the sketch which required facing off as well as turn stepping them. While the job looks like a simple one some difficulties are encountered which one would not look for at first glance.

The manner in which the various difficulties were overcome may be of interest and service to your readers, as similar jobs, or substantially similar, are by no means rare.

First a driver was put on one of the jaws of a three jawed gear universal chuck, shown at (G). Due to the thinness of the plates they would chatter and spring, so a 5-16 inch hole was drilled in the face to step off the three jaws, and



A Turning Job.

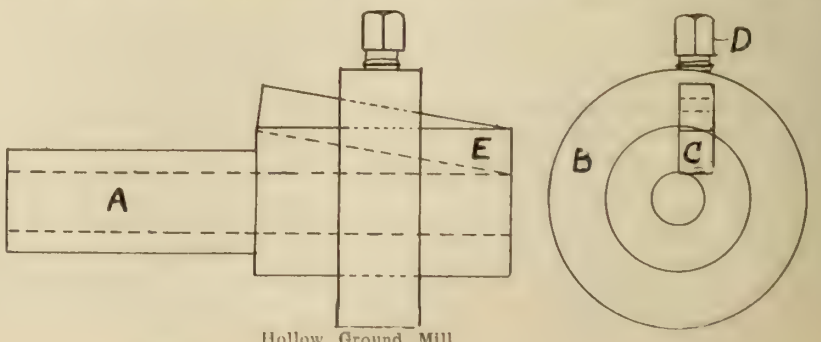
pressed in the stud (B) allowing the lugs (b) to rest on the stud. This was found very effective while the chuck was new and unworn, but after continued use and it was affected by wear, the plates tipped so that the lugs did not rest on the studs as designed, thereby causing the same trouble of spring and chatter as was experienced.

The bushing shown at (C) the spring (E) and the stud were therefore made, and the jaws drilled and tapped as shown at sketch (F). Stud (D) was made a nice sliding fit in the bushing (C) hole. The spring (E) was then placed on the stud shown at small (d) and allowed to rest on bottom of drilled hole in jaws, forcing the stud (D) outwards. After assembling the parts and passing the plate in so as to have the lugs (b) rest on bushing (C) it was found that when the jaws were tightened that the spring (E), when made of proper tension in order not to spring the plate, held the stud (D) against the lugs (b) with sufficient force to avoid all chatter and spring due to the worn jaws tipping.

A GOOD HOLLOW MILL.

By B. L. Hamilton.

The writer has had quite a lot to do with hollow mills and often found them troublesome, for when the clearance wore



Hollow Ground Mill.

off they would bind on their work. Probably other men have had the same trouble too, therefore I am submitting this sketch of a mill that has proved most satisfactory both for drill press and turret lathe.

A is a piece of tool steel $\frac{7}{8}$ inch. diameter and 3 in. long turned down to $\frac{5}{8}$ in. diam. x $1\frac{1}{2}$ in. at one end. A $\frac{3}{8}$ in. hole is drilled through the entire length and a groove is milled in one side of same as shown at E, in which is held a piece of 5-16 in. square tool steel. This serves as a cutter being held in place by collar B and setscrew D.

CUTTING SPEED OF TOOLS.

By J. H. R. Hamilton.

Often when a man is working on a machine tool he is wondering whether his tools are working at their proper speeds, and doing their maximum amount of work.

The older mechanic can tell from past experience whether he is getting out of a tool all there is in it, but sometimes a foreman will come along and tell a new man to "speed her up," knowing that from previous trials the tool is capable of doing more work. While it is true in some cases the foreman is trying out the new hand; in the majority of cases the new man is practically feeling his way and trying out the machine on which he is placed.

The idea of this article is to show that the placing of index plates similar to that shown in Fig 4 (each plate suited to the machine for which it is intended) would overcome this trouble to some extent, as the man could tell in in a few minutes with a piece of chalk or pencil whether he is working up near the limit or not. The index plate shown will show the idea of this article, but to give some of the younger readers the purpose for which it is intended the accompanying drawings will prove of some benefit.

Take the Lathe First.

Knowing the main shaft to be traveling (in this case) 150 rev. per minute. The speed of lathe spindle can be found by multiplying the number of revolutions of the main shaft by the diameters of all the driving pulleys in the series and dividing by the diameters of all the driven pulleys.

Take the drive shown in the sketch.

For straight drive.

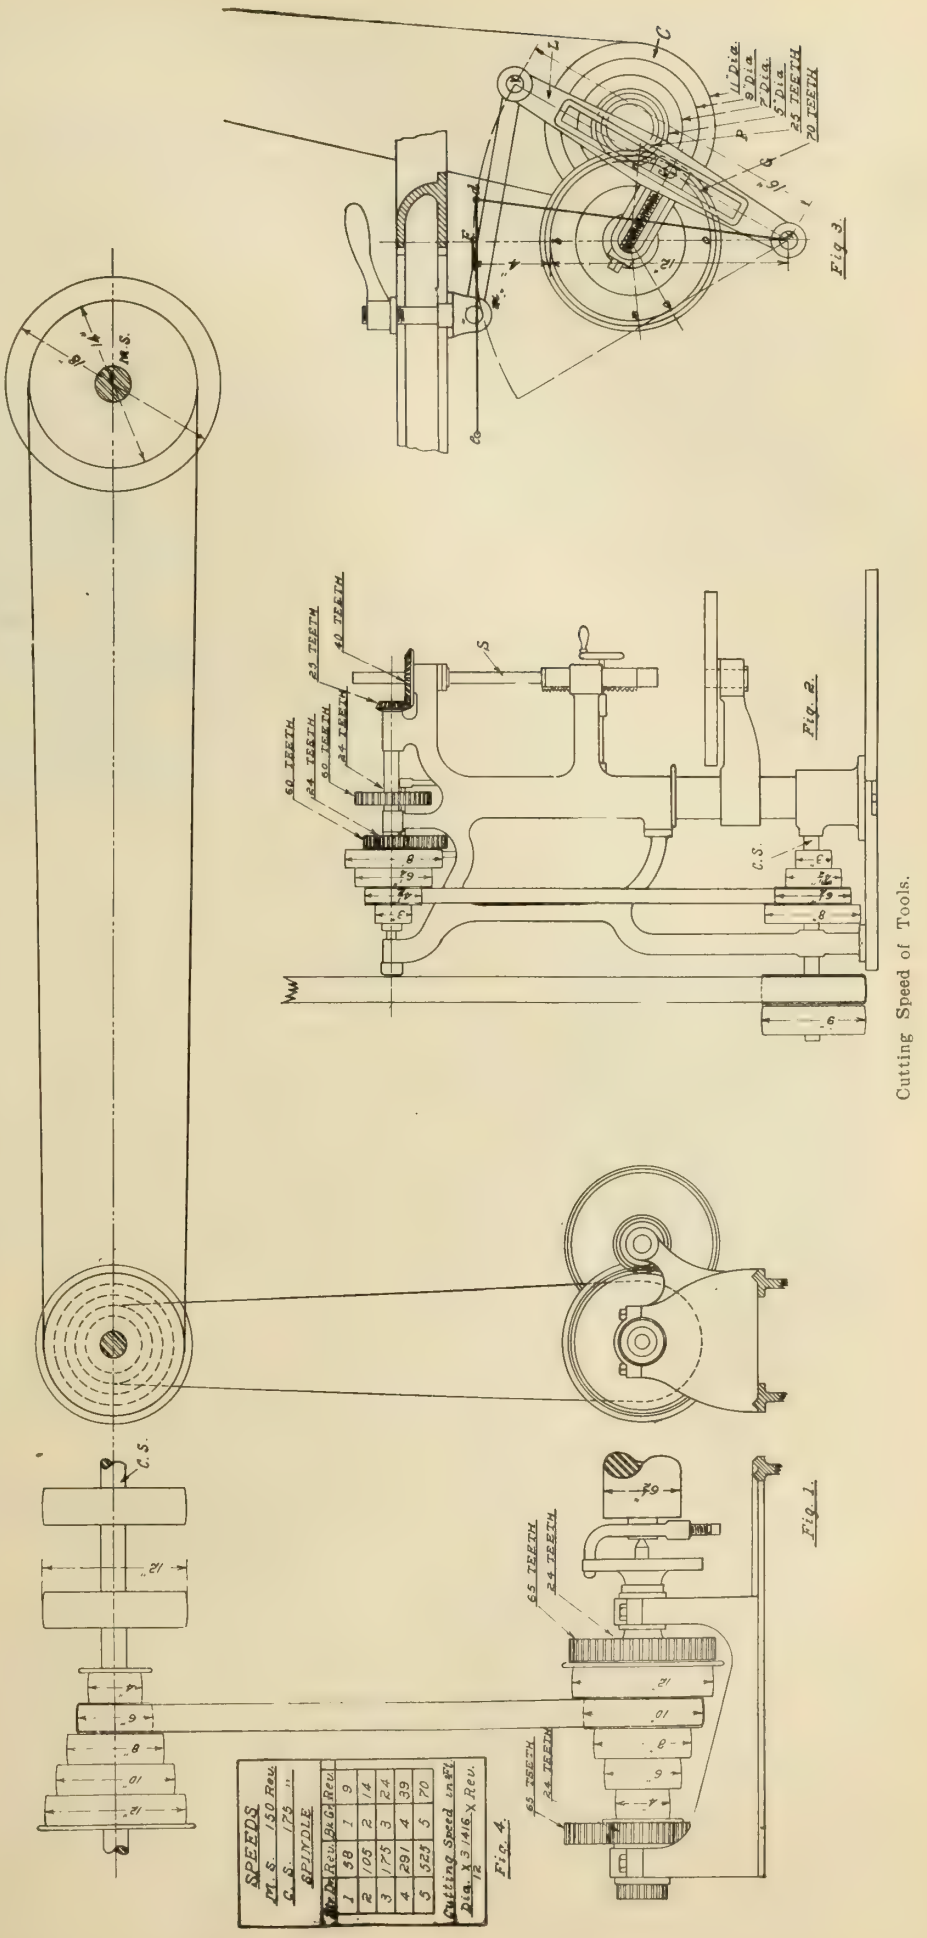
By the formula:

Rev. of spindle =

$$\frac{\text{Rev. of M.S.} \times \text{dia. of drivers}}{\text{dia. of driven}}$$

$$\frac{150 \times 14 \times 6}{12 \times 10}$$

105 r. p. m. of lathe spindle.



With Back Gear.

Take number of teeth in gear instead of the diameter.

$$\text{Rev. of sp.} = \frac{150\times14\times6\times24\times24}{12\times10\times65\times65} = 14.3+$$

say 14 rev. per min. Cuttting speed in ft. per min. on shaft 6½'' dia. with back gear=

$$\frac{\text{dia.}\times3.1416}{12}\times\text{No. rev.} =$$

$$\frac{6.5\times3.1416}{12}\times14 = 23.8 \text{ ft. per min.}$$

which is a pretty good average for cast or wrought iron.

With modern high speed steels the cutting speeds can be increased from 20 per cent. to 60 per cent. according to the grade and condition in which the tools are kept.

The different revolutions of the drill spindle are found in the same way.

Take the drive shown.

24'' pulley on the main shaft. Straight drive:—

$$\frac{150\times24\times6.25\times25}{9\times4.5\times40} = 347.2$$

or 347 rev. per min. of drill spindle.

With back gear:

$$\frac{150\times24\times6.25\times24\times24\times25}{9\times4.5\times60\times60\times40} = 55.5$$

or 55 r. p. m.

The positive cutting speed on a shaper or slotter is not so easily found as the cuting speed varies for every position of the stroke as will be seen by the sketch of the shaper action shown in Fig. 3.

When the link L is in the position shown the tool, ram and upper end Y of the link are practically stationary, but the action of the machine causes the reciprocating parts to gradually increase their speed until the link L is in a vertical position. Further movement causes the reciprocating parts to gradually decrease their speed until the link L is at the extreme left, when it is returned to its former position by a gradual increase and decrease of speed, but with a greater velocity according to the angle through which the block C travels.

The ratio of return to that of advance in the position shown or on a 16'' stroke is 2:1 as the angle of advance C B A is twice that of the angle of return A O C. But if the block C is moved toward the centre or to a position that will give a 4'' stroke (as that shown by the skeleton sketch) the ratio of return to that of advance will only be about 9:8, as the angle of action of link L has been greatly reduced.

As long as the belt is on the same step of the cone pulley, the number of strokes per minute will be the same whether it is a 1'' or 16'' stroke, but the cutting speed will be reduced in proportion to the length of stroke.

To find the maximum cutting speed, which will be when the link L is in a vertical position on in the middle of the stroke.

Find the number of revolutions of gear G in the same manner as the previous example.

Main shaft pulley 9'' dia.

Counter shaft pulley 18'' dia.

Cone pulleys same as on machine.

The four speeds are 12 rev., 21 rev., 34 rev. and 58 rev.

The maximum cutting speed of the tool is to the speed of the link block circle as the length of the link is to the distance of the link block C, from the fulcrum, when in a vertical position on the forward stroke.

Cutting speed (maximum) for 16'' stroke on slowest speed.

Speed of link block circle=

$$\frac{8\times3.1416}{12}\times12 = 25 \text{ nearly ft. per min.}$$

Max. cutting sp; sp. lk. blk. circle::16:12 or max. cutting speed=

$$\frac{25\times16}{12} = 33\ 1\text{-}3 \text{ ft. per min}$$

Take a 2'' stroke on same speed.

$$\frac{1\times3.1416\times12}{12} = 3.1416 \text{ ft. per min. of link block circle.}$$

Then maximum speed $= \frac{16\times3.14}{8.5} = 5.9$

or 6 ft. per min.

By changing belt to the highest speed the maximum cutting speed for 2'' stroke=

$$\frac{6\times58}{12} = 29 \text{ ft. per min.}$$

where 58 is the rev. of gear G on the fastest speed and 12 is the rev. of gear G on the slowest speed.

GASOLINE ENGINE CYLINDER REPAIRED BY AUTOGENOUS WELDING.

By Frank C. Perkins.

The accompanying illustration, Fig 1 shows a cylinder of a two cycle engine which was damaged by the breaking of a connecting rod, allowing the piston to strike the top of the cylinder, the deflector on the piston punching a hole in the combustion chamber wall. The illustration, Fig. 2, shows the same cylinder from the outside after welding by the autogenous process.

The same sort of puncture of combustion chamber wall often occurs by the head of a broken valve or other foreign object getting between the cylinder head and piston. This class of breakage is the most difficult to repair, as it is nec-

Fig. 1.—Broken Cylinder

essary in most cases to cut out a section of the water jacket to be able to work on the inner wall the only deviation oc-

Fig. 2.—Repaired Cylinder.

curing when the break happens to be opposite a large hand hole.

The illustration, Fig. 3, a double cylinder is noted at the left, which was dam-

aged and repaired by this welding process, the broken parts being seen at the bottom, and the repaired cylinders at the right.

The illustration, Fig. 4, shows an air cooled cylinder, which was welded perfectly by the oxy-acetylene process and made practically as good as new.

It is held that breakage in automobile cylinders can be divided into three main

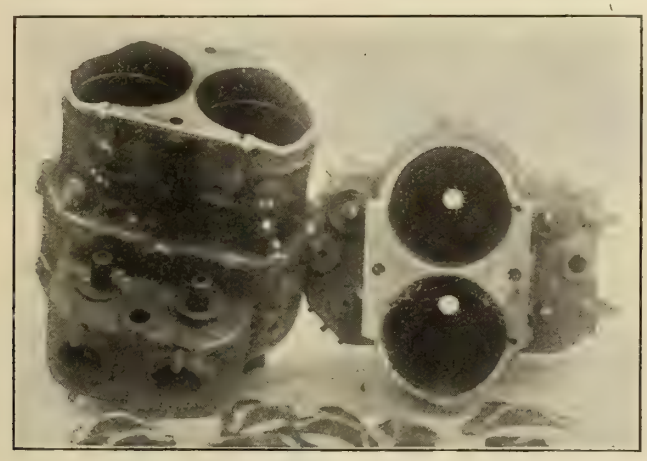


Fig. 3.—Broken Pan of Cylinders.

classes which cover at east ninty per cent. of the cases, and most of these breakages can be satisfactorily repaired by means of the oxy-acetylene flame when proper utilized. The Davis-Bournonville apparatus is constructed for autogenous welding, which consists of fusing the metal around the break by means of an acetylene flame. The heat is concentrated to a very small area of being burnt with pure oxygen in a torch giving a flame temperature of over six thousand degrees, additional metal being added where necessary from a rod of the same material. This is practically recasting the part locally.

There is no doubt that autogenous welding is proving a great boon to those who are unfortunate enough to have their cylinders broken, as they can be satisfactorily welded up in the majority of cases, and with a little trimming off will not show. In fact some people require this as they wish to sell their cars without the fact of the repair having been made, being noticed.

It is well known that broken flanges are a great source of annoyance. A portion of the flange, which holds the cylinder to the crank case is broken away, either due to their being insufficient metal to withstand the strain or to carelessness in assembling. It may be mentioned that these breakages occur in two ways, the wall of the cylinder may be broken away or part of the flange may be cracked off. In the latter case it is said to be an easy matter to make the repair, but when the break runs through into the bore of the cylinder considerable care is required. It being first necessary to consider whether it is desirable to weld in the bore which would then require machining, or at any rate filing out, or only groove and weld from the outside to within a sixteenth of an inch of the face, sufficient metal being added to the outside to insure ample strength. This, of course, leaves the crack on the inside which can, however, be smoothed down, and is not objectionable for a repair job, not interfering with the satisfactory operation of the motor in any way.

The next class of breakages, in order of frequency of occurrence, are those in which the wall of the cylinder, combustion or valve chamber is broken or cracked. These are in most cases due to freezing, but a certain number of them occur due to the designer making a flat surface too large without adequate ribbing to support the intermittent pressure of the explosion.

Many water jackets are broken by freezing and this is said to be the largest class of cylinder breakages, mainly due to carelessness in allowing the water jacket to get frozen up, resulting in the breaking of the water jacket wall. This is not always termed carelessness, as water jackets have been cracked as early as the middle of October when the owner had no thought of such a thing being possible.

It is also true that engine cylinder jackets have been frozen, due to too small drain cocks, and it is quite frequently the case that when shipping a car by rail in winter the drain cock will be opened, but due to some pocket in the water system, in some cases very small ones, which did not drain the cylinders, have been broken.

It is stated by engineers of the autogenous welding process who have had experience with broken cylinders, that curiously enough, the majority of cylinders cast from the same patterns will break in just the same place when frozen up. In a number of cases the break causes a piece of the wall of the water jacket to be entirely detached, and the breaks occur so near alike, in similar cylinders, that it would be possible to take the detached piece from one and weld it into another even the smaller irregularities coinciding.

In case a break of this nature is autogenously welded by means of the oxy-acetylene frame, the crack or edge of the broken part is prepared so as to leave a groove nearly through the metal. The whole part in then heated to about five hundred degrees, uniformly, this is not enough to warp the bore as has been repeatedly proven by careful measurements before and after treatment. The sides of the groove are fused together and filled from a rod of cast iron, the resulting weld being very neat in appearance, not generally requiring any finishing, and it is as strong as the original wall. And as a very small number of units have been added to the part,

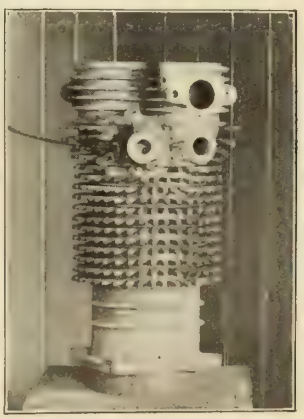

Fig. 4.—Cylinder Repair.

owing to the intense heat of the flame fusing the metal before the heat has time to spread, there is seldom any trouble with cracks when the metal contracts in colling.

Frank Barber, County Engineer for York, and C. R. Young, B.A.Sc., Lecturer in Applied Mechanics at Toronto University, and for three years connected with the structural departments of the Dominion Bridge Company, and Canada Foundry, have entered into partnership as consulting and designing engineers on steel and concrete bridges and general engineering. Their address is 57 Adelaide Street East, Toronto, Ont.

DEVELOPMENTS IN MACHINERY

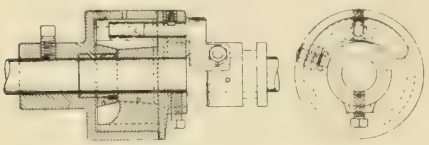
New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

NEW LIGHT POWER CLUTCH.

The accompanying illustration shows a small power clutch. It is designed for use on counter shafts, gas engines, or any machines which have to be put on and off often. It has been designed to run at very high speeds; this makes it a satisfactory clutch for this class of work.

It can be used with a pully and sleeve or used as a cut off coupling parts, and there is only one place of adjustment which makes it easily and quickly adjusted.

It is made in eight different sizes, ranging from ½ horse to 7 horse power.



"Ideal" Hub Clutch.

To operate this clutch push the sliding collar (D) along the shaft by an ordinary clutch shifter till it touches the hub (D). As it slides along the shaft its taper sides press lever (C) outwards, this acts on the oval end of lever (C) which is in between the lips on spring (B). The action of the oval on lever (C) forces spring (B) outwards against hub (A). When used as a cut-off coupling; or sleeve when used as a clutch, the spring (B) and hub (B) are cast in one piece.

The clutch is mandfactured by the Ideal Clutch Co., 16 Pearl St., Toronto.

PARAGON TAPER SHANK DRILLS AND SOCKETS.

The drill, Fig. 1, is twisted from flat stock, with a shank forged and

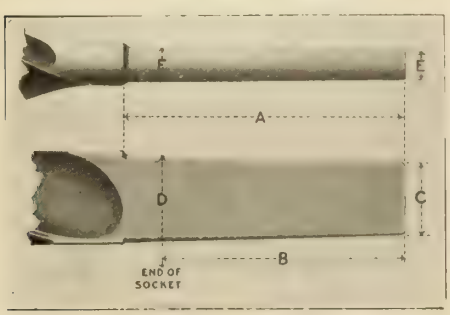


Fig. 1.—Paragon Taper Shank.

ground to size from the original bar, without weld or joint. This shank has a uniform taper on the flat sides as well as on the rounded edges.

The attractive feature of the shank, Fig. 2, lies in its strength and simplicity. It is the natural, logical method of driving a flat twisted drill. A regular taper shank sleeve outside, with

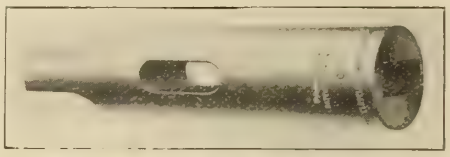

Fig. 2.—Paragon Taper Socket.

a flat tapered hole inside to correspond to the shank, is all that is required to hold the drill. A good true fit is thus secured, resulting in a firm accurate drive, with the strain distributed over the entire length of the shank.

The sockets are finished in either rough, fitted or sleeve styles. The Paragon taper shank high speed drills and sockets are manufactured by the Cleveland Twist Drill Co., Cleveland.

DOUBLE THREADED SCREW.

The Caldwell patent screw has two threads, one of which is half a turn behind the other advance along the blank twice as quickly as the single spiral of the old type. These two threads are continued beyond the core of the blank, forming two chisel lips. These two lips are diametrically opposite each other, and are of such shape that the under side will clear itself as the screw enters the wood, the upper side being bevelled to raise the fibres when cut by the sharp edge and permit an easy entrance for the core. This shape continues throughout the length of the thread.

The following advantages are claimed for this type of screw:

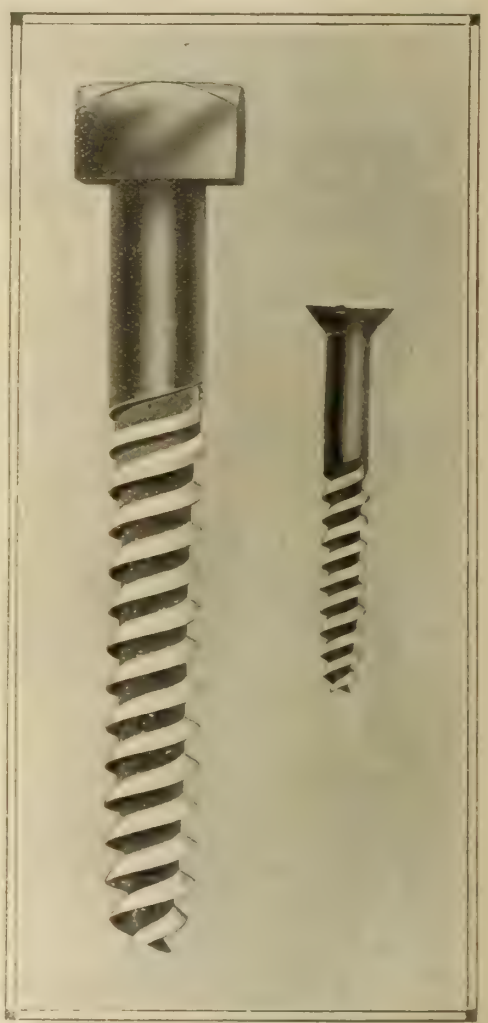
(a) The two projecting lips will take an instantaneous grip on the fibres of the wood, and even in hardwood the screw can be put in without the usual preliminary boring.

(b) With surprising ease the screw will cut its own way, the bevel side lifting the fibres and the undercut side free of all friction or hindrance.

(c) The double thread is so fast that less than one-half the time is required to put in or take out a given size.

(d) Although it gains so much in time, it loses nothing in holding power and vibration or shock will not loosen it as easily. The reason for these facts is that the fibres are not broken and chewed up by the screw in entering, but are split in one direction only and wedged tightly against that face of the thread, which must take the burden of the work the screw is called upon to do.

(e) The threads being opposed to each other give the screw a certain balance, and it will go in a straight line even across holes, cracks and knots.



Caldwell Patent Log Screw and Wood Screw.

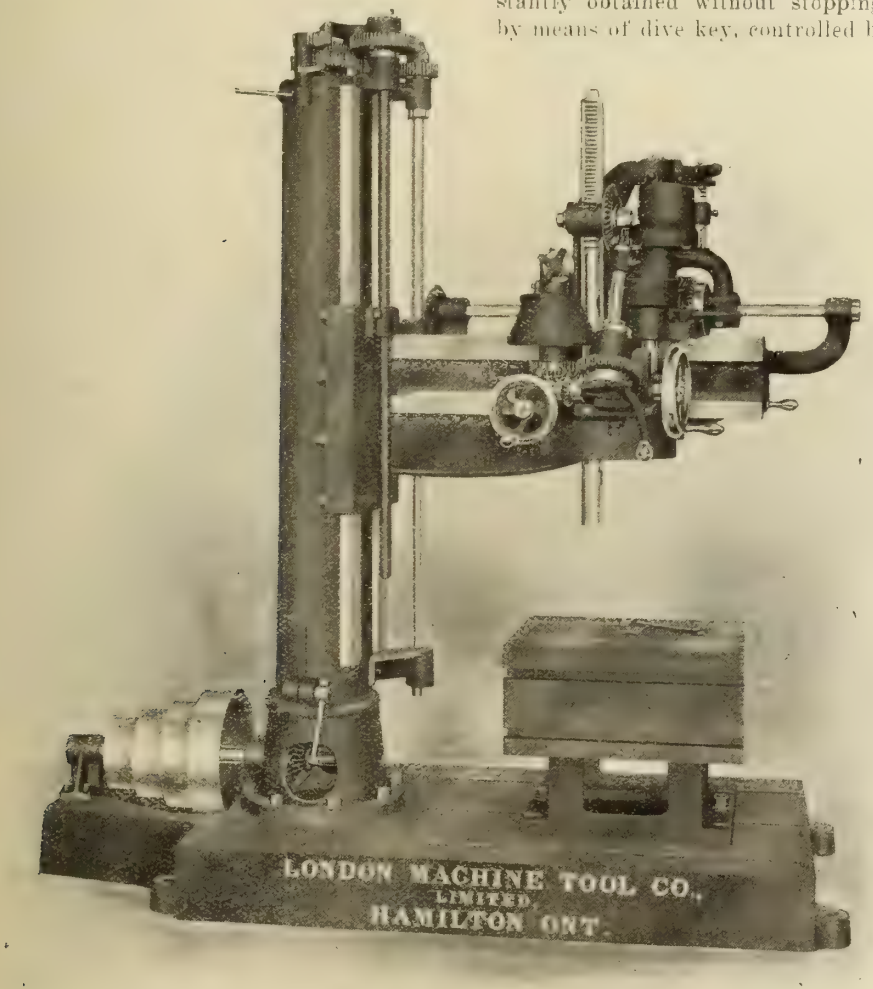
These screws are made on specially designed automatic machinery. The lag screws are used in bridge work, railroad, telephone telegraph work, machine shops, etc. The thread is used on hooks, etc., and can be easily screwed in by hand.

The screws are manufactured by the Anchor Screw Co., Toronto.

A 3-FT. RADIAL DRILL.

This drill marks an advance made in high-speed high-powered drills. The column is of the double type, having an inner column bolted to base and running clear through to the top of column. The outer column, which has a square sliding surface for an arm to slide on, revolves on inner column with large bearing surfaces. This system makes for rigidity and the square sliding face for accuracy.

The arm is of heavy box section with stiffness properly placed. The face of arm is very wide. The faces are nearly



New Radial Drill, London Machine Tool Co., Hamilton.

frosted and are accurately scraped. The rack on arm is of steel cut from the solid cold drawn bars; the rack being secured by ample screws and taper dowel pins. The arm is raised and lowered by power. It is not necessary to stop machine to raise and lower head.

The head is so designed that the driving gear on spindle is not placed on top, subjecting the whole of the spindle to very severe torsional and bending strains, but it is placed below head neatly enclosed in light joint gear case and at the closest point to the drill. By this system of construction the spindle is made very much larger, and torsion on spindle is reduced.

The spindle diameter at point of application of power is $2\frac{1}{4}$ in. This increase of diameter also means that the pressure on driving keys is very much reduced, making drill very much easier to feed under heavy cuts. The spindle is of crucible steel, accurately ground and is double keyed. Ball bearings in hardened steel thrust collar are designed to take up the thrust.

There are four changes of geared feed, .0078, .0135, .021 and .034 per revolution of the spindle. These feeds are instantly obtained without stopping drill by means of dive key, controlled by convenient lever. Feeds can be thrown in at any point.

The tapping mechanism is carried on the head between the back gears and the cone or speed box, giving the friction always a high-running speed, even when the spindle is running at a slow rate of speed, hence making a very powerful drive. The frictions are of a very powerful inside band type, and the pressure is placed on same by small finger having great leverage.

The base is deep and is very heavily ribbed, with four ribs running the entire length and is provided with T-slots, for bolting work on table thereto.

The machine is provided with plain box table, having a top surface 18x22 in. and a side surface of 10x22 in. It is 18 in. high. Both top and side are made perfectly square and are provided with T-slots.

The machine is provided with two speed friction countershaft, having pulleys 12 in. diameter, for 4 in. belt, which should run at 185 and 250 r.p.m. These speeds give 16 changes from 20 to 360 r.p.m.

Diameter of spindle—$2\frac{1}{4}$ in.

Feed of spindle—$11\frac{1}{2}$ in.

Maximum height of nose of spindle over base—54 in.

Minimum height of nose of spindle over base—24 in., spindle up.

Maximum swing of spindle diameter —6 ft. 1 in.

Traverse of head on arm—22 in.

Total height of drill, spindle up, 7 ft. 10 in.

Width of base—34 in.

Height of base—$6\frac{1}{2}$ in.

Weight of machine complete—3,600 lb.

It is manufactured by the London Machine Tool Co., Hamilton.

HOBBING MACHINE.

A machine has been designed by E. J. Lees, of the Lees-Bradner Company, Cleveland, O., for hobbing spur, spiral and worm gears and threading worms. Spur and spiral gears of not over fourteen inches in diameter and not over four diameteral pitch, worm gears of the same diameter not over one inch circular pitch, and worms of one inch circular pitch and any lead, and not over eight inches long and eight inches diameter, all in steel, are rapidly and accurately handled.

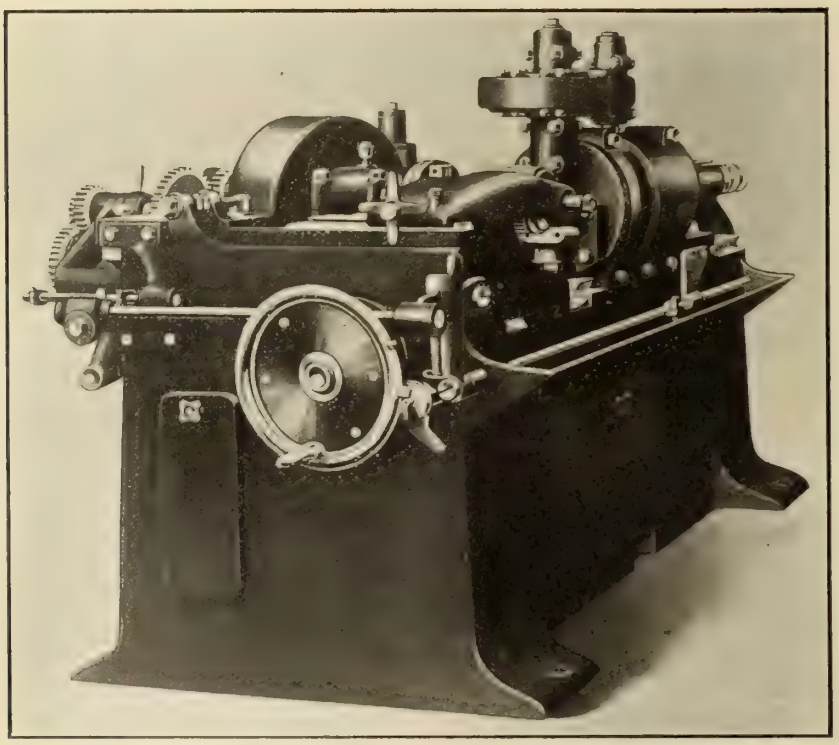
The machine is back-geared eight to one, is driven by a three-step cone located midway between cutter and spindle mechanisms, and the larger the diameter of gear to be cut the closer the cutter is brought to the original point of power, and the screws used for feed and head slides both operate with a draw pull and not a push.

The swivel head which has a swing of 180 degrees is of original design and has no over-hang, the swivelling mechanism consisting of one pair of bevel gears inside of a large cylindrical head which in turn fits in another cylindrical bearing on a slide, the two being rigidly locked together by bolts at either end, no balance weights being necessary and ample adjustment being provided for moving the hob on the cutter longitudinally. Care has been taken that all movements are in one direction in all operations, which is of vital importance, as it eliminates back lash, and the ma-

chine can handle a six-tooth seventy degree right angle spiral as readily as a gear of large number of teeth, this being accomplished by a compound indexing gear of two distinct ratios; and if an odd gear is needed and the necessary hob is not available, a single cutter can be used.

The work spindle and arbor are horizontal and the arbor is rigidly supported at both ends, which is of vital importance, especially in hobbing a spiral gear, and owing to the design the work is held close to rotating mechanism, and as the spindle has a very accurate independent rotary adjustment a re-location for tooth to cutter can be made.

In order to have a micrometer easily adjusted and readily operated for duplicate work without having to watch the graduations after a setting is made, one is provided with the graduations on a disc six inches diameter, which is locked with a thumb screw at zero when starting to take the reading. The setting for the depth of the cut is taken and a stop rod collar is adjusted, the original feature of this mechanism being that the slide can now be backed away to any distance and then returned to its original setting to a positive stop without attention to the graduations, although should the operator wish to set the cutter in or out a few more thousandths the original reading is visible and can be worked from.



Machine for Hobbing Spur, Spiral and Worm Gears, and Threading Worms.

As every worm gear necessarily requires a worm the ability of this machine to thread a worm will be of interest. For this a single cutter is used, which runs from seventy-five to one hundred and seventeen revolutions per minute, the worm being rotated with the necessary lead. As the cutter head is very rigid this eliminates the posibility of thin and thick threads. The worm is rotated by change gearing, ample provision being made for correct rotation to suit large and small diameters of work, the depth of thread being obtained in the same manner as in cutting a gear. The worm can be mounted on a shank arbor or on one or two centres or held with a draw-in collett with either bush or centre at the other end.

All the mechanism is in one horizontal plane and every part can be readily reached, adjustments being provided especially for the rotating worm and gear to positively take up any back lash.

The chips are readily disposed of without coming in contact with any moving part and are removed by taking out a pan located directly back of the door in the machine, this chip pan and the receptacle for oil being the only parts inside the machine—the pump being located outside and below the oil supply, which obviates the priming of the pump.

As the work spindle has a three-inch bore, gears on a shaft can be either held in the spindle with a draw-in collett, or can be held on one or two centres. In operating the machine the necessary change gears are placed to suit the work to be cut. The necessary depth is obtained by adjusting the head, at which time the micrometer is set and the work is fed across the cutter head. At the completion of the cut the main drive is automatically tripped and all mechanisms stop in unison, which is necessary in cutting a spiral gear, and relieves the operator of constantly watching the work and having to stop the machine.

DRILLING MACHINE FOR HOBBING TAPS

We illustrate herewith a new type of drill press especially designed for the use of manufacturers of taps. The tap blank is inserted in the end of the vertical spindle, as the tap itself would be in the case of a drill press used for tapping, and is then driven through a die bolted to the table beneath. In actual use, two dies are employed in succession, one a roughing die and the other a finishing die.

While the machine resembles, in many respects, an ordinary drill press, it differs notably in that the automatic feed is secured by means of a lead screw on the top end of the spindle, which is extended through the crown gear for that purpose. The upper end of the spindle is turned down to a smaller diameter than the remainder and a threaded sleeve, serving as the lead screw, is fastened upon it by means of a locknut, this removable sleeve having the same lead as the tap which is to be threaded.

When the tap blank has been driven through the die, it drops out and at the same moment an adjustable tripping dog clamped on and revolving with the threaded sleeve throws out of mesh the nut which engages the sleeve, whereupon the spindle is returned automatically, by a counter balance weight, to its original position and is ready to be supplied with another blank. The downward feed is thrown in again by means of the hand lever at the side of the lower spindle bearing.

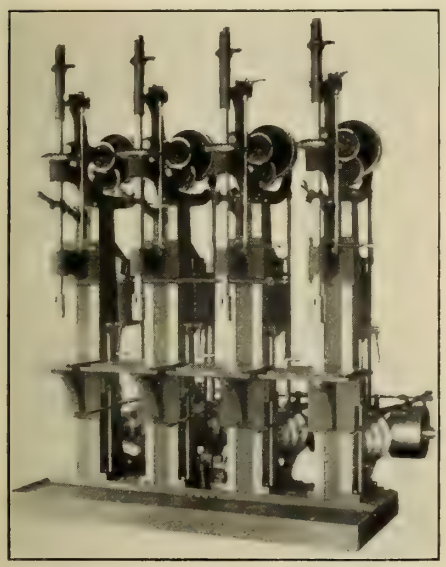
The lower end of the spindle is fitted with a spindle head and having the usual Morse taper and a special fixture for holding the square head of the tap blank. This spindle head is of further interest because of the special method employed for slotting it. The slots in the spindle head are milled out on a special machine having two milling cutters forking from both sides at once. This results in an accurate and smoothly finished slot.

The machine has four spindles and therefore provides for two sets of dies. Each of the spindles is attached to an independent column and is equipped with its own independent driving mechanism, although all four columns are bolted to a common base plate.

Inasmuch as hobbing tap blanks does

not require a high speed, the back gears are designed to be left permanently in mesh, changes of speed being made by shifting the belts on the cone pulleys. Each lower cone pulley is driven at right angles from a shaft bearing a tight and loose pulley, and hence any spindle can be stoped independently of the others by means of the belt-shifting levers projecting through under the tables. Each table can also be lowered or raised independently of the others by means of a screw passing through a nut attached to the table and provided at its upper end with a bevel gear drive and crank.

The columns supporting the spindle heads and driving mechanism are of the box type and very substantial. The upper head is fitted with an additional back brace supporting the outter end of the coned pulley shaft, for rigidity. One oil pump supplies oil to the four spindles, and drainage from the tables



Drilling Machine Specially Designed for Hobbing Taps.

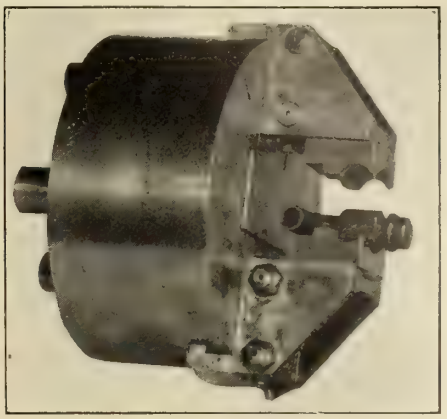
returns to the oil pan base, so that the oil can be used over and over.

This machine has been designed by the Hoefer Mfg. Co., Freeport, Ill.

NEW QUICK ACTION UNIVERSAL CHUCK.

At the recent Foundrymen's Convention in Cincinnati, the Manufacturers' Equipment Co., North Jeffgerson Street, Chicago, had on exhibition their new two-jaw Universal aero-chuck.

As the name implies, this chuck is operated by compressed air, and was designed with a view of producing a chuck with all the advantages of the older box chuck, with the added features of being opened and closed rapidly without the aid of a wrench or key. The chuck was primarily designed for brass work, but has been used in iron and steel work with satisfaction, as the construction gives great holding power. There is no necessity of making new false jaws when instaling this chuck, as the design will accommodate any false jaws that may be on hand.



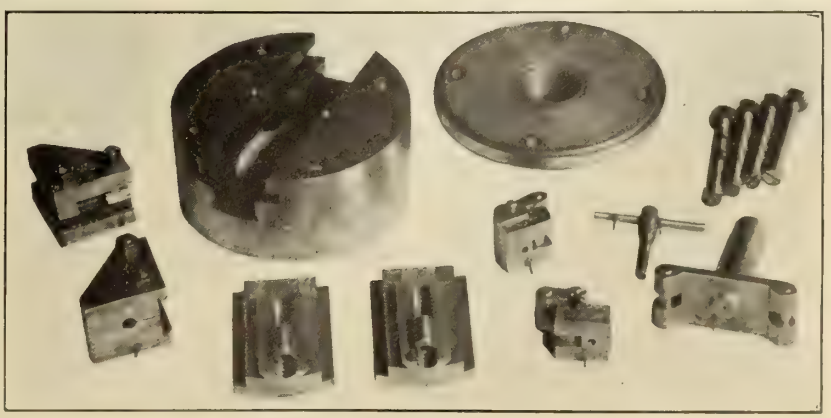
Quick Action Chuck.

The jaw-plates, which carry the master jaws, are operated upon by toggle joints so placed to exert the greatest pressure when the jaws are closed or nearly so. This arrangement will adjust itself to any variation that may occur in the castings. The advantage of using air is that there will always be a constant pressure on the piston, insuring flexibility of use. When using air, there is no more consumed than that which is necessary to fill the cylinder and this has to be provided whether the air is used constantly or shut off after each chucking operation. Where air is not available, this chuck can be operated with a hand lever.

One of the features of the chuck is the wide range of adjustment of the master jaws, and the fact that any false jaws can be accommodated within the limits of the chuck. The jaw-plates have a transverse movement of ¾-inch each, or a full opening of 1½ inches. The master jaws are adjusted by short screws fitted into recesses at the back. The jaws are locked by clamping bolts when in the desired position.

This aero-chuck is made in the three following sizes:

	No. 0	No. 1	No. 2
	inch	inch	inch
Capacity	2	4	6
Dis. jaws project	2½	3	3½
Largest outside dia. ..	7	9	12
Length of chuck	7¼	8¼	8¾
	lbs.	lbs.	lbs.
Approximate weight ..	27	45	60



Details of Quick Action Chuck.

Many hospitals in England are provided with a special apparatus for extracting iron and steel fragments from the eye by means of powerful electro magnets. The magnet employed has a core three feet long and six inches in diameter of the best Swedish soft iron. Two hundred pounds of insulated wire are wound in two coils about the core. The end of the magnet is threaded to receive terminals of different shapes to suit various conditions. The magnet is mounted on ball bearings and can be moved in any direction. The strength of the magnetic field may be varied at will by means of a rheostat. When used at its maximum power the magnet exerts a pull of 30 pounds per square inch at a distance of an inch. A special type of apparatus is provided for reclining patients. In this case the magnet is mounted on trunnions, and is tilted by means of suitable gearing operated by a hand crank.—Scientific American.

Walter R. Duckworth, who for the last twelve years was chief inspector for the Dominion Bridge Co., at their Lachine Works, has opened an office in the Eastern Townships Bank Building, Montreal. The business carried on will be the inspection of bridge and structural work, materials of construction, reports and valuations..

Difficulties Overcome by Hydraulic Elevator

The Problem of Transportation Across the River St. Lawrence at Quebec Solved by an Hydraulic Elevator to Overcome Tides

By J. PARKIN

Among the many interesting problems that have been solved during the past year, special notice might be taken to the car ferry which has commenced regular traffic across the St. Lawrence River from Quebec to Levis and Point Levis. The object of the ferry is to transfer loaded freight cars from one side of the river to the other and in order to do this, many difficulties presented themselves to the promoters of the scheme, but all these difficulties have been over come.

Shortly after the fall of the Quebec bridge, the idea was conceived by the Directors of the Quebec and Levis Ferry Co., that it would possibly be practicable to convey loaded freight cars from one side of the river to the other and thus fulfill in a great measure the object for which the Quebec bridge was being built.

One of the great difficulties which was encountered in the first place was the purchase of a boat, as to build and construct a boat suitable for this work would have taken very much longer than the Directors cared to wait, and it was deemed advisable to get the ferry into commission as quickly as possible, as no one but those who ship freight to Quebec and points east are better able to testify to the advantages that such a ferry would be. We might say that, at the present time, all through freight that is shipped via Grand Trunk, is unloaded at Point Levis onto boats and lighted across the river and re-loaded; so an immense amount of work and time would thereby be saved by getting the ferry into immediate commission.

A boat was purchased from Ogdensburg which filled the requirements of the Ferry Company on account of its length and its width being 40 feet beam and some 300 feet in length, and having a hold below the deck some 15 or 16 feet deep.

The next proposition which confronted the Directors of the Company was, what were the best means of getting the cars on and off the ferry, on account of the unusual high rise and fall of the tide, the rise and fall every day varying from 12 to 18 feet. It will readily be seen then that it was an utter impossibility to make use of the ferry under these conditions without some appliances being placed on the boat for raising and lowering the cars.

It might be suggested however, that a long slip might have been provided, which would have floated in the water and to the same level as the ferry, but when we take into consideration that the ferry company have six different landing places what an enormous cost the building of these slips would have been for a private corporation to undertake.

A disadvantage presented itself in connection with the slips, as the land was not procurable for providing such slips, as they would have had to have been of extreme length and the grade would have been such as to have made it dangerous to have allowed loaded cars to run down these slips to the boat.

A huge crane was suggested, which would pick the cars up bodily and place them on the deck of the ferry, but this would have necessitated a crane at each landing place, which would have also been an expensive proposition, and would not have been convenient as the directors intended using the ferry during the winter and, they were of the opinion that cranes and metals exposed to weather, such as these would have been exposed to, would have been practically useless during the severe winter months, both on account of the extreme cold and on account of the unreliability of metals such as chain, etc., in extreme cold weather.

Fig. 1.—Elevator Car.

Fig. 2.—Taking on a Car.

It was then thought that possibly the cars could have been run onto the boat from the fore part of the boat by having a dock provided so that the boat could run its bow right to the dock and take the cars on in the fore part of the boat. This was also impracticable for the reason that docks would have had to have been built at the different landing places to allow the full length of the boat to go into, to be clear of the strong current that is constantly running either up or down the St. Lawrence, when the tide is coming in or going out. It would have been absolutely impossible to have

made the boat secure to the different landing points, as the stern of the boat would have been 300 ft. out into the river, while the bow would have been touching and made fast to the dock.

Still another idea was considered, that even although the cars could have been brought on at the bow, it would have required an elevator in the bow of the boat to take the cars on and lower them to the deck and visa versa when the ferry reached the other side, to raise cars to the height of the deck. The difficulty that presented itself in this case was that only one line of tracks could have been put on the boat.

Install an Elevator.

It was arranged then to install a powerful elevator, which would be raised up to the height of the dock when the tide was out and the cars put on the elevator and lowered to the deck, and when the ferry had its full load of cars, they would be crossed to the other side of the river and placed on elevator one by one, and raised up to the height of the dock and pulled off the ferry.

Fig. 3.—Row of Steel Rails.

Then the capacity of the elevator had to be considered on account of the extremely heavy loads now hauled by the railway companies in steel gondola cars and the latest of the G.T.P. cars, which are longer and very much heavier than the ordinary style of freight cars. It was therefore decided that an elevator to adequately handle the loads should be of 120 tons capacity, and that it should be operated by hydraulic pressure, as there would be ample steam power on the ferry to run the necessary steam pumps.

The contract for the elevator of this capacity was given to the Parkin Elevator Co., Hespeler, Ont.

Description of Instalation.

The elevator is what is known as the "Hydraulic Plunger Type," and consists of six cylinders, 21" in diameter and 15' in length, all below the deck, and the tops of these cylinders are fitted with stuffing glands capable of receiving 10 rings of best hydraulic packing. The walls of cylinders are 2" thick, and 3' from the bottom of the cylinder, a wide flange was cast onto same, extending out from cylinder a distance of 12" on each side. This was done in order to distribute the weight so as to prevent all the weight being carried by the cylinders standing on the bottom or bilge of the boat. A concrete foundation 40 feet long and 4 feet deep was placed on the bilge of the boat, and all the cylinders were set into this concrete base.

It might be worth while pointing out here that the cylinders had to be plumb with the upright supports on the boat, as it was impossible at any time to use a plumb line for setting the cylinders, as the boat listed from one side to the other at different intervals; the same applies to the setting of the cylinders to correspond with the angle of the boat fore and aft; by this we mean that the stern of the boat was very much lower in the water on account of her heavy engines being placed there, so that the elevator had to be set plumb fore and aft, irrespective of the slope of the deck. The elevator car, proper, which is shown in Fig. 1, is 40 feet long and consists of two, 24" x 24" I beams, 40 feet long, and the heaviest rolled by the Carnegie Steel Co. These two beams weigh in the neighborhood of three tons each. Immediately below the platform will be seen the six plungers, two in the centre and two at each end, which do the lifting. These are turned accurately, and are fitted to the elevator platform by means of 8" steel shafts, and it will also be noticed that the bearing at each end of the elevator platform has a slot hole in same, which admits of either end of the elevator being hoisted or lowered while one end may remain stationary. This provides for any listing that might be in the boat. The plungers of this elevator are 18½" in diameter and are made of cast iron reinforced with six 1¼ steel rods running through the entire length of same. These plungers weigh 3½ tons each.

Each battery of cylinder is operated by operating lever, and in order to raise or lower one end while the other end remains stationary, all the operator has to do is to open the lever controlling the centre battery of cylinder half way and one of the end batteries fully open and the elevator will incline to a distance of 5 feet in its total length of 40 feet.

The pressure used in each of the cylinders is 225 pounds to the square inch and is compressed by means of a steam pump having a pumping capacity of 1000 gallons per minute. The water used is not wasted, but is discharged into a discharging tank and is pumped from the discharge tank into pressure tank and from pressure tank into elevator cylinders and the elevator is operated by this means.

On the elevator car, there is a steel truck with rails running lengthwise and crosswise. The car is drawn onto this steel truck. The elevator is then loaded and then by means of a steam winch placed fore and aft, the car is drawn along the deck of the ferry. The rails upon which these trucks travel are plainly shown in Fig. 1. Cars can be placed on either side of the elevator. These trucks are built altogether of steel, and weigh, approximately, six tons each.

Fig. 3 shows a row of these steel trucks on the deck of the ferry, and it will be noticed a piece of the rail is cut out. This being necessary for the flanges of the truck wheels to pass through

Fig. 4.—First Cars to Cross.

while the process of racking the buggies is going on as it will readily be seen that these buggies have to be placed one on top of the other as the cars are taken off the boat, as there is no other way to dispose of them.

Fig. 3 shows one of the buggies standing on top of one of the lower buggies. This process can be repeated until four of the buggies stand one above the other.

Fig 4 shows the first railway cars that were actually ferried across the river and shows the ferry leaving the Point Levis side of the St. Lawrence with cars for the Quebec side. The success of the excellent work of the elevator and providing of the buggies is due to the Parkin Elevator Co. The ferry has been given severe tests, ferry cars with stone, weighing seventy tons, but the elevators will lift up to 120 tons. The test was made under the supervision of the officers of the Ferry Company and a number of officers of the G.T.P., H. E. Whitenberger, general supt. eastern division; J. J. Connolly supt. eastern division; McCooe, supt. maintenance of ways, and A. Findlay, inspector bridges and buildings.

GUARD DANGEROUS MACHINES.

Had not the smock worn by an employe of the London Street Railway power house given way, he would have met a terrible death by contact with a four-foot wide belt, recently. As it is, he is suffering from a badly crushed chest, bruised arm and body, but will recover. The point we wish to make is that more time and thought should be given to the protection of belts, pulleys, machinery, etc. The writer has seen men twisted up in drill presses and seen men get fingers mangled from unprotected gears. In some shops, attention has been given this matter, but there is room in a great many yet, for the instalation of devices to protect the workmen.

Factory Inspector Fred Kellond, in his report to the Ontario Government, draws attention to the necessity of more attention to this matter:.

"Modern industry is becoming increasingly more dangerous, and in the many varied processes involved many cases of accident, resulting in the injury, sometimes in the death of the employe, inevitably occur. The utmost precautions on the part of both employer and employe might reduce the number of accidents, though one can never hope to entirely stop them; but every effort should be made to decrease the number and to reduce the possibility of injury.

"The guarding of machinery and dangerous places forms a very important part of an inspector's duties. I have been able during the past year to have a large number of guards put on different machines, as well as have dangerous places, such as holes in floors, drive belts, etc., guarded. I have experienced very little difficulty in having my wishes carried out, especially after the second visit. I say second visit, for perhaps in this connection, if in no other, frequent inspection is fruitful of good results. In previous years the small number of inspectors in the province rendered it impossible for inspectors to see that their recommendations of improvements in factories were followed up; but with the increase in the staff more frequent inspection is possible, and the procrastinating manufacturer gets a reminder in the person of the inspector, who drops in to see "how that guard works." Another difficulty, I regret to say, that I have met with is the statement that, "My men will not use guards." This is most frequent in woodworking machinery. Jointers, saws, and shapers are the machines in connection with which this statement is made. While I believe this statement to be true in a number of cases, my opinion is that if an employer can make certain rules which he expects his men to observe, i.e., "no smoking," "start at 7 a.m., work till 6 p.m.," and the employes breaking these rules are promptly discharged, why can he not make a rule that guards must be used, and further see that they are used?"

FINE FINISH ON MACHINERY.

Recently one of the large railroad companies introduced an innovation among engine drivers which met with such results as to make it necessary to return to their old system. It was thought by some in authority, that by having the engineer take out any engine that was ready, a great saving in time would be made. The results were far from satisfactory, however, and the old order again came into force, of an engineer taking care of his own engine.

It is well known that an engineer takes a great pride in the engine committed to his care He speaks of it as if it were a living being, and handles it with affection. The same should be the case with the machinist, the machine operator in the machine shop, or the engineer in the power plant. He should take a delight in seeing his machine look well and run well. It should give him pleasure to see it looking bright and clean. To make the machinists enthusiastic about this, machinery should be symmetrical and have a good finish. The machine must possess some attraction for the eye just the same as a handsome suit of clothes. We might all wear burlap, but the resultant economy would be imaginary. The average man would lose more in efficiency and self-respect than he would gain by the saving in cost.

Consider two machine tools that are built with the same accuracy, and the same capacity for work, the one with handsome lines and fine finish should be given the preference every time, even if there is a slight difference in price. It will pay the buyer to pay the extra amount to obtain the finely finished machine. Man is largely influenced by his environment and with a fine equipment the mechanic will help to keep the shop spick and span. It will not only look better, but it will pay. It will arouse an interest among the mechanics that will be a valuable asset.

From the standpoint of the seller, too, the symmetrical design and handsome finish of a machine, add to its selling qualities and make an impression upon the prospective purchaser. A fine design and finish will at once suggest careful workmanship and a poorly finished machine, the reverse. It is, therefore, important that machines should be of good design and fine finish.

CANADA'S ANNIVERSARY.

Canada's anniversary month (July) is made notable by distinct signs of progress. Throughout the land, the crops are flourishing wonderfully, climatic influences have been most favorable, and the country's industries are springing into new life under the stimulus of a hopeful harvest outlook. One of the most important events of the industrial world has been the beginning of huge improvements in the maritime steel plants, not only at Sydney, but at Amherst, and the resumption of full-time in various railway shops and large manufacturies. A statement of the general manager of the Dominion Iron & Steel Co., that he had been authorized to proceed immediately with the outlay of $2,500,000, for the erection of a blast furnace, a full completion of coke ovens and a merchant mill.

W. C. Franz, manager of the Lake Superior Corporation, Sault Ste. Marie, Ont., announces that the new No. 3 open-hearth furnace of the steel works has made its first steel. The foundation work on No. 3 blast furnace has been started, and it is expected that work will be begun on the new structural steel mill at once. It will require one year to complete the blast furnace, and about seven months to have the structural mill ready for operation.

The Nova Scotia Steel .& Coal Co., which has not attempted operations on the scale of the plants at Sydney and Sault Ste. Marie, now looks toward larger things, preliminary to which a $6,000,000 bond issue is being bronght forward. The company's large resources in coal and in the Newfoundland, or Wabana red hematite, ores, that are the dependence of the Sydney industry, entitle it to a larger place than it has yet undertaken to fill.

These developments in the affairs of the leading steel companies of Canada point to expansions such as have not been possible in the difficult years through which these enterprises have passed. The companies will now be placed in a much more important position than they have heretofore occupied.

THE HARDNESS OF METALS.

At the recent meeting of the British Iron and Steel Institute, a paper was read entitled "Notes on Tests for Hardness," in which the methods used were described. The four principal methods of making hardness tests are: 1. Turner's sclerometer—A weighted diamond point is drawn, once forward and once backward, over the smooth surface of the material to be tested, the hardness being measured by the weight in grammes required to produce a standrard scratch. 2. Shore's scleroscope—A small steel cylinder with a hardened point is allowed to fall upon the smooth surface of the material to be tested, and the height of the rebound of the hammer is taken as a measure of hardness. 3. Brinell's test—The hardness is measured by the indentation of a smooth surface by a standard steel ball under a standard pressure. 4. Keep' stest, in which the hardness is measured by the power of the material to resist the penetration of a drill.

The results obtained by each of these four tests are comparable for relatively pure metals in their cast or normal condition, but the results are not so satisfactory in the case of metals that have been hardened by mechanical treatment. The second and third tests give results which depend on the tenacity and elasticity of the material. Thus a piece of hard-rolled copper gives a greater hardness number than that of mild steel. A tool made of mild steel will, however, always cut, and is therefore harder than even the hardest of hard-rolled copper. The first shows comparatively little difference in the hardness of hard-drawn and annealed copper. Varying results by the different methods are obtained in testing the loss of hardness due to tempering hardened steel. There is thus a field for further investigation in measuring accurately the hardness of metals.

THE FRANCO-CANADIAN TREATY.

The French Chamber of Deputies has finally ratified the Franco-Canadian trade convention, as negotiated by Hon. Messrs. Fielding and Brodeur in 1907, and amended in a few minor particulars by a sub-convention last January. Under the terms of this treaty Canada will receive all the minimum rates of the French tariff, with the exception of the rate on cattle fattened for slaughter, which will pay the general tariff.

As pointed out in the April issue of Canadian Machinery Canada will enjoy the minimum tariff of 5 per cent. on agricultural implements. European companies enjoy the privileges of this tariff, compared with 20 per cent. levied on this machinery imported from other countries.

By the treaty, Canada will enjoy the minimum tariff on a number of natural and manufactured goods, including wood, metals, grain, agricultural implements, machine tools, electric motors and generators, etc. The treaty calls for a direct steamship service between the two countries. No transhipment of goods may be made, except where a country enjoys the privileges of the minimum tariff. That is, France may use the port of any third country enjoying the privileges of Canada's preferential or intermediate tariff, and Canada may tranship at the port of any third country enjoying the French minimum tariff. The treaty should stimulate the export of Canadian-made agricultural implements and finished products in iron and steel.

TOPICS OF THE MONTH.

We have received information that the International Harvester Co. have prepared a profit-sharing plan, which has been submitted to the employees. According to the plan, 12,500 shares of the preferred stock of the company will be offered to employes at $6.50 a share below market price, and 15,000 shares of common stock at $10 a share below the market. This offer will hold good until August 15.

* * *

We have made reference on several occasions, recently, in these columns to Germany having its eyes on Canadian trade. Efforts of the German Government are being backed with the greatest enthusiasm by merchants and commercial magnates. Scarcely a day passes without the attention of traders and exporters being drawn through the press to Canada as a field for German enterprise. The Berliner Lokal Anzeiger will despatch in August its naval correspondent, Captain Von Pustau, to the Dominion to make an exhaustive tour and to write a series of articles. Von Pustau will also interview Canadian statesmen in order to bring to their notice the recently-formed German-Canadian Economical League, and will investigate the prospects for a better commercial understanding in the near future.

* * *

A train load of 20 cars of harvesting machinery was shipped to Winnipeg and points further west by the Massey-Harris Co. of Toronto, on June 23. Unusually large orders from the west have been received this season, and the company is shipping an average of five carloads per day. This is surely a sign of the condition of trade in Canada.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

THE MURPHY BOUNCER.

James A. Murphy, foundry superintendent of the Hooven-Ovens-Rentschler Co., Hamilton, Ohio, has recently invented and constructed a new type of jarring molding machine which he has named the Murphy Bouncer.

The general appearance of this machine when removed from the pit for photographing is shown in Fig. 1. It will be noticed that it differs from other machines on the market. The principal difference is that in place of attaching the table to the piston it has been attached to the cylinder, the piston being stationary and connected to the base, while the cylinder is arranged to move up and down upon it and carries the table with it. This construction permits the casting of heavy ribs on the outside of the cylinder walls to support the table, thus giving a most rigid arrangement.

The impact of the falling table is taken on a series of steel pins shown about the base of the machine. The air for operating comes in from an opening on one side, and is admitted by a cut-off valve controlled by an adjustable tappet on the side of the cylinder, as shown clearly in the illustration.

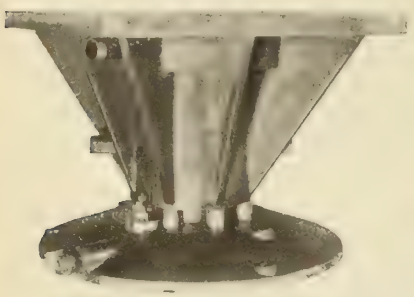

Fig. 1. The Murphy Bouncer

The valve proper rests on springs and when air is turned onto the machine the table immediately starts up. If the tappet is adjusted to its lowest point the cut-off valve is considerably below port entry for the air when the stroke begins, hence air will be admitted for a considerable portion of the stroke. As the tappet is run back the springs throw the valve higher and higher, thus causing the valve to cut off earlier. This enables the air to be used expansively in the cylinder.

Of course, when very heavy work is to be jarred it is necessary to use full pressure air for the greater portion of the stroke. When light work is being used, great economy can be effected by cutting off the air early in the stroke.

The exhaust port is uncovered when the piston reaches its highest point, the exhaust port being through the walls of the cylinder and practically continuous about the cylinder. The exhaust pipe shown at the left in Fig. 1 is connected by a hose to the stationary exhaust pipe in the pit. The arrangement of the machine as shown keeps all of the working parts free from sand or dirt. On the bottom of the base plate Mr. Murphy arranges a segment of a sphere, as shown in Fig. 2, so as to distribute the thrust equally to the foundation. The machine is mounted on concrete.

As installed in the plant of the Hooven-Owens-Rentschler Co. the machine is arranged with a flat iron table each side of the machine proper. The workmen places on one of these tables a bottom-board pattern and drag, and shovels in sand. As soon as the machine is idle the drag is slid along the iron table on to the machine, where it is jarred and then immediately slid off on to the table, where the parts were assembled.

In the meantime the men on the opposite side of the machine have prepared a drag for ramming. In this way the crew of men keep the machine fairly busy. The patterns are ordinarily left in the

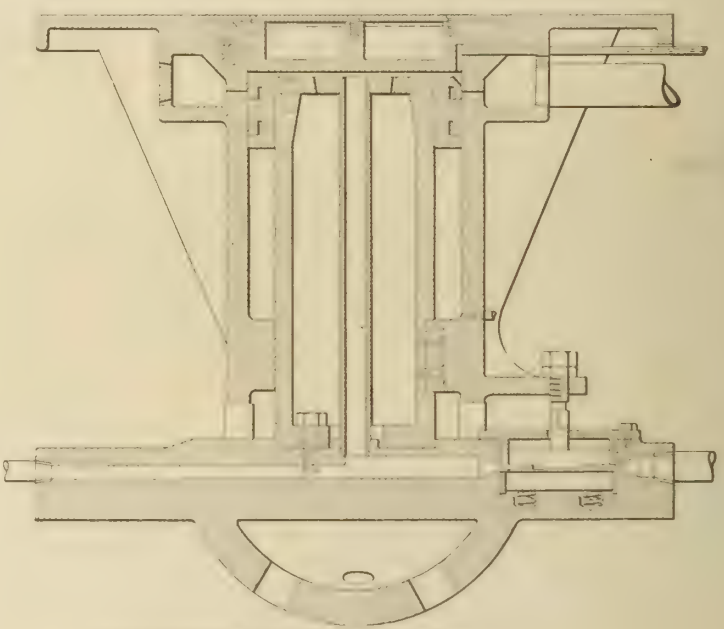

Fig. 2.—Section Showing Valve Action.

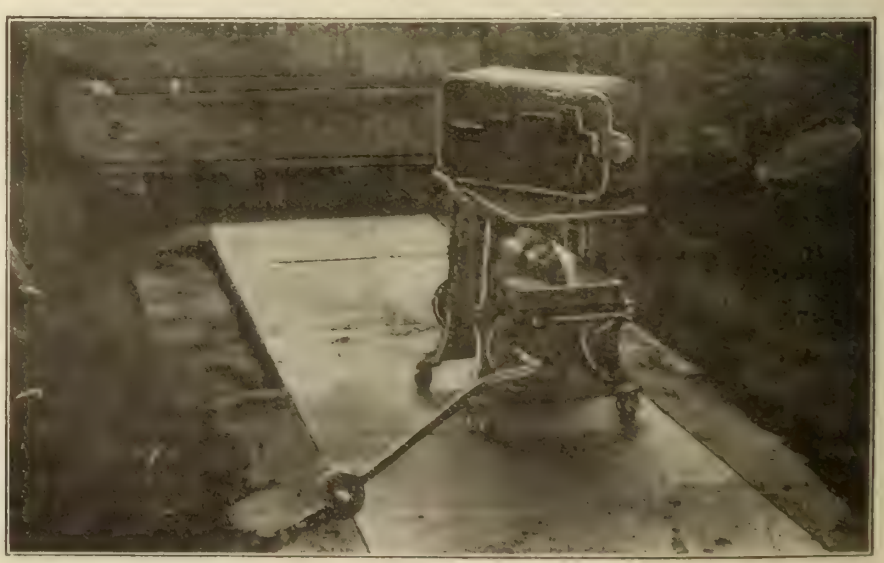

Fig. 3. Machine With Side Tables.

drags until they are carried to the floor where the copes are rammed by hand.

They sometimes use Pridmore molding machines, however, the machines being mounted on casters and run on to the jarring table after the flask has been filled with sand. The machine is then removed and the pattern drawn in the ordinary way. In this way the jarring machine may be used for ramming the molds from two or more Pridmore machines. Fig. 3 shows the machine with a Pridmore molding machine upon the side table on plate after ramming.

Fig. 4 shows a general view of the floor taken a little after 3 o'clock in the afternoon. At the time this picture was taken there were 53 molds on the floor for castings ranging from 50 pounds to 2,000 pounds. This work was done by 6 molders, 5 apprentices and 2 laborers. All of the drags were rammed on the Murphy bouncer, while the copes were rammed by hand. In cases where flat-backed copes are required, these could also be rammed on the machine but none

Fig. 4.—A Floor of Molds with Machine-rammed Drags.

of the molds shown in this illustration are of this type. Some of them were quite complicated, requiring drawbacks in the cope or having the patterns so arranged that various parts of it had to be picked in during the pattern drawing operation.

Mr. Murphy has not yet been able to work the machine to its capacity, because he has not had work enough available on the floor. The machine crew do no pouring, and by working during pouring time they have on the floor a drag ready for each one of the regular molders to begin work on in the morning, so that the molders work a full day molding copes.

One of the jib cranes serves the jarring machine floor, and the traveling crane carries the drags from the machine to the floor, and later in the day takes care of the pouring, shaking out, etc. The stroke of this machine can be varied to suit conditions, but as constructed at the plant described it is three-fourths of an inch.

TO PREVENT BUBBLES IN IRON CASTINGS.

Bubbles in iron castings are caused by evolution of carbon monoxide and other gases in the process of cooling and solidification. The formation of bubbles, which greatly diminish the strength of the casting, can be prevented by the addition of certain metals and alloys, which absorb oxygen and facilitate the elimination of other gases by raising the temperature of the molten iron, making it more fluid and producing more or less agitation in the mass. Ferro-manganese and ferro-silicon, which were first employed for this purpose, make the grain of the casting much finer and increase its strength by 15 per cent.

But pure and easily oxidizable metals, such as aluminium, magnesium, or sodium, are far more effective and they do not, like the alloys above mentioned, affect the general quality of the casting. Aluminium is especially suitable for very hard iron containing little silicon. An addition of 1-50 to 1-20 per cent. of aluminium suffices to prevent the formation of bubbles. Magnesium has been used for several years in casting copper and copper-nickel alloys. It is now being employed in iron and steel foundries, in the form of an alloy with iron or with aluminium and in the proportion of 1-20 per cent. of the weight of the casting. Sodium has not yet been employed in practice. Calcium not only absorbs oxygen but eliminates dissolved hydrogen. It combines with the carbon of the iron to form calcium carbide, which is decomposed by the hydrogen. Thus the calcium is again set free and the hydrogen is converted into acetylene, which rises and burns at the surface. Experiments have recently been made with ferro-vanadium containing a large proportion of carbon and consequently unsuitable for the manufacture of special steels.—Scientific American.

HOT BEARINGS.

By H. H. Ward.

A hot bearing is ever a source of annoyance to the modern engineer, yet bearings do not become overheated through "pure stubborness"—there is always "a reason."

The fault, great or small is one which is always irritating to an engineer who likes to have his engine running smoothly, and economically. By economy I refer to the lubrication of the different parts of his engine. Sandpaper will not become smooth by being saturated in oil. This is true also in reference to the motion-work of any piece of machinery, the indiscriminate oiling of which will not prevent the bearing from running hot, once there is lodged sand, or other hard substance on its face. Therefore great care should be taken to see that your oil is perfectly free from any substance that may cause the bearings to run hot.

Flake graphite mixed in small quantities with the contents of your oiler is a preventive if not a cure in dealing with hot bearings.

If a bearing becomes so heated that the babitt is being melted let it clean itself entirely out, then sprinkle thoroughly with sulphur. This has been found to be an excellent remedy for cooling hot bearings, and is well worth trying.

Too much troweling of the mold surface closes the pores of the sand and tends to a spoiled casting as the result of blow or kick. It is better to finish the face of a mold with a brush or with the hand.

The Detroit Foundry Supply Co., Detroit, has just placed on the market a facing for steel foundries that will allow of printing the pattern back and eliminating the use of nails for plate work. This the company calls its "Shakeon facing."

Mr. T. Y. Sherwell of the Drummond, McCall Co., Montreal, sailed for England, Saturday, July 17th. He will be gone about a month and on his return will be accompanied by Mrs. Sherwell.

J. R. Baxter & Co., 102 St. Antoine St., Montreal, have been appointed sole Canadian agents for Gooderich Rubber Co., Akron, Ohio.

It is stated that the Michigan Central Railroad will commence shortly the erection of a new depot at Windsor, estimated to cost $75,000 to $100,000.

The Paris Agricultural Society is asking for tenders for a new exhibition building.

The Work that is Applicable to Permanent Molds*

Statements Made and Conclusions Formed are Directed Towards that Branch of Foundrymen's Work Applicable to Permanent Molds.

By EDGAR A. CUSTER, Tacony, Pa.

Some twenty years ago the late Harris Tabor brought to the attention of the writer a machine for making break-shoe molds. He was very enthusiastic over it, and predicted that in a very short time all the foundries would be making their duplicate work with that class of machine. He had worked at it long and earnestly, and believed that it would win instant recognition. He lived to see the molding machine field extending far beyond his wildest dreams, but it took twenty years!

To such an extent has this feature of the founding art grown that to-day we have molding machines, each of which cost more than the entire equipment of an ordinary foundry thirty years ago. The modern manufacturer is under the necessity of keeping down shop costs and his constant endeavor is to substitute machines for manual labor where possible. It is this tendency that has of late years turned attention to the question of how far permanent molds may be used to reduce the cost of production. It is not a new question by any means, but the information available is very meager.

It is the purpose of this paper to give a full and free account of the conclusions formed after three years of constant work on the problem, and if it promotes a good healthy discussion the main object has been attained. It must be understood, however, that this paper deals solely with work that is applicable to permanent molds and the statements made, and the conclusions formed, are directed only toward that branch of the foundryman's art.

The subject may be taken up under the following heads: -

(1) Of what material should the molds be made?

(2) What effect has such a mold upon the castings?

(3) What effect has molten iron upon the molds?

(4) What remedy should be applied for any bad effects shown?

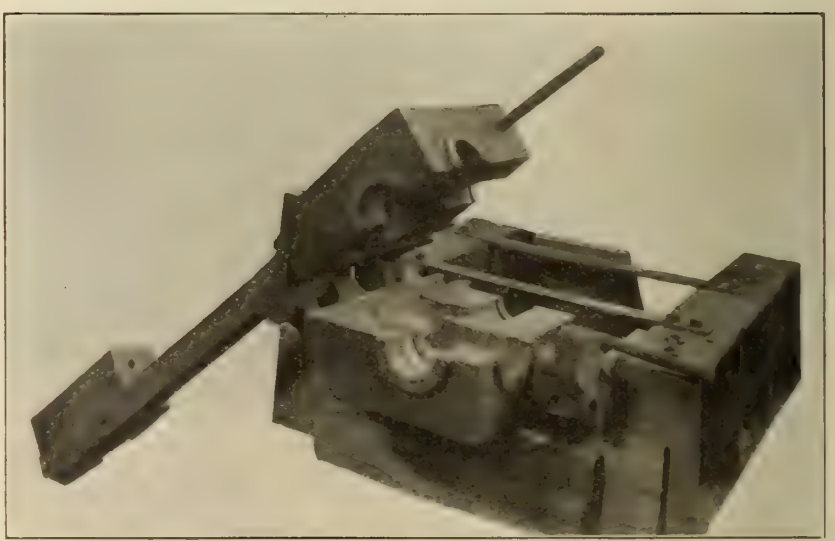
These four points having been carefully considered, and the efficiency of such a mold conclusively demonstrated, the value of the permanent mold for certain classes of work is established.

The ideal material for permanent mold would be one that would not chill the molten iron, would stand swift heating and cooling without disintegration and would be capable of being machined or molded into the shape required. This material should be very nearly as hard as iron, quick to conduct heat and of low specific gravity.

There are a number of substances that fulfil these requirements in part. Lava rock will stand the sudden changes of heat and cold, can be cut into the shape desired, and does not chill the molten iron. When a coating of finely ground mica or some other inert substance is rubbed into such a mold it will give beautiful castings. But it wears away rapidly, and soon needs renewal. Were it not for this fault it would very nearly solve the problem. We found it extremely difficult to handle and prepare this substance, and this led us to seek a material that would possess both hardness and ability to stand the heat changes. Cast iron has been the favorite medium, and so far, nothing has been brought forward that is so well adapted for foundry work. It has the advantage of being easily machined, and the added advantage that it is formed by a process with which we are all familiar, while its possible disadvantages are more easily overcome than those of any other substance.

It is not much trouble to make and machine an iron mold, and we can calculate the expansion and contraction to a nicety. Its great drawback is its chilling effect. Some investigators make the claim that if the mold is heated to nearly the temperature of the casting, when it is ready for removal, no chilling effect is perceptible; also that the molten iron should cool at the same rate in a permanent mold as it does in a sand mold. To both of these propositions I would answer that they defeat the object of permanent mold work, in that they destroy the permanence of the mold, confer no benefit on the finished product and set up a multitude of difficulties such as core-crushing, shrinkage strains, and segregation.

But these two claims have been so persistently made that it seems advisable to treat them at some length. We are all familiar with the rapid disintegration of cast iron when kept at a very dull red heat—the rapid oxidization and the tendency to sprawl and crack. When the heating and cooling is carried through a range of 200 or 300 degrees F. —and this must of necessity occur—the mold becomes useless in an incredibly short time. Again, the molten iron will not lay close to such a mold and the resulting castings are far from perfect.



A 4-inch Trap Mold Weighing 42 lbs.

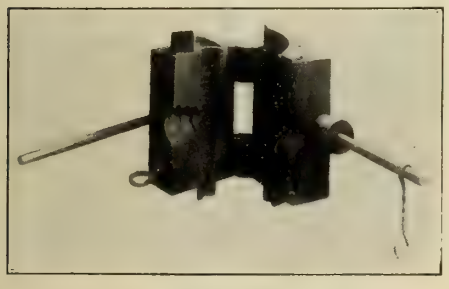
It has been conclusively demonstrated that mold distortions due to heat become permanent after a temperature of 900 degrees F. has been passed, so that highly heated cast-iron molds seem to be out of the question. While there is no doubt that they would prevent chilling, the cost of such a method would be prohibitive . . . . Should the iron cool at the same rate in a permanent mold as it does in sand? The answer to this is most emphatically in the negative. The effect on the mold would be the same as main-

* Read before the A. F. A. convention, Cincinnati, June 1909. The paper is divided into two parts. The second part will be given in the September issue of Canadian Machinery.

taining it at a high heat, and the time lost in cooling would slow the process up materially. Slow cooling would not improve the casting, nor would it prevent segregation. It would induce shrinkage strains, and in fact would be no improvement over the present sand-casting method, except that it would obviate sand ramming.

Effect of Mold on Casting.

When we first contemplated using permanent molds it was considered a foregone conclusion that unless the interior of the mold was heavily coated with some inert substance, the casting would necessarily be chilled, and extensive arrangements were made to prevent or to remove this chill. For a time the molds were carefully coated after each pouring, but, in our efforts to gain time this coating was neglected, and we noticed that even when this was the case no chill appeared provided the casting was removed above a certain temperature. Following this lead we found that when the surface of the mold was practically free of any coating, no gases were formed by



A 2-in. Lee Mold in Constant Use

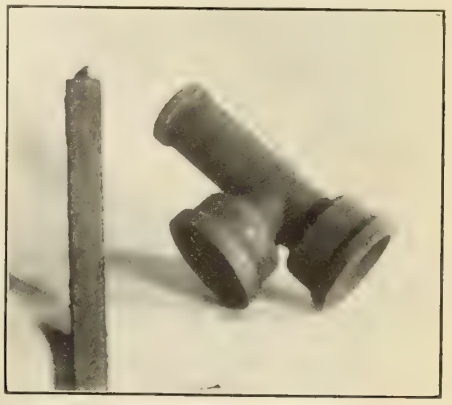
contract of the molten metal, and that chill could still be prevented by removing the casting at the proper temperature. Once these facts were thoroughly established all our attention was centered on the posibility or removing the casting as soon as it was set. A few trials proved beyond doubt that molten cast iron does not chill until after the casting has set, and it was simply a question of reasonably quick work to produce castings not only perfect in form and texture, but answering all the requirements for high-class marketable work.

The next step in this line of reasoning was that if the contact with comparatively cold iron on one side, did not necessarily chill the casting, then contact with iron on both sides need not chill it. To demonstrate this point several thin sheets were cast between heavy plates and removed without chilling. This suggested the possibility of using metal cores, provided these could be removed before being caught by the shrinkage and immovably held or the casting cracked. Reasoning that cast iron does not contract until after it is solid, we believed that it would be possible to remove a core before such contraction occurred This was tried first on the T-shaped fitting, the entire core being made of cast iron, in two parts, one part for the main body and one part for the branch. These core parts were fitted to the mold and metal was poured around them, and it proved to be not only possible, but very easy to withdraw the core, provided it was done when the casting was at the proper temperature. Nor was the allowable time for the withdrawal of the core so short as would be expected. In fact, it was necessary to wait a few seconds after pouring, before removing the core.

If, then, an iron core could be easily withdrawn from a tube one foot long, it was possible that it could be withdawn from a tube 5 feet long. This was attempted, and repeatedly accomplished, a four-inch pipe 5 feet long being cast on an iron core and the core removed before being gripped by the contraction of the pipe. We found by these trials that no gases were formed other than those from the air in the mold, and if this air was allowed free vent no trouble was experienced in filling a mold of any shape or size, and in removing the resulting casting at such temperature as to avoid white chilled crystals.

The next step was to determine what size and shape of mold was best adapted to this process. This was a long and tedious investigation, most of the results obtained being of a negative character. It is almost impossible to formulate any set rule as to size and shape of mold for various castings. The one general rule of allowing a surplus of metal in every case seems the best practice. This is, of course, very indefinite, and experience only will show what is best. The mold in which this trap was cast weighs 1,700 pounds, and the 2-inch tee mold confesses to over 500. The advantage of providing a large bulk of iron is too great to be ignored when it is considered that the objects desired are not only to swiftly remove the heat from the molten iron, but also to provide enough metal to store this heat and resist the tremendous strains imposed.

It is to be observed that in using these molds we take no precautions against shrinkage. We depend altogether upon the fact that chilling molten iron swiftly to the point of setting makes castings that are homogeneous, and thus the shrinkage strains due to irregular cooling are reduced to a minimum. The main object to be accomplished is to secure rigidity of the mold in all its parts—there is always time enough to remove the casting and retain the shape given it by the firm unyielding surface. A mold that has thin walls—1½ or 2'' thick—will spring away from the molten iron under the influence of the intense heat, and the casting will invariably follow the spring. Molten iron, like water, moves in the line of least resistance. Its peculiar property of increasing in bulk when passing from the molten to the solid state makes it possible to get a casting that fills every crack and cranny of the mold so long as this tendency to swell is successfully resisted. This same mass of iron in the mold, by reason of its rigidity and its capacity for quickly transmitting and storing heat, will great-



Effect When Castings are Taken From Mold Interior Still Mo ten. Globules of Iron on Surface of Lee and Irregular Excrescence on Top of Bar.

ly lessen the liability to cracks in the mold cavity. The only place where any deterioration sets in is where the molten iron strikes in the gates, and our experience has shown that we can safely neglect this item.

How long a cast-iron mold will last has not yet been determined. So far, we have made over 6,000 pieces in a single mold, and it is in better shape now that when we started. There is no reason why its life should not be indefinite, although there must be a point of time and service when the cast iron has reached its ultimate capacity for work. Our statistics show that the life of the mold depends, not upon the number of pourings, but upon the number of times the mold is allowed to become entirely cold and then reheated. Continuous pouring, when correctly timed so as to preserve a generally even temperature, has but a very slight tendency to crack the mold. It is only when it is allowed to cool that the cracking becomes at all noticeable, and then only in the gates.

Queen's University, Kingston, will erect two new science buildings one for chemistry and the other for mining and metallurgy. A new club house will also be erected.

New Plant of E. & T. Fairbanks & Co., Sherbrooke

The Construction and Equipment of this Company's Plant for the Manufacture of Scales, Valves, Power Hammers and Other Specialties.

There was a time when all weighing was done by means of beams or steelyards, but this method was found to be too slow and the inventive genius of Thaddeus Fairbanks brought out the Fairbanks' Platform Scale in the year 1831. The resulting economy in time and labor has proved of increasing value in every industry. Hundreds of modifications from the original size and style have come into daily use and there are few weighing requirements for which specially adapted scales have not been designed.

The buildings making up the Fairbank's Scale factory are situated in the centre of the town of Sherbrooke at a point where the plant is well served by the C.P.R. and G. T. R. The buildings extend from east to west 303 feet with a varying width of 63 feet to 115 feet.

The Foundry.

The iron and brass foundry is located in the west end, and has an annex for storing sand and clay on the ground floor of the cupola house. There is an elevated charging floor, with a coke storage compartment on the same level. The coke is elevated by means of a bucket conveyor from alongside the railway siding, where it is dumped from the cars and put into the building through a chute and opening in the roof. The molding sand is carried up in the same elevator, and is spouted to a bin on the ground floor below the coke storage bins.

The iron for the cupolas is elevated to the charging floor by means of an Otis-Fensom elevator, in front of which is located a 3-ton scale which weighs all charges before they go to the elevator.

The core room adjoins the cupola house. It is equipped with Millett core ovens for baking the cores. The foundry floor is 75 feet wide by 60 feet long, one-third of which is reserved for brass work, and the remainder for cast iron. A 60-inch Whiting cupola has been installed, and provision has been made for the addition of a future cupola of 72 inches diameter. A 10-ton Niles traveling crane conveys the metal from the cupola to the flasks, and runs up and down the building in the centre of the three bays. The brass melting section is fitted with a Swartz melter. It is equipped, also, with the usual crucible melting pots set in a pit on a level with the floor, so that either or both methods of melting may be used.

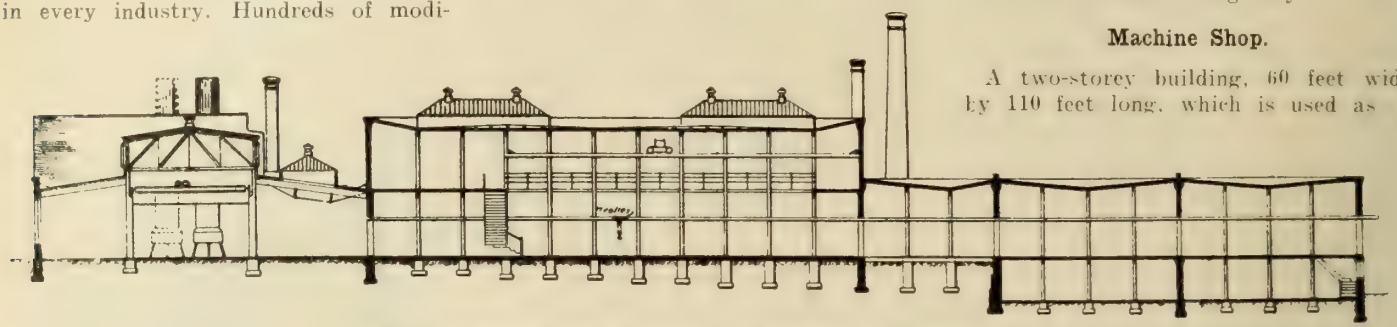


Fig. 1.—Longitudinal Section E. & T. Fairbanks Plant, Sherbrooke.

Machine Shop.

A two-storey building, 60 feet wide by 110 feet long, which is used as a machine shop and cleaning room adjoins the foundry. The cleaning room takes up three bays, or 30 feet, next the foundry. This building has an open well 70 feet long, over which a 7½ ton Niles traveling crane operates. The second floor is in the form of a gallery on which are located light machine tools. An Otis-Fensom elevator has been installed between the ground and first floor of this building.

The machine shop is equipped with a full line of modern machine tools for not only manufacturing purposes, but also for making their own special tools, and for doing all necessary repair work.

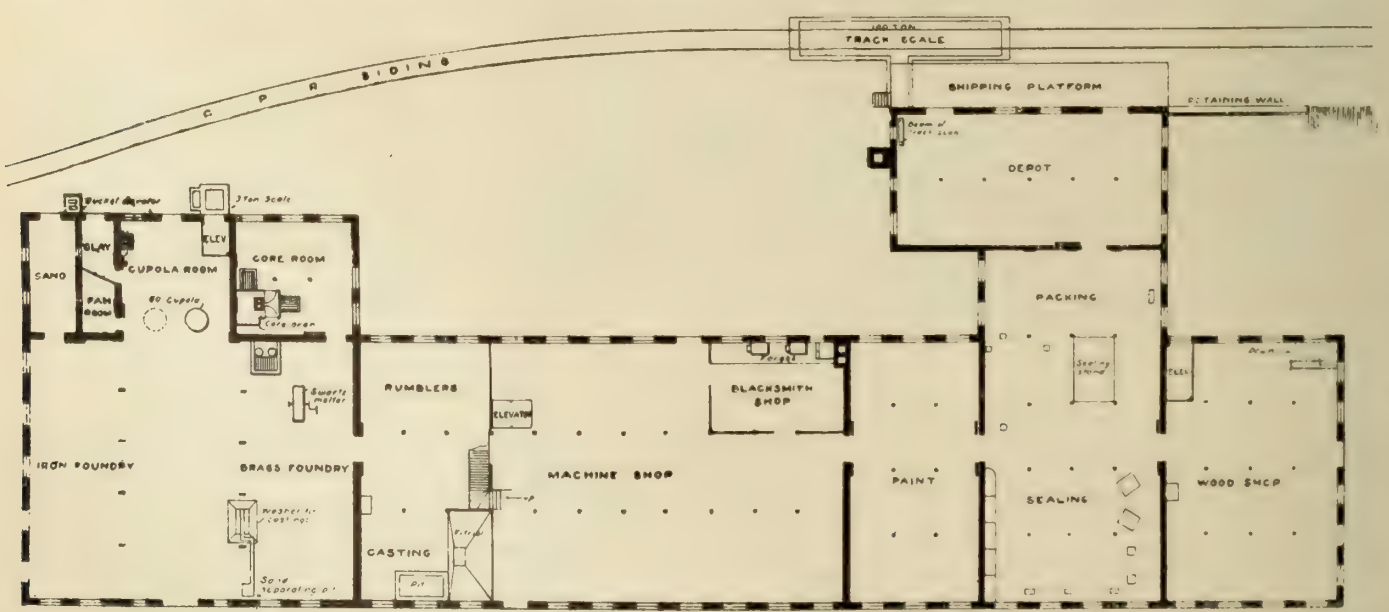

Fig. 2. Ground Floor Plan E. & T. Fairbanks Plant, Sherbrooke.

A space 21 feet by 30 feet in the gallery floor of the machine shop is set apart as a tool room, which is conducted on the principle whereby each workman is held accountable for the tool temporarily in his possession.

Other Departments.

Next the machine shop is located a building 30 feet by 60 feet, which is known as the paint shop. Beside the paint shop is situated the sealing and packing department, a long building about 40 feet in width. In this department the various parts are assembled and tested, sealed and finally packed for shipment, the depot being located at the end of the packing room.

On the south side of the sealing room is located the wood working department, 40 feet wide by 60 feet long, with a 10 foot basement underneath. An elevator with a 14x6 foot car, operates between the basement and first floor of the wood shop. This department has an equipment of the most improved machinery, including Fairbanks' saw tables.

The blacksmith shop is a department off the machine shop. It is equipped with forges, power shears, power hammers, etc.

Construction.

The buildings throughout are built with monolithic and reinforced concrete foundations which are carried up to the first floor level where the walls are continued in red brick set in lime cement mortar. The floors are 2-inch by 4-inch spruce on edge and ⅞-inch hardwood flooring on top, with heavy timber beams and columns, the construction being known as slow-burning or mill construction. Each department is divided from the other by means of brick walls, with tinned standard automatic fire doors.

The arrangement of the departments is such that the raw materials come in at one end crude, pass through the factory and go out the other end finished, with all unnecessary lifting and handling eliminated.

T. Pringle & Son, Limited, Montreal, were the engineers and architects, and had charge of the design and supervised the construction.

Heating and Power Equipment.

The heating is accomplished by a boiler in the depot shown in Fig. 2, with a low pressure direct radiation system, Bundy traps being installed throughout the plant to return all condensation to the boilers.

The heating system was installed by A. R. Wilson, Sherbrooke, the electric wiring by Scott & Rubestein, Montreal. The structural steel was fabricated by the Structural Steel Co., Montreal. The electric motors, cranes and machine tools were supplied by the Canadian Fairbanks Co., Montreal.

Power is supplied by the Sherbrooke Electric Power Co. at 110 volts, this being stepped up to 220 volts outside the building for power. The lighting is at 110 volts, Adams-Bognal arc lamps and incandescent being used.

Fig. 1 is a longitudinal section, Fig. 2 a ground plan and Fig. 3 a general view. One railroad siding is shown and another runs along the front of the buildings.

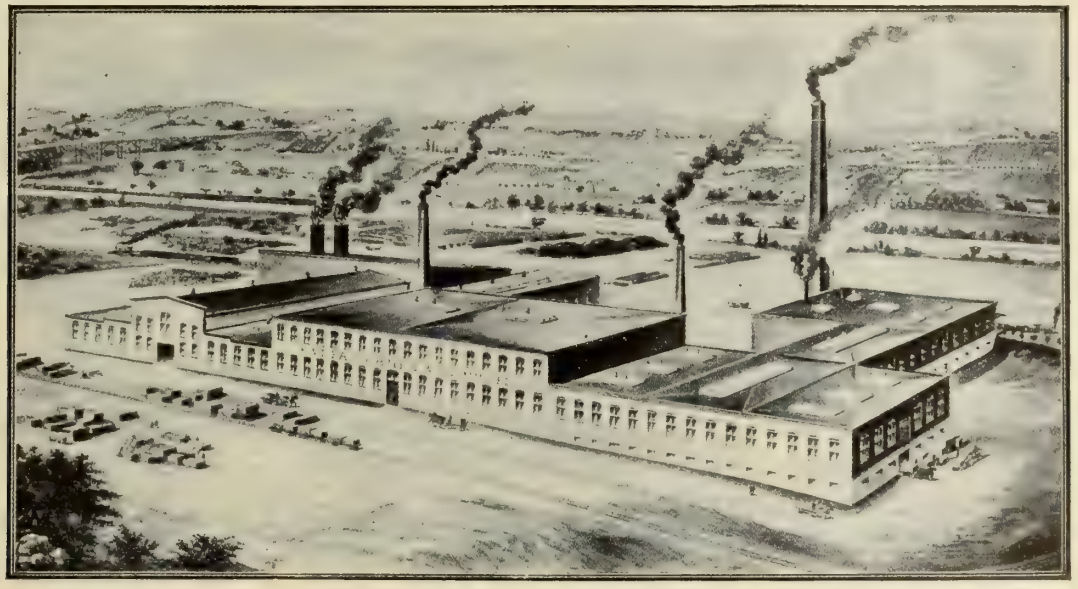

Fig. 3.—New Fairbanks Scale Plant at Sherbrooke, Quebec.

CURING HOT BEARINGS.

By E. B. P.

The bearings on a belt-tightener pulley which carried the main driving belt 48 inch in width caused me some anxiety from heating for some few weeks after being installed. These bearings were of the self-oiling, self-aligning variety and had independent oil-cellars at each end of the bearings. The trouble seemed to be caused by the oil creeping on the shaft from one cellar to the other and then being thrown out upon the floor. Thus one end cellar would become dry, and heating would result. After taking these bearings down a couple of times, and scraping them the idea came to my mind to join the cellars.

Each oil-cellar had an ⅜ in. plug in the bottom for draining it, and, by taking out these plugs and by using some nipples, ells, and a union the job was soon done and the trouble was over.

The B. C. Electric Railway is to spend $2,000,000 during the next two years on a power plant at Victoria, B.C. The railway system will be extended and the company agrees to reduce the rates charged for lighting and power.

Sarnia ratepayers have voted in favor of the extension of the gas franchise to the Sarnia Gas & Electric Light Co., for a term of twenty years, the by-law being carried by a majority of 555. The Sarnia Gas Company have completed a contract to pipe gas from the Tilbury field and sell it for fourteen cents per thousand feet for manufacturing purposes and thirty cents per thousand for domestic use.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

B. Dawson, of Campbellford, Ont., is arranging preliminaries for the location of a large bridge building works at Port Arthur.

Yarmouth ratepayers have ratified the agreement empowering the town to grant a concession to the new Burrell-Johnson Iron Co.

The foundation has been commenced for an addition to the Maple Leaf Tool Works, Tillsonburg, for the manufacture of handles. Other extensions are contemplated.

The Polson Iron Works, Toronto, will lease for twenty years the dry dock at Owen Sound. The same company is looking for a larger site in the Ashbridge Bay area at Toronto to erect a new plant.

The Polson Iron Works wish to build a drydock and transfer their shipbuilding and boilermaking plant to a site on Ashbridge's Bay and, the C.N.R. is desirous of building car works and machine shops in the marsh owned by the city of Toronto.

A proposition has been made by the London Foundry Co. to Louis Kindling, of Milwaukee, to manufacture the Kindling washing machine for Canada. A conference was held lately between the parties interested and a definite offer is under consideration.

Wheaton Bros., Folly, N.S., have been awarded the contract for the construction of a railway from the Drummond iron mines, in Gloucester county, to Bathurst, where smelters and shipping facilities will be constructed. The road will be 16 miles in length.

F. P. Jones, general manager of the Dominion Iron & Steel Co., at Sydney, C.B., states that he has received authority to spend the $2,500,000 voted for the expansion of the plant on the immediate construction of a blast furnace, a full complement of coke ovens, and a merchant mill.

Toronto city council has agreed to sell to the National Foundry Co., twenty-three acres of land and land covered by water as the site for a large iron-founding plant. The city gets $37,000 for the property, and the pledge that buildings to the value of $100,000 will be erected within a year.

The smelter at Boundary Falls and the mines of the Dominion Copper Co., in Deadwood and Phoenix camps, Boundary district, B.C., recently sold at public auction in Vancouver to the New York bondholders, will resume operations as soon as the work of reorganization can be rushed to completion.

New I.C.R. freight car and passenger car repair shops are to be built at St. John. They will be of the most modern and advanced style. The new building will be 125 feet long and forty-five feet wide. It will be a wooden frame of one story. There will be a wheel pit where the wheels can be conveniently taken off and replaced on the cars.

The Canadian Potato Machinery Co., Galt, has begun operations and has several men at work in the factory. Chain making has been commenced and the building of potato diggers is also under way. Manager Schreiber reports a good demand for the machinery which will be largely increased next season, when the machines will be better known.

The Fernie board of trade are considering a proposition of establishing a structutal steel manufacturing plant in the Elk valley. A large American firm, which has been constructing many tipples and other mining plants in this country, has concluded that it would be more profitable to have a plant of its own near the field in which so much work is to be done in the future. There are large iron deposits within easy reach of Fernie.

Rhodes, Curry & Co., Amherst, N.S., have absorbed the Malleable Iron Co. of that place and the entire concern will be reorganized with increased capitalization. Locomotive shops will be added to the industry and now it is announced that the transfer of the Rhodes, Curry business at Amherst has been made, and that the owners are C. Meredith & Co., and the Royal Securities Corporation, Montreal, and J. M. Robinson & Sons and W. B. Tennant of St. John, and J. R. Douglas of Amherst.

It is considered probable that in the near future Vancouver will be provided with a dry dock and machine shop to cost $1,250,000. The proposal is said to be taking definite form, as negotiations are in progress in Ottawa. The syndicate which is to undertake this work is headed by Nicol P. Thompson, of Vancouver, and the site which has been selected is the Ross and Howard Iron Works, on Burrard Inlet. It is thought that the dock will be large enough to accommodate the Empress liners.

J. C. and A. J. Macdonald, proprietors of the Grand Forks, B.C., Machine and Structural Iron Works, are looking over the situation with a view to starting an establishment at Vancouver. They have received much encouragement from individuals prominently connected with the building trade. The firm has two plants in the Boundary district, where the mines brought considerable business, but with the relaxing of the activity of this industry it is proposed to move the larger to either Spokane, Vancouver or Prince Rupert. At present, Vancouver is the choice.

McKinnon & Holmes, Sherbrooke, are erecting a large plant for the manufacture of structural steel work and bridges of all kinds. The building is steel and brick, the works will be equipped with up-to-date machinery. Some of the machinery has been ordered and will be installed as soon as the boilding is completed. The firm expect to be manufacturing about October 1. Mr. McKinnon was for a number of years with Jenckes Machine Co., Sherbrooke. Mr. Holmes has been connected with a large manufacturing concern in Philadelphia in the capacity of designer.

The engineering firm of McDougall, Jenkins, Ltd., has approached the city council of North Vancouver for concessions in the way of exemption from taxation and water rates for a period of ten years, in consideration of establishing a $75,000 machine, boiler and foundry plant. If terms were agreed upon, the company stated it would start with a pay roll of 70 men at $3.50 per day, and later on would double the force. The council were in favor of granting the exemptions asked for, subject to the city solicitor's opinion, there being a point as to whether the city could give free water.

Municipal Enterprises.

Work has begun on the New Liskeard water system.

Baddeck, N.S., is to establish a waterworks system.

Wingham's proposed waterworks system is estimated to cost $5,865.

Extensions are to be made to the sewer system at North Vancouver.

Regina is asking for tenders for sewer pipe and waterworks supplies.

Tenders will be received for sections of Chapleau's proposed water works system.

Morristown, Ont., is to vote on a by-law to spend $15,000 for a waterworks system.

The Toronto City Engineer will shortly call for tenders for eight miles of water mains.

Claresholm, Alta., ratepayers have carried a by-law to issue debentures for $56,000 for a water system.

Toronto is to ask for tenders for 31,000 feet of 12-inch water pipe for extensions in recently annexed districts.

The Vancouver Board of Works have adopted the scheme for the Mount Pleasant sewerage system. Estimated cost, $133,000.

Vernon, B.C., ratepayers have passed by-laws to issue $75,000, 5 per cent., 25 years waterworks and $30,000, 20 years, school debentures.

The Burridge-Cooper Co., Winnipeg, have been awarded the contract for the waterworks system at Estevan, Sask. Contract price, $50,000.

By-laws amounting to $313,600 in all have been carried by Regina ratepayers, of which $148,000 is for waterworks, and $9,000 for sewerage.

An engineer will report on the three plans and estimates submitted for new steel tower and tank for the waterworks at Shelburne, Ont.

Guelph now secures its drinking water from a spring five miles from the city. The new system, including a two-foot conduit, cost $35,000.

Work on the Carman, Man., waterworks system has begun. W. E. Porter, of Medicine Hat, has been engaged to work on and superintend the laying of the water mains.

City Engineer Benzie, of St. Catharines, estimated the cost of the proposed sewer on York Street at $7,200, and of that on Dacotah Street at $1,080. The recommendation in favor of this has been submitted to the council.

The B. C. Electric Railway is to spend $2,000,000 during the next two years on a power plant at Victoria, B.C. The railway system will be extended and the company agrees to reduce the rates charged for lighting and power.

Brant Bros., of Vancouver, who had the contract for building sewers at Prince Rupert, have thrown up their contract, and it is reported that the work will now be carried on jointly by the Provincial Government and the Grand Trunk Pacific.

By July next year, the Esquimalt Waterworks Co. expect to be in a position to deliver 15,000,000 gallons of water at Esquimalt from Goldstream. Already preliminary preparations have commenced on the work and within a short time active operations will commence.

A considerable amount of sewer construction is to be undertaken this season at Victoria. The most extensive work is that on Queen's Avenue, and immediate neighborhood, which it is proposed to operate by a system of pumps. To instal this system will, it is estimated, cost $11,700.

The Peterboro water commissioners awarded the contract for building the dam to the Bishop Construction Co., Montreal, and for the water wheels and pumps it was divided between the Wm. Hamilton Co., and the John McDougall Caledonian Iron Works, Montreal. The total cost of the dam will be $120,000.

Sarnia ratepayers have voted in favor of the extension of the gas franchise to the Sarnia Gas & Electric Light Co., for a term of twenty years, the by-law being carried by a majority of 555. The Sarnia Gas Co. have completed a contract to pipe gas from the Tilbury field and sell it for fourteen cents per thousand feet for manufacturing purposes and thirty cents per thousand for domestic use.

Railway Construction.

The Western Canada Ry. are building from Butte to Calgary.

An electric railway may be built from Edmonton to Pigeon Lake.

The C.N.R. line between Vegreville and Camrose is being built at the rate of three miles a day.

The Spokane International are extending their line into the Alberta and British Columbia coal fields.

The C.N.R. has decided to build twelve more miles of the extension into the St. Rose country, in Manitoba.

A by-law to provide $19,000 for double track work on the Berlin Street Railway will be voted on by the ratepayers on June 28.

Work on the new C.P.R. line from Thief River to Duluth will be rushed to completion. One hundred miles will be ready this year.

Engineer Cole, of the T. & N. O. Railway, is preparing plans and estimates for the extension of the line to Elk Lake and Gow Ganda.

The Hudson Bay & Pacific Ry., have filed the routes of their proposed lines from Fort Churchill to Prince Albert and the Pacific Ocean.

Development work is going ahead rapidly at Comox. The Fraser Lumber Co. is pushing on the railroad construction and material is arriving daily.

The Canadian Northern will this year construct a line from Buffalo to Ottawa. Mr. Mackenzie has been successful in raising $3,600,000 in England, much of which will be devoted to this purpose.

A French syndicate, represented by Short, Cross & Biggar, Edmonton, has applied to that city for franchises for the construction of radial railway lines with a total mileage of 160. The franchises will, in all probability, be granted, the council being strongly in favor of the proposition.

Wheaton Bros., of Folly, N.S., have been granted the contract for constructing the G.T.P. from the Drummond Iron mines in Gloucester Co., to the Town of Bathurst, where smelters and shipping facilities will be constructed. This road will be upwards of sixteen miles in length and a good sized crew are at work.

Within a couple of months fifteen thousand men will be at work on the National Transcontinental road on the lines east and west of Cochrane for 150 miles. Tenders have already been received, for an eight-mile extension of the Manitoulin & North Shore Railway from the thirteen-mile line already operating from Sudbury.

Electrical Notes.

Stirling, Ont., is to vote on a by-law to spend $10,000 for electric light purposes.

G. C. Mason has secured the contract for the erection of the new transformer house of the Falls Power Co., at Welland.

The contract for a motor generator set and switchboard panel for Vancouver was awarded to the Canadian Westinghouse Co.

The finance committee of Stratford's city council has been authorized to offer $30,000 for the electric light plant and equipment there.

The suggestion of Ald. Mills that $20,000 be raised by debentures for the distribution of Niagara power was endorsed by the Ingersoll Fire, Water and Light Committee.

The Colonial Engineering Co., have offered a proposition for the construction of Montreal's generating station for the purpose of lighting the streets at a cost not exceeding $40 per lamp a year.

The British Insulated and Helsby Cables, Limited, have sold their Canadian interests to the Canadian British Insulated Co., Montreal, the latter firm taking over the whole of the former's business, including Toronto's contract for electric light cables for the power distribution plant.

A special meeting of the directors of the Merchants' Light and Power Co., Montreal, was held recently at which it was decided to ask Messrs. Ross and Holgate, the experts who had charge of the installation of the municipal lighting plant in Westmount, to prepare plans for the electric plant of the company.

The property and buildings of the Olds Gas Power Co. at Saskatoon, has been purchased by the Saskatoon Electrical Co., for the purpose of carrying on foundry work, machine shop, electrical work, pattern making and blacksmithing. A company will be incorporated as the Saskatoon Electrical and Foundry works to carry on the work.

The Calgary Power and Transmission Co. will shortly commence a great work on the Horseshoe Falls on the Bow river, near Kananaskis. It is expected that the work will cost approximately $700,000. As soon as the contract is let the work will be commenced for the power plant to supply cheap power to Calgary. Smith, Kerry & Chase are the engineers in charge.

Lindsay has a mortgage of $1,500 on what is known as the Burleigh Falls Power, and G. H. Hopkins, K.C., has been instructed to look up the old agreement with a view to securing the power for Lindsay. Recently the company asked $150,000 for the Burleigh Falls Power, and the city of Peterboro made them an offer of $50,000. The offer is laughed at by the company.

The purchase by Montreal interests for several months past of the stock of the Quebec Railway, Light and Power Co., which recently gave the controlling interests to Montreal capitalists, interested in the Light, Heat and Power Co., has all along been understood to be the initial step to the amalgamation under the same management of the rival gas and electric light companies in Quebec.

A joint stock company is being formed to build dams at Gull and Long Lakes, in Addington county, to retain water for use by the power companies along the Mississippi river. The companies using the water for power uses will be assessed according to the benefits derived. It is said that this movement is the first step in the consolidation of all power companies at a future date.

The power lease at Healey's Falls, on the Trent River, held by the Northumberland-Durham Power Co., has been cancelled. An order-in-council declaring the forfeit has been gazetted. The action was taken on the recommendation of Hon. Frank Cochrane, Minister of Lands, Forests and Mines. This is the second lease this company, of which Sir Mackenzie Bowell was the head, has had, but the conditions have never been fulfilled and no power was ever developed.

The addition to the electric light station, in which will be placed the pumps for the Vancouver salt water system, is almost completed. The turbine pumps, which have been manufactured by the D'Olier Co., of Philadelphia, are expected shortly. There are two of them, one is to be operated by electric power, the other by steam. All the mains are laid and hydrants installed, so that when the pumps are in and in working order the additional fire protection will be an actual fact.

The Vancouver Power Co., capitalized at $2,500,000, has given notice that on August 11 application will be made under the Water Act for a license in the New Westminster District. The company wish to divert a part of the Misliloet River, North Arm, Burrard Inlet, some 12 miles above the mouth of the river, for a water power plant for the purpose of generating electricity for mechanical, industrial and commercial purposes. The company wish some 800 cubic feet of water per second for this plant.

The B. C. Electric Co., will make a big addition to its plant at Victoria, whereby additional power to the amount of about 750 horse power will be provided. The steam plant which was formerly in use at Vancouver, has been brought to Victoria, and work on the erection of a power house will commence at once. The contract for the work has been let to Malcolm & Dinsdale. The cost of the erection of the power house and installation of the plant will be in the neighborhood of $50,000.

The Erindale Power Co., which recently purchased the power station on the Credit River, of the Southern Light and Power Co., and also the land holdings at Port Credit harbor, will spend $100,000 on the construction of the dam and the erection of buildings for the machinery at the station, with a view to delivering 1,000 horse power to the distributors, the Stark Telephone, Light and Power Co., within six months. The York County Loan Co., spent about $200,000 on the work. English capitalists are behind the Erindale power scheme. It is said that subsidiary companies will take over the Oshawa and Bowmanville holdings of the Stark Co.

The London Board of Directors of the British Columbia Electric Railway having voted to appropriate $2,500,000 for extensions and improvements to its system in Vancouver during the next twelve months, R. H. Sperling, general manager of the company, states that over half of the amount appropriated will be used for the construction of new tram lines in Vancouver. A new 10,000 h.p. water wheel and generator will be installed at the generating plant on the North Arm of the inlet at a cost of $250,000. A new dam will be erected at the mouth of Lake Coquitlam, to cost $200,000. Improvements will be made to the New Westminster interurban line between Vancouver and Central Park, which will involve an expenditure of about $200,000. The company will also equip the railway recently built by the Canadian Pacific Railway from New Westminster to Eburne along the North Arm of the Fraser to be operated by electricity. Several other extensions are also contemplated by the company.

Structural Steel.

Seaforth ratepayers of the county of Huron will shortly be asked to vote on by-laws to raise $20,000 for steel and concrete bridges.

W. J. Dunlop, secretary-treasurer of Shell River municipality, Man., is taking tenders for erection of a bridge over the Assiniboine river.

The contract for the superstructure of the bridge across the Madawaska river at Stewartville, Ont., has been awarded to the Hamilton Bridge Co.

City Engineer Clement, of Vancouver, has received from Waddell & Harrington their estimate of the full cost of the new Cambie Street bridge. The sum is fixed at $763,500 not including land damages.

For special steel track in connection with Ross Street subway, St. Thomas, the following tenders were received: Montreal Steel Works, (f.o.b. Montreal), $1,447; Nova Scotia Steel Corporation, $1,485; Dawson & Company, Montreal, $1,559.

The G.T.P. has awarded contracts for six steel bridges on the hundred mile section east of Prince Rupert to the Canadian Bridge Company, Walkerville, Ont., for $400,000. Contractor Ferguson will do the concrete foundations. The company also announced that steel laying begins in September out of Prince Rupert.

The Canadian Bridge Co., Walkerville, Ont., has been awarded the contract for the construction of six steel bridges on the 100-mile section of the Grand Trunk Pacific between Prince Rupert and Kitsalas canyon on the Skeena river. The total amount involved is between $350,000 and $400,000.

The Winnipeg civic works committee have instructed the city engineer to prepare plans for a new superstructure for Louise bridge and Main street bridge. They have also instructed him to submit the plans already made for the Brown and Brant overhead bridge, which were approved by the Railway Commission. It is stated that the plans of the overhead bridge will be carried out. The estimated cost of the structure, according to this design, is $229,000.

Planing Mill News.

Friedman Bros., Montreal, will build an up-to-date planing factory.

The lumber mill of B. W. Titus, at Upham, N.B., was recently destroyed by fire.

The Rainy Lake Lumber Co. will this fall erect a large sawmill with a capacity of 100,000,000 feet per annum at Fort Frances, Ont.

The headquarters of the Crescent Lumber Co., which recently took over the Moose Jaw Lumber and Supply Co., will be located in Moose Jaw. The company have five yards at present, and expect to be operating in the neighborhood of twelve to fifteen yards before fall.

Trade Notes.

The Waterous Engine Co., Brantford, is supplying the machinery for the Mundy Lumber Co.'s mill at Three Valley, B.C.

Kilmer, Pullen & Burnham, Toronto, have been incorporated with a capital of $40,000 to manufacture electrical machinery.

The Smart-Turner Machine Co., Ltd., Hamilton have supplied W. A. McGowan, Durham, with one of their Centrifugal pumps.

John Taylor & Co., Toronto, have ordered a Duplex Pump from the Smart-Turner Machine Co., Limited, Hamilton, Ont.

The Corbet Foundry and Machine Co., Owen Sound, were the successful tenderers for the contract of building a county line bridge near Dundalk.

A representative of Dodge Mfg. Co. reports having recently booked contracts for over six hundred tons of machinery, chiefly grain elevator equipment, for the large terminal houses now building.

The Dominion Foundry Equipment Co., Montreal and Toronto, have supplied a Whiting traveling crane to E. A. Wallberg, for his plant at Matabitchouan, Que., and a six ton cupola to the Lee Mfg. Co., Peterboro.

The Hill Electric Switch & Mfg. Co., 1560 St. Lawrence Boulevard, Montreal, have supplied the Montreal Harbor Commissioners' Elevator, Montreal, with panelboards.

The Parkin Elevator Co., Hespeler, recently booked over $6,000 of orders, and the Hespeler Machinery Co. lately booked a hurry-up order for 17 machines for Fort William.

The Ontario Iron & Steel Co. has just cast a steel flywheel weighing 40,000 pounds, for the Allis-Chalmers Co. It is said to be the largest casting of its kind ever made in Ontario.

The tender of the Robb Engine Co., of Amherst, N.S., for a 750 horse power compound Corliss engine for Saskatoon's electric light and power plant at $16,145, was accepted. A 500 k. w. generator was purchased from Allis-Chalmers-Bullock Co., Montreal, for $6,860.

The Toronto Board of Control have awarded to the Canada Foundry Co., the contract for supplying 12 and 15-inch penstocks for $29.84 and $35.02, and to the John Inglis Company the contract for the 18 and 24-inch penstocks at $43.75 and $57.65. The penstocks are for the high level interception sewer.

J. W. Williamson, Montreal, has about completed arrangements for making Hendry's Patent Laminated Belting in Canada and so supply the Canadian trade from this side. This step will enable prompt shipments to be made. Previously this belting has been supplied direct by the original maker James Hendry, Glasgow, Scotland.

Contracts were recently awarded in connection with improvements to the Peterboro Waterworks. The contract for the new concrete dam, pump house foundations, wheel pits, etc., was awarded to the Bishop Construction Company, of Montreal. The price was by quantities. The

contract for one unit of pumps of 3,000,000 gallons capacity, with turbine, was awarded to the Wm. Hamilton Co., Peterborough, the price being $12,900.

General Manufacturing Notes.

The Postum Cereal Co. will erect a $10,000 plant at Windsor.

The Acheson Graphite Co. will enlarge their plant at Niagara Falls.

The Alberta Pacific Co. will enlarge their elevator at Red Deer, Alta.

O. H. Waug, Sons & Co., Buffalo, will erect a factory at Port Arthur.

The Edwards Mfg. Co., Toronto, are erecting a new building to cost $7,000.

The Imperial Extract Co., Toronto, will erect a new factory to cost $18,000.

The Aberdeen Flour Mills, will erect a mill to cost $25,000 at Humbolt, Sask.

The Imperial Vacuum Machinery Co. is to establish a factory at Brantford.

O. K. Wilson secured the contract to build a 30,000 bushel elevator at Corinne, Sask.

The J. Y. Griffin Co. will spend $20,000 in extending and enlarging their premises at Nelson.

A wagon factory may be established at Port Arthur if the city guarantees an issue of bonds.

The erection of a large spice mill and warehouse is planned by G. F. and J. Galt, at Winnipeg.

The Victoria city engineer's department is preparing plans for a new incinerator to cost about $2,000.

Kelowna, B.C., has secured a new industry, in the shape of a factory for the manufacture of wooden pipe.

A glue factory may be established at Port Saxon, N.S., by Dr. James H. Melanson, Gloucester, N.S.

The Kinistino, Sask., Milling & Elevator Co. have secured a mill site and will at once start building operations.

The Borland Carriage Co., Stratford, will be reorganized as the Stratford Carriage & Motor Co., with $100,000 capital.

The Williams, Greene & Rome Co., shirt manufacturers, Berlin, will probably build a $6,000 branch factory at Hanover.

The Imperial Elevator Co. will put up an elevator at Carstairs, Alta. The Alberta Grain Co. will also erect an elevator.

The Western Milling Co., Calgary, will rebuild their elevator destroyed by fire a few months ago. The estimated cost is $12,000.

A. E. Smith, Reading, Mich., is negotiating with the Winnipeg city council with a view to establishing a new tanning and manufacturing plant.

Campbellford ratepayers have approved a by-law to give the Northumberland Pulp Co. a fixed assessment of $3,000 for ten years on a pulp mill to cost $10,000.

Frederick Harcourt, managing director of the Loose Leaf Ledger Co., is negotiating with the Fredericton, N.B., Board of Trade with a view to establishing a factory in that city.

J. H. Sutherland, J. R. Sutherland and John S. Blanchard have formed the United Glass Mfg. Co., and will erect a big glass factory and warehouse adjoining the G.T.P. shops at Winnipeg.

The B.C. Electric Railway are enlarging their present power house at Victoria and are calling for tenders for excavating for and building of concrete foundations for steam engines and boilers.

Definite announcement has been made that the new Ogilvie elevator at Fort William will be commenced immediately. It will be of 500,000 bushels capacity and built close to the present elevator.

Cook & Vanstone intend to expend $35,000 on the erection of a flour mill and a thirty thousand bushel elevator at Regina, as well as making provision for ample extension of the enterprise should it justify the outlay.

The American Shipbuilding Co. have been having some negotiations with Port Arthur regarding a proposition to build a dry dock at that place, and a by-law will be voted on by the people of Port Arthur on August 10.

Another new proposition is the erection of a mill for the manufacture of black powder at Ruskin by the Giant Powder Co. Ruskin is located 30 miles from Vancouver on the main line of the C.P.R., on the Fraser river. This concern already has a dynamite plant at Telegraph Bay, near Victoria, on Vancouver Island. C. C. Bemis, of San Francisco, president of the company, has been here in connection with the matter, and now that the site has been secured, he says that work on the plant will be started without delay. The total investment will be $60,000. As the product is used mostly in clearing timbered land, there is a market all about.

Gas Items.

The Gas Engine & Traction Co., Winnipeg, will erect a large factory at Elmwood.

The Brooks Gasolene Engine Co.'s plant at Niagara Falls was totally destroyed by fire early in July.

The by-law to give the Provincial Natural Gas Co. the right to pipe the town of Welland was endorsed by the electors recently by a large and almost unanimous vote.

The Monitor Mfg. Co., Fredericton, have made a large shipment of Acetylene Generators to Berwick, N.S., where they are installing among others, a lighting plant for Dr. Geo. McNally.

The Colonial Engineering Co., Montreal, have received a contract from C. S. Hyman & Co., London, for 275 h.p. Hornsby-Stockport gas engines. The Colonial Engineering Co. agree to furnish the power at $18.80 per h.p. a year.

The Montreal Fire and Light Committee have received an offer from the Colonial Engineering Company to erect a gas engine generating plant for the electri light ing of the city for a sum not exceeding $250,000, exclusive of the cost of the site.

Sarnia ratepayers voted for the extension of the gas franchise to the Sarnia Gas and Electric Light Co. for twenty years. The Sarnia Gas Co. have a contract to pipe gas from the Tilbury field and sell it for fourteen cents per thousand feet for manufacturing purposes and thirty cents for domestic use.

The contract for the construction of a tank and pumping station at the Blenheim electric light power house was awarded to J. H. Collier and D. H. Gray. Cunis & McIntyre will instal an International Harvester gas engine capable of lifting 2,000 gallons per hour. Engine pump, etc., complete costing $173.

Electricity and Steam.

Tenders will be received by the City of Toronto, Canada, until noon of June 30th, 1909, for laying between 350,000 and 450,000 duct feet of underground conduit. For specifications, form of tender, etc., apply Electrical Department, City Hall.

Tenders will be received until 8 p.m., June 21, by O. T. Springer, City Secretary, Burlington, Ont., for the following work: Contract B pump house; Contract G electrically operated pumping machinery; Contract I steel pump well. Willis Chipman, C.E., Chief Engineer, 103 Bay St., Toronto, Ont.

Tenders will be received for electrical machinery, until 5 p.m., June 22, by J. H. Trusdale, City Clerk, Saskatoon, Sask., for the following: (A)—500 K. W. 2,200 volts, 60 cycle, 150 R. P. M., 2 phase, generator, exciter, and switch board, installed, complete (B) 750 H. P. 150 R.P.M. vertical, cross-compound Corliss engine, with the necessary condensing apparatus, installed complete. Plans and specifications may be seen at the office of the Electrical Superintendent, E. L. White, Chubb Block.

New Companies.

The American Laundry Machinery Company, Toronto, has been chartered with $40,000 capital. B. N. Davis, Toronto, is one of the promoters.

The Imperial Vacuum Machinery Co. has been organized with headquarters at Brantford. Capital is $40,000 and M. Ungar, J. Ker and A. Goodwin, directors.

The Consumers Cordage Company, Montreal, have been granted a license to do business in Ontario with the Colonial Cordage Company, Toronto, as agents.

Hew R. Wood, Ltd., Toronto; capital, $40,000: to manufacture and deal in machinery. Incorporators, C. R. Allison, H. J. Welch and C. R. Howard, Toronto.

Canadian May-Oatway Fire Alarms, Limited, Winnipeg, capital $100,000, to manufacture automatic fire alarms. Directors: W. Sanford Evans, W. A. Black, and M. Bull, Winnipeg.

The Welland Glass Manufacturing Company, Welland, Ont., has been granted a charter with a capitalization of $350,000. E. A. Fultz, Cleveland, and B. J. McCormack, Welland, are directors.

Advance Power Co., Toronto; capital, $200,000: to manufacture gas and steam engines, boilers, machinery, yachts, automobiles, etc. Incorporators R. E. Clisdell, Anna E. Clisdell and A. W. Holmsted, Toronto.

The Oro Telephone Co., Hawkestone, Ont., capital, $20,000: to carry on telephone business in Vespra, Oro and Medonte townships, Simcoe county. Incorporators, R. W. Metcalf, Geo. Raikes, and Geo. Crawford, Oro.

Wolford Rural Telephone Co., Easton's Corners, Ont.; capital, $10,000; to carry on telephone business in Wolford township, Grenville Co. Incorporators, W. H. Watts, J. B. Arnold and Wm. Hughes, Wolford township.

Manitoba's Resources to be Developed.

The mineral resources of Riding Mountain, Manitoba, are about to be developed by a syndicate which has purchased the mineral rights of many of the settlers. Samples taken at a depth of 300 feet have been reported on favorably by the head office of the syndicate and it is the intention to sink a shaft 1,000 feet when it is confidently expected that oil and coal in paying quantities will be found.

Factory Products Limited

Mr. H. C. Nicholls, who has for several years been Assistant General Manager of the Canadian General Electric Company and the Canada Foundry Company, has resigned that position in order to go into business for himself. He has organized a company called "Factory Products Limited," with offices in the Confederation Life Building, Toronto, for the purpose of acting as Canadian Selling Agents for representative manufacturers.

A Handsome Catalogue.

The Hamilton Facing Mill Co., Hamilton, have issued complete catalogue No. 6 of their "Made in Canada" foundry facings, supplies and equipment. The catalogue consists of 146 pages on coated paper, describing fully the lines handled, consisting of several grades of plumbago, foundry facings, core oil, molding sand, crayons, brushes, flasks, chaplets, rammers, wheelbarrows, molders' small tools, ladles of several descriptions, cupolas, firebrick, melting furnaces, blowers, core ovens, molding presses, sand sifters, firebrick, tumbling barrels, etc. Prices are given for the greater number of this equipment so that the volume is a valuable one for any manufacturer to have on hand for reference.

"Rival" Engines Change Hands.

J. T. Schell has now a complete chain of agencies extending from Halifax to Vancouver.

J. T. Schell, Alexandria, Ontario, has acquired the right from the Launi Engine Co., to manufacture their line of "Rival" horizontal engines.

Work will be begun at once on the small sizes 15, 20, 27 horse power, but later on their machine shop and foundry at Alexandria will be extended to enable the larger sizes to be built.

These engines will be remodelled somewhat and will embody several well defined improvements and together with the "Auto Climax" engines of 5 and 10 horse power will make a very complete line.

Monster Power Co. for Manitoba.

Small supplies of power from 100 h.p. up will be delivered at the rate of $20 per h.p., measured at the plant, while for amounts of from 5,000 to 10,000 h.p. the charge will be $15. The charge for transmission will be 4½ cents per mile. Brandon is 225 miles from the plant, which will bring the rate for 6,000 h.p. up to $22.87½, delivered at the high tension station here.

The Bellesby company has 12 plants in operation in the United States, and is considered one of the strongest engineering firms in America. Their idea is to supply power for manufacturing and municipal purposes throughout the whole of the province, the modern improvements in transmitting high tension current making this possible.

More complete details of the monster power project being planned for Manitoba have been given out. It is claimed by the Bellesby company that they can develop 150,000 electrical horse power at their site at Great Falls, at the lowest initial cost of any electric hydraulic plant of similar size on the continent, though

it is not proposed to undertake the full development at the present time. The plan of operation is that the company will close contracts for the delivery of 20,000 horse power and as soon as these are made construction work will be begun. At the present time they have contracts for 17,500 horse power in different parts of the province, and construction work will be started in the immediate future, or as soon as 20,000 horse power is contracted for.

Large Gas Engine.

The Dominion L. H. P. Company have already purchased a suitable plot of ground in Maisonneuve for the erection of the new plant, and are at present in consultation with their architects over the plans. Work will be commenced very shortly on building the power house. The site cannot at present be divulged.

A contract for a large gas engine has been placed with the Colonial Engineering Co., 222 St. James Street, Montreal. This company has contracted with the Dominion Light, Heat & Power Co. to furnish 1,000 h.p. Hornsby-Stockport gas engine for the purpose of public and private lighting and the sale of current for power.

The equipment will consist of three 250 h.p. Twin Cylinder Hornsby-Stockport gas engine units, and two 125 h.p. units. The station will be the most modern one of the kind in the Dominion, if not on the continent—the building to be of concrete construction throughout, and 3-phase, 60-cycle alternating current will be developed. This plant is to be in operation by December next. Anthracite pea coal, coke or charcoal will be the available fuels.

Canadian Machine Tool Markets

HALIFAX.

The Dominion Steel Co.'s proposed expansion at its plant will give employment to a large number of men, and as a result business should naturally benefit thereby. The expenditure of several million dollars on construction work is hailed with delight by the business men of Sydney, C.B., the "Pittsburg of Canada," and a renewal of the boom times of several years ago is predicted. In addition to this everything is bright and prosperous at the collieries. The shipments of coal are very heavy so far this season, and they will likely continue until the close of navigation. There is a large amount of building operations going on in the mining towns of Cape Breton and the Dominion Coal Co. recently awarded a contract to the Rhodes, Curry Co., of Amherst, for the construction of thirty cottages for the miners. The construction of these is to be proceeded with at once. Many fine private residences are also in the course of erection, and others are being contracted for. Barring labor troubles, everything gives promise of a banner year in the mining districts of Cape Breton.

MONTREAL.

Metal working tools are enjoying a steady demand and compared with this time last year, an increased business of about twenty per cent. is being done.

Orders are coming in with satisfying steadiness and inquiries have more to them than the earmarks of curiosity. Wood-working machinery is very active, which is rather to be expected at this time of the year when saw and planing mills are at their busiest, supplying the building trades.

The summer months have abundantly proved the fact that the return to old normal conditions—and better—of the machinery trade is assured. Usually this time of the year with its attendant holidays and hot weather results in the slackening of business in machinery lines but this last month's buying has not felt these effects to any appreciable extent.

The foundries are nearly all working full force, full time now, mostly on contract work, but small separate orders are numerous. The demand for cast iron pipe is heavy. This is due to the summer undertakings of municipalities which are extending water systems, etc. The demand for railway castings is not as brisk as was anticipated earlier in the spring but shows evidence of increasing.

The dealers in automobile supplies are very busy which is but to be expected at this time of the year. This draws attention to the increased number of garages and automobile repair shops. Although these are not, individually, buyers of heavy machinery not machinery in large quantities, nevertheless the aggregate of their orders is such to make them a serious consideration in the machine tool trade.

Underlying all this increased activity and optimism on the part of the dealers, is the condition of the money market. The recovery from the "recent depression" has been so rapid during the last three months that imports and exports into and from this district are now close to the record mark set in the summer of 1907. There is a plentitude of available money and loans are being negotiated at very low interest which are being used to further industrial extensions.

Among the lines most active on the power development side of the fence is the apparatus tending to economies in power generation such as steam traps, regulators and forced and induced draft appliances. These latter are particularly noticeable. The reason for this seems to be the fact that manufacturers, having reorganized shop conditions to meet existing close competition, are now turning their attention to economies in the power development end, with the view of further reducing costs and overhead charges.

TORONTO.

Reports from New York, Cleveland, Cincinnati and Milwaukee are very encouraging. Machinists are being taken on, following the increased demand for machine tools.

Canadian companies are busy and though there were fewer orders placed during the first part of July than in June, inquiries kept up and some good orders are now being placed.

An addition to Toronto's foundries will soon be made when the National Iron Works will erect a plant in the east end. This is controlled by Hon. William Mulock and Cawthra Mulock.

The grey iron and brass foundries are busy with orders showing that the smaller machine shops and also the larger ones without their own foundries are busy. Some of the foundries are working to their capacity.

Power lines are in demand and Canadian companies are very busy. One Galt company received one order for two engines and seven boilers from British Columbia totalling $30,000. This is a sample of the demand for power machinery.

Both Canada and United States are seeing the steel industry improve week by week. The Canadian industries in Nova Scotia and Ontario are enlarging and prospects are very bright. Canada has entered the export trade of steel rails and having an industry nearer the sea than Pittsburg, should become a prominent factor in the foreign steel rail trade.

The conditions existing in the United States point towards an advance in the price of machine tools made across the border. During the depression the efficiency of machine tools has been greatly developed so that the capacity of some of the machines now being placed on the market has a capacity of double and treble that of less modern types, so that the rise in price will be offset in the increase in efficiency of the machines.

WINNIPEG.

Regarding the price of power, it is only a matter of two years or less when much cheaper power will be available. The new city plant now under construction will have a capacity of 65,000 horse-power, which will be put on the market at a very low figure.

The supply trade is also weak as is expected from the nature of the machine shop business. Blacksmiths' supplies are in fair demand throughout the west. The heavy machine tool business is all that could be expected. The extensive building, railway construction and mining that is now in progress, calls for a large amount of the heavier machinery.

Saw milling machinery is also in considerable demand. A local supply house recently shipped a derrick iron and hoisting engine to Calgary for construction work.

The Burridge-Cooper Co., Winnipeg, have been awarded the contract for the waterworks system at Estevan, Sask. The contract consists of one 500 horse power gasolene engine and one 10 horse power gasoline engine, one double acting triplex power pump, capacity 6,000 gallons per minute, and a quantity of high pressure piping. The contract price is in the neighborhood of $50,000.

The Waterloo Manufacturing Co., Waterloo, Ont., shipped a trainload of threshing machinery to their new western quarters in Portage la Prairie. The shipment passed through Winnipeg on July 22. This is the first trainload of machinery forwarded from Waterloo, and it is likely to be followed by other shipments in the near future, as the demand in the west is increasing. The shipment weighed 350,000 pounds, and was valued at $100,000.

The Canadian Westinghouse was much in evidence in the manufacturers' exhibits. Besides exhibiting a number of appliances for electrical equipment in the city of Winnipeg booth, they had an attractive booth of their own in which they had on exhibition a number of articles manufactured especially for household use. Particularly noticeable were electric tailors' irons, sewing machine motors, electric motor drivers, vacuum cleaner machine and electric radiators. The booth was lighted by means of the Nernst lamp, for which they are agents.

The Ontario Wind Engine and Pump Co., Toronto, had one of the best exhibits of gasoline engines. A 1½ h.p. Stickney engine was operating a pump, while a 16 h.p. Stickney was operating a threshing outfit. They also showed 30 and 40 h.p. gasoline traction engines called the "Flower City." These were the engines that captured the gold medal last year. They were also showing a line of well-drilling machinery, grain grinders, wood saws, pumps and scales.

One of the first plants that will open in Winnipeg when power and labor will permit, will be a steel casting and malleable plant. There are no steel casts or malleables made in western Canada, and the great volume of shipments of these lines from Ontario foundries would warrant the opening of a plant here as soon as possible. Carloads of castings from various Ontario foundries enter here monthly for the supply of such goods as those required for the several fence companies and the Great West Saddlery Co.

The model was about 15' x 12' and gave a splendid idea of the appearance of Winnipeg river, where the power is derived. In miniature there was a waterfall of 45 feet which is fully taken advantage of by a station. Accompanying litelature explained that the first unit of power delivered in Winnipeg will be 17,000 horse power, which will cost $18 at the city sub-station. Eventually there will be 65,000 horse power developed. Nothing has yet been done in Winnipeg, in spite of all the publicity which the Point du Bois development plan has received to bring home to the minds of the citizens, as this did, the great project in which Winnipeg is engaged.

Local machine supply firms look forward to the time when Winnipeg will become known as a manufacturing centre. The great drawback in the past has been chiefly that of labor and high priced power. The labor question is not so serious as it was a few years ago, with the influx of laborers to the west, and the gradual diminishing of laborers in eastern Canada, the wages paid in the west and the east do not vary so much as a few years ago. Consequently old manufacturers in Ontario and Quebec find the same difficulties as employers in the west. In the east labor is high because it is scarce; in the west labor is high on account of economical conditions.

Until manufacturing develops there will be a weak market for small machine tools. In this line the trade is not so strong as it was a few years ago. Several attempts were made about three or four years ago to work up a machine shop business, but few of them have had great success. The result is that there are few of the smaller machine tools moving at present. It must be admitted, however, that if the managers of the smaller machine shops were content to make legitimate profits on their products, the machine trade would not be so low. A western manufacturer is not satisfied with such small profits as are enjoyed by eastern manufacturers. Competition in the east has compelled manufacturers to reduce their prices, and in time the same thing will result in Winnipeg.

There were several splendid exhibits of machinery and display at the Winnipeg Industrial Exhibition held from July 10 to 17. The main display in the central manufacturers' building was that of the city, an exhibit planned in part by the industrial bureau, and partly by the electrical department of the city hall. It was designed to educate visitors and the citizens of Winnipeg in the uses to which electricity may

be put. It was chiefly designed to interest the public in the cheap power which will be at their disposal upon the completion of the plant two years hence. F. A. Cambridge, city electrician, set up the exhibit and it was interesting not only for its educative value but for its attractiveness. In addition to the electrical display there was a model of the civic power plant as Point du Bois, 75 miles from Winnipeg.

The exhibit of the Stuart Machinery Company greatly eclipsed the efforts of previous years. This year trouble was taken to show the public the different uses to which machines could be put. In the centre of the display was a large planer and matcher operated by an electric motor. Other wood-working machines such as band saws, rip saws, sash stickers, moulders, etc., were shown to good advantage. This firm is showing its confidence in western Canada by removing the present building at 766 Main Street, back to Queen Street, with the intention of erecting a building four storeys in height with all the modern conveniences necessary to the handling of machinery on a large scale. This is indicative of the material progress being made in all branches of the machinery industry, and probably the astounding increase of prosperity in western Canada is to a large extent indebted to the manufacturers of machinery.

CATALOGUES.

DROP FORGINGS—J. H. Williams & Co., 150 Hamilton Ave., Brooklyn, N.Y., manufacturers of drop forgings, have issued a fine 120 page catalogue, a striking feature of which is the front cover design of a red-hot fac-simile of a drop forged wrench. On page 7 of the book mention is made of the new lines made by the company, these, including amongst others the "Vulcan" bijaw chain pipe wrenches and the "Agrippa" fittings chain wrenches. A numerical index on page 8 is also very convenient and a special talk on steel specifications is given on pages 107 to 110. In addition to the large edition of these catalogues, a separate edition of pocket size will be printed for distribution among employes of workshops, etc.

MOTORS—The Westinghouse Electric & Mfg. Co., Pittsburg, Pa., has issued a handsomely printed little booklet describing the applications of its line of small motors to office, store and shop services. The numerous illustrations scattered through the pages suggest many time and labor saving uses for these efficient little power devices; among these are the motor-driven adding machine, mailing machine, envelope sealer, buffing and polishing wheel, blower, hand drill, hack saw, etc., applications selected at random from the large number mentioned.

BOOK REVIEWS.

COPPER HANDBOOK—The eighty annual edition of the Copper Handbook, just issued by the author, Horace J. Stevens, of Houghton, Mich., is at hand.

The principal chapter of the book, devoted to detailed descriptions of the copper mines of the globe, describes no less than 6,767 copper mines and copper companies, in all parts of the world. This long chapter has been completely rewritten.

Rarely is a single work found of such general importance to such a great diversity of interests as is the Copper Handbook, which is practically an encyclopedia of the entire subject of copper, and, as such, is of equal interest to miner, metallurgist, refiner, producer and consumer. To the investor or speculator in copper shares, it is as nearly indispensable as a work of reference can become.

The Copper Handbook is exceedingly frank in its comments, and the descriptions of mining companies considered by the author to be dishonest, are marked by the utmost limit of plain-speaking. That seven preceding editions, embodying language of the same tartness, have appeared without a single libel suit being brought into court, though many going companies are branded as swindles, is evidence that Mr. Stevens, notwithstanding the fact that he denounces several hundred companies as frauds, is sure of his ground in making such scathing arraignments as are contained in this and the past editions of his book. The price of the Copper Handbook is $5 and the publisher prepays carrying charges, allowing the purchaser a week's inspection.

ANNUAL REPORT OF THE MINISTER OF MINES of British Columbia for the year ending 31st December, 1908, being an account of mining operations for gold, coal, etc., in the Province. William Fleet Robertson, Provincial Mineralogist (British Columbia Bureau of Mines.) 271 p., plates, maps, 1908.

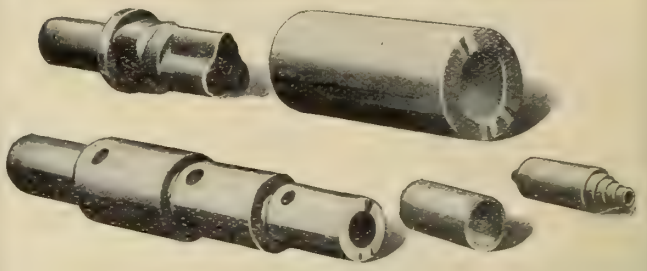
Derrer Oval Taper Drill Sockets

Give an Absolute Perfect Positive Drive



The Derrer Oval Taper Drill Socket and some of the products.

The DERRER OVAL TAPER DRILL SOCKETS solve the perplexing problem of drive for drills.

The DERRER OVAL TAPER DRILL SOCKETS are simplicity itself, and enjoy the following points of superiority over all others:

From one-third to one-half shorter.
No tangs to twist off.
No set screws or keys.
Positively no slipping or binding.
All our work interchangeable.
Absolutely true running drills.
Drill breakage reduced to a minimum.
Drill accounts reduced 25 to 50 per cent.
25 to 50 per cent. more work through your drill presses.
Chuck and socket account reduced 75 to 90 per cent.
A drill chuck or socket that is practically indestructible.
Gives an absolute perfect positive drive.

Eastern Salesroom:
94 Reade St., New York

"Atlas" Worm Gear Chain Blocks

With Automatic Brake

ESSENTIAL FEATURES:

1st. High return in efficiency for power expended.

2nd. Safety in supporting the load at any height.

3rd. The principal parts are constructed of steel and wrought iron, thus reducing the possibility of breakages to a minimum.

The "Atlas" is a High-Grade Block at a Moderate Price

Machinery Wanted and For Sale

It will pay you to watch our condensed column each month. There are many money-making propositions brought to your attention here. You may find just what you are looking for.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c. a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

AGENTS WANTED.

TO MACHINE TOOL AGENTS — DRILLING Machines — British firm, specialising entirely upon manufacture of Drilling and Boring Machines of highest class for high speed duty, is open to appoint sole agent for Canada. Agents of good standing, preferably having showrooms, are invited to correspond. Must be sound salesman, able to sell profit-making tools on their merits as higher productivity machines, as being best class and superior materials they cannot be sold purely on price. Address to William Asquith, Ltd., Machine Tool Makers, Halifax, England. (8)

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES — Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

MACHINERY WANTED.

BOILER WANTED—40 h.p. horizontal tube. Must be in first class condition. State full particulars. Imperial Extract Co., Toronto. (6)

D. MAXWELL & SONS, St. Mary's, Ont., want second-hand air compressor in good condition. Belt driven, with capacity of about 100 cubic feet free air per minute.

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

MACHINERY FOR SALE.

FOR SALE—One new Jacques & Son 45-inch paper cutter, latest improved pattern. Reasonable price for cash or short credit to responsible party. Tolton Bros., Ltd., Guelph, Ont. (6)

ONE 2nd-hand 60-lb. spring hammer. 1 24" x 24" x 7' 2nd-hand iron planer. Address J. D. Anderson, Box 203, Windsor, Ont. (8)

ONE 5 h.p. Cook vertical gasoline engine, double ignition, complete with tank, skids, and all accessories. A new engine at a bargain for quick sale. Kellogg & Co., 196 King St. West, Toronto.

POSITION WANTED.

BRIGHT YOUNG MAN wishes position in drafting office. Has just completed I.C.S. course in mechanical drafting. Address Box 89, CANADIAN MACHINERY, Toronto.

CIVIL ENGINEER, A.M.I.C.E., London, desires position with manufacturing firm. Specialist in machine tool design, jigs, fixtures, etc., modern methods for rapid production. Ten years in automobile and marine works. First-class mechanic and draftsman. Used to handling foremen, etc. Address Box 87, CANADIAN MACHINERY, 10 Front St. East, Toronto. (6)

SITUATIONS VACANT.

MACHINERY SALESMAN, experienced in flour mill and transmission appliances. Reply, stating experience, Box 88, CANADIAN MACHINERY, Toronto.

WANTED—Two experienced machinery and mill supply salesmen. Applications to be made by letter only, with references, to the Canadian Fairbanks Co., Ltd., Toronto.

FACTORIES FOR SALE.

IN the growing town of Welland. Foundry, Machine Shop and Carpenter Shop, with engine, boiler and line shafting; blacksmith shop, boiler shop, pattern and other storehouses. Welland has cheap electric power, natural gas, sewers, fine railways and water transportation on Welland Canal. Apply M. Beatty & Sons, Welland, Ont.

VALUABLE Manufacturing premises in the town of Galt—Building is of stone, three storeys, equipped with boiler, heating and lighting pipes. Immediate possession. Apply to C. R. H. Warnock, Galt, Ont.

OIL ENGINE FOR SALE.

NINE Horse Power New Campbell Oil Engine, Electric Lighting type. Cheap. Most economical engine for small plant. Jones & Glassco, Montreal. (tf)

MISCELLANEOUS.

AN EXTRA 1 PER CENT. PROFIT.—A National Cash Register will earn at least an extra one per cent. profit for any retail merchant. The National Cash Register Co., F. E. Mutton, Canadian Manager, cor. Yonge St. and Wilton Ave., Toronto, Ont.

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employe's time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Limited. Office and factory, 27 Alice Street, Toronto. (tf)

ELLIOTT-FISHER STANDARD Writing-Adding Machines make toil easier. Elliott-Fisher Limited, 513, No. 83, Craig Street W., Montreal, and 129 Bay Street, Toronto.

CUT DOWN YOUR PRINTING BILLS one half by installing a "Writerpress." Your office girl or boy can with it print your circulars, price lists, etc., at the rate of 1500 to 2000 copies per hour. Best machine ever made for printing facsimile typewritten letters. Prints from printers' type, half-tones, etc. Retail stores could greatly increase their business by using a Writerpress to run off circulars and letters, sending them out to their customers and probable customers announcing special sales, etc. Send for illustrated catalogue and samples. The Canadian Writerpress Company, 33 John St. South, Hamilton, Ont. (tf)

LIVE BUSINESS MEN insist that their business correspondence be typewritten. Keen, progressive merchants find personal typewritten letters bring the best advertising results. They are secret, individual, powerful business getters. The Light Touch MONARCH is especially attractive to the merchant. Write for interesting literature. The Monarch Typewriter Company, Limited, 98 King Street West, Toronto, Ont.

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling, and greatly facilitates the loading of cars, drays, etc., and for handling goods in and about the warehouse and factory reduces the cost of labor because far less warehouse help is required. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley St., Toronto. (tf)

Held Down by Expenses

Burdensome shop expenses are keeping down many a live manufacturer. The best way for a manufacturer whose capital is small to get a firm foothold on the ladder of success is to have his manufacturing done in a shop that is already well organized and to devote his own energies to marketing the product. Our completely equipped shop is at your service for this purpose. Let us give you an estimate. We will prove by actual figures that you can save money by this plan.

This is Your Wheel

You can have it free of cost by doing a little easy work for us among your acquaintances in your spare time.

MODEL 88

IMPERIAL

It is a first-class wheel made for us by The Canada Cycle and Motor Co., of Toronto, and will give you excellent service. Here is a table showing the regular sizes of the various parts, with the other sizes that may be had instead, if desired:—

	Regular	Option
Frame	22-inch	20, 24 and 26-inch
Finish	Black	
Chain	3-16 inch. Block.	
Gear	77	72, 80, 87.
Handle-bar	No. 20, Adjustable.	

	Regular	Option
Pedals	Rubber 3¾-inch	3¾-inch or 4½-inch Rat Trap.
Cranks	7-inch.	
Saddle	No. 15	No. 14, 11, 17.
Tires	1¾-inch Dunlop	1 5-8-inch Dunlop or Hartford single tube
Wheels	28-inch, with striped rims.	

To Get this Wheel

absolutely free of cost, send us in 32 Paid-in-Advance yearly subscriptions to the BUSY MAN'S MAGAZINE (2 six-months or 4 three-months subscriptions count as one yearly subscription). You will find it an easy matter to get these subscriptions with surprisingly little canvassing as the Busy Man's Magazine is very attractive and interesting. Try it!

Let your boy earn one.

This bicycle offer is an excellent opportunity for your boy to acquire some training in the art of salesmanship. Send him out to procure the 32 subscriptions with the bicycle as his reward. He will enjoy the work; it will help rouse his enthusiasm for a business career; and it will put him in possession of a splendid bicycle that will be useful in your business as well as affording the boy a lot of pleasant, healthy exercise.

Fill out this Coupon and Mail it to us To-day.

The Busy Man's Magazine,
10 Front Street East,
Toronto, Canada.

Gentlemen;— I would like to win one of the Imperial Bicyles you offer for 32 new, paid-in-advance subscriptions to Busy Man's, Please send me sample copy and order book, and I will do my best to win. I agree to report progress once a week.

You Foundrymen-

When you happen to want Foundry Supplies you usually want them quick. That's a very good reason why you should deal with us. We are manufacturers; and the largest and most reliable foundry supply house in Canada. We can fill your requirements with the utmost speed and satisfaction with "Anything for the foundry, from a Dust-bag to a Cupola."

HERE ARE A FEW OF OUR SPECIALTIES:

Genuine Ceylon Plumbago

The pure article, thoroughly refined and ground, in various grades for various purposes.

Hamilton Sea-Coal Facing

The very best grade, low percentage of sulphur, very high percentage of carbon and gas-producing qualities.

Hamilton Dry Core Compound

Costs less than a mixture of your own and gives much better results, as our facilities for mixing are unequalled in Canada.

Hamilton Moulding Sands

Now is the best time to buy sand; prices always rise towards winter, and deliveries become uncertain.

MOULDING MACHINES, CORE OVENS, CUPOLAS, BLOWERS, FURNACES, ALL KINDS OF MOULDERS' TOOLS AND BRUSHES, CHAPLETS, SCREENS, ETC.

COMPLETE CATALOG MAILED FREE ON REQUEST.

Send us a trial order; our quick methods and close prices will convince you.

The Hamilton Facing Mill Co.

Hamilton Limited Ontario

JEFFREY ELECTRICALLY DRIVEN DUMP CAR, handling train of similar cars. Equipments of this kind built to suit any conditions and of any capacity.

ELEVATORS and CONVEYERS

A New Departure

We have recently installed a strictly up-to-date plant for manufacturing **TRIPOLI** and other **POLISHING COMPOSITIONS**, and are now in position to fill orders for the same, as well as platers' supplies.

For finishing Nickel, try our **"WHITE LILY"** (Standard White Finish). There is none better.

Our **TRIPOLI** is high grade, and for a high grade article our price will interest you.

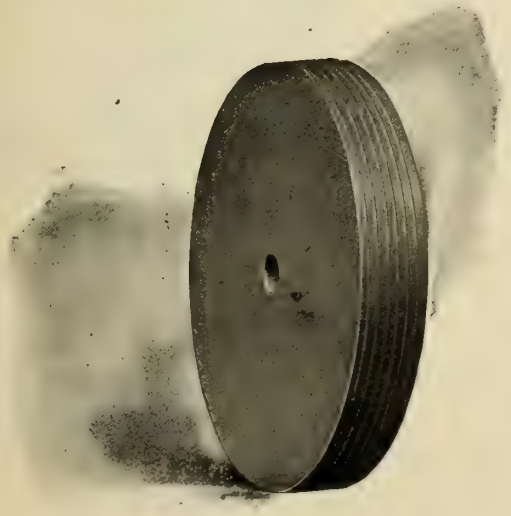
FOUNDRY SUPPLIES
FOUNDRY EQUIPMENT

Platers' and Polishers' Supplies



THE PROGRESSIVE MAN

thinks in the middle of next week. He looks ahead!

It was that forethought that caused my ***SOLID CANVAS WHEELS*** to be so constructed that the warp and woof of the discs is locked while running in opposite ways. That means no ravelling, but uniform wear instead.

They are needed for "roughing out" in every polishing room, and are to be set up with glue and emery. I have the Wheels, the Glue and the Turkish Emery; each one of these items bears the quality stamp.

For "coloring up" brass castings, such as valves, brass fittings—spun brass or cast brass—use my ***"WHITE COLUMBIA COLORING"*** on Cotton Buffs. You know beauty goes a long way in the sale of goods.

If you are a stove manufacturer the dark blue lustre follows the use of ***"STEVENS' WHITE POLISH,"*** and the bright, silvery sheen on nickel comes with a touch or two of ***"STEVENS' SILVER FINISH"*** on a Spani h Felt wheel. I can give you the whole outfit—it spells "SUCCESS."

Incidentally, I manufacture ***FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS*** and ***PLATERS' SUPPLIES.***

MONARCH

Modern Original Melting Furnaces.

If a real saving of 50% in Fuel, Labor, Output and Crucibles is of any attraction to you, we can certainly interest you in the

Crucible Original **"STEELE-HARVEY"** *Tilting Furnace*

It has been proven beyond all question the most economical and satisfactory Furnace ever invented for melting Copper, Brass, Bronze, Nickel, Silver, Gold, Cyanide Precipitate, Ferro Alloys, Iron, Steel. The fuel may be either oil or gas and air no coke or ashes in any event; no loss of metal in the pit. It can be instantaneously started or extinguished. It is so simple and effective in operation that one man can easily operate several furnaces after watching our demonstrator.

BLACK DIAMOND

CORE COMPOUND

NEVER-VARYING QUALITY

¶ Our customers are unanimous in praising the never-varying quality of Black Diamond Core Compound. Its results are always uniformly excellent.

¶ Black Diamond Compound never solidifies, not even in the hottest weather. It never absorbs moisture. It makes a strong core in the green, permitting of safe handling; and a smooth, hard core when baked, that easily releases from the casting, leaving a clean, smooth surface.

¶ Black Diamond Compound will bind from 30 to 100 parts of sand, according to sand conditions, a large part of which may be old gangway sand.

¶ May we ship you a trial lot on approval?

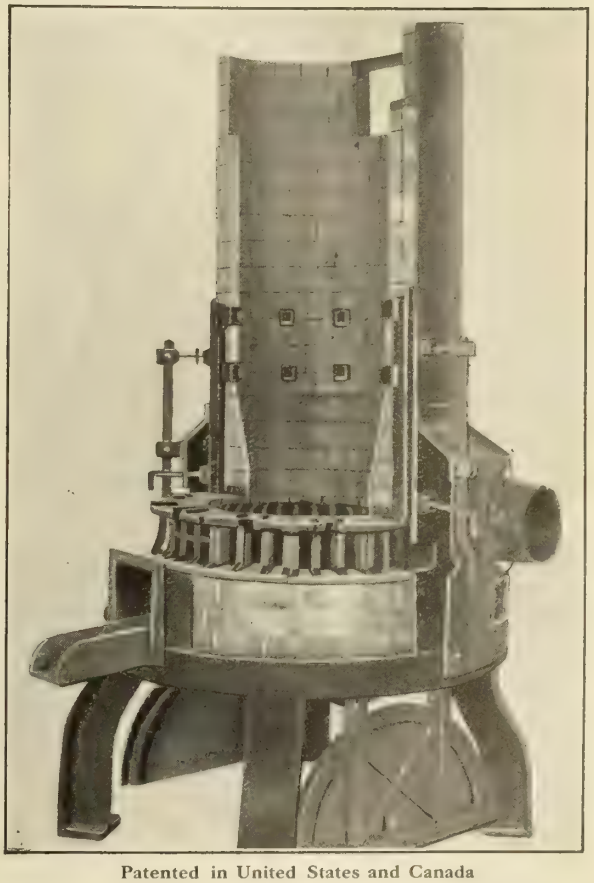
FOR SALE

The Canadian Patent Rights
OF THE

Knoeppel System of Cupola Twyers



Patented in United States and Canada

Or we are open to dispose of Shop Rights or the Right to Manufacture and Sell in Canada.

The principal features of The Knoeppel System are:—
A continuous twyer; large twyer area; maximum air delivery; lower blast velocity; air belt surrounding the back of the twyers; air supply flues above the melting point; adjustment of twyer area; adjustment for small diameters of lining; separate overhang plate; twyers projecting from 2 to 10 inches further into the cupola than any other; delivery of blast nearer the centre; can be applied to any Cupola in use.

There is a splendid opportunity for a pushful man with this greatly improved twyer system. For the purchasers of manufacturing or shop rights we will supervise the manufacture and installation of the first one made free of cost.

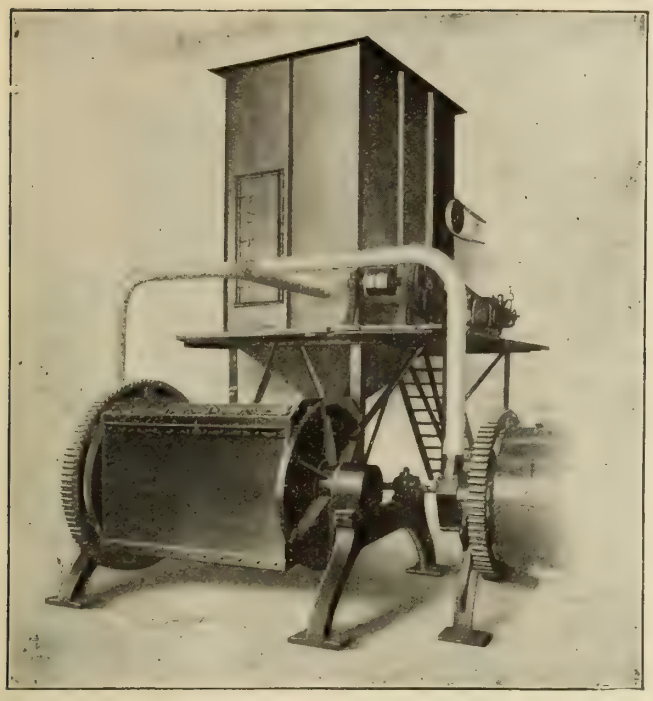
HARVEY, ILLS. (Chicago Suburb)



The above cut shows two of our up-to-date mills properly piped for exhaust to our patent Dust Arrester.

Are you anxious to save money in the operation of your plant? Do you wish your castings cleaned and polished, and to have the same finished appearance as those being turned out by your competitors?

You can well afford to take out the old stave mills and scratch brushes, old type of exhaust mills, and place them on your scrap heap. Your loss will be fifty per cent. less than if you continue their operation.

Advise us as to the style of work you are making, and we will be glad to plan an outlay of improved exhaust cleaning mills that will do your work to perfection. In fact, after you have them installed you will wonder how you ever got along without them. We will clean your castings better, in less time, and use only one-half as many mills, at the expenditure of one-half the horse power.

Are you not daily confronted with the dust problem? Is it not flying about your plant, injuring your machinery, impairing the lives of your workmen, and becoming a public nuisance? How long will you evade answering these questions, and installing the proper equipment to better these conditions?

It is absolutely necessary that the dust and dirt from an exhaust mill be taken from the mill as fast as it is scratched from the castings. There is no other known method of disposing of this dust than by the installation of one of our improved Dust Arresters. This machine is so constructed that it can be placed almost anywhere about your plant, and not a particle of dust will escape from the same. All the dust and dirt is confined in the Arrester and is discharged through a hopper at the bottom of case. Not a particle of dust passes through the exhaust fan, thus extending the life of the fan indefinitely. We have made a scientific study of the cleaning room, and our experience is at your disposal simply for the asking. Plans and specifications gladly furnished.

St. Catharines

Ontario - Canada

Power House at Decew Falls of Dominion Power and Transmission Co., Ltd., and Lincoln E. L. and P. Co., Ltd.
2½ miles from St. Catharines, 100,000 H.P.

WHY? BECAUSE—

1. TWENTY-EIGHT PLANTS have located here for good reasons—most of them Metal-working Industries.
2. ELECTRIC POWER is cheaper here—right where it is made—than elsewhere. Less than one-third the cost of steam.
3. WATER SUPPLY is from Lake Erie, with a head of about 200 feet.
4. FREIGHTS are as cheap here as if we had 100 railroads. BESIDES, you can use our port for water shipment to all great lake points and to salt water.
5. LABOR—Good supply of skilled mechanics and laborers. Most workmen own their own homes. They come to stay.
6. SITES are available for YOU to choose from, all good ones, and to be got at figures and terms which are big inducements.
7. INCIDENTALLY—We are one hour (by electric and steam railways) from Niagara Falls and Hamilton.

ALSO—St. Catharines is the market and shipping point for Canada's Greatest Fruit District——

Pattern Making

By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions

Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

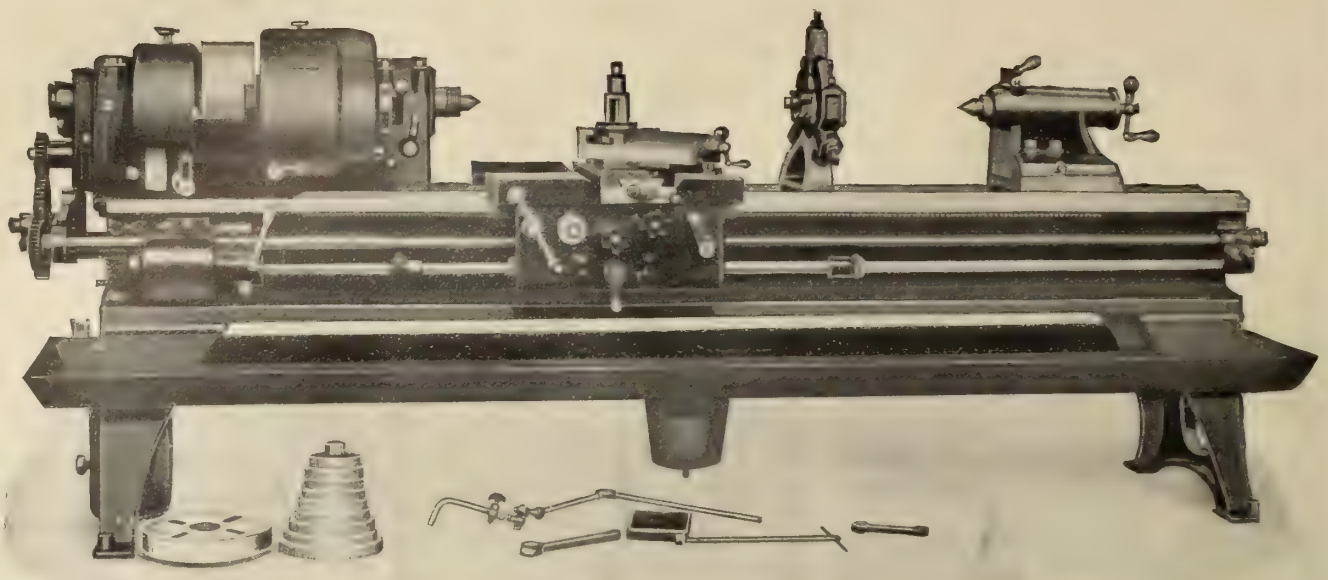
CANADIAN MACHINERY, 10 Front St. E., Toronto



The Springfield High Power Rapid Reduction Lathe

might be used as a model of modern lathe construction. It is one of the most powerfu and rigid machines ever put on the market. The operator has full control at all times. Six variations of speed are instantly obtainable. The compound rest is of new design, countershaft particularly simple and every convenience for operating incorporated in the general plan. Try it when accuracy means money.

This Lathe under severe test has proven to be remarkably steady under the heaviest cuts—the carriage traveling steadily along, due to its most excellent design, and the proper distribution of metal—thus doing away with chattering, and jerky motion, so often found in so-called Rapid or High Speed Lathes.

With the number of speeds and feeds possible, together with its high power, accuracy and ease of operating, we confidently place this Lathe on the market, as representing the highest type of design, excellence, and accurate and careful manufacturing.

We also supply for Prompt Shipment:—Engine Lathes, Turret Lathes, Brass Finishers' Lathes, Automatic Machines, Horizontal or Vertical Boring and Turning Mills, Planers, Shapers, Slotters, Bolt and Nut Machinery, Cutting-off Machines, Drilling Machines, High Speed Cold Saws, Velos High Speed Steel and Twist Drills, Special Steel for all Purposes, Pneumatic Tools, Woodworking Machinery, Chain Hoists, Electric Travelling Cranes, Etc.

FOR ECONOMY

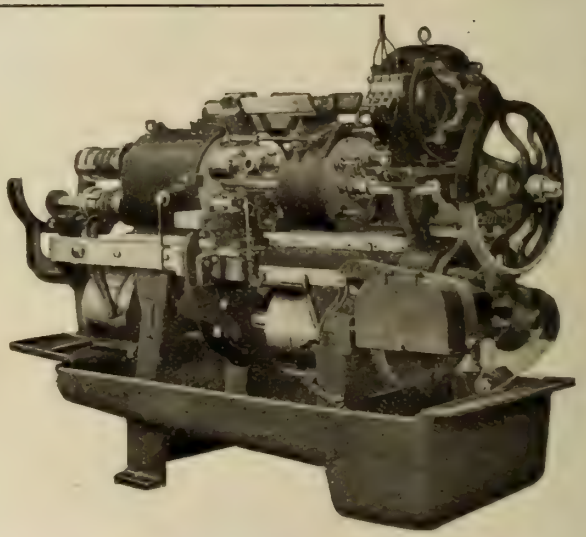
the ACME AUTOMATIC MULTIPLE SPINDLE surpasses all others in quantity of output.

¶ It allows more operations--resulting in labor saving and increased production.

¶ The Single Drive does away with multiple belts, economizes space, time of the operator, and lowers the expense of upkeep.

¶ It's safer, quieter and easier handled.

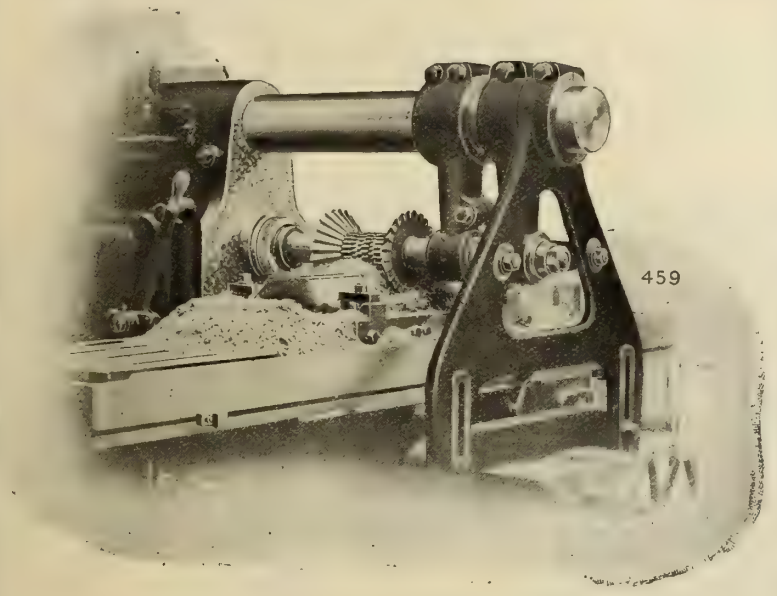
Look it up



THE NATIONAL-ACME MANUFACTURING CO.
CLEVELAND, OHIO

BRANCH OFFICES NEW YORK BOSTON CHICAGO ATLANTA
GEN. FOREIGN REPS. SCHUCHARDT & SCHUTTE ALFRED H SCHUTTE

The No. 4 Plain High Power Miller



The material being milled is grey iron. The cutters, 7½", 3½", 3⅛", in diameter, run 33 rev. and take a cut which averages 3/16" deep over a total width of 9.4", at a table travel of 6⅛" per minute, which amounts to 10.8 cubic inches of metal removed per minute.

That is heavy cutting for gang work. A spiral nicked tooth mill, working on a flat surface, would remove more metal, with the same amount of power.

It is the NATURE OF THIS CUT, as well as the rate at which it is regularly done, to which we wish to direct your attention.

The great difference in the diameters of the cutters holds down the peripheral speed of the small ones, imposing on them tremendously heavy cutting per tooth, with a tendency to fill up the space between the teeth, when milling at this rate.

This results in unusually severe strains on the working parts of the machine.

All these have been designed to meet all the conditions of severe service.

The OVER-ARM is solid steel, and is more rigid than others because of its larger diameter.

The Braces have all the elements of rigidity for strains in any direction.

The KNEE, which is the foundation of all the working parts, is a reinforced box.

We invite comparison of these features with other makes.

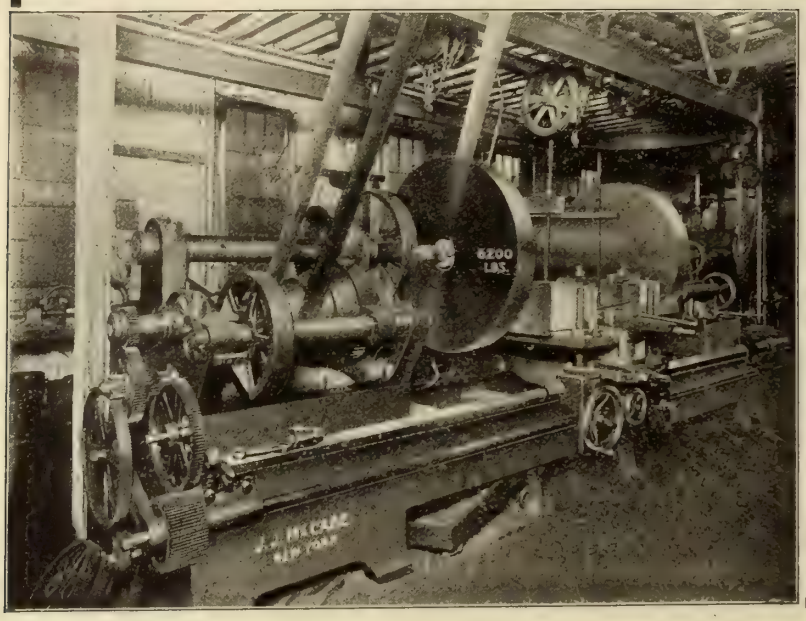
A Big Lathe Couldn't, but McCabe's "2-in-1" Lathe Could



The "forty eight" of the **"2-in-1" Lathe** has the power and rigidity of any regular style large Lathe, at half the price, or near it.

And the "down to the minute" conveniences on the "low down" Lathe handles other work that comes along. Has a "big day, every day"

If your mind is on a big Lathe, you shouldn't let this pass—**a Big Lathe couldn't, but McCabe's "2-in-1" Lathe could** handle everything you have to do.

The changing from a big to a small Lathe is done only by **McCabe's "2-in-1" Lathe.**

Get the book on the "advanced Lathe" for Machine and Repair shops.

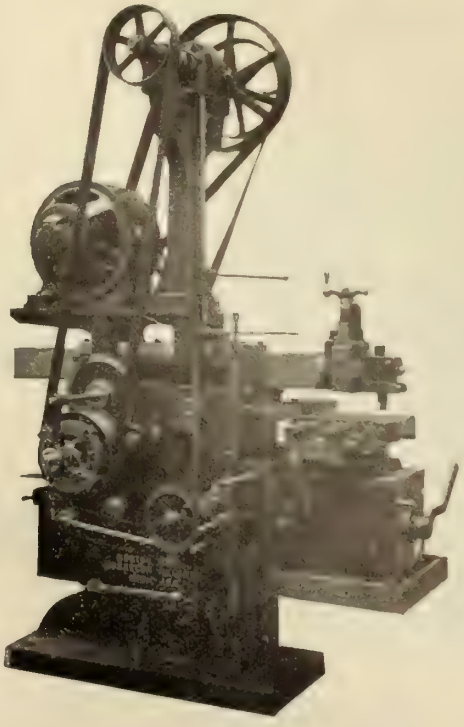
The Shapers for High Speed Steel



Morton Draw Cut Shapers

This is our Improved Electrically Driven 26-inch Stroke Pillar Shaper, an extremely rigid, accurate, powerful tool that makes tremendous savings of time on all kinds of work.

The fact that many shops are using from four to ten of these machines is pretty good proof that they make good on modern work.

Great capacity for shaping out work from the solid and removing metal; rapid feed change with wide range, rapid power traverse movement, quick and easy stroke adjustment—these are a few features.

Let us send you complete details.

Morton Pillar Shapers are built in sizes from 26" to 48" stroke.

Makers of the well-known "NOVO" Steel

HARDENS IN WATER or OIL or AIR BLAST

The astonishing claims recently made for **Novo Superior** by eminent metallurgists, and accounts of which have been widely published in the trade journals and papers, are now in every way being substantiated by results being obtained all over the country.

Toughness, Cutting Power, Durability many times greater than that of the present Standard High-Speed Steels.

Exceptionally remarkable results obtained when working on Cast Iron, Chilled Rolls, Hard or Skidded Tires, Steel Castings, etc., etc.

WRITE FOR FURTHER PARTICULARS **SEND US A TRIAL ORDER AND CONVINCE YOURSELF**

HERMANN BOKER & CO., 332 St. James St. MONTREAL

This is the Patent "Dreadnought" Patent Milling File

Doesn't it strike you as odd to be able to use the same tool as a wood rasp (you should see how it gnaws wood) on the glass hard fin of a fresh roasted iron casting—and then to work a bit of copper or brass or horn or—WELL, a bit of just anything.

The Dreadnought Patent Milling File is just such a many sided bit of **Ever-ready** helpfulness. It will cut anything from **Phosphor Bronze** to **White Pine,** will cut that anything fully 5 times as fast as the very best file can—and then (now just ponder this well), and then: when its appetite has become a little blunted that same Dreadnought File may at trifling cost be re-sharpened (without drawing its temper) **many times.**

When it comes down to cheapness, on the basis of the work to be g tten out of it (the only one that "long headed men" evsr figure on) the Dreadnought, seems to the user of ordinary files to be almost a **donation.**

You will soon notice the increase in daily output when the Style "D"

Screw Cutting Die Heads

take the place of solid dies on your screw machines

These tools are adapted to cut any size or style of thread, right or left hand, and the length of thread is limited only by the travel of the turret slide. They are very rapid, insuring the maximum output; cut close to a shoulder—open automatically at the end of the cut, thus averting danger of spoiling work and saving the time usually wasted in running back over finished threads. The Style "D" Adjustable Self-Opening Die Head is well made, durable, and one of the time savers of the busy plant. Samples or drawings of the work you are doing would enable us to submit estimates on asuitable outfit of tools for your machine.

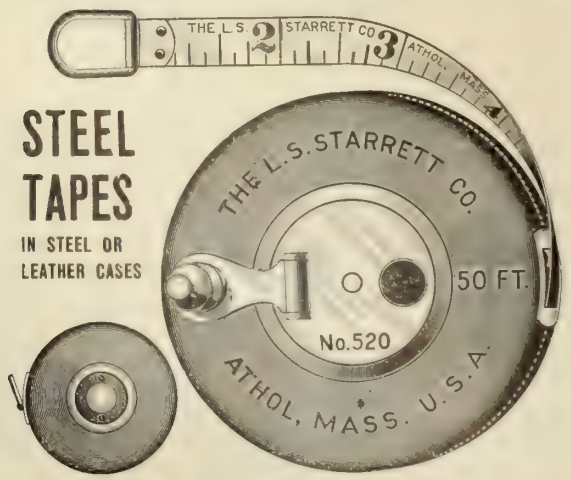
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES

IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this:

This dissimilarity of figures materially lessens (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures denoting feet allow the graduation line under each to be plainly visible, instead of being obliterated by the usually larger figure.

Graduated in feet, inches and eighths of an inch, or in feet, tenths and hundredths of a foot.

So simple and effective!

Simplicity and effectiveness are the distinguishing characteristics of the International Rochester Card Time Recorder illustrated on this page. It is entirely mechanical. When entering, the employee takes his card from the pocket in the card-rack allotted him by number, stamps it on the clock and replaces it. On his way out at noon, in again, and out again at night, he repeats the operation. If he is working overtime there is a separate column on the card on which entering and departing time is recorded. Thus, with the

International Rochester Card Time-Recorder

it is an easy matter for the paymaster to compute the exact amount due to each employee by a few moments' addition. There can be no dispute, because the records on the cards are indisputably correct.

Any employer who is using a time-recording system that is dependent to any degree upon a clerk or time-keeper may be losing money every day. A human timekeeper can't help making mistakes, and, maybe, showing spite in some cases, favoritism in others. Every hour for which you pay wages without receiving value in time is that much lost money to you. Our automatic time-recording systems will protect your pay-roll from padding and encourage honesty and punctuality among your employees.

TALK (2) ON

BELTING

vs.

INDIVIDUAL ELECTRIC DRIVES

¶ In presenting these short talks to you who are connected with the problem of power transmission we want to say right at the offset that we are not basing them on our own knowledge of shop systems. We are not shop experts (we confine ourselves to one line, i.e.; making the best belts) so we have consulted eminent authorities on this question and will tell you what we have learned from them.

¶ Because individual motors have replaced horses on street cars, cable transmissions, storage battery systems, etc., it was but natural to infer that individual motors might do equally well in the machine shop in order to increase the efficiency.

¶ Now, in perhaps three cases out of four, a properly designed belt drive is preferable to the individual motor drive for machine tools.

¶ There is no question that through a term of years the total cost of individual motors and electric wiring, coupled with the maintenance and repairs of this system, will far exceed the first cost of properly designed shafting and belting, plus their maintenance and repairs.

¶ Lately it has been admitted that there is little if any economy in power obtained through promiscuous motor driving and it will certainly be found a safe rule not to adopt an individual motor for driving any machine tool unless a clearly evident and large saving can be made by so doing.

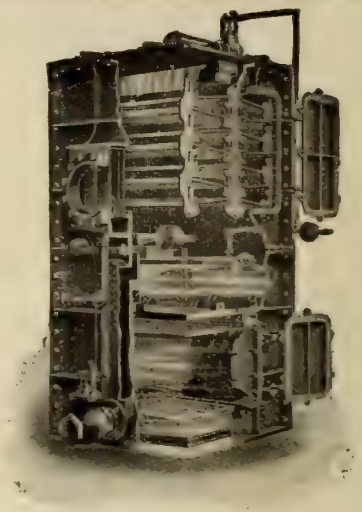
It Is More Profitable

It is more profitable to render it impossible for scale to form in your boiler than to remove it after it has formed. As the efficiency of your boiler is at stake, you should instal a

WEBSTER Feedwater Heater, Purifier and Filter

which purifies the water of all scale-forming elements, and makes use of all condensations and waste steam. By u ing this purified water you get every ounce of power out of your boiler, and at the same time you are using le s fuel.



More Work for Less Money

We shall be happy to give you the benefit of our wide experience in utilising waste steam or exhaust steam.

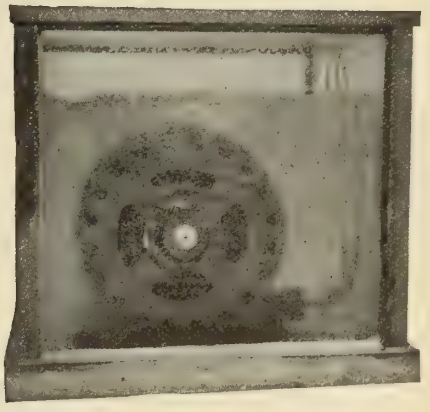
THE WATER TEST

Packard

Type "D" Motor



Reproduction from an actual photograph, showing the "Water Test" as applied to a Packard Type "D" Motor.

shown in the picture, proves one of the many points about the PACKARD Type "D" Motors, that combines to make them peculiarly adaptable for severe operating conditions.

The test consisted of a submersion of the motor in a tank. Connection being made to the circuit, the motor was allowed to run—completely under water – for several hours at a time—and, after repeated tests, the insulation was found to be in no-wise affected.

Could you ask better proof of the **ruggedness of design** and **careful construction** of the motor; or of the success of our Vacuum process of insulation?

FACTORY: TORONTO, ONT.

New Shops of "The People's Railway" at Moncton, N.B.

A General Description of the New I.C.R. Shops, Showing the Arrangement and Construction of the Buildings—Equipment—The Largest Single Unit Gas Engines in Canada.

An almost level plateau, on the main line of the Intercolonial Railway to Montreal, about a mile from Moncton, was the site chosen on which to erect these fine new shops of "The People's Road." The soil is admirably suited to building purposes being a firm dry clay. Having lots of land at their disposal the designers have allowed plenty of room to each building with ample provisions for extension.

Fig. 1.—View of Part of the I. C. R. Yards, the Old Shops and the City of Moncton. The Large Brick Building on the left is the I. C. R. General Office.

A glance at Fig. 2 will show the way the different shops are laid out, and the excellent track facilities. Two main sidings are fed by numerous branches all having easy access to the various shops. All the buildings are laid out parallel to the main line with the exception of the passenger car repair and paint shops, and the main machine shop.

Industrial narrow gauge railways run on the standard tracks' sleepers and numerous turntables throughout the plant greatly facilitate the handling of material. The turntables were furnished by the Whiting Foundry Equipment Co. through their Canadian agents, The Dominion Foundry Supply Co. Ltd. Part of this turntable equipment is, where needed, heavy enough to sustain the heaviest locomotives and are supported on chilled rollers traveling on turned tracks.

The driving equipment for the machines consists of upwards of 210 motors, both alternating and direct current. These are of various makes including Allis-Chalmers-Bullock, Westinghouse, and Canadian General Electric. The English machines are in some instances equipped with English motors. The heavy machines are all individually driven and the lighter ones are arranged in groups. Fig. 2 gives the exact layout of all the various machines.

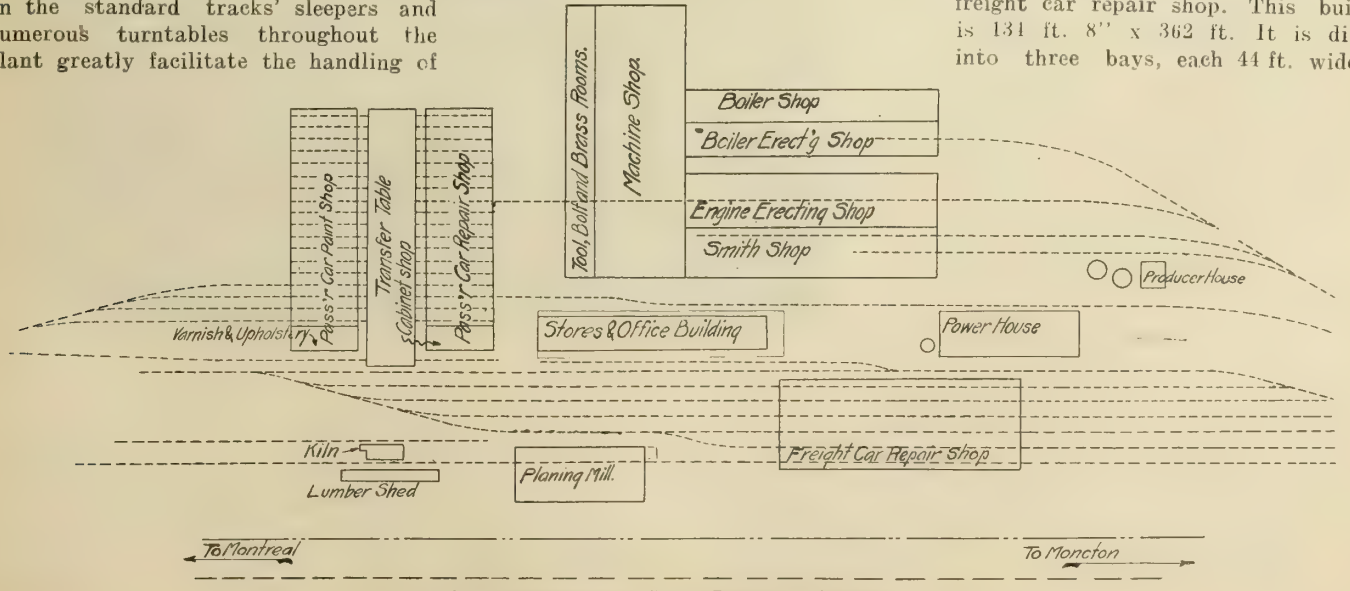

Fig. 2.—Layout of I C. R. Shops at Moncton.

Fig. 3 is the exterior of the planing mill showing the reinforced concrete construction typical in all buildings, although the shops and interiors are, of course, laid out to suit the work for which they are intended. The buildings are all well lighted and the fact that the interiors, with the exception of the exposed steel work, are all sprayed with a white cold water paint adds materially to this most important feature in modern shop design—light. The steel work is painted a dull red and windows and doors have a light drab covering.

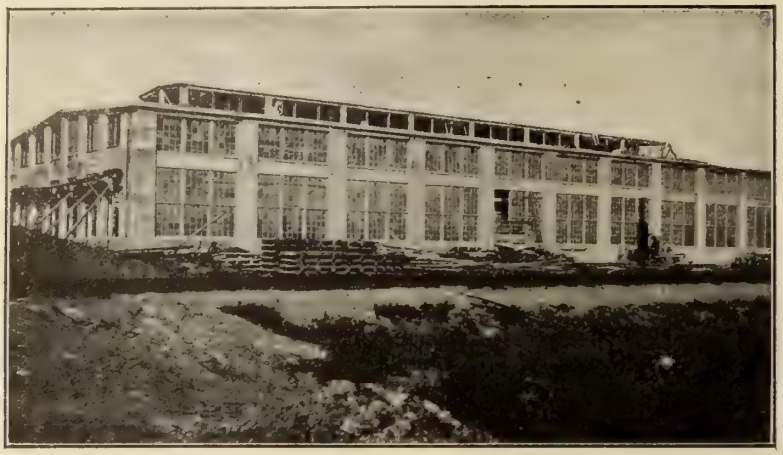
Planing Mill.

The planing mill is a one storey building 81 ft. 10" x 202 ft. 8" with a small heater room at the east end. There are twenty-eight machines in this shop, nine of which are individually driven. The rest are divided into groups. In the equipment are ten machines from the Fay & Egan company including a planer and matcher, the large dimension planer shown along the north wall, automatic cut off saws, tenoners, etc. The McGregor-Gourlay company have provided four machines, including two planer and matchers and a band re-saw. Other machines include a surfacer by S. A. Woods, a variety woodworker by Greenlee Bros., a Berlin machine works double cut-off saw and a 48" grindstone by the Oliver Machine Co. A standard gauge track runs right through the mill with industrial tracks down the centre.

Freight Car Repair Shop.

Fig. 4 shows the interior of the freight car repair shop. This building is 131 ft. 8" x 362 ft. It is divided into three bays, each 44 ft. wide, by

two rows of columns and each bay is served with two rows of tracks extending through the building providing accommodation for about fifty cars. The construction is all steel and reinforced concrete and is as absolutely fireproof as is possible to make it. The pilasters are on 20 ft. centres and the space between is completely glazed with the exception of a strip about two feet in width.



Figf 3.—Exterior of Planing Mill. This Style of Reinforced Concrete is Typical of all the Shops.

Passenger Car Repair and Paint Shop.

These two buildings are identically alike in construction and are each 361 ft. 8" x 100 ft. and are built entirely of reinforced concrete. At the south end of the paint shop are the upholstery and paint mixing departments. In the former is a motor driven single sweeper vacuum cleaner (Canadian Vacuum Cleaner Co.) and a Dutton hair picking machine.

The cabinet shop is at the south end of the passenger car repair shop. All the machines in this department are individually driven with the exception of the grinders and trimmers which are grouped. There are thirty-four machines here including a Goldie & McCulloch universal wood worker, eleven McGregor-Gourlay wood working machines for different purposes, a Fay & Egan 1½ inch hollow chisel mortiser with boring attachment, band saw and mortiser from Cowan & Co., an Eaton, Cole & Burnham pipe threader, and several machines from the Oliver Machinery Co. The lacquering department is at the north end of the shop.

Parallel tracks run between the columns and between the two shops is a transfer table (Fig. 7) which facilitates the movement of cars from any track in one shop to any track in the other. Since the construction of both shops is identical, Fig. 5, which is a photo of the interior of the paint shop may also be taken as one of the repair shop. There are four rows of reinforced concrete columns, 20 feet between centres of rows and 18 feet between centres of columns in the rows. Each column is 14 inches square and they are used for the supports of the adjustable platforms as shown in Fig. 6. The arms of these platforms slide vertically on pipes and are held in place, after being brought to the required position, by a pin inserted in holes drilled in the pipe. They reach to within easy distance of the side of a passenger car and greatly facilitate the work of repairing or painting. These buildings are directly connected to the locomotive erecting shop by a track through the machine shop. This will be used to run an engine into the paint shop if the erecting department is crowded. In Fig. 6 may be seen construction of the doors. These are counter-balanced and slide vertically. Each door is in three sections connected by a pantograph arrangement of iron bars and are easily raised and lowered.

The Machine Shop.

This is the largest of the buildings being 131 ft. 6 inches x 408 ft. with an annex 44 ft. x 408 ft. As seen in Fig. 8 the main building is divided into two bays each served with a Babcock and Wilcox electric traveling crane of ten tons capacity. The building is of structural steel and the roof of reinforced concrete similar to the other shops. The floor is of 2 inch hemlock plank nailed to 3"x3" strips on a bed of concrete. Light, the all important adjunct to good work and a healthy shop, is abundantly supplied. The sides are practically all glass and the skylights are large and numerous.

The smaller machines are ranged in groups along the centre columns and at one side, each group having its own motor. The heavy machines are mostly in the bay next the locomotive and smith shops, being driven by individual motors.

In the south end of the annex is the nut and bolt department. In this shop the tools are all grouped. There are twelve machines from the Acme Manufacturing Co. consisting of nut tappers and bolt cutters. There are four turret machines, one from each of the following concerns: Jones & Lamson, Warner & Swasey, Cleveland Automatic Machine Co., and Smith & Coventry. Other machines include a four spindle Lassiter stay bolt machine (Foster & Co.), two bolt lathes from the London Machine Tool Co., a Hendry 16 inch lathe and a 20 inch lathe from John Bertram & Sons.

North of the bolt department is a small testing laboratory. The machines here consist of a Pratt & Whitney 10 inch lathe, a stay bolt vibrator, a spring tester and an Olsen tension and compression machine. These are all group driven. The brake department comes next and then the tool and tool

Fig. 4.—Interior of Freight Car Repair Shop.

grinding rooms, and along further is the brass and tool departments. With the exception of a J. Bertram & Sons 30 inch drill, all the tools in these departments are in groups. In the brass working department there are no two tools by the same maker with the ex-

Fig. 5.—Interior of Passenger Car Repair Shop.

ception of four machines from J. Bertram & Sons and two from Wood, Light & Co. Among the others is a 14 inch lathe from R. K. Leblond, lathes from Hendry Machine Co., J. Whitworth & Co., Smith & Coventry, American Machine & Tool Co., etc. Brown & Sharpe are represented by one of their No. 4 millers.

In the tool department are five Pratt & Whitney tool-maker's lathes, Brown & Sharpe's grinders and millers, Alfred Herbert & Co.'s sensitive drill, a centreing machine from the D. E. Whiton Machine Co., a car brass borer from J. Bertram & Sons, a Wm. Sellars & Co. lathe and others. The brass foundry is at the north end of the annex, convenient to the brass department. The tin, copper and lagging department is at the north end of the main bay. The Niagara Machine & Tool Works have supplied five out of the seven machines for work here. These, consisting of shears and rolls are all individually driven.

The plant being, at present but an erecting and repair plant the pattern shop is necessarily not extensive. This department is at the north end of the machine shop, on the east side. The Oliver Machine Co. have supplied the majority of tools in this shop, the remainder, representing Fay & Egan, Fox Machine Co., H. B. Smith Machine Co. and the Sussex Manufacturing Co.

Main Machine Equipment.

There are upwards of 125 different machines in the general machine shop. A large majority of these are driven each with its own individual *motor. Where convenient, the smaller machines are divided into groups. The heavy machines for working on tires and wheels are ranged along the east wall near the erecting shop. The majority of these were supplied by J. Bertram & Sons, including the 100 inch wheel lathe with its 50 h.p. motor. The London Machine Tool Co. have one of their driving wheel journal lathes in this department as well as a 72"x72"x25 ft. planer in the frame and cylinder department. Among the other makers represented are W. Sellars & Co., double car axle lathe, motor driven; Pratt & Whitney lathes and centreing machine; R. D. Wood, hydraulic wheel press; Brown & Sharpe, milling machines; McGregor, Gourlay & Co., lathes; R. K. Leblond, lathe; Binse Machine Co., Smith & Coventry, Henry & Wright.

The Chapman Double Ball Bearing Co., Toronto, have supplied double ball bearings for the complete line shafting in both planing mill and machine shop. The equipment for the former has been running since July, 1907, while the latter equipment including fifty-nine 2 3-16 inch and fifteen 1 15-16 inch bearings are now being installed.

The Blacksmith Shop.

This building is at right angles to the machine shop and is of the same construction. It is 375 ft. x 76 ft. 8 inches, and is served with jib cranes only. There are 25 of these which were supplied by the Whiting Foundry Equipment Co., through the Dominion Foundry Supply Co. There are 12 of 1,000 pounds capacity, mounted on rigid posts and serving the forge fires and forging machines. Five jib cranes of 3,000 pounds capacity, three of 4,000 pounds, four of 6,000 pounds, and one of six tons capacity. These heavy cranes are used with the steam hammers and have hand power gearing. There is also a special spring attachment to absorb shocks from the steam hammers. The cranes all have frames of structural steel sections. The shop is still further served by a standard gauge track the whole length of the shop as well as cross tracks through to the erecting and boiler shops.

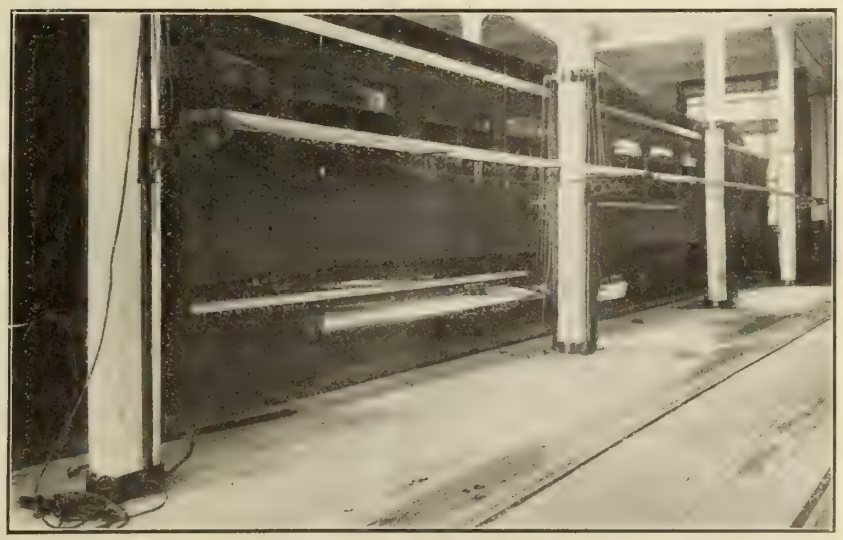


Fig. 6.—Adjustable Platforms in Passenger Car Repair Shop.

Blacksmith Shop Equipment.

The heaviest tool in this shop is a double frame Bement steam hammer of 4,000 pounds capacity. There are five

single frame steam hammers from John Bertram & Sons, ranging from 600 to 2,000 pounds capacity, and a 600 pound single frame steam hammer, built by the London Machine Tool Co. There are also four Beaudry power hammers with individual motor drives. The furnaces are fired by water gas from the producer house. These were supplied by W. S. Rockwell Co., New York. The remainder of the equipment includes

Fig. 7. Transfer Table Between Passenger Car Repair and Paint Shop.

John Bertram & Sons and Ajax Manufacturing Co.'s bulldozers, Ajax hot pressed nut machines, Cleveland shears, Diamond Machine Co.'s grinders, R. D. Wood 60-ton stripping press, Bullard Pneumatic Tool Co.'s draw bar riveter, an Oliver grindstone, etc.

The Locomotive Erecting Shop.

Parallel to, and of the same construction as the machine shop, this building is 375 ft. x 81 ft. and has capacity for 24 locomotives over the pits. The arrangement of the pits is rather unique. Instead of being arranged at right angles to the length of the shop they are laid out herringbone style on either side of a central surface track which runs the entire length of the building. This centre track is used for light repairs and is provided with a shallow concrete pit. There are eight pits on either side of the central track, designed to accommodate the heavy repairs. This arrangement provides ample room and eliminates, to a great degree, the necessity of lifting the engines over one another. Serving this shop are two Babcock and Wilcox electric traveling cranes of 60-ton capacity each. These cranes are provided with 10-ton auxiliary hoists and work on a 76 ft. x 10¾ inch span.

In the pipe fitting department at the east end of this shop is an Eaton, Cole & Burnham 8-inch pipe threading machine. There are also two portable bolt lathes supplied by Williams & Wilson and 32 inch portable drill by the Cincinnati Machine Tool Co.

Boiler and Tender Shop.

This building is 375 ft. x 100 ft., divided into two bays by a row of centre columns. The bull machine and riveting tower are at the west end of the erecting shop and are served by a three motor, floor controlled Whiting electric crane of 30-tons capacity. The "bull" is a 13 ft. gap Bement machine with three controls using hydraulic pressure at 1250 pounds per square inch. The main erecting bay is served by a 35-ton Pawling & Harnischfeger electric traveling crane. The machine bay is served its entire length by a 10-ton crane. The floor is 3 inch hemlock plank on 6x6 inch sills at 3 ft. centres. All the machines are individually driven. The tube and tender shops are at the east end of the building.

The equipment is completely up to date and includes John Bertram & Sons 12 ft. x 1 inch horizontal plate rolls, 6 ft. x ⅜ inch rolls and a 20 ft. plate planer. The punches and shears include a ¾-inch rotary bevel shears, built by Lennox & Co., four punch and shears by London Machine Tool Co., an R. D. Wood 200-ton sectional flanger, a Hilles & Jones ¾-inch punch and a 24 ft. flue cleaner (pit type) by Jas. T. Ryerson & Co.

The tube and tender repair departments are at the east end of this shop. Standard and industrial tracks connect it with the machine and erecting shops. Between the boiler and erecting shops is a 25 ft. space which allows plenty of light to the adjacent sides of the shops.

Stores and Office Building.

This building is conveniently located with reference to the shops, and is a splendid example of reinforced concrete construction. Every part is of reinforced concrete with the exception of the office partitions which are of porous tile. Along two sides there is a reinforced concrete platform, 6 feet wide, which extends in the front to 25 feet. This is designed for very heavy loads and ramps on each side, at the east end, allow trucks to be run up

Fig. 8—Interior of Machine Shop, I.C.R. Shops, Monet on.

from the ground level. Freight elevators connect all floors and the basement.

The first floor and the basement are given over to local and general stores and as the building is 343 ft. 8 inches x 51 ft. 8 inches there seems to be ample space. The second storey, over the west half, is devoted to the offices of the stores department and of the superintendent of motive power. Large windows give plenty of light and the building is arranged for steam heat. The floors are of hardwood laid on reinforced concrete. The building is almost perfectly fireproof in construction.

Power House and Gas Producer Plant.

The engine and boiler rooms are each 100x69 feet, under one roof, but separated by a reinforced concrete wall. The construction is steel, and reinforced concrete. The columns are imbedded in concrete pilasters and the concrete roof is supported by steel trusses. The sides are practically all glass, giving plenty of light and the height is such that good ventilation is assured. The floor is of patented "Terrano" construction, material for which was supplied by the Eadie-Douglas Co. This makes an admirable floor, pleasing to the eye and very easily kept clean. The boiler room floor is of tar macadam, laid on a 6 inch course of gravel, well rammed and rolled.

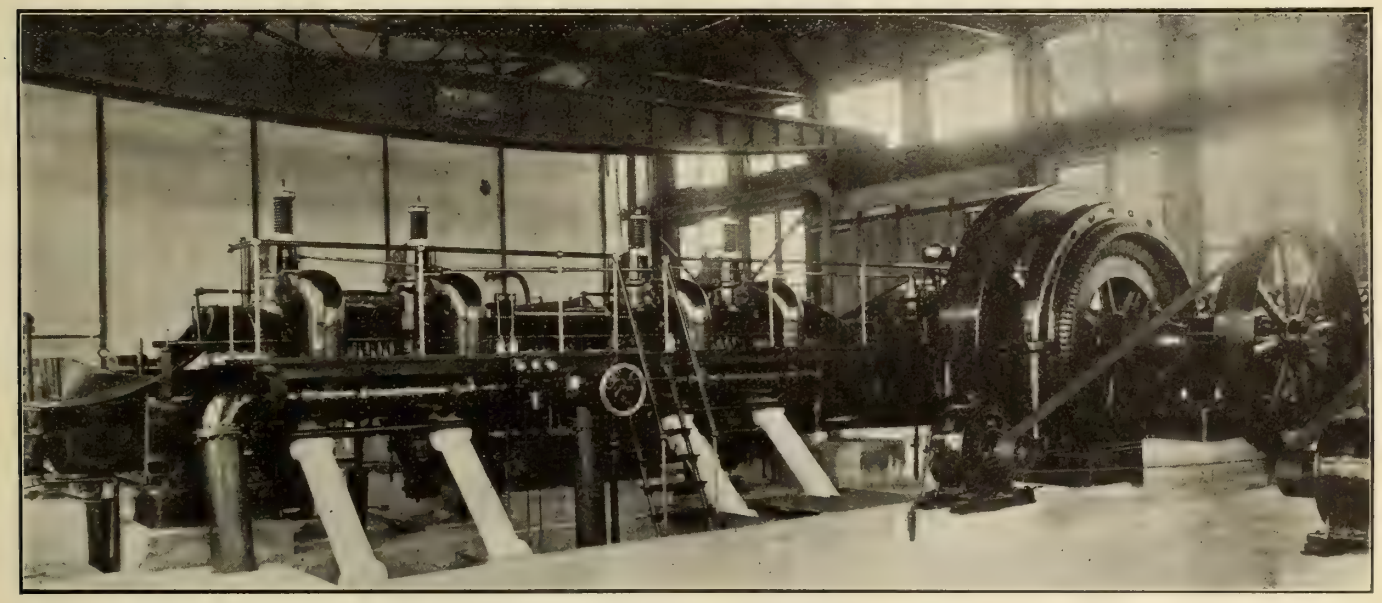

Fig. 9.—Generator Side of 500 h.p. Gas Engine in the Power House.

Power Equipment (Engine Room)

The largest single unit gas engines in Canada comprise the main source of power. There are two of these, each being a 500 horse power, Westinghouse, tandem cylinder double acting four stroke cycle engine, running 150 revs. per minute on producer gas. The cylinders are 23 inches in diameter with 33 inch stroke. The weight of each engine, including shaft and generator, is about 90 tons. The cooling system is the ordinary circulating water system in vogue on small engines with the addition of a device for circulating the cooling water through the pistons. The pump supplying this circulating water for the engines and air compressor is a 300 gallon Fairbanks-Morse duplex steam pump, 8"x7"x12". A Richardson sight feed oil pump (on each gas engine) supplies oil under pressure to the pistons, packing boxes and exhaust valve stems. The other parts are oiled by gravity from a tank suspended in the roof trusses. The oil is collected in the basement and returned by a pump driven from the lay shaft by a set of mitre gears and shaft. This shaft can be seen in Fig. 10 running down through the floor. The engines are controlled by Hartung governors and are easily started by compressed air at 75 pounds per square inch furnished by a compressor in the basement. This compressor is driven by a Brown & Cochrane gas engine.

There is a double, make and break ignition at each end of each cylinder, which is connected to a "tell-tale" box consisting of an arrangment of spark coils which raise a flap every time a spark is made. This arrangement allows of close observation of the action of the ignition service. Current for ignition is supplied by a ¼ k.w. motor-generator set, which derives its current from the exciter bus bars on the main switch board.

Direct connected to the generators are the Westinghouse generators. Each is 300 k.w. capacity delivering a 220-volt 3-phase 60-cycle alternating current. The exciters are belted from pulleys on the outside of the out-board bearings. These are 17 k.w. Westinghouse machines running at 1125 revs. per min. The direct current for the cranes and variable speed motors throughout the shops is derived from a 200 k.w., 220-volt Allis-Chalmers-Bullock motor-generator set running at 575 revs. per min. For auxiliary purposes there are two 105 k.w. Canadian General Electric generators direct connected to 125 h.p. Robb-Armstrong engines.

The main air compressor outfit shown in Fig. 12 is a type B.B.3, compound Rand-Corliss engine, direct connected to a compound Rand-Corliss compressor. The capacity of this unit is 2027 cu. ft. of free air per minute at 85 revolutions, and 125 pounds per square inch steam pressure. The air is delivered at 125 pounds per square inch. A distinctive feature of the compressor is the Rand-Corliss valve gear on the low press air cylinder. This gives an unrestricted area of intake valve equal to 12 per cent. of the piston area. The sizes of the cylinders are 16 inch and 30 inch at the steam end, and 27 inch and 16 inch at the air end, with 36 inch stroke.

For fire purposes there is a Smart-Turner Machine Co.'s underwriters double compound pump, having a capacity of 1,000 gallons per minute. There is also a Smart-Turner high pressure pump 7½"x3¾"x10" for supplying the pressure used in testing the boilers, etc. The engine room is served by a Whiting crane, supplied by the Dominion Foundry Supply Co. This is a 16-ton hand power traveling crane, carrying a Yale & Towne chain block operated, by pendant hand chain, from the floor.

The switchboard, Fig. 11, when com-

pleted will have sixteen panels of No. 1 Blue Vermont marble, each 96"x26", with a swinging panel on the end carrying two volt metres, power factor meter and synchronscope. The instruments are of Westinghouse make and the whole is very proportionately designed and convenient. There are four

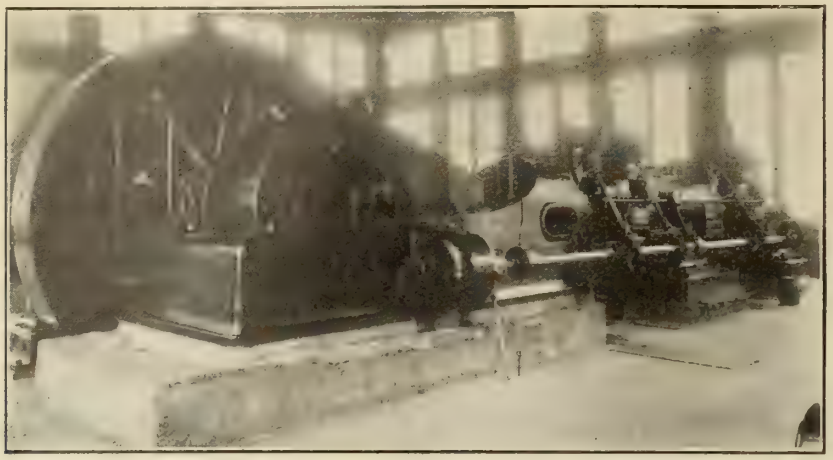

Fig. 10.—Valve Gear of 500 h.p. Gas Engine in the Power House.

Cooper-Hewitt mercury vapor lamps for the main lighting system.

Boiler Room Equipment.

The present capacity of 1,000 horse power is furnished by four 250 h.p. Babcock & Wilcox water tube boilers in two batteries and space is provided for an additional battery. The boilers are fired by Babcock & Wilcox patented improved chain-grate mechanical stokers the hoppers of which are fed by hand from the coal bins in front of the boilers. The feed water level in the boilers is automatically regulated by two Berry safety feed water regulators, supplied by Peiler & McKenzie, Monreal. These regulators control a 3-inch pump governor in the steam supply.

Two 10"x6"x12" duplex, outside packed plunger pumps, supplied by the Smart-Turner Machine Co., furnish the feed water. This is heated by a Babcock & Wilcox vertical water tube heater having a capacity of 21,000 pounds of water per hour, and contains 319 square feet of heating surface.

Heating and Return Systems.

The heating system for the freight car repair, smith and erecting shops is situated in the boiler-room. The rest of the shops have their own independent heating systems. These are the indirect hot blast Sturtevant system with the exception of the stores and office building, which is steam heated by direct radiation. The fans and blowers were also furnished by the Sturtevant people. The hot air is forced through concrete conduits to the risers in the walls of the buildings. These discharge close to the floor near the windows.

Two sections of the system use the exhaust steam from the fan engine and other auxiliaries. For the other sections steam is taken direct from the boilers through reducing valves which bring the pressure to 40 pounds. The exception to this is in the stores and office building where the heating is by direct radiation. Here the pressure is 60 pounds.

The condensation (including the drips) throughout the shops is handled by Bundy steam traps supplied by Peiler & McKenzie, Montreal, and manufactured by the Bundy department of the American Radiator Co. The condensation of the exhaust is handled by means of Bundy lifting pump traps, which discharge the water to the general hot well. All the condensation from the live steam heater sections, as well as the drips from the main steam lines, lye-pots and direct radiation is handled by Bundy tank traps, which discharge to a closed receiver over the boilers. From the receiver, the water flows under pressure to two large Bundy return traps, which deliver it direct to the boilers. The whole system is automatic and there is not a pump outside of the power house.

The Sturtevant fans for the heating system and induced draft are all direct connected to their own individual engines. Two Cooper-Hewitt mercury vapor lamps are used for lighting the boiler room.

Producer House and Equipment.

This building is a steel frame structure with reinforced concrete walls and roof slab. It is of one storey with a basement with floors of steel and concrete respectively.

The apparatus was supplied by the R. D. Wood Co. There are two retorts or generators, having a combined capacity of 1,000 pounds of bituminous coal per hour, or 1,500 pounds for not more than three hours. The output is 55 cubic feet of producer gas or 18 cubic feet of water gas per pound of coal. The water gas is used in the various furnaces throughout the shops, while the engines take the producer gas. By a well arranged system of hydraulically operated valves the two forms of gas are made intermittently. Gauges connected to the holders warn the attendent of the supply in each. There is a holder having a capacity of 10,000 cubic feet for each kind of gas.

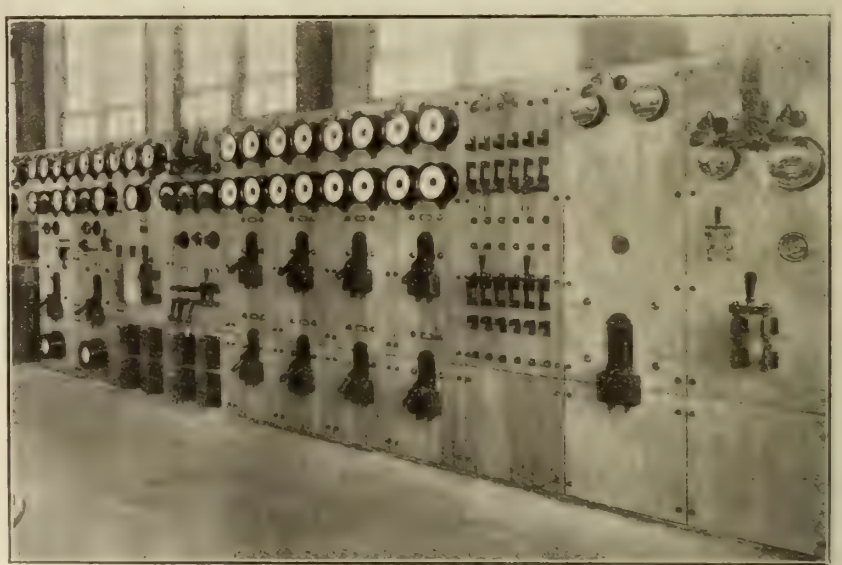

Fig. 11.—Switch Board in the Power House of the I. C. R. Shops, Moncton.

The outfit consists of these two retorts, a boiler, (into which the hot gases pass and generate steam used to run the exhauster and scrubber engine), a vertical scrubber, a rotary scrubber and a Root exhauster. The gas goes to the holders under a pressure of 3 inches of water.

The producer house is illuminated by

two Cooper-Hewitt lamps. The use of these lamps is a feature of the whole plant. There are 117 of these lamps for the main shop lighting, on the present layout. These are divided among the various shops as follows: machine shop 32, erecting shop 16, boiler shop 14, smith shop 14, freight car repair shop 10, planing mill 9, brass and tool rooms 7, bolt and nut rooms 5, engine room 4, brass foundry 2, boiler house 2, gas house 2.

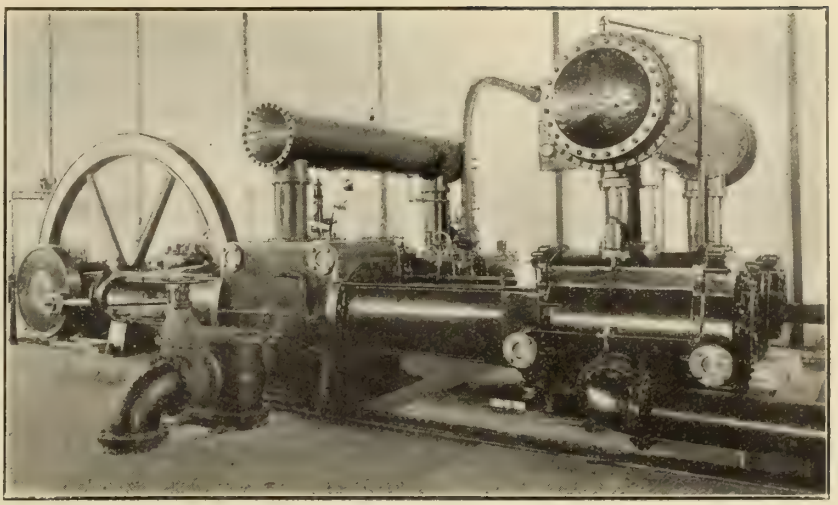

Fig. 12.—Air Compressor in the Power Plant of I. C. R. Shops, Moncton.

MACHINERY EQUIPMENT, I. C. R. SHOPS, MONCTON, N.B.

The numbers on the left correspond to the numbers on the plan and give the readers an idea of the layout of this modern shop.

Power House.

2—300 k.w. generators, 3 phase, 60 cycle, 220 volt, alternating current direct connected to.

2—500 h.p. gas engines, 150 r.p.m., using producer gas. Both the generators and the engines are manufactured by Westinghouse Machine Co.

1—200 k.w. motor generator, 220 volt direct current, Allis, Chalmers, Bullock.

1—70 k.w. motor generator, 220 volt, direct current. Westinghouse Machine Co.

2—105 k.w. generators, 3 phase, 60 cycle 2,200 volts, alternating current. Canadian General Electric. Direct conoected to.

2—14" x 14" single cylinder steam engines 257 r.p.m. Robb Engineering Co.

1—2000 cu. ft. cross compound Corliss steam, two stage air compressor. Air cylinders 16" & 30"; steam cylinders 16" & 27" x 36" stroke. Can. Rand Co.

1—1000 gallon Compound Duplex steam pump, steam cylinders 12" & 18½"; water cylinders 10" x 12" stroke. Smart, Turner Machine Co.

1—300 gallon Duplex steam pump, 8" x 7" x 12". For providing the circulating water for gas engines and air compressor. Fairbanks Morse Co.

2—Watertube boilers, 5,346 sq. ft. heating surface, 160 lbs. pressure. With chain grates. Babcock & Wilcox, Ltd.

2—10" x 6" x 12" Duplex, outside packed plunger pumps for boiler feed equipped with "Berry" governor in connection with "Berry" feed water regulators on boilers. Smart, Turner Mach. Co.

1—Vertical water tube feed water heater, 319 sq. ft. heating surface. Capacity 21,000 lbs. water per hour. Babcock & Wilcox.

Gas Producer House.

The Producer Gas Plant has capacity of 1,000 lbs. of coal per hour, or 1,500 lbs. of coal for not more than three hours. The output is 55 cubic feet of producer gas, and 18 cubic feet of water gas per pound of coal.

There is a holder for each kind of gas with a capacity of 10,000 cubic feet each.

Acheson Graphite Company's Hydro-Electric Plant.

The International Acheson Graphite Co. is enlarging the output capacity of its branch works in Niagara Falls, Ont.

This company has long operated a Canadian branch with facilities far in excess of the demands of the Canadian trade. It recognizes, however, in the hydro-electric development, now so active throughout the Dominion, and the new trade spirit and energy everywhere present throughout Canada, an indication of an additional industrial enterprise, and it is to meet the prospective demand for its product, that it is increasing the size and output capacity of its existing plant in Niagara Falls, Ont.

A new furnace room providing for a 1,000-horsepower unit, is being built, and on completion the new furnace installation will be placed in operation. This will be an important aid in the development of Canadian resources, particularly now that so much attention is being paid to new processes, which mean much for the future of the Dominion. Especially is this true of electrometallurgy and electrochemistry, the product of the enlarged works of the International Acheson Graphite Co., at Niagara Falls placing all such industries in close touch with a ready supply of electrodes.

It may be noted that the International Acheson Graphite Co. is the only maker of artificial graphite in the world. The Acheson graphite is made in the electric furnace. All other graphite is mined.

BOOK REVIEWS.

STEAM POWER PLANT PIPING SYSTEMS—By William L. Morris, M.E. Published by the McGraw-Hill Book Co., New York. 490 pages, 6 x 9 ins., illustrated. Price $5 net.

This book treats of such parts of the power plant relating to piping. All auxiliary apparatus in the pipe line between the boiler and engine and in the various systems for steam, oil, air, etc., are taken up and their general design discussed.

There are thirty-one chapters, each taking up a different phase of the subject. Chapter 1 takes up Origin of Improper Piping, 2 Piping Diagrams, 3 Piping Systems, 4 Condensers and Heaters, 5 Live Steam Drips, 6 Blowoff and Exhaust Piping, 7 Air and Oiling Systems, 10 Live Steam Details, 11 Vacuum Exhaust Details, 13 Boiler Feed Details, 26 Steam Drip Details, 27 Oil and Drip Piping Details, etc.

This will give the reader an idea of the comprehensive way in which the subject is treated. Another subject covered is City Water Piping, making the volume very complete. It is a useful book of reference which should be in the library of every progressive engineer.

PROCEEDINGS UNDERGRADUATE SOCIETY—Published by the Canadian Engineer, Toronto, 77 pages, 6 x 9 ins., illustrated. Price 25 cts.

The book contains addresses before the Undergraduate Society of the Faculty of Applied Science, at McGill University, of Montreal. These include six papers, the Relation of the Engineer to the Community; Description, Instalation and Economy of CO_2 Recorders; Value of Gas Power, etc.

Some Recent Improvements Made in Bertram Planers

John Bertram & Sons Co., Dundas, Ont., Have Installed Special Planers in G.T.R. Shops, Toronto, and Made Several Improvements on the 54-in. Planer.

The accompanying cuts show some frog and switch planers recently installed at the Grand Trunk Railway switch shops, in Toronto, by The John Bertram & Sons Co., Ltd., of Dundas, which have made and are making rather startling records for themselves. At least they are startling to the man who is conversant with the average output of machines of this class.

As regards the machines themselves, there is nothing in their general appearance to call for comment except perhaps their general stockiness and simplicity. They look to have been designed for the work they are doing, and that back of the intention was the knowledge gained by experience which consists as much in knowing what to leave off as what to put on. Convenience is there, but many attachments often causing trouble and delay by getting out of order, are absent.

In adition to the capability of the planers for their work, there must not be overlooked the handiness of the fixtures for setting and holding the work. These fixtures were originated and put on the planers by Mr. Garden, who is foreman of the shop, (Mr. Garden has since been transferred to the Montreal shops), and are decided time savers and most efficient.

Referring to the cuts:—Fig. 1 shows the standard planer arranged with motor drive, a constant speed one in this case.

The length of table is 23' for the switch planer referred to in this article. The cutting and return speeds are made in most cases to suit the idea of the purchaser and depend upon the kind of rails he must handle and the quality and shape of the tools to be used.

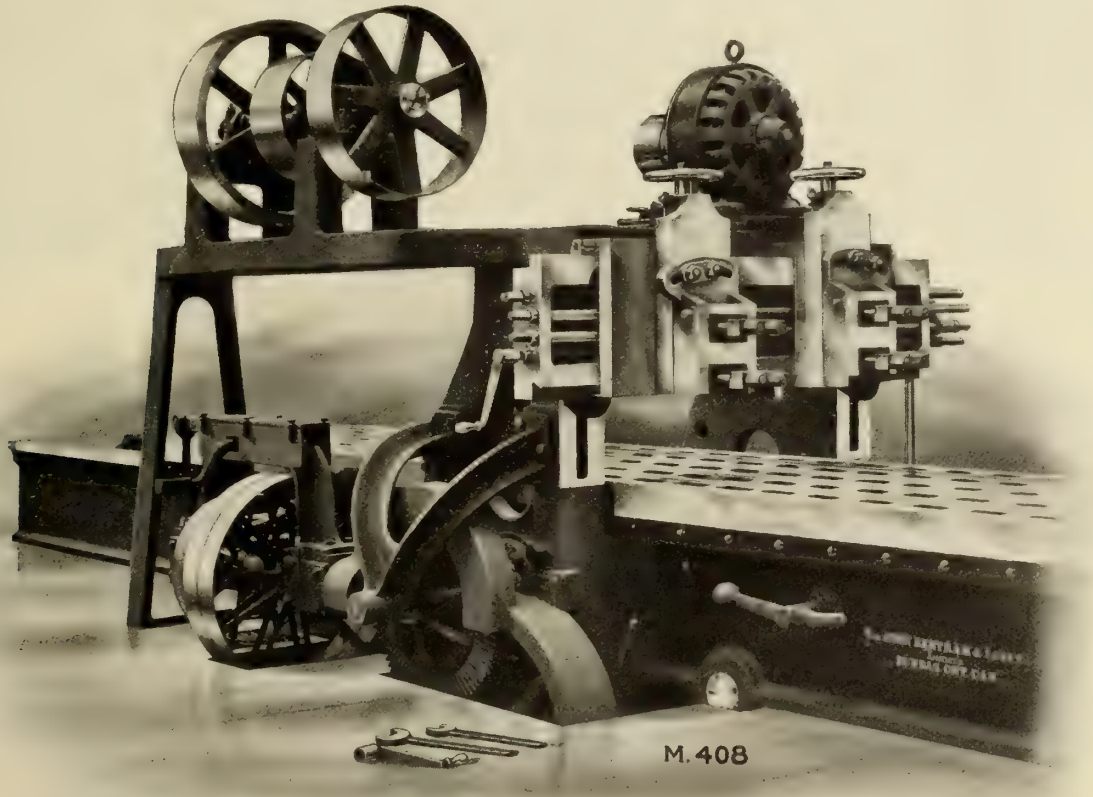

Fig. 1.—Standard Planer With Motor Drive.

Fig. 2 shows the switch planer working on a pair of 100-lb rails. These rails are high in manganese, and quite above the average for hardness. Records made on such rails are therefore the more to be commended than if made on rails of average hardness. This machine is belt driven, but is expected to be motor driven later, and the machine was so designed.

On the end of the table may be seen a lot of chips that perhaps show better than figures, the work the machine is doing. They were not piled there for photographic purposes, but are the result of regular work.

In ten hours this planer removed 1,140 lbs of material, and as, of course, it is not cutting all the time or even half of the time, it means that when it is working, it must take cuts rather large in size. The number of pairs of switch rails finished in 10 hours is 6 or 12 rails in all, which is far beyond the guarantee under which the planer was sold.

Fig. 3 shows the frog planer. This is also belt driven, and arranged to be converted to motor driven later, and is practically the duplicate of the switch planer, except the length of table, which is 16'. In 9 hours, this planer finished 32

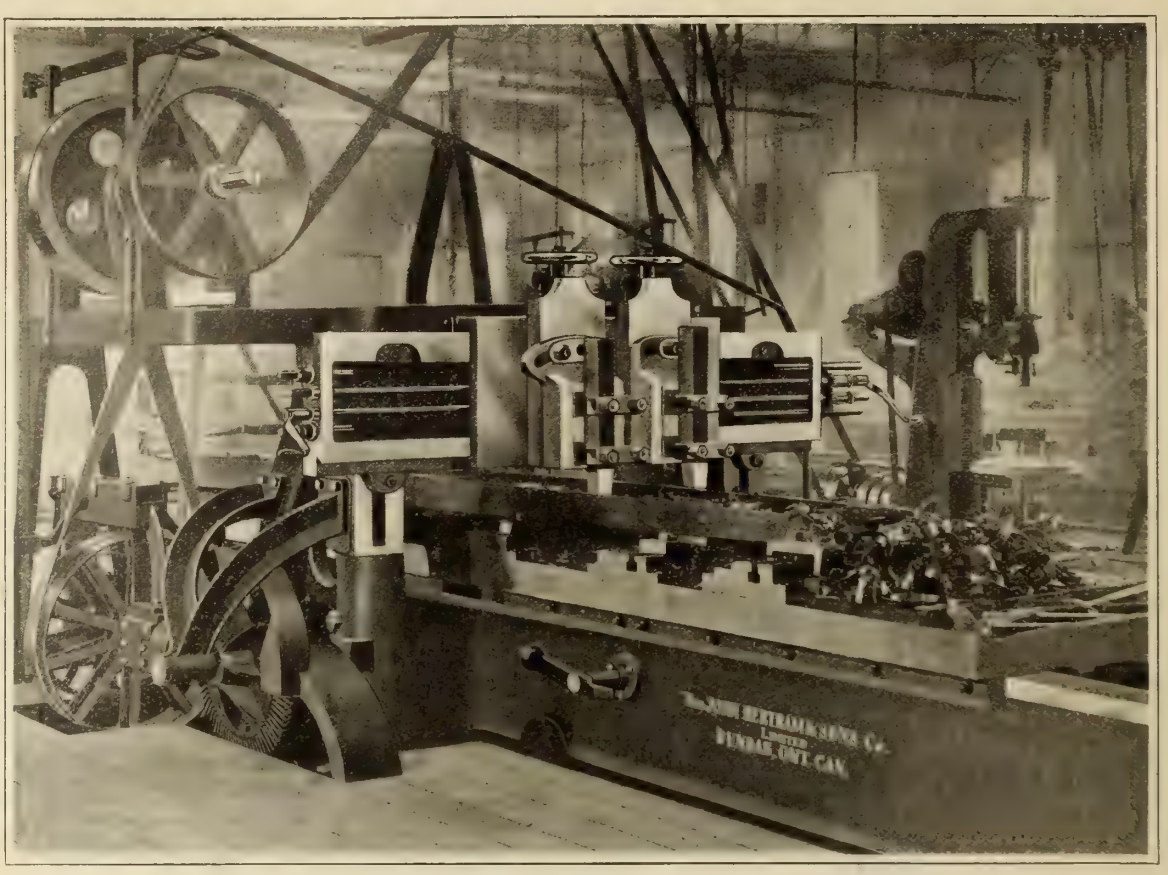

Fig. 2.—Switch Planer Working on 100 lb Rails.

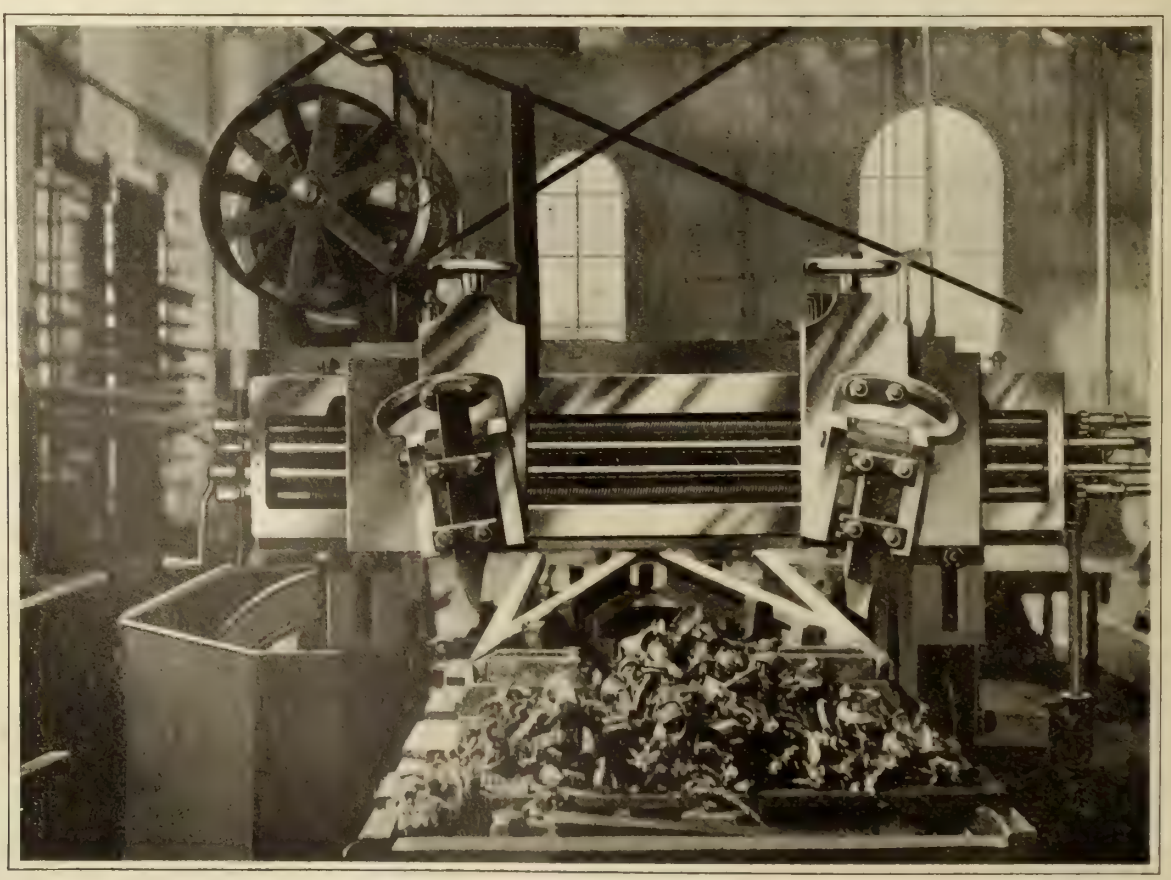

Fig. 3.—Frog Planer.

frog points, removing in that time 576 lbs of metal.

While these performances may not be the best ever made, they are certainly good, and when all conditions are considered it will undoubtedly be admitted that they are hard to beat.

Improved 54'' Planer.

Important improvements in Bertram planer construction are well illustrated in the attached cuts, showing a heavy 54-inch planer recently built at the shops of The John Bertram & Sons Co., at Dundas.

Notable among these is the new style of four-belt drive shown in Fig. 4. By the use of two driving belts and two reversing belts, greater driving power with reduced belt speed is obtained. There is a resulting steadiness while cutting, and accuracy and precision at point of reversal. This obviates the use of belts reversing at a high peripheral speed, a very objectionable feature, owing to the constant slip of the belt, especially at the ends of the stroke and unavoidable loss of power.

Fif. 5 illustrates the improved feed mechanism, which is of the positive gear type. The one feed box is used to operate the four planer heads, and these four heads may be fed separately or together in varied directions at different cutting speeds at the same time. This construction does away with the vertical feed rack, a contrivance which was very apt to wear loose and get out of adjustment. The feeds are all obtained from the right hand side of the planer, the drive being also on the same side. Both crossrail weights are carried beyond the left hand housing, which places them completely out of the operator's way.

The crossrail heads are made right and left hand, which makes it possible to bring the tools together on the rail when necessary. These heads are constructed with outside clapper boxes, which give a wide face for tool adjustment and accommodate a wide variety and size of tools. The side heads may be lowered below the surface of the working table to allow of wide work.

This style of drive is readily convertible from belt to motor or from right angle to parallel drive, after the planer has been already built.

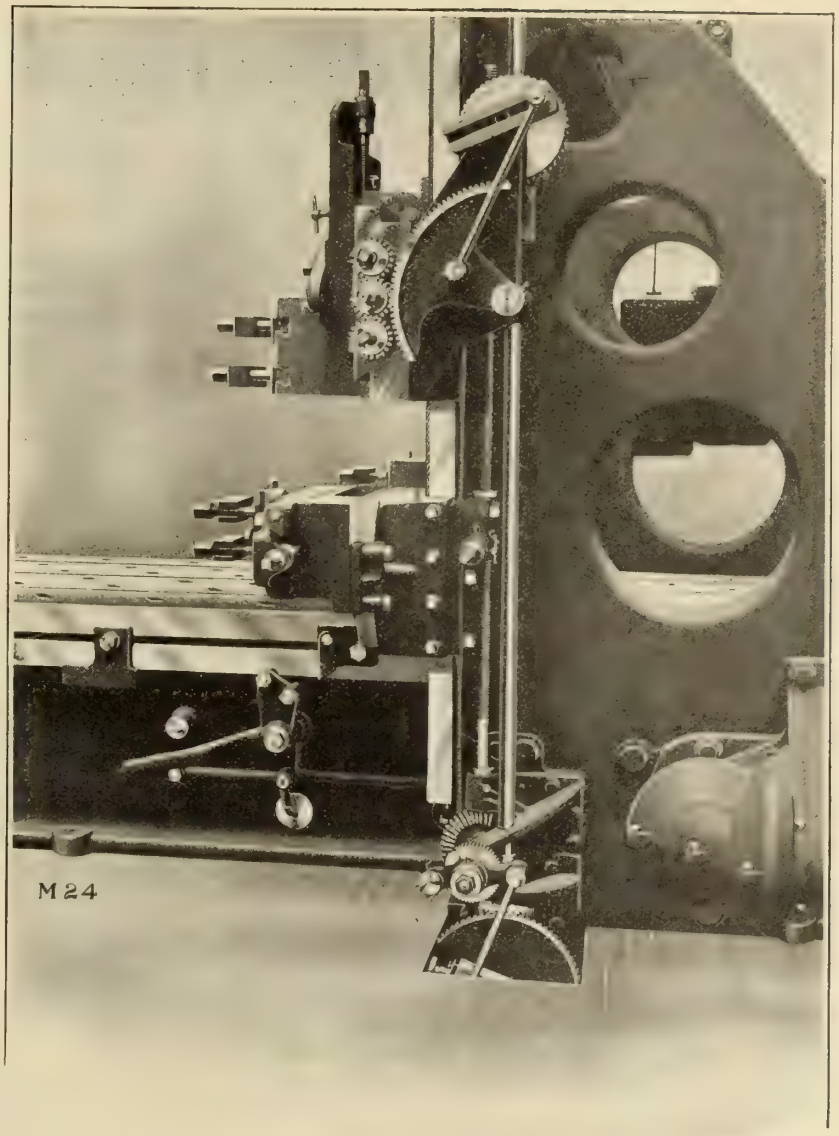

Fig. 5.—Improved Feed Mechanism.

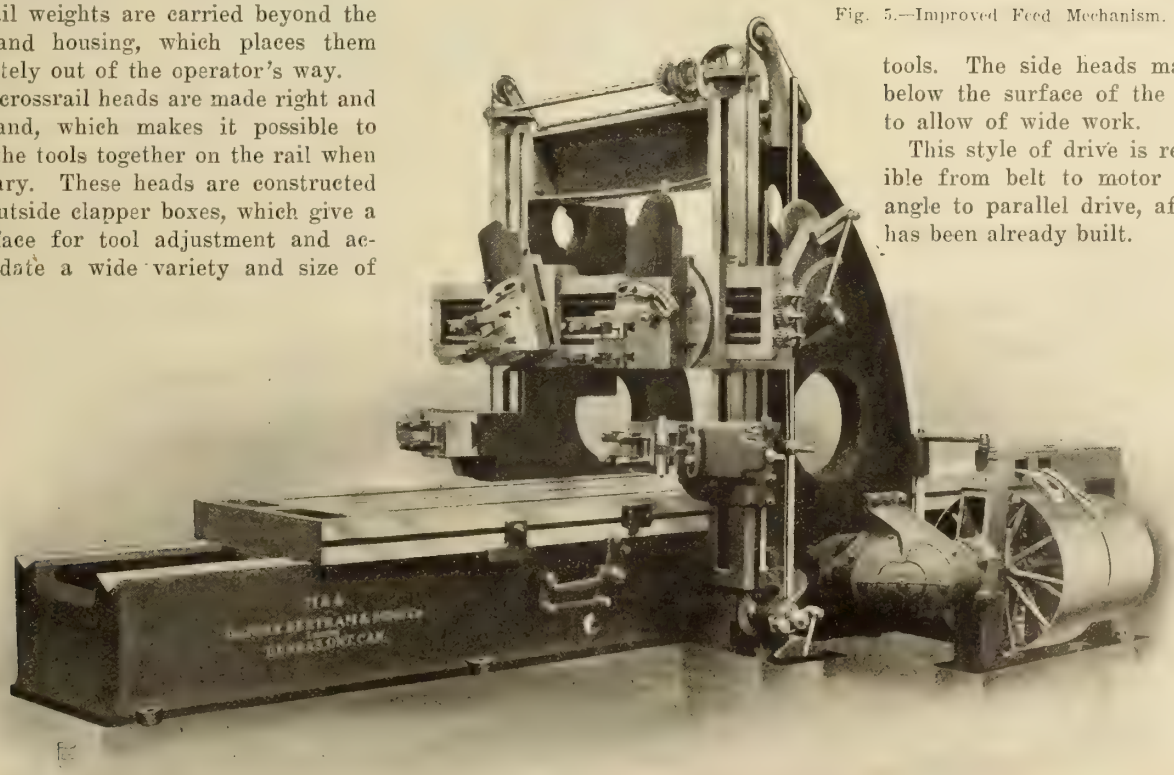

Fig. 4.—54-inch Planer with Four Heads and Four Belt Drives.

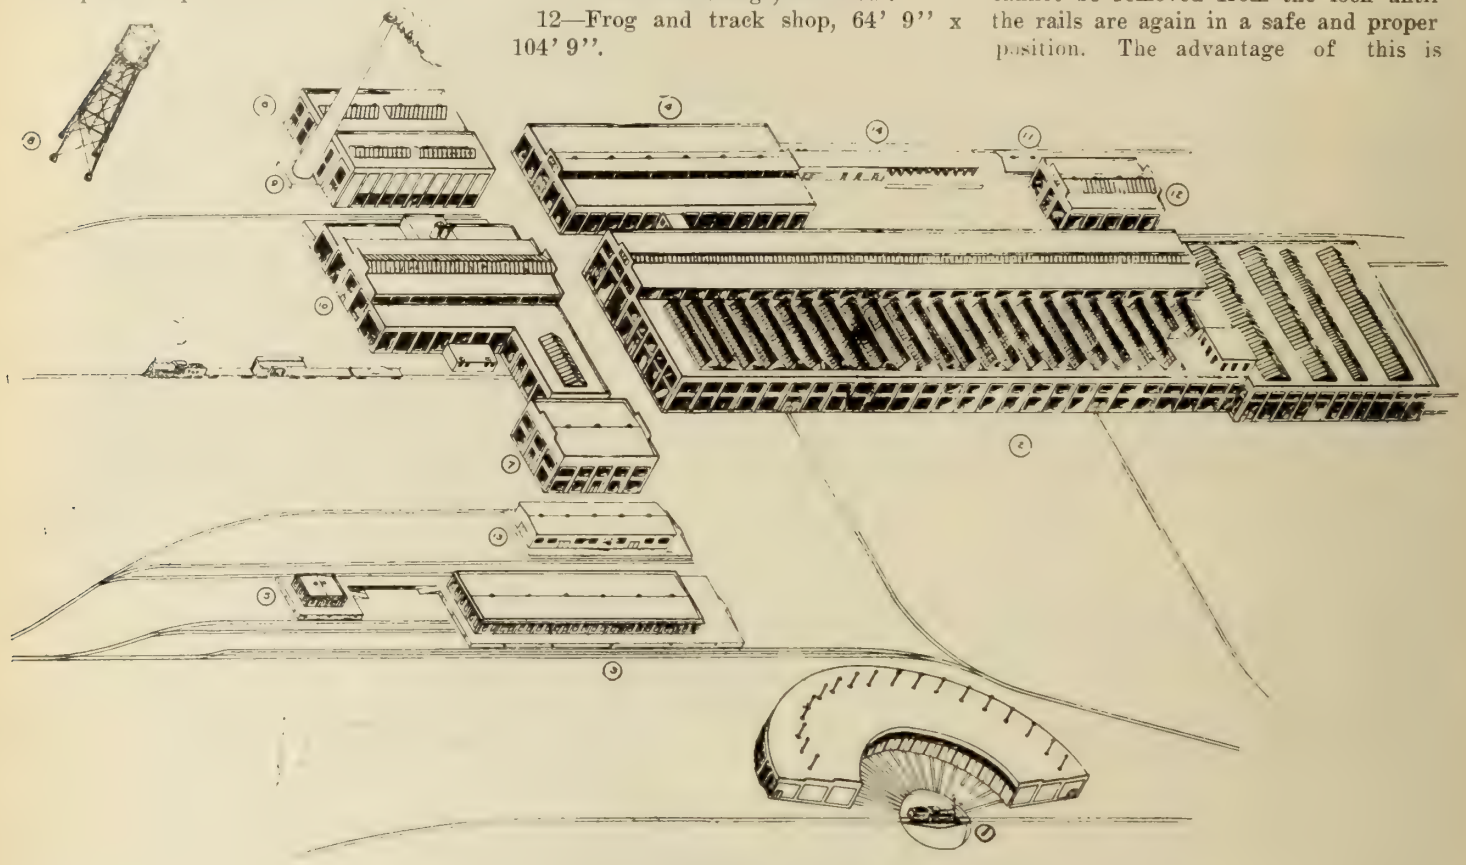
The machine shown has a clear table length of 14 feet, and a bed length of 23 feet. All gears are steel. It has power elevation to crossrail and parallel drive. The design of the planer throughout is to give maximum reduction for work within its range. The width centre to centre of the "V's" is unusually large, as well as the working surface of the "V's" themselves.

The results obtained have been very satisfactory, and it would appear that these improvements must make a permanent and necessary place for themselves in upto-date planer construction.



Shops of the National Transcontinental Rail way now in course of Construction at Winnipeg.

NATIONAL TRANSCONTINENTAL SHOPS.

Frequent reference has been made to the N. T. R. shops, Winnipeg, in Canadian Machinery. The accompanying drawing is an isometric view of these shops. The following numbers correspond to those in the illustration:—

1—Round house. The drawing shows a capacity of 18 locomotives, but it was afterwards decided to enlarge it to accomodate 25.

2—Locomotive shop. It comprises tank, boiler, machine and erecting shops being approximately 823' x 174'. The building has 26 engine pits and two transfer tracks.

3—Store house, 62' 6'' x 262'.

4—Forge shop, 104' 9'' x 264' 9''.

5—Oil house, 30' x 40'.

6—Power house, 154' 9'' x 110'. The engine room floor is oiled maple and boiler room floor is concrete.

7—Carpenter shop and pattern stores, 104' 9'' x 74' 9''.

8—Steel water tank, capacity 100,000 gallons, 125' above ground.

9—Chimney, 200' high, 11' average inside diameter.

10—Gray iron foundry and brass foundry 204' 9'' x 134' 9'', with cleaning room 64' 9'' x 82' 4½'', sand sheds, coke bins, etc., are also provided.

11—Crude oil storage, 25' x 62'.

12—Frog and track shop, 64' 9'' x 104' 9''.

13—Stores platform is 56' x 180' and superstructure is 58' x 151'.

14—Forge stores and scrap bins. The iron storage is 30' x 60'; coal, 30' x 30'; coke, 30' x 20'; scrap, 30' x 100'.

IMPROVED RAILROAD DEVICE.

C. P. R. officials have received word from Calgary of the testing of the invention of E. Woodhouse, master mechanic of the western division of the railway, regarding the locking of switches. As is well known, there is at each switch a switch-post with a bar and lever by means of which the rail is thrown from one side to the other, according to where the train is desired to go. When a switch is thrown over it is secured by a padlock and chain. The trouble with the padlocks is that they are being constantly lost or broken, being wrenched off the chain by careless workmen, or becoming jammed with ice or snow in the winter. Another trouble is that the men often leave the key in the padlock, thus placing the safety of the switch in the hands of anyone who may find it.

Mr. Woodhouse's device has the lock inside the switch-post. It will not operate until the point of the rails are in exactly the right position, and once the key is inserted to unlock the rails, it cannot be removed from the lock until the rails are again in a safe and proper position. The advantage of this is obvious. There is no padlock to lose, and the lock cannot be tampered with. Furthermore, by numbering and registering the name of the man who has each key, it can always be told who has left the switch in a wrong position, because he cannot take his key away with him. In this and many other respects, Mr. Woodhouse's invention is regarded as a valuable addition to railway equipment, being also entirely new in principle. The western division of the C.P.R. has already placed seven or eight of these switches in the main line yards at Calgary, where they work splendidly. It is proposed to equip switches throughout the west with this same kind of lock, and the invention is also before the general officials of the company on other parts of the system.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

TURNING A LARGE THREE THROW CRANK SHAFT.

As everyone knows, who has had any of this sort of work to do, it is not the easiest thing in the world to accurately turn up a three throw solid crank shaft. The writer happened to be in the machine shop of the Robb Engineering Co., recently, and noticed how they used the jigs in turning up a large, eight inch, three throw, crank shaft.

Fig. 1 shows the construction of the jigs or centreing pieces, of which there are two. These are partially split by a ⅜-inch cored slot, which runs to within two inches of the front end. The centreing pieces are held on the shaft by clamping with four 1-inch studs, as shown. It will be noted that the diameter is 1-16 inch larger than the finished shaft on account of the shaft being set up rough turned. The taper plugs are a feature of this jig. These carry the centres for the tail stock spindle, and are easily renewed from time to time as needed.

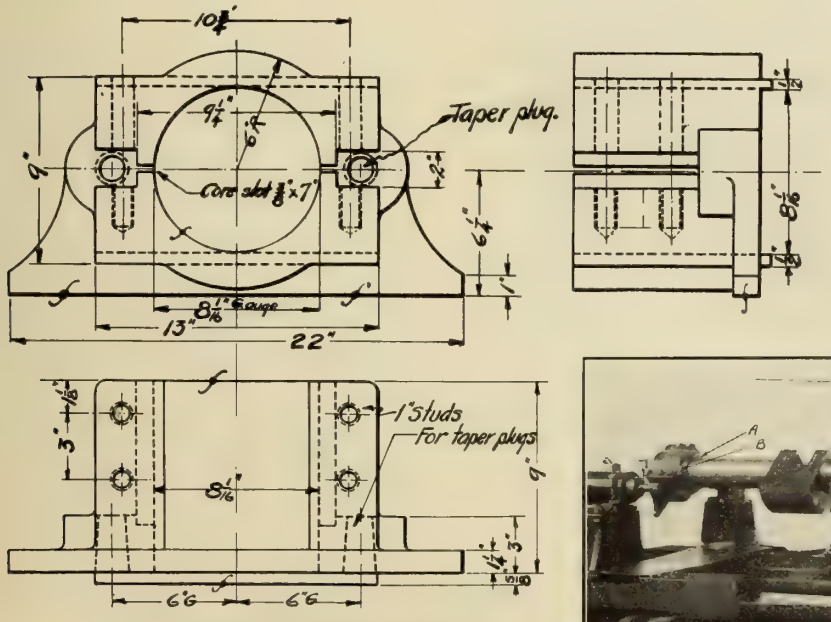


Fig. 1.—Jig for Turning Crankshaft.

Having two centreing plugs in each of the jigs, allows the turning of the pins of a two throw, 180 deg., crank shaft, without readjusting the centreing pieces. The bottoms of the webs in the front of the jigs are scraped absolutely parallel with a line drawn through the centre of the shaft and centres of the taper centre plugs. Fig. 2 is a drawing of the eccentric steady collar. This runs in a steady rest having four adjustable bearing surfaces as can be seen in the photo.

The collar marked "A" in the photograph is marked off accurately in three spaces of 120 degees each and on each of the centreing pieces is a pointer, "B," which engages the marks on the collar. These collars are set by allowing the centreing pieces to rest on the ways of the lathe and allowing the shaft to revolve. In this way the marking off of of the centres of the crank pins by surface gauge is facilitated and then the collars are clamped to the shaft to suit. The use of two collars is helpful in case one is moved in some way while turning and adjusting.

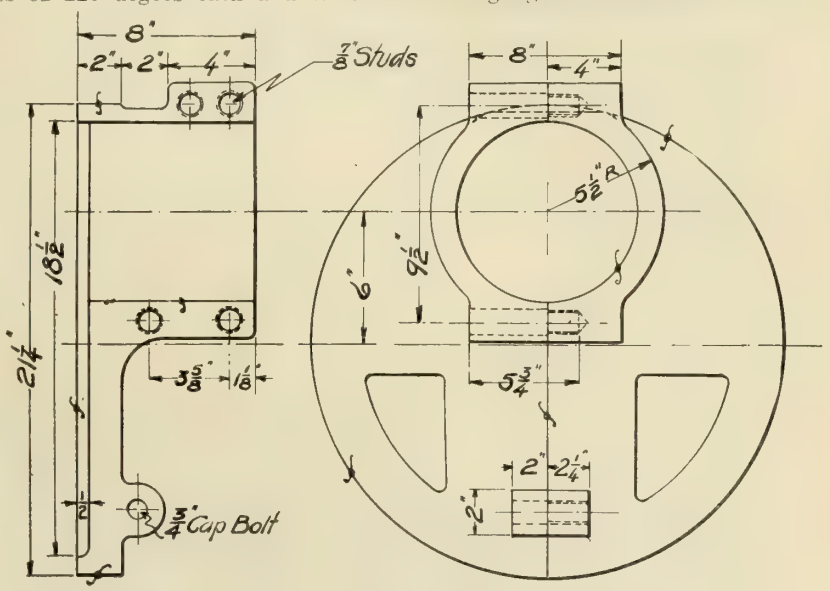

Fig. 2.—Steady Collar.

The two centreing pieces being absolutely identical in every respect allow of adjustment, on the ways of the lathe in setting up, that insures the three crank pins being turned exactly parallel with the shaft.

Fig. 3.—Turning Large 3-Throw Crank.

The pins are first all roughed out to within 1-16 inch of true diameter and then gone over with a light finish cut.

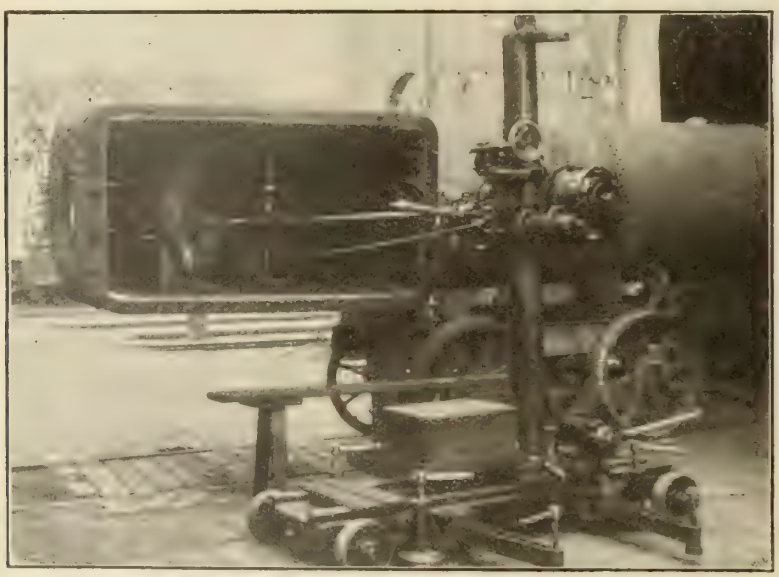
ground and lapped. The reason for the two operations is the fact that in the first the spring of the shaft, due to forging and cooling, is eliminated and the last operation brings the shaft up true and straight. Besides the pins the journals, too, are ground and lapped.

It will be noticed in the photograph that there is a compression grease cup on the spindle of the tail stock. This is very saving on the spindle itself and on the centreing plugs. A ¼ inch pipe tap is tapped in the spindle and an ⅛ inch hole is drilled from the point to meet this tapped hole. A small groove is also filed on the outside of the cone to provide assistance to the lubrication.

UNIQUE ELECTRIC TRAVELING DRILLING MACHINE.

By Frank C. Perkins.

The construction and method of operation of a novel universal electric drilling and tapping machine of the portable type is shown in the accompanying illustration. This traveling and electric drilling tapping machine is largely used in locomotive works and repair shops as well, as in boiler shops for drilling in frames, boilers, and fire-boxes, as well as in drilling out defective stays.



Unique Electric Drilling Machine.

It affords many advantages over stationary machines, as it is easily transported and placed in service without any preparatory work, and can often be employed in positions where other drilling machines cannot be utilized to advantage. The drilling spindle is driven by an electric motor of two horse-power, through the agency of a double-threaded worm gear and spur-wheels, which can be put in and out of gear and enable the machine to work at four different speeds. The head can be turned round its horizontal axis, and through 360 degrees on the column, which can be moved horizontaly on the carriage.

It will be noted that the complicated and lengthy operation of securing the machine to the work-piece to be drilled is quite superfluous, and in drilling holes of small and medium diameter the weight of the machine affords sufficient stability. For drilling larger holes, and when the head works at the top of the column, the stability of the machine is secured by two arms attached to the base plate. The carriage is fixed on the ground by means of four strong disc screws.

It is of interest to note that the spindle can consequently be set to any position and the machine drills holes up to 60 mm., and with a core cutter, holes up to 120 mm., and taps up to 1¾-inch. The electric motor can be reversed for cutting left and right-hand threads.

The diameter of the spindle is 45 mm. and the feet of the drill is 450 mm. The maximum height of spindle from ground is 2,100 mm., and the lowest position of spindle from ground is 600 mm., while the length of the traveling plate is 1,500 mm. The total weight is about 1,500 kg., and the electric motor is provided with reversing rheostat, cable coil with 10m. cable, plug and socket with flues, and complete electrical connection, which can be readily attached to any power circuit junction box.

It is maintained that the universal drilling and tapping machine is especially adapted for drilling and tapping holes in locomotive frames, as it turns out more work in less time, than older types of drilling machines, and saves the time required for fixing small portable electrical or pneumatic drilling machines. It will be noted that the standard having a longitudinal adjustment, a large number of holes can be drilled without moving the machine.

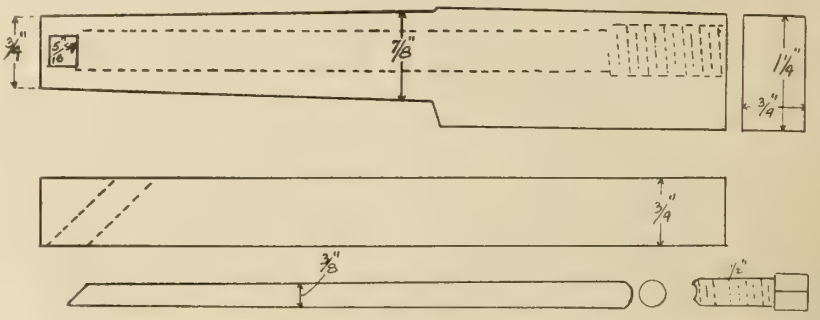


Fig. 1.

HANDY AND ECONOMIC TOOL HOLDERS.

By Mack K.

The accompany sketch, Fig. 1, shows a tool holder designed first to use boring and threading flanges but is now used in preference to a forge tool on anything within its limit of length.

As shown, the forging is bored pass for ⅝ rod and tapped ½ inch. The square hole is cut through at an angle of 30 per cent. This makes threading tool grinding easy, it being necessary to grind one side only of the steel. The push rod is beveled on one end and rounded on the other. The holder and pin are both case hardened all over. An ordinary cup point set screw is used to tighten.

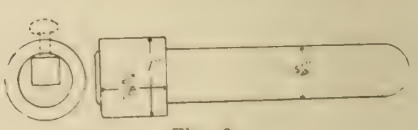

Fig. 2.

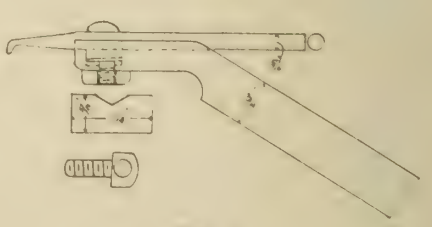

Fig. 3.

In the tool room for grinding these short points a piece of ⅝ round C.R.S. 4½

inches long with a 5-16 inch slot milled 1½ inches in one end, and having a collar with thumg screw on it, Fig. 2 permits of grinding without burning operator's fingers.

The sketch Fig. 3 shows a boring tool holder, using 5-16 round stubbs, of steel, forged to different diameters and styles of points. Offset at an angle of 5 degrees, the holder as shown has a "V" groove planed or milled the full length of the offset. Near the end a 11-32 hole is drilled through and counteredbored 17-32 inch leaving 1-16 inch. The draw bolt is drilled pass, for 5-16 inch round, spring of piano wire and a hexagon nut complete it. It is compact and rigid.

FACING BRASS COCK KEY WASHERS.

By Ethan Viall.

The brass "D" washers used on the small, or lower, end of cock keys, are usually cast in the shape wanted, and

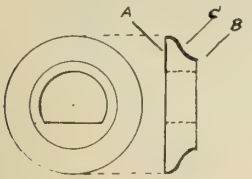

Fig. 1.—The Two Faces.

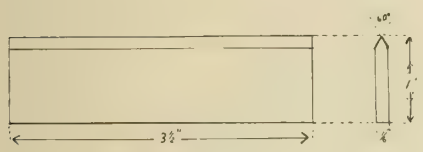

Fig. 2.—Steel Blades.

then machined all over. The hole is cored small and then drifted or broached out in a small press. After the hole is broached out the two faces A and B, Fig. 1, are next machined by being placed on a stub mandrel in a special lathe, the machining being done with steel blades similiar to Fig. 2. These blades are made of either self hardening or high speed steel, and are one-eighth of an inch thick, three and one-half inches long and when new are one inch wide, with a 60 degree cutting edge ground on one edge.

Fig. 3 will give an idea of the special machine and the way these cutters are used. In this cut D is the brass washer, which is placed on the stub D-shaped mandrel, mounted in the special cap F. The blade E is clamped securely in the sliding tailstock, and is fed up to the work by means of the handle G. The knurled nut H is used as a stop. It will be noticed that the blade is placed high in the clamp. This is done when the blade is first put in, and as it dulls it is lowered far enough to bring sharp edges against the work. On ordinary brass work a blade will last about three hours before it needs regrinding.

With the form of stub mandrel, and spindle cap used, a boy can put on or take off a washer without stopping the

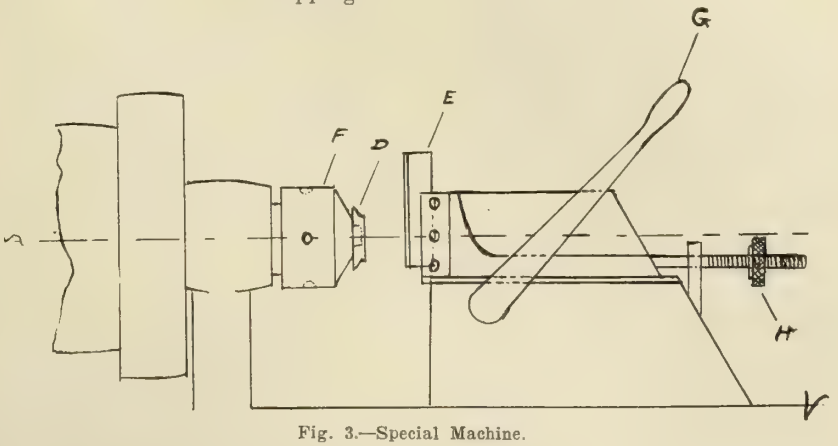

Fig. 3.—Special Machine.

machine. In order to more easily obtain a uniform thickness, one side of an entire lot of washers is usually faced off, the stop adjusted, and the other side finished. On these washers only sides A and B, Fig. 1, are machined on this machine, as surface C is not machined off until after it is in place on the assembled cock, when it is placed in a special lathe and turned with a forming tool.

A cutting edge with a 60 degree angle has been found to give the most satisfactory results on these washers, as there is little tendency to chip out or to chatter on the cut.

For grinding, a jig shown in Fig. 4 is used. Very little clamping effect is needed to hold the blade, so only a single thumb screw is used. The lower part of the jig is extended out under the edge of the blade in order to do away with the tipping effect, while grinding.

A jig in which both sides of the edge could be ground without removing the blade was at first planned, but was abandoned for various reasons. When the blade gets narrow, a small parallel is

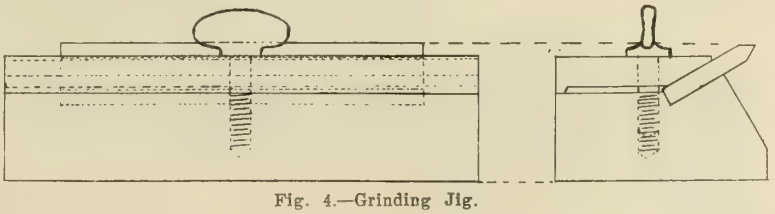

Fig. 4.—Grinding Jig.

placed between its back and the bottom of the slot in the jig.

To grind the blades in this way, a special guide, Fig. 5, is used on the grinder. In using this, the jig holding the blade is placed against the guiding strip L, and run back and forth under the emery wheel, which revolves in the direction shown. As the wheel cuts, the guide is gradually raised by means of the screw K, which is turned by the left hand while the right moves the small jig back and forth.

It isn't necessary to have the cutting edge absolutely central with the stock of the blade, so this edge is usually centred approximately by the eye, or by

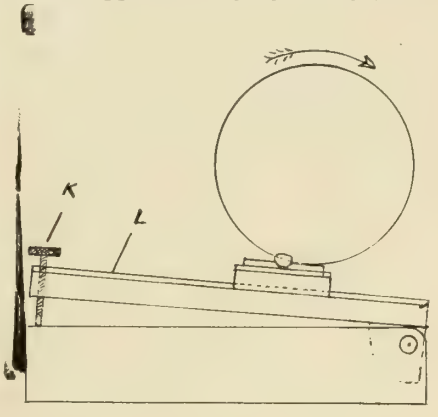

Fig. 5.

turning the screw K a certain amount for each side.

The cutting power of paper revolving at a high rate of speed will be surprising to those who have not seen such experiments conducted. A circle of good quality stiff paper about eight inches in diameter mounted upon the shaft of a motor rotating at a high rate of speed will cut through cigarbox wood in a fashion that makes the onlookers respect the cutting power of paper for other reasons than having once received a finger cut in carelessly handling wrapping paper.

DEVELOPMENTS IN MACHINERY

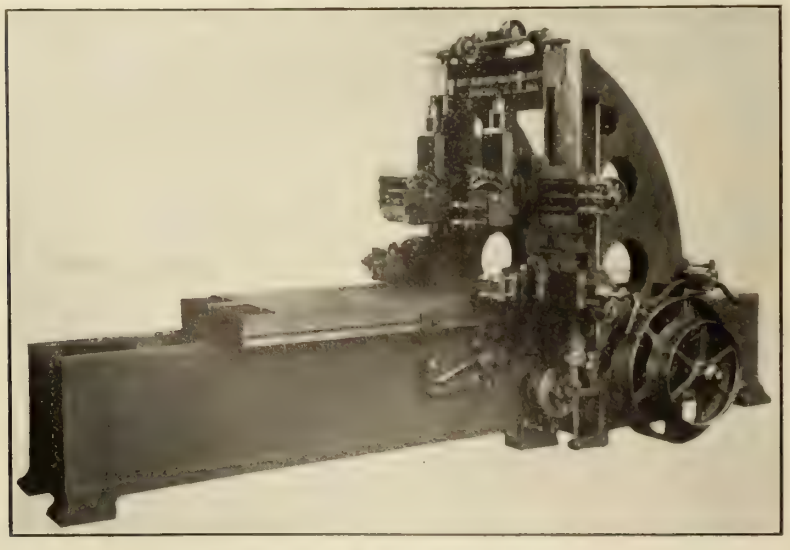
New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

ROCKFORD 32'' PLANER.

The accompanying illustration shows the Rockford 32'' x 32'' x 8' heavy duty planer, manufactured by the Rockford Machine Tool Co., Rockford, Ill.

The gearing in the drive is located inside the bed between the bearings. The bearings are long straight bushings accurately fitted into holes bored directly in the bed castings. Ample means are provided for perfect lubrication. The belt shafting device is very simple and reverses the table without shock or jar. The heads on cross-rail, also the side heads, have horizontal, vertical and angular feeds. The down feed to the heads on rail is 12''. The feed friction is of the combination releasing type. It will carry the heaviest feeds without slipping, and will not run hot. The feeds are changed by the knob shown on the front of friction, a pointer indicating the feed obtained at the different settings. With this device, the feed can be changed for the finishing cut after roughing a piece of work and returned for the next casting, and the operator will know exactly what feed he is going to get without making several adjustments, counting the clicks of the ratchet, etc.

The different parts of the machine are very accurately fitted, and are interchangeable. Side heads can be furnished



Rockford 32'' Planer Equipped With Four Leads.

at any time. Ample means are provided on all bearings for adjustment for wear, taper gibs being used throughout. All bevel gears, pinions and feed racks are made from open hearth bar steel.

JEFFREY STORAGE BATTERY TRUCK.

The accompanying illustration shows a new yard truck just brought out by The Jeffrey Mfg. Co., Columbus, Ohio.

Jeffrey Storage Battery Truck.

The electrical equipment, including storage batteries, motor, controller, with all necessary charging instruments, are all located below the platform, so that the truck can be used for carrying material of any kind, or for hauling yard cars. The design is such that it can be used on any gauge from 18 inches up, and on the shortest curves encountered on industrial tracks. The electrical equipment is furnished in sizes to suit the service.

For loads up to 10 tons a 6 H.P. motor with 10 K.W. battery is provided. For heavier service, larger motors and batteries are supplied, depending on the maximum loads and the frequency of the trips. The platform is made removable, allowing easy access to the electrical equipment.

For the service usually encountered around the average manufacturing plant, moving raw material, castings, etc., the 6 H.P. equipment will operate two or three days on a charge.

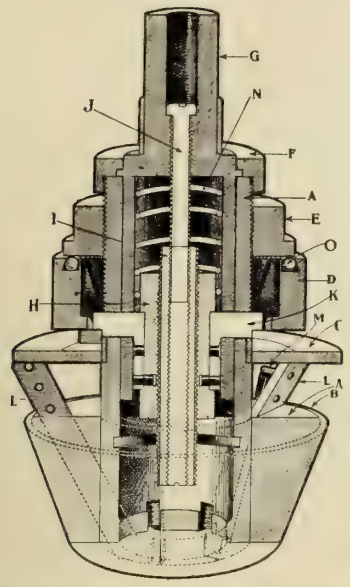
By estimating the average weight and average length of trip the proper size equipment can be determined. The use of these cars facilitates the handling of material around a manufacturing plant, and also effects a very material saving in the cost of this work.

SELF-OPENING DIE HEAD.

A new self-opening die head has been placed on the Canadian market, the invention of W. Richmond. It contains many good features which recommend it to those in need of opening die heads for drills, threading machines and lathes.

The illustration shows the construction of the die head. A is the main body of die, B is a cone-shaped ring which fits over A and retains chasers in place. C is a plate with three stops to rest against ratchet D. D is ratchet ring with groove for trip K to travel in. E is adjusting nut threaded to fit shank of A. F is trip nut threaded to fit shank of A. G is the driving shank made to slide easily in body A, with two keys to drive or hold die. H is trip plunger and is a stop screw. J is a screw for adjusting trips. K are the trips. L are the chasers. O are balls between nuts E and ratchet D. M is chaser plunger, with spring not shown. N is the trip plunger.

Wortman & Ward, London, Ont., who are manufacturing the die heads and placing them on the market, use them on



Wortman & Ward's Self-Opening Die Head.

a turret lathe for threading and on drill presses. The drill press die head is tripped from the plunger. On the turret, it can be tripped from plunger, turret stop or by pulling back the turret slide.

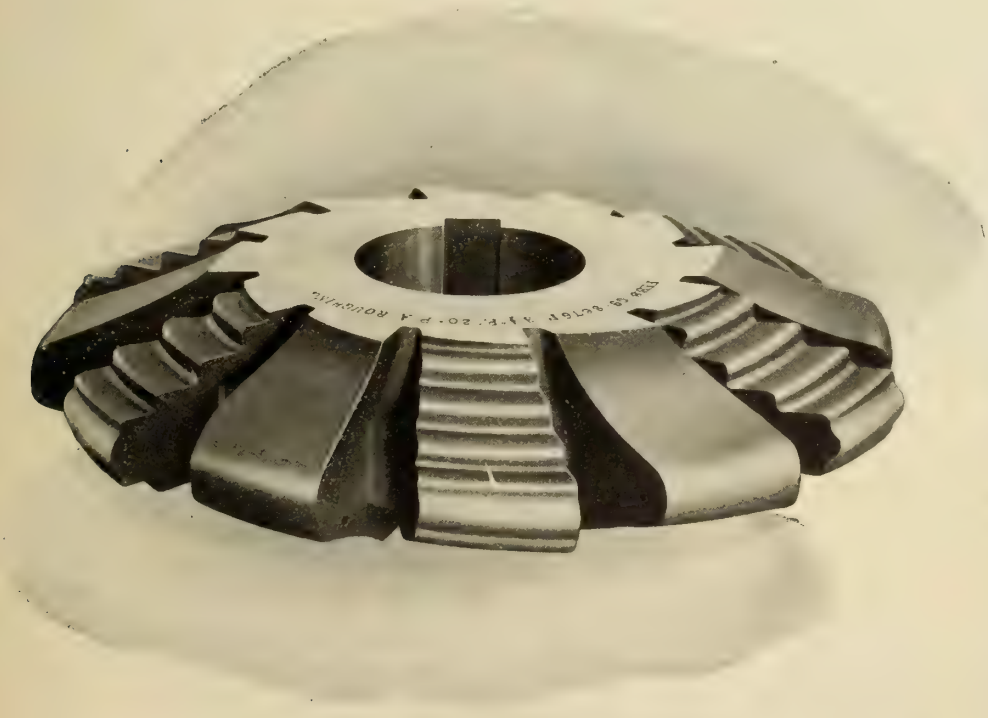
One of the best features is that it allows cutting up to a shoulder. When the teeth of the chasers are worn, grind off bolt work. Teeth can be recut from eight to fifteen times. They are made with 4, 5 and 6 cutters. In threading cylinders, a roughing cut is given and by putting in operation a second cylinder a second finishing cut is given.

STOCKING GEAR CUTTER.

The formed cutter shown herewith is intended for stocking and roughing out the teeth of gears. It is of unusual construction, as may be seen, in that it is made up of alternating plain and stepped teeth. This construction has the advantage that it closely conforms to the shape of the finished tooth space, thus leaving little to be removed by the finished cutter; and at the same time breaks up the chip, so that high speeds and feeds can be used without subjecting the cutter to great strains or heating. It is superior in this respect to both the plain formed cutter and to the design in which all the teeth are stepped.

The cutter shown is an unusually large one, being 13 inches in diameter and being intended for cutting teeth of 1 diametral pitch. In spite of its size, the way in which the chips are produced enables heavy cuts to be taken without undue strain on the teeth or the driving clutches.

The cutter was made by Brown & Sharpe, Providence, R.I.

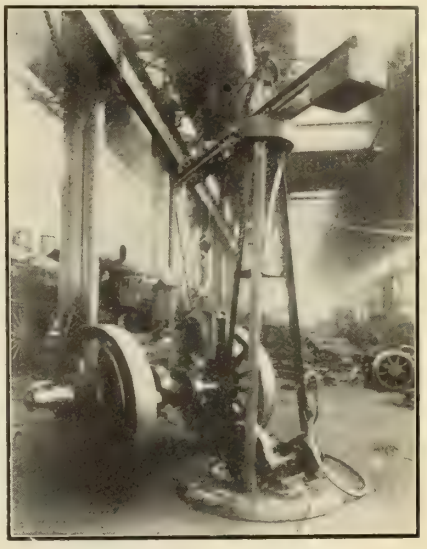


Brown & Sharpe Stocking Gear Cutter.

dies and they are again ready for use. In Wortman & Ward's works these die heads are used for threading cylinder, caps, pump plungers. All these are cut up to a shoulder. They are used also for

PORTABLE JIB CRANE.

The portable jib crane described in this article was designed by a master mechanic on one of the large railroads. It may be placed in any position on the floor by overhead traveler in a moment's time, and will handle loads without any manner of assistance from traveler. Not only is labor of men engaged on a given job rendered more ef-



Whiting Portable Jib Crane.

ficient, but the time of traveling crane is conserved most effectively. On account of flexibility of location, this portable crane is destined to become exceedingly popular among railroad men as an auxiliary service crane.

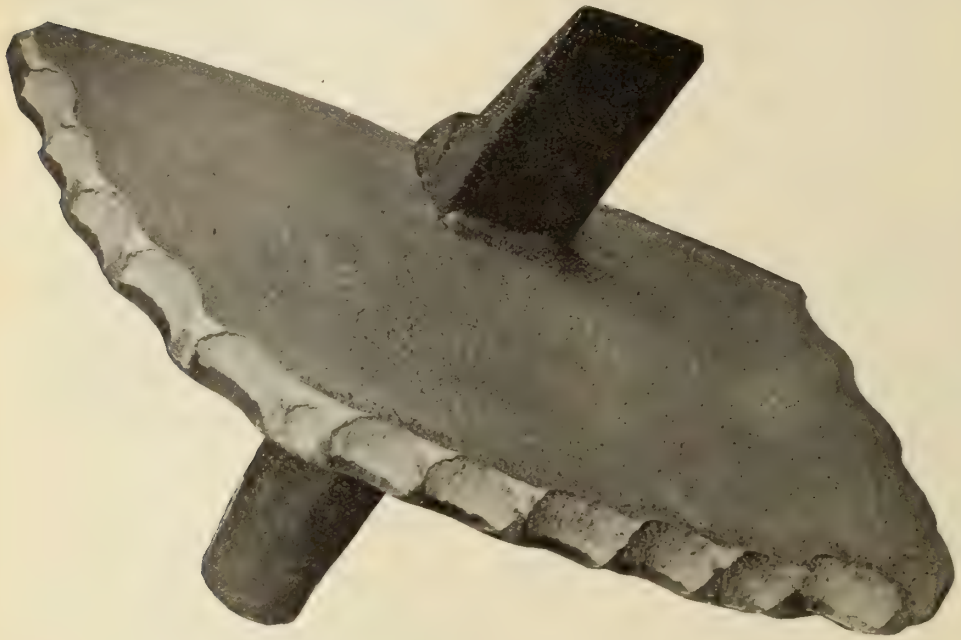
The work handled by this crane in railroad shops includes the removal of driving boxes, eccentric straps and eccentrics from driving axles, and after repairs have been made, of refitting these parts to the axles. All work in connection, such as putting up the collars, sponging boxes and bolting the eccentrics and eccentric straps is done under the crane, and driving wheels are ready to place under engine. One of these cranes will serve a shop handling 60 engines a month for average repairs. One-third the time of the traveling crane is available for other operations, which could not be performed by one auxiliary crane, thus greatly increasing the commercial efficiency of the more expensive tool.

This portable crane can also be used advantageously in locomotive boiler shop, and for handling pneumatic gap riveter or staybolt breaker. In machine shop for assembling tools and for handling heavy vise work, etc.

The crane consistes of a heavy base plate and structural pillar attached thereto, and having a swivel plate on top on which rotating jib is pivoted. A movable trolley is provided which supports a block and hook. A weight attached to opposite end of jib balances trolley and part of load. Jib is stayed by tension rods. Strut for same contains eye bolts for clevis loop by which

crane is lifted and transported by overhead traveler.

Hoisting gearing is attached to base plate or structural pillar, and is operated by pneumatic or electric motor, or hand power. Swinging and trolley travel are operated by hand power. Capacities range from 1,000 lbs. to two tons, with effective radius of about 10feet.



Kalux Hardened Chisel Driven Through Boiler Plate.

These cranes are manufactured by Whiting Foundry Equipment Company, Harvey, Ill.

KALUX, STEEL HARDENING SOLUTION.

For the hardening of carbon or tool steels the Metal Hardening Solution Co., Granite Building, Rochester, N.Y., is introducing a liquid chemical preparation known as "Kalux." It is emphasized that it is only for carbon or tool steel. Air hardening steels naturally have no use for it, and machine steel or iron cannot be hardened by it.

The action of hardening is produced by the shock caused when heated steel is immersed in a liquid of a much lower temperature than itself. This shock can only be obtained where carbon is present to a greater or less extent, as is always the case in tool steel, and cannot be looked for in other classes of steel or iron, where, although carbon is present, it is in graphitic or some other form, which does not respond to or expand to the same extent that the carbon in tool steel will. The action of any hardening bath, such as water or brine, on machine steel can have no effect whatever unless potassium cyanide or some other such chemical is used, and then the effect is only the surface, or penetrates but slightly, producing what is known as case hardening.

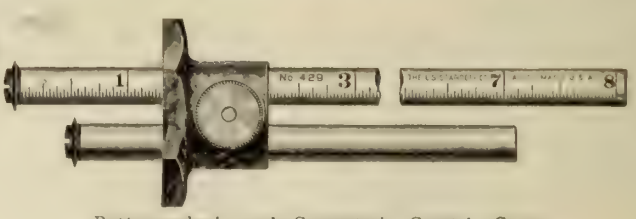
The percentage of solution required for the bath depends somewhat on the grade of steel to be tempered. The higher grades of carbon steel require less solution—½ ounce per gallon of water is sufficient—while the very lowest grades may require as much as 2 ounces of solution per gallon of water. The correct amount to be used can only be determined by experiment in any particular case. It is always allowable, however, to quench the tools at a lower temperature than that which is customary. It is emphasized that Kalux is a liquid, not a powder; that it contains no cyanide of potassium, nor yellow prussiate, and that the process of using it is not a complicated one. In tools of heavy stock, such as dies, lathes and corrugating tools, etc., the temper need be drawn only enough to relieve the strain. Longer life and better service from carbon steel tools are the benefit derived by the use of the solution. The cost of the bath all prepared with Kalux ready for use is about 6 cents per gallon, where the medium grade steels are in general use.

One testimonial received by the company, states that among other tools treated was a circular forming tool for an automatic screw machine, which previous to being treated by Kalux had required grinding at least three times a day, but after treatment it would go for three days without grinding. The material operated upon was 3-16-in silver steel and the cutting speed was 80 ft. per minute. The tool was made of Jessop's steel. Another user found that drills that before would not go through certain stock could do so after being tempered in Kalux. The same shop tested a blanking die, which was used to stamp out small pieces of tempered spring steel. It was found to be still in good condition after 10,000 operations.

The method of hardening steam drills where "Kalux" steel hardening and tempering solution is in use, is to heat tool to a light cherry, then shape, size, and sharpen in machine (where one is in use.) By this time, the steel is about low cherry. The tool is then dipped deep in a bath prepared with "Kalux." Then stand on a rack with about ¾" of steel in the solution, where it is left to stand until all color is gone. Local conditions, such as the kind of rock to be drilled, and the grade of steel in use, may make a slight change necessary, but as a rule the above method will secure the best results.

CARPENTER'S AND PATTERN MAKER'S GAGE.

The head of this gage is made from steel with octagon shaped periphery, case hardened. Two 5-16 in. bars, one plain, 4 in. long, and one graduated in 32nds of an inch, 8 in. long, with sharp rotating cutters on the ends, slide through the head. Either is adjustable in relation to the other, and may be used to make two marks at once, or by slipping one back into the head, out of the way, the other bar may be used for single lines. The gage is nicely finished, having but one fastening screw to hold both bars with a frictional pressure, or to firmly lock. It is made by L. S. Starrett Co., Athol, Mass.



Patternmaker's and Carpenter's Scratch Gage.

D. Smith, formerly shop foreman on the G.T.P., at Rivers, Man., has been appointed locomotive foreman at West Fort William, in charge of the locomotive and car works at that point, vice W. P. Agnew, resigned.

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical.
Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

LEATHER BELTING.

By K. Campbell.

In discussing a paper on the transmission of power by leather belting H. J. Hathaway of the Tabor Mfg. Co. gave some interesting data in relation to belt drive.

If a machine stands idle during working hours while the belt is being repaired or tightened it produces nothing during that time, and there is a distinct loss to the manufacturer. If a machine stands idle for one-half hour out of ten hours working time there is a lost of 5 per cent. in the output of that machine and if in a shop having 100 machines, 10 machines out of the 100 lose one-half hour each day on account of repairs to belts it amounts to a loss of 0.5 per cent. on the total output of the shop. This feature, however, is probably not so bad as the loss in output due to the machine belts being run so loose that they cannot begin to take the feeds, speeds, and depths of cut for which the machines are designed and that the tools will stand.

Almost every engineer, foreman or superintendent, in attempting to bring up the speeds of his machines to something like what he knows to be possible, has found that such attempts usually result in the belt's slipping or breaking, or the lacing giving out, and knows that where the care of belts is left to the man on the machine, only in a very few cases can the belts be depended upon to do the maximum amount of work. Belts of the best quality must be used at proper tension, and they must be kept in first-class condition, and inspected outside of working hours.

Very few machinists or even foremen know how to tighten or lace a belt properly, the amount to be taken out being usually guessed at, and a great deal of time is lost through the machine's standing idle while the cutting and trying is going on. A good machinist has been seen to run a cone belt, which he has made too tight, on "cross cones," i.e., on steps not in line with each other, with the result that it twisted itself up like a corkscrew and was practically ruined.

Another cause of premature ruin of belts is improper lacing, the ends not being cut square and the lacing on one side stretching more than the other, causing the belt to run crooked.

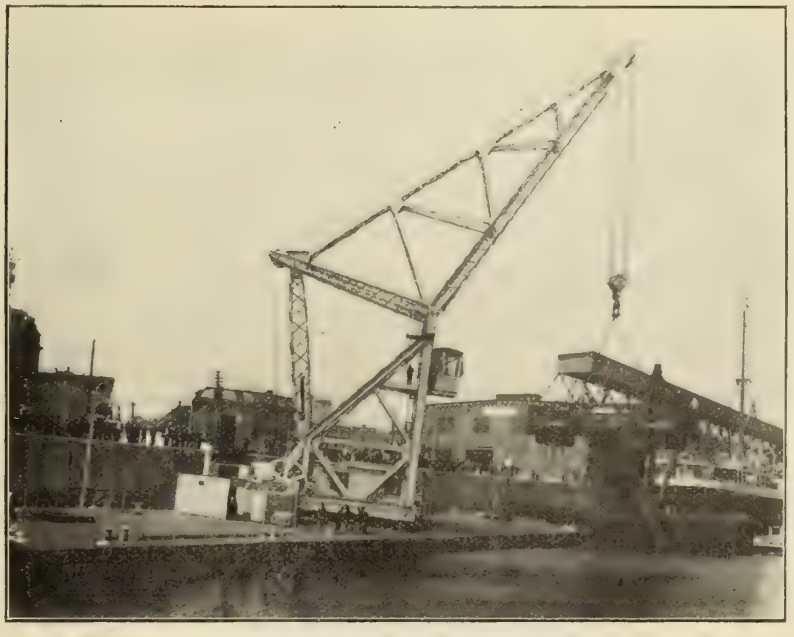
Cemented splices, when properly made, give the best results. Machine lacing, using a spiral wire lacing, while not so good as a cemented splice, is very satisfactory, however, and more convenient, and takes less time for putting on and taking off belts for the purpose of testing and tightening on the belt bench. A belt joined by a cemented splice must be tested and spliced in position, which is not so convenient as on the belt bench, especially in the case of over-head belts.

NEW HARBOR CRANE FOR MONTREAL.

In Montreal, until recently, there has been a good deal of difficulty experienced by shippers and importors of heavy freight, such as steel, boilers, machinery, etc., on account of lack of crane facilities for handling this class.

The Harbor Commissioners decided to overcome this difficulty, and ordered the floating crane shown in the illustration This was built by Vickers, Sons & Maxim, Ltd., London, England. It was to have been delivered in 1908, but owing to the strike in England at that time, work on the crane was delayed. It met with an accident in transport, which further delayed delivery. This occurred when well out to sea. Heavy weather compelled the tug to abandon the crane, which was left to its fate. However, it was picked up later, towed back, overhauled and delivered to the Harbor Commissioners this summer.

The hull, which is non-propelling, is of steel, 200 ft. long, with a moulded breadth of 43 ft. Power is supplied to the winch engines by one vertical boiler. The crane is built to slew in a complete circle, thus giving it the largest possible scope. The extreme radius of the crane is 72 ft. at which point the capacity is 10 tons. At 51 ft. radius the capacity is 75 tons, which is the weight being lifted when the accompanying photo was taken. This is a steel car, weighing 22½ tons loaded with 50 tons of coal and 2½ tons of steel. At this test the radius of the crane was increased to 54 ft., and with the adjustable counter balance on the load side of the crane the freeboard was two feet.



Floating Crane in Montreal Harbor.

The heel of the jib turns on a trunnion and the radius is increased or decreased by the large screw, which can be plainly seen in the latticed member over the large spur gear.

In addition, a portable self-contained grain elevator is supplied. This has a capacity of 2,800 bushels per hour, and is handled by the crane, when desired. The elevator leg is 75 ft. long and is driven by electric power generated on the crane barge itself.

CANADIAN MACHINERY AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol. V. September, 1909 No. 9

LOOKING AFTER THE WELFARE OF THE MEN.

There are so many companies and corporations who think of men as mere machines that it is a pleasure to note from time to time companies taking an interest in the workmen who toil for the good of their company. In other issues of Canadian Machinery we have referred to the provisions for the welfare of the men. In our June issue we referred to the men's rooms in the Hamilton Bridge Works, Hamilton.

The McClary Mfg. Co., London, have also provided rooms for the men. The dining room was opened on Saturday, June 19. It is a fine, airy place, about 100 feet square, where the men are provided with hot water and towels for cleaning their hands, and in addition are provided with tea, coffee and the necessary dishes without cost to themselves. The dishes are thoroughly sterilized after each meal. To the other provisions for the men's welfare are added a large number of current periodicals and playing cards for those who feel so disposed, while those more athletically inclined are provided with a quoiting ground. This move is an effort in the right direction to improve the health conditions of the men.

TWO URGENT NEEDS OF THE DAY.

Dr. Charles B. Dudley, in his presidential address before the American Society for Testing Materials, pointed out that more research and conscientiousness were needed in the work of to-day. In view of recent failures of material in large structures in Canada, and the many large buildings under construction, Canadian mechanical men should approach the problems with all the care and knowledge they can command. Employe and employer should unite in increasing the knowledge of materials and in securing the best workmanship.

In his address, Dr. Dudley said:

"The truth is we are using materials in construction without sufficient knowledge. There is crying need for experiment. Testing machines adequate to cope with some of the problems which now confront engineers do not exist. We are increasing sizes and constantly building larger structures. The factor of safety everywhere is largely a guess. We can not help feeling that no better use could be made of some small fraction of the millions that have been accumulated in connection with our great industries during the past half century than in the establishment of a Bureau of Engineering Research. Who will avail himself of this magnificent opportunity?

"The producer of material is anxious to secure the largest possible amount of successful output and the greatest possible amount of reward therefor. The consumer wants to limit this by restrictions as to quality, and to obtain the material at the lowest figure. The workman's interest is to secure the maximum of pay for the minimum of effort, and in this struggle it may perchance happen that the quality of work suffers. The employer's interests are clearly the reverse of the workman's, and so on. The foundations of these diverse interests are, of course, very deep, and with the present organization of society, it is not easy to see how they are to be obliterated or their antagonism neutralized. But, we beg to make one suggestion. Would not an infusion of genuine conscientiousness into our industrial life bring an amelioration? If a little less energy was expended in the mad race for wealth and a little more zeal manifested in maintaining the rugged virtues of honesty, integrity and fair dealing, would not some of the friction and contention of our present commercial life disappear? We must all live together, and surely harmony is better than contention. There are some things in life of more value than money."

MUNICIPAL ENTERPRISE.

Toronto owns a marsh containing several hundred acres, known as Ashbridge's Bay. After a great deal of strenuous kicking by two or three, the sale of 26½ acres has been made to the National Iron Works for $37,400.

The present council of Toronto is to be commended, for Ashbridge's Bay has been a source of much talk for the past twenty or thirty years. It is recalled that the iron furnace now located at Hamilton desired a site in Ashbridge's Bay, when R. J. Fleming was mayor. The same dog in the manger opposed the sale and Hamilton benefited by not only the iron furnace, but also by other companies which followed the iron furnace. Hamilton is to be commended for the enterprise in securing it.

With Toronto the same opposition has been going on since that time and now that a broader policy has been adopted, it is hoped that it may be continued and that Toronto may be an example to other municipalities in giving companies fair treatment in the sale of sites at a reasonable figure.

It is well known by men who know anything about financing new companies that, if the ground is leased, it mitigates against the sale of their bonds. If the opposition to the sale of Ashbridge's Bay were taken through the swamp, which is at present a breeding place for mosquitoes and bacteria, in a punt or canoe, they would, no doubt, be willing to give it away for the improvements that will be made. Many other cities would be willing to give the site as a bonus in return for the taxes and

for the employment which the works would give to hundreds of workmen.

We do not approve of giving companies large bonuses, but the broad policy now adopted by Toronto will be an example to other municipalities who wish to secure new industries.

GIVE HIM THE HORSE LAUGH.

If you have anything in your system work it out. Don't be afraid to stand up like a man and tell your boss or the head of your department just how you feel, writes Mike Kenny, in the Gimlet.

But for goodness sake don't sulk—don't pout—don't throw things around—don't pull down the corners of your mouth. Don't get in a dark corner with the other fellow and tell him all about it. That's the way cowards act.

If you are not afraid, if you know your reasons are good, if you know you are right, then you should not hesitate to stand up and give your boss the "straight goods."

Generally when a fellow sneaks around and mumbles to himself he is in the wrong and he knows it, and when he tells a fellow clerk his side of the story, he does not tell it straight.

May the good Lord deliver us from grouchy people—from the man who beckons to you to come with him under the stairs and then whispers his troubles in your ears.

If there is a man of this kind in your works, when he gives you the secret signal to come into the dark corner, give him the horse laugh. Tell him you live out in the sunshine, where the work is done and where you can do an honest day's work.

TREND OF TRADE IS UPWARD.

Canada's trade is booming again, and at the present rate of growth will soon reach the highwater mark of a couple of years ago. The total trade of the Dominion during the first four months of the present fiscal year, which is to the end of July, approached the two hundred million mark, totalling $191,919,304. Of this $111,791,842 was merchandise entered for consumption, a gain of $22,377,301. Dutiable goods were entered to the amount of $66,028,887, a gain of $13,810,834 and free goods entered were valued at $45,762,945, a gain of $8,566,467. Duty was collected to the amount of $17,855,948, an increase of $3,633,440. Exports of domestic produce totalled $73,398,595, a gain of $6,193,585.

For the month of July alone the trade of Canada totalled $56,250,000, a betterment of $7,500,000. In this month there was a gain of $9,500,000 in Canadian exports, and an increase of $7,500,000 in articles entered for domestic consumption.

The bank statment for July, as compared with the statement for June, indicates continued growth and expansion of trade throughout the Dominion. Deposits increased by $7,229,621. Current loans in Canada increased by $4,608,772, and call loans in Canada by nearly $2,000,000. Loans outside of Canada decreased by $1,219,115, thus indicating the continued withdrawal of funds from the United States to meet the business demands of the Dominion.

An astounding improvement is to be noted between the current statement and the statement for July, 1908, the aggregate deposits having increased during these twelve months by $122,000,000.

A comparison between the statements for July, 1908 and 1909, respectively, follows:

	July, 1908	July, 1909.
Current loans in Canada	$525,271,185	$539,821,041
Current loans elsewhere	23,153,095	32,753,385
Call loans in Canada	40,467,165	54,603,054
Call loans elsewhere	54,915,935	114,685,537
Deposits payable on demand	164,791,398	222,555,749
Deposits payable after notice	402,964,565	466,337,816

Official figures of Canada's pig iron output for the first half of 1909 are not yet obtainable, two of the largest producers still withholding their figures. From United States sources, however, estimated figures have been published, and while these are not always trustworthy, they seem likely to be accurate on this occasion.

According to the estimate referred to, the production for the first half of 1909 is the largest of any previous six months by twelve per cent., the figures being 349,641 tons in the first half of 1909, as compared with 311,046 tons in the last half of 1907, the best previous record. In fact, the first six months of 1909 totals more than the production of any whole year up to 1905. The outlook is for an equally good record during the balance of 1909, and it is probable that the figures for the year will exceed 700,000 tons.

TOPICS OF THE MONTH.

Toronto's National Exhibition this year opens on August 30th, and lasts for the following two weeks. It is hoped that the mechanical men, generally, will take advantage of the cheap rates and will visit the exhibition. It is a liberal education, to see the various exhibits and to mix with the people, and the visit will broaden the outlook for all those who attend from smaller places. Machinery Hall will contain factory equipment and machinery that will make it well worth the cost of attending.

* * *

The thirty-eighth annual meeting of the Canadian Manufacturers' Association is to be held in Hamilton, on September 14th, 15th and 16th. A number of most important matters are listed for consideration. The last day for receiving notices of amendment will be August 25th; nominations for the offices of president, vice-president, the executive council, and the various committees will be closed on August 31st; and all proposed resolutions must be submitted to the secretary before noon, September 15th.

* * *

Some excitement was caused at the Victoria Machinery Depot, Victoria, B.C., recently, by the discovery of an infernal machine in the tool box where the boilermakers store their tools. In a yeast tin, powder, rivet heads and iron filings were placed with matches arranged with the heads placed so that the slightest friction would explode the powder and scatter the missiles. The bomb was found by a boilermaker, who took off the top to investigate, and, miraculously, the thing failed to explode. No trace was found of the maker, nor can C. J. V. Spratt, manager of the Victoria Machinery Depot, the police or others, give any explanation of the reason for placing the bomb in the tool chest. As far as can be learned there is no trouble among the men employed in the shops. If the person responsible for this is caught an example should be made of him. We cannot afford to have the lives of our workmen or the property of manufacturers at the mercy of men without consciences.

The Work that is Applicable to Permanent Molds

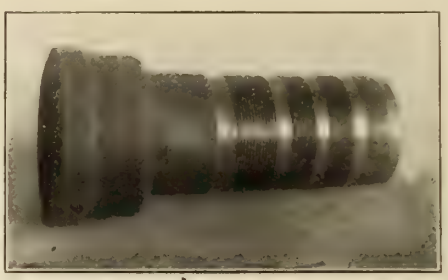
Second Part of Paper read before A.F.A. Convention in Cincinnati by Edgar A. Custer—First part Appeared in August Issue.

We have found that a good casting can be made in a cold mold without any trouble, provided the mold is perfectly dry. But the tendency of the iron to condense moisture from the atmosphere while heating up is so great as to make it almost impossible to get a good casting unless the pouring is done rapidly, so that the mold will be filled before the moisture is deposited upon the face of the mold. In a perfectly dry atmosphere, with a cold mold, the iron pours readily and makes a fine casting. The only reason it is desirable to have molds warm is that they will then keep perfectly dry. We would much prefer to do all our work with a mold at a temperature of not more than 125 to 150 degrees F. As a general rule the first casting is not a very good one, but after the casting has warmed up the mold, there is no further difficulty.

In order to preserve an even temperature in the mold it becomes necessary to put weight into it and pour the castings at such intervals that the temperature will not rise over a certain number of degrees. For instance, we found that casting a four-inch pipe, weighing 65 pounds, into a mold weighing 6,500 pounds every seven minutes, does not raise the temperature of the mold to more than 300 degrees. This matter of heating depends altogether upon the thickness of the casting, and the molds must be designed with that particular point in mind.

That a permanent core can be used in a great many cases has been shown. The use of this permanent core is necessarily limited to castings in which the core is either in a straight line or is in a regular curve. Combinations of straight lines, such as in T's or Y's, or double T's or double Y's, or straight pipes, are especially adapted to this feature. When the core is in the shape of a regular curve, or combination of a straight line and regular curve, it can be made in two or more pieces and easily withdrawn from the casting. This can be done in the case of L's, or sweeps. Irregular curves or cores that would be destroyed in removing them from the casting are, of course, not possible.

We have found that the best metal for these cores is ordinary cast iron, and that the same method of procedure must be carried out for the core as with the mold. There is plenty of time to remove the core and open the mold and yet have the casting without any hard spots. The use of permanent cores suggests the possibility of a machine for duplicate work that is to be made in large quantities, and this machine can be practically automatic in its operation. Pipe fittings, chain links, elevator buckets might possibly come under this class. This is, perhaps looking rather far into the future, but it is the logical outcome of the successful carrying out of the principle involved.



Thread from 8 to 3½ per in. Cut on Pipe Cast in Permanent Mold.

Removing Large Cores.

Another point: It has been found easy to remove a five-foot core in the manufacture of cast-iron soil pipe. It should be just as possible to remove a 12-foot core from a water-pipe. It is only a question of apparatus large and powerful enough, and removing at the proper speed. Cores made of steel and wrought iron have been tried, but give very poor results. The cast-iron cores require considerable attention for the first few pourings, to prevent burning and distortion, but after a few castings have been made the iron seems to become seasoned, and after 50 or 100 castings have been poured, very little care need be taken in regard to overheating the arbor or burning it by the impact of molten iron.

Soft cast iron seems to be the best medium for both molds and cores. It cracks less, and is not liable to distort as is the case with a casting made of low-silicon or very close iron. It may be that this is due to the fact that a high-silicon iron melts at a much higher temperature than iron containing a low percentage of silicon, and consequently requires a higher temperature to reach the point at which it softens.

The conclusions arrived at as the result of these investigations may be summarized as follows: Any casting that can be poured in a sand mold can be poured in an iron mold. If the iron is hot enough to run in a green sand mold it will surely run in an iron mold. Iron that is suitable for radiators or fittings, or brake shoes, or any other class of duplicate work that is made in the sand, will be suitable for the use of permanent molds. The same experience that shows the foundryman what is best for sand molding can be utilized in permanent mold work. It is true that a somewhat wider range of iron can be used in permanent molds for the same class of work than is the case in sand molding, but any change from the general practice in selecting irons for any particular class of work must be made with a great deal of care. It is, of course, a subject that demands close and incessant study, and every manufacturer who wishes to use permanent molds must give the same care and thought to this method that he gave to previous methods emp'oyed. When the high-class engineering and technical skill is applied to the permanent mold that has been devoted to the molding machines now in use, we may expect to see some very wonderful developments in the foundry line.

Temperature of the Iron.

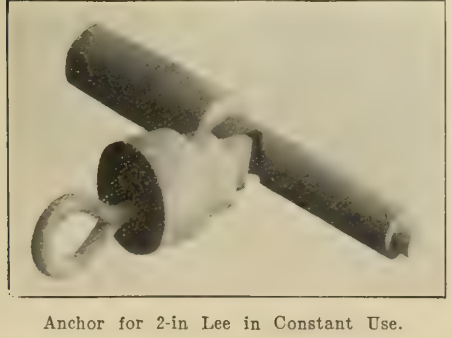
There is one more feature that has not been touched upon, and that is the temperature of the molten iron. In all cases, when using permanent molds, the iron as it comes from the cupola should be very hot, and should never be allowed to stand any length of time before pouring. The first element it loses in cooling is carbon, especially if there is considerable silicon in the original charge. Iron at 2,100 degrees F., with 2.5 per cent. silicon, will not hold as much carbon in solution as it will at 2,400 degrees F., and it is the carbon we wish to preserve. In fact, it is almost impossible to make a very thin casting in an iron mold, with iron containing 2.75 silicon and low

in phosphorus and sulphur, unless the iron is very hot. Our work has shown us conclusively that the best results are obtained with iron containing over three per cent. carbon and about two per cent. silicon. Again, the higher the temperature of the initial iron, the more time there is for the removal of the casting, and the longer shrinkage is delayed. The importance of hot iron is therefore evident, although there is but little loss of carbon when the silicon does not exceed 2.25 per cent., and ordinary diligence is used in pouring.

Prevent Sticking to Mold.

Some care must be exercised to prevent the casting sticking in the mold. It is sufficient to coat the mold occasionally with a mixture of thin oil and graphite. There is no virtue in any of the many coatings recommended other than keeping the molds smooth and preventing the castings from sticking. None will prevent chilling, unless laid on in such quantities as to form a substantial wall of inert material. The writer has used almost every available substance in an infinite number of mixtures, with but indifferent results. Mica, lithophone, clay, graphite, molasses water and clay, paraffin with any number of materials, have been tried, but one and all require a coating at each cast, which is out of the question in rapid work. A thin solution of wood alcohol and shellac, thickened with finely-ground clay, when applied to a slightly warm mold will usually prevent chill, but here again the mold must be cleaned and recoated for each casting. Silicate of soda when fused to the mold has but a very short life, and amorphous phosphorus has an entirely undeserved reputation in the line of chill prevention. The best way to prevent a chill is to take the casting away from the mold before the chill sets in.

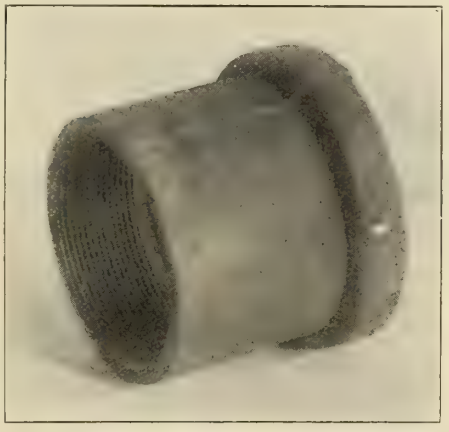
That this chilling does not take place until after the iron has been set sufficiently to handle is demonstrated by a small sample casting made especially for



Anchor for 2-in Lee in Constant Use.

the purpose. One side of this casting is soft and the other is chilled. The casting has been broken to show the effect. You will notice that the quality of the iron in the unchilled portion is of the highest character, and the facility with which it can be machined is shown by the section of pipe on which some threads have been cut. This sudden chilling to the point at which the molten iron sets produces an iron that is nearly homogeneous as it is possible to obtain. That it is entirely free from shrinkage strains is shown by this casting that was taken from the mold at a bright red heat and thrown into cold water. It is absolutely sound and free from all cracks, surface or otherwise.

Now, what peculiar molecular action is set up that produces this result in an iron that when cast in sand exhibits all the defects we are accustomed to see in sand molding? To get at this explanation we must begin with the great unmeasurable force of heat contraction and expansion. No one knows how many tons per square inch is exterted when molten iron cools. This force is always greater than the tensile strength of the material under treatment. If, now, molten iron be subjected to this enormous



Thread was Cut and micrometered, Then Heated and Quenched in Cold Water Six Times. With Distortion of Only .002 in.

force exerted through the mold swiftly robbing it of its heat, it probably follows that the molecules are crushed together with an enormous pressure, and since this action is a matter of a few seconds at the most, there is no chance for segregation, and the impurities remain in the same relative position in the casting that they occupied in the molten iron. That this peculiar action continues after the casting has been taken from the mold is shown by the small globules of iron that have been squeezed from the casting as it cooled. It is further shown by this bar of 1⅛" iron that was taken from the mold at a bright yellow heat, with the interior still molten. The excrescences on the top were formed as the bar cooled in the atmosphere, and the broken section will show that the bar is of equal hardness throughout.

Now, let us go a step further. It has been found that iron when cast in an iron mold and removed as soon as it

Crack in a Gate.

sets, possesses some unusual properties. For one thing it will take a temper, and when tempered will retain magnetism. If the casting be taken from the mold at a bright red heat and suddenly quenched in cold water, it has all the cutting power of a good high-carbon steel. This result is invariably obtained whether the iron be a high or low in silicon, phosphorus, sulphur or manganese. There is no evidence of what we generally speak of as "chill"—no white crystals are shown; in fact, an iron that chills white first in the mold and is then quenched in water, will not harden in the manner described, but will crumble when applied to the emery wheel.

The fact of the matter is simply that chilling molten iron swiftly to the point of setting, and then allowing it to cool gradually, produces a metal that is entirely new to the art. It has all the chemical characteristics of cast iron, with the exception of combined carbon, and it also possesses some of the properties of high-carbon steel. We have been taught that steel will not take a temper when it contains a very appreciable amount of free carbon, yet this piece of cast iron, that has .44 per cent. combined, and over two per cent. free carbon, has been tempered repeatedly, and will do better service in a lathe than a very good non-alloy steel. Once this peculiar property is imparted to the casting, it is impossible to eliminate it except by remelting. A bar of iron so treated can be held in a flame until the metal drips from the end, and yet quenching will restore it to its original hardness. The analysis of the piece of treated iron before us is as follows:—

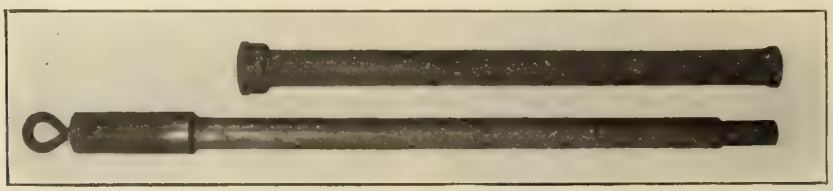
Si	2.28
Phos.	1.21
Sul.	.108
Mn.	.41
T. C.	2.05
C. C.	.44

An analysis of another piece shows:—

Si.	2.24
Phos.	1.12
Sul.	1.01
Mn.	.38
T. C.	3.02
C. C.	1.54

It will be noticed that the carbon for the first piece is low—much lower than we like to have it for our general work. But the remarkable feature about this particular phase of the process is that such a close-grained, tough and strong iron should be produced with an analysis such as given above. The analysis of this iron taken after it is removed from the mold, and without quenching, is the same as above, except that the combined carbon is not over .28.

The character of the iron before being quenched, is very fine, close-grained and yet it is easily machined. In all this work there are no blowholes, and any dirt that enters into the piece must come from the ladle.



A 4 in. Pipe and Permanent Core.

In some of our earlier writings the effect of the carbon in cast iron was exhaustively treated; in order to make clear the chemical changes that occur in in this process, it may be well to repeat some of the conclusions:—

All the carbon in molten iron is in solution, and exists in the combined form. Now, if molten iron be instantly cooled to 1,000 degrees F. all the carbon will be held in the combined form—there will be no free carbon. If, however, it be instantly cooled to the point at which the iron sets, and then allowed to cool normally, the carbon will be in the combined form at the time of setting, but will change to the free form as the cooling progresses. This formation of free carbon is very rapid; the major portion present in the casting is formed within a few seconds after it is taken from the mold. The analyses below give a very fair idea of this action, the pieces in question being 6 x 1¼ x ½'':—

	C. C.	T. C.
Cast in sand and cooled normally	.27	3.20
Taken from permanent mold at bright yellow and quenched	1.50	3.02
Taken from permanent mold at bright red and and quenched	.49	3.10

It will be seen from this that two-thirds of the combined carbon has been changed in the few seconds required to cool from a bright yellow to the bright red. The free carbon in all these castings is not in the form of graphitic carbon, as we usually see it in ordinary cast iron, but partakes more of the character of annealing carbon. It is probably this annealing carbon that gives permanent mold castings their unusual strength and toughness.

The difficulties that confront an investigator who attempts to look into the manufacture of castings are so great, owing to the peculiar conditions that surround the art, that much of the information that has heretofore been given is of value only when the local conditions are fully known. Our present-day technical journals, with their earnest and persistent work, have gone far towards making the foundryman's art a scientific process; but, after all, the sum total of all these efforts has been to seek a remedy for the difficulties encountered, in a process that in itself must of necessity often give unsatisfactory results. Sand as a medium for making general castings will always hold its own. We have discovered nothing that is so cheap and so efficient, considering the vast range of work it is required to do. Its deficiencies are well known; but so far, all efforts to overcome these deficiencies have been solely in the direction of shedding light upon the characteristics of the iron used. We read a great deal about the evils of sulphur and of phosphorus, and we find that these evils are not exaggerated when it comes to making castings in sand. But to my mind, the reason why phosphorus and sulphur are the bane of the foundryman's existence is not because of the mere fact that sulphur and phosphorus are present in the casting, but because in slow cooling in sand molds, sulphur and phosphorus segregate. Therefore, the great evil in cast-iron work is not so much the presence of impurities, but the fact that segregation allows these impurities to mass themselves and thus destroy the homogeneity of the iron.

Our experiments have shown that an iron containing 1½ per cent. phosphorus when cast in an iron mold is as strong as iron containing .4 per cent. when cast in the same mold. We can find no perceptible difference in the tensile strength under these circumstances. The same is true with sulphur at .1 and sulphur at .03, and it would seem, therefore, that the mere fact of the presence of sulphur and phosphorus in these irons is not deleterious when segregation is prevented.

It is not within the province of the sand mold to prevent segregation, and the remedy can not be looked for from that point; nor is it possible to prevent a certain amount of segregation in a permanent mold when the casting is so thick in section as to make the cooling comparatively slow. Fortunately, most of the duplicate work in this country to which the permanent mold is applicable is comparatively small section—very little of it is more than 1'' or 1½'' in the thickest part, and when a casting in not thicker than the figures given above, and is made in a mold properly designed, there will be absolutely no segregation.

The formation and segregation of graphitic carbon is familiar to all, and its weakening effect upon cast iron is very well known. The casting made as above described, and containing free carbon that is thoroughly distributed throughout every portion of the iron, and is not allowed to collect in large flakes or bunches, will be as easly machined, and will have greater tensile and crushing strength than a casting made in a sand mold in the ordinary way.

The position the writer takes in this matter is that the evils of phosphorus and sulphur are due, not to the fact that these elements are present in the casting, but to the fact that the slow cooling allows them to collect in masses. If segregation were prevented a high-phosphorus or a comparatively high-sulphur casting would be just as strong as if these elements were low in percentage.

So far, we have discussed simply the use of the permanent mold as applied to the foundryman's art, with iron taken from the cupola. If, then, permanent molds can be used with success in the foundry, and a system of continuous pouring be inaugurated, which in duplicate work would obviate the necessity of having molders, why is it necessary to melt pig iron in the cupola? What could be more ideal than a series of permanent molds supplied with molten iron practically direct from the blast furnace? The interposition of a reheating ladle such as is used by the steel makers of to-day, presents no unusual

features; and this ladle makes possible the treatment of the molten iron. Modern practice has eliminated much of the uncertainty in blast furnace work, and it is not unusual to find these furnaces so equipped as to produce an iron that varies but few points from the quality desired by the foundryman. The molten iron we get from the blast furnace is much hotter than that obtained from the cupola, so that there is every reason to believe that the castings we would obtain would be of a better quality than when the pig is remelted in the cupola.

In our work we have conclusively demonstrated that it is immaterial whether an iron contains 1.75 or 3% silicon, so long as the molten mass is at the proper temperature, so that the high temperatures obtained from the blast furnace would go far toward offsetting the variations in the impurities. Given, therefore, a furnace properly equipped and properly handled, with the interposition of a reheating ladle, there is no reason why a very high class of work should not be obtained with the use of permanent molds. How far this thought can be carried out lies with the blast-furnace owner.

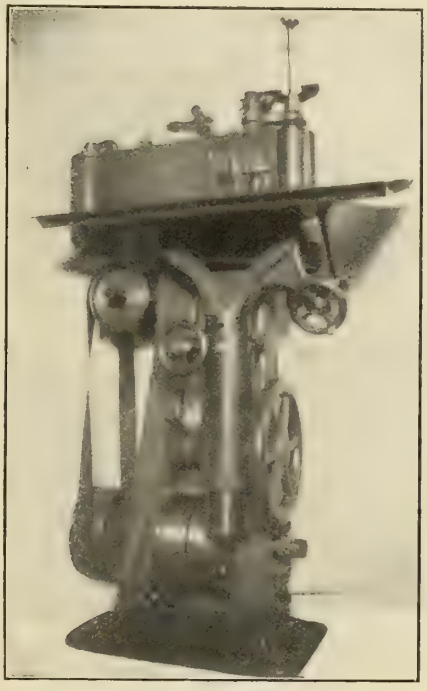
PATTERNMAKERS' POWER TRIMMER.

The proper jointing of patterns is an important part of a patternmaker's work and the machine shown has been designed to assist in making joints of all kinds accurately and rapidly. In the trimmer illustrated a sanded belt replaces knives, the work being held against this at any desired angle by the tilting table in front and its guide. The sanding belt is 6 inches wide, and runs over a metal backing plate, which keeps it perfectly flat while the work is being pressed against it. This belt is automatically moved up and down through a limited range by a very ingenious arrangement of the idler pulley at the left. This is shifted into an inclined position, first one way and then the other, so that the sanding belt is continually traveling up and down, which distributes the wear and insures better work.

The table is 28'' x 10'' and has an extension that goes around the leading roll, which is very useful for inside circular work. It can finish core boxes to a knife line, with a great saving of time, draw prints, and, in fact, round and square prints can be cut to shape with even draft on all sides. For small core boxes or inside of small circles, there is a spindle on top of the leading roll on which may be turned a special roll for any purpose.

The tension of the sand belt is controlled by a toggle, making it convenient to take off and replace belts. To increase or reduce the tension a knurled nut is close to hand over the toggle. The tension is not rigid, but has a cushion spring in the toggle so that no undue strain need come on the belt.

The table is adjustable vertically and horizontally, all movements being obtained easily and rapidly by handwheel and not requiring the use of a wrench in any case. Careful attention has been paid toward making this as convenient as possible to the patternmaker. It is designed and built by Alfred R. Benn,



Trimmer Showing Table Adjustment.

1757 Seventy-second Street, Brooklyn, N.Y.

HANDY SHRINKAGE RULE.

A handy shrinkage rule, as shown in the accompanying illustration, has been brought out by the Keuffel & Esser Co., Adams and Third Streets, Hoboken, N.J., and 252 Notre Dame Street, Montreal.

Keuffel & Esser Shrinkage Rule.

It is intended to fill the demand for an accurate, well finished shrinkage rule at a moderate price. The particularly desirable feature of this shrinkage rule is that each of the four edges is graduated in 16ths, instead of in 8ths, 10ths, 12ths and 16ths, on respective edges, as in the case with the old style shrinkage rule. All the edges are numbered from left to right, so that the rule is always in proper position for use. The rule is two feet long, nominal size, the graduations being made in four different scales for 12.1, 12⅛, 12 3-16 and 12¼ inches shrinkage measure, respectively, to the foot.

ANTHES IN THE WEST.

A certain railroad in Western Canada is not yet in very good working condition, and the trains consequently run at a phenomenally low rate of speed. When the conductor was punching his ticket a few days ago, Laurie Anthes, of the Toronto Foundry Co., who is on a trip to Edmonton and other western points, remarked:

"Does this railroad company allow passengers to give it advice, if they do so in a respectful manner?"

The conductor replied in gruff tones that he guessed so.

"Well," Anthes went on, "it occurred to me that it would be well to detach the cow catcher from the front of the engine and hitch it to the rear, for we are not liable to overtake a cow, and what's to prevent a cow from strolling into this car and biting a passenger?"

CUPOLA PRACTICE.

By T. Ben Bennett.

Generally speaking, articles written by foundrymen refer to large cupolas and up-to-date foundries. Now I judge by the questions asked by many foundrymen that a great many of its readers are handling small furnaces in a not too well-equipped foundry. Now the man who can select from his yard the grades of iron laid down by the foundry chemist to make a proper analysis for a line of work and who is melting fifty ar sixty tons in a seventy ton furnace, will not meet with the same kinks as the man who has only one grade of iron (the supposed analysis of which is furnished by the dealer) and a scrap heap and who is trying to melt seven tons of iron in a furnace of five ton capacity.

I believe small foundries require a more all-round up-to-date manager than a large up-to-date one. Large foundries generally have experienced melters, foundry chemists and a foundry superintendent, who is generally a practical man. This relieves the foreman of a great deal of responsibility.

As I am operating a small furnace and have had considerable experience on small furnaces in shops, I thought

my experience might be of help to others who are meeting with difficulties, which I have surmounted. Our melter was an intelligent man drawn from the laborers' gang. He was very anxious to learn and has made a first-rate melter. When he leaves me, which he may do some day, and goes to a larger shop, I shall not try for an experienced melter, but shall do as I have done in the past, take an intelligent laborer, show him that the responsibility of a good heat rests with him; instruct him thoroughly in the method of handling a cupola and I shall soon have another good melter ready for the larger shops, to offer him as an experienced melter, a larger salary that I can afford to pay. I have yet to see a good up-to-date man on a small furnace make a failure of a large furnace, yet I have known good men handling a furnace of sixty tons make a total failure on a small furnace of eight tons.

The furnace I am about to describe is not a model one by any means and could be improved in almost every respect, but it is the furnace we have to melt with.

The Cupola.

The cupola is 36 inches inside the brick lining. We have two linings of brick, the one next the shell is ordinary fire brick, standing on end, flat side to the shell. This is merely to protect the shell. The inside lining is built of circle brick with an ordinary sand bottom, the distance between the bottom and the tyyeres is too great, so that we are obliged to use a nine inch sand bottom, which reduces tne distance to 12 inches. From tuyeres to melting point is about 16 inches, melting zone is about 20 inches, charging door is about seven feet above tuyeres (which is far too low). It has a wind belt five and a half inches by two feet with eight tuyeres 3x3¼ on wind side flaring to 6 x 3¼ on inside.

We use a wind gauge of our own construction. A glass tube is marked off in inches, the water rests at 0' each inch, and as the pressure forces the water up represents 1 oz. wind pressure, the highest pressure we get is about 7½ to 8 ozs. When melting six to seven tons I would use a higher pressure if we nad it. I have experimented considerably as to advisability of early and late lighting of the furnace and have found the following gives the best practical results.

We place on the bottom enough shavings and hardwood cuttings to ensure the coke getting a good start. There are four hundred lbs. of coke. At 1.30 p.m. we light the shavings. As soon as the coke shows red through the top, we insert a bar through the tuyeres to level the coke down on the bed as the wood burning from under often leaves the coke arched up, which would give trouble when the iron was placed on and the coke settled unevenly. We then charge 300 lbs. more coke (less about three shovels or 50 lbs.) On this 2,100 lbs. of pig iron and 1,100 lbs. of scrap in alternate layers, before putting in the last 600 lbs. of iron we add the three shovels of coke held back and 3,200 of iron. The second charge is 150 lbs. of coke then 1,000 lbs. of pig and 500 of scrap. This fills the furnace to the door. Now it is necessary to note the natural draft through the furnace. If this is necessary, we leave the furnace door open and the tuyere eyes also open. If the draft is heavy and the coke is being consumed too rapidly, we close the tuyere eyes leaving the furnace door open.

The top half of the front is left open, the lighting finished, at 4.15 the wind is put on, and iron appears about 4.25. We allow about 25 lbs. of iron to run from the furnace then we bank it up till there has melted about 800 or 1,000 of iron, when we tap out and begin pouring molds. As the iron melts down the other charges follow at 150 lbs. of coke to 1,500 lbs. of iron up to the full heat of six or seven tons.

Our melting ratio being about 7.56 to 7.80, this gives us a good hot iron which is necessary, as much of our work is very light. We run the iron into a large bull ladle so as to allow a thorough mixing.

In order to handle a furnace successfully a melter must know the weight of his coke and also the displacement in his furnace of a given weight of coke. As the lining burns out and the melting point becomes larger in diameter, we increase the coke on the bed to bring it up to the proper height and also increase the weight of iron charged correspondingly.

Some foremen are having trouble with chilled iron or rather with white streaks of chilled iron running through the grey iron castings. I venture to say that this unexplainable change in the metal takes place in every case in the iron first tapped from the furnace. Up to recently I have had considerable difficulty with this hard iron problem, especially when melting certain grades of pig iron. The cause of this has been ascribed to the sand used in the furnace bottom being too wet, too hard rammed and to a green ladle being used. While this will cause the chilled iron to appear, removing the above causes does not always remedy the difficulty as I have found to my own loss.

After seeing that the sand used is as dry as possible for the purpose of a bottom and that it is rammed properly, I overcome any further difficulty by allowing as much molten iron to collect in the cupola as I can safely handle before making the first tap. My reason for this is, that the first iron melting and coming through the bottom of the coke bed, to the more or less damp sand bottom, becomes a mass af small particles of chilled iron. Now the more iron allowed to melt and mix with the first melted iron, which has been chilled in warming the sand bottom, the softer the metal from the first tap should be. Unless the bottom is very wet or rammed far too hard, the hard iron will not appear in any but the first iron drawn from the cupola. Of course a wet boiling ladle would have the same effect as a wet bottom in the cupola, only not so great, as the first ladle of iron will dry the ladle whereas one ladle of iron will not dry the furnace bottom. Some reader may say that allowing the iron to run in a large bull ladle before distributing to hand ladles, as mentioned in the forepart of this article, should have the effect of mixing the metal and overcome the difficulty; but for some reason, which I cannot explain at present, it does not mix in the bull ladle and will show through all the castings formed from that iron. With that grade of iron and with other conditions being normal, the only way that I have been able to get over the trouble is to allow as much metal as is convenient to collect in the cupola before tapping out.

EDUCATION SYSTEM FOR MOLDERS.*

The Association Institute of the Y. M. C. A., Hamilton, Ohio, conducts a class for those now employed in the foundry and teaches them what they ought to know about the trade, things that cannot be learned in a shop.

The course consists of twenty-four lessons and covers the field very thoroughly. Besides taking up actual molding, the methods are fully illustrated. One lesson takes up the trade of molding in general, another bench molding, sand, gaggers, venting, shrinkage, casting special pipes in green sand, how to get castings clean, weighing down copes and skin drying.

Lesson 12 illustrates the many methods of making Corliss and slide valve engines and air compressors. Lesson 13 illustrates methods of making gas engine, marine, automobile and other cylinders.

Other lessons include making of cores, another use of wet blacking, burning, use of flour, rosin, core compounds, etc.; treatment of the laying out of plates for loam rigging, illustrating the making of a plain cylinder; general principles of loam molding and sweeping of wheels in loam illustrating the

*Articles on Technical Education have appeared in March, November and December, 1908; January, February and March 1909, issues of Canadian Machinery.

most modern way of sweeping wheels in halves from two centres by using one spindle only.

Lesson 21 is sweeping a large pump air chamber. Others are on how to find the capacity of ladles, etc.; making permanent molds and finding the weights of castings, cylinders, wheels, weights of castings from patterns, etc.

Mr. James A. Murphy, superintendent of the Hooven-Owens-Rentschler Co. foundry, teaches this class. Mr. Murphy is especially well qualified to have charge of this work. His training, experience and present position peculiarly fit him for it.

Students are especially requested to ask questions pertaining to shop troubles with their work. At least fifteen minutes of each evening is devoted to this part of the work.

Models and blackboards are mostly used. Drawings are also used and the students are taught how to read them.

Winona Technical Institute.

Winona Technical Institute is a group of trade schools, affording instruction in iron molding, printing, lithography, carpentry, electricity, mechanical drawing, civil engineering, machinery, bricklaying, pharmacy, chemistry, house and sign painting, interior decorating and paper hanging and mantel and tile setting.

The foundry school was established for two purposes. One is to broaden the opportunities for young men to learn the trade of iron molding, which are restricted under the old shop apprenticeship system, the other is to draw upon the school for young men to help carry on the foundry business. Another reason for establishing the Foundry School is, in shops where apprentices may be received, the pressure of business is such, that superintendents and foremen are unable to give beginners merited attention.

Equipment.

A Whiting cupola; No. 9 Buffalo blower driven by a twenty-five horsepower motor; a traveling crane supplied with a General Pneumatic Company hoist with a lifting capacity of five tons, traversing the entire length of the building; a large drying oven of the latest improved type for large cores and dry sand molds, together with portable ovens for drying small cores. The core room, besides other appliances, also contains one Hill-Griffith portable oven, one Millett portable oven, and a Wadsworth core machine of the latest improved type. A Steele Harvey crucible melting furnace is used in melting copper and its alloys. The general foundry equipment consists of one Hanna and one Deane pneumatic sand shaker, the Tabor, Pridmore, Stearns and Cincinnati molding machines, a universal power saw used in fitting up flasks, etc., besides all other appliances necessary to the modern foundry practice. An Ingersoll-Rand air compressor with a capacity of 215 cu. ft. of free air per minute furnishes air for the pneumatic appliances. The cleaning room adjoins the foundry and is equipped with one Farnham sand blast, exhaust tumbling mills, grinders, pneumatic chisels, etc., in fact everything necessary to facilitate the work in this department. The National Founders' Association co-operates with this department in every way.

T. H. C. Homersham, director of Thwaites Bros., Ltd., engineers, Bradford, England, is paying a visit to Canada this month (September) with a view to arranging representation in the Dominion, and studying the requirements of the Canadian market. The manufactures of Thwaites Bros., Ltd., cover a very wide range and include power plant, machine tools and foundry equipment.

LIMIT GAUGES.

The following tables belong to the article on "Limit Gauges" on pages 35 and 36 of the August issue Canadian Machinery. They are fully explained in that number.

TABLE B.

Formulae for extension of tables of limits over 6".

Class		
A	High limit	$+\sqrt{D}\times.0006$
	Low "	$-\sqrt{D}\times.0003$
B	High limit	$+\sqrt{D}\times.0008$
	Low "	$-\sqrt{D}\times.0004$
P	High limit	$-\sqrt{D}\times.0002$
	Low "	$-\sqrt{D}\times.0006$
X	High limit	$-\sqrt{D}\times.00125$
	Low "	$-\sqrt{D}\times.0025$
Y	High limit	$-\sqrt{D}\times.0010$
	Low "	$-\sqrt{D}\times.0018$
Z	High limit	$-\sqrt{D}\times.0005$
	Low "	$-\sqrt{D}\times.0010$

For Classes F and P no exact figures are generally useful, as conditions vary so widely as to design.

TABLE A.

Class	Nominal Diams.	Up to ½"	9/16 to 1	1 1/16—2	2 1/16—3	3 1/16—4	4 1/16—5	5 1/16—6

NOTE—Run Fits:

Class X is suitable for engine work and other loose fits.
Class Y for high speed work and good average fits.
Class Z for very fine work, tools, etc.

The Tolerance is in each case the difference between the High and Low Limits and represent the working margin.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shops.

Hall & Wallace are erecting at Vancouver a $21,000 machine shop.

The Vancouver Furnace Co. are erecting a $2,500 shop and foundry.

The striking Hamilton moulders have taken out a permit for a foundry building.

The Transcontinental Ry. will erect machine shops at St. Perpetue and Baker Lake, Que.

The I. C. R. is calling for tenders for the erection of car repair shops at St. John, N.B.

The International Harvester Co., Hamilton, says that the stock it allotted to its employes has been over subscribed.

The M. C. R. locomotive shops at St. Thomas after being on short time for several months, have started working full time.

The Westminster Iron Works is shortly to make an addition to its building in order to accommodate its growing business.

The Belleville Brass and Steel Works have recently been so rushed with orders that they have found it necessary to work night and day.

John F. Bethune and ex-Chief Engineer Tye, of the G. T. P. are forming a company to establish at West Fort William a steel plant and car-building shops.

The Hydro-Electric Power Commission has made application to the Town of Dundas for the privilege of using the north bank of the Desjardins Canal as a right of way.

At a meeting of the board of directors of the Brandon Machine Works, held recently, it was decided to amalgamate the company with that of the Stewart Nelson company of Winnipeg.

The $100,000 that the directors of the Nova Scotia mine at Cobalt have voted is for the purpose of erecting a twenty-stamp mill with an amalgamation and cyaniding process plant.

The Reid foundry at Ingersoll is likely to be re-opened. Stephen King, a prominent hardwareman of that town, has purchased the property with the prospect of rebuilding and carrying on the business.

The Sherbrooke Construction Co. has the contract for erecting the new C.P.R. buildings at Sherbrooke. The new structure includes a station, engine house, coal chutes, machine shop, and store and oil house.

Arrangements are being made by General Manager Chamberlain of the G. T. P. to give out contracts within a short time for the erection of the company's workshops and roundhouses on the main line just north of Edmonton.

The Belleville Iron and Horseshoe Co. have just closed their first year under the present management and they do this with a good balance on the right side of the ledger, the business having increased every month this year.

Work has commenced on the installation of the electric lighting plant at Ladysmith, B.C. Already the agents have begun to collect the material for the plant, and C. R. Yuill is making preparations for the delivery of the poles.

A. C. Rioux's new machine shop at Claresholm, Alta., has a complete equipment. The power is derived from a 10-horse power gasoline engine. There is no other foundry nearer than Calgary 82 miles to the north, and Lethbridge, 65 miles south.

A fourth copper furnace has been "blown in" at the smelter of the Consolidated M. & S. Company, at Trail. The smelter now has four large copper furnaces and can now reduce about 2,000 tons of ore in 24 hours. It is evident that additional furnaces will have to be installed before many months.

The McGuigan Construction Co. is erecting the towers on the power transmission line between Dundas and Niagara Falls. Two large gangs of men are at work between the two points, and a third has started to build the Toronto line between Oakville and Toronto.

Conditions on the coast appeal so strongly to J. C. and Angus McDonald, of Grand Forks, B.C., that they will move to Vancouver their large steel and iron plant, which has been operated in the Boundary mining town under the name of the Grand Forks Structural Iron and Steel Co.

Russell Brothers, who have been engaged in the McKinnon Dash and Metal Works, St. Catharines, for years, have taken over the Ford & Dickenson plant, in the buildings at the old fair grounds, where they will enlarge and improve the premises, which will hereafter be known as the Russell Machine Company.

Concessions were made by the representatives of the National Iron Works to the Toronto council. In addition to the terms already named the company agree to use the property for their own purposes solely, to spend $100,000 within a year from the date the agreement is signed, and to do their own dredging.

Fort William is to have the first steel dry dock installed at the Canadian head of the Great Lakes. It will be located in McKellar river and will be operated in conjunction with the shipbuilding plant of the Great Lakes Dredging Co.

The Silliker Car Co., Halifax, are now engaged in building steel cars for the Ontario Government Railway. The cars are the first of she kind ever constructed in Nova Scotia. This firm has recently received several good orders for cars and everything is booming at the plant. More than three hundred men are employed by the company, and all the skilled men who apply are taken on.

L. D. Barchfield, representing John Patterson, of Hamilton, and the interests that electric railway promoter represents, says that definite information with respect to the Galt-Hamilton Electric Railway may be expected any day. All the money required for the enterprise has been raised and both the Guelph and Galt lines will be built at once. It is expected that construction work will start in a few weeks. As a very large force will be put on it is believed that the road will be finished within one year.

Plans for the establishment of iron and steel works in the vicinity of Vancouver, representing an investment of nearly three million dollars, are considerably advanced. The proposed enterprise is being initiated by James A. Moore, a well known Seattle capitalist, in conjunction with prominent local capitalists. It is the intention of the promoters to draw their supplies of raw material from the vast iron deposits at Quatsino sound, Vancouver island, and from Texada island. Construction work, it is expected, will be started early next year.

A company has been formed at Vancouver to take over the business of McDougall & Jenkins, boiler-makers, machinists and engineers of Victoria and Vancouver. The new company, to be known as the McDougall Jenkins Co., will erect a plant which will be unsurpassed in the province. Machinery will be installed to enable the plant to handle all kinds of shipping and general engineering work, which is on the increase here just now. The former members of the firm will be retained. The council of North Vancouver will give the company special consideration in the way of freedom from taxation for a period of years and a supply of water at a nominal rate.

Since the rolling mills at Belleville closed down a few weeks ago for necessary repairs great improvements have taken place in the plant, several thousand dollars having been spent in improvements. An additional engine has been installed to take the place of the high speed engine running the fans. The old high speed engine is now in the power house where it will be used in running a generator. A new set of bar rolls has been added to the 18-inch mill. New rolls have been placed in the 12-inch mill. The 9-inch mill has been completely overhauled and new roughing rolls and new roughing plates and feed rolls added. The furnaces have been rebuilt, the boilers inspected and retubed and many other necessary repairs were completed. The mills started full blast with a large staff last week.

It is reported that the London Electric Co. is figuring on buying water-generated power to fight the city's Niagara power plant. It is said the company is carrying on negotiations with the big electrical merger, which holds a charter for a line from Hamilton to Brantford, and Brantford to London. The merger will sell power to consumers and will supply the London Electric with current from the Cataract Power Co. at Hamilton or from the big private plants at the Falls.

The Power Committee of the London City Council have recommended for acceptance tenders for a considerable quantity of equipment required for the distribution station. The contract for poles was given to the Bissell Company, of Toledo. The same firm got the contract for cross arms, the London Bolt & Hinge Co. obtained the contract for braces for $423.90, and for bolts, etc., for $317.88. The wire contract was awarded to the Wire & Cable Co., Montreal, for $9,292.50. The Northern Electric Co., Toronto, was given the contract for pins for $320, and the Locke Insulator Co., New York, was awarded the insulators for $640.

Municipal Undertakings.

R. S. Low has the contract for installing sewers at Sydney, C.B., at $20,000.

The municipality of Richmond, B.C., is planning for a water supply system.

Work has been commenced on the new $20,000 waterworks system at Francis, Sask.

The B.C. Government have decided on the expenditure of $35,000 on waterworks improvements.

Bids will soon be asked for the construction of the proposed sewer system at Barrie, Probable cost, $30,000.

Montreal's Finance Committee has decided to vote $17,000 for the purchase and laying of water pipes in that city.

Laurie & Lamb, Montreal, have been awarded the contract for a Heenan refuse destructor for the city of Westmount.

New Westminster's waterworks scheme is estimated to cost $378,000, of which Richmond municipality will contribute one-third.

Ratepayers of Notre Dame de Grace having voted $350,000 for public improvements, about $125,000 of this will be expended on sewers, work to begin this fall.

The North Sydney, C.B., Town Council have decided on the extension of the sewerage system on Margaret Street. Work will be proceeded with at once.

Broley & Martin have secured the contract for constructing the pipe line from Fairy Creek to connect with the present Fernie, B. C., waterworks system. Work will be commenced at once.

New Westminster, B.C., ratepayers will shortly be asked to approve of a by-law to raise $234,000 for waterworks improvements, and $104,000 for street improvements, the latter amount including a large sum for street lighting.

The contract for a new steel tower at the Shelburne waterworks, to replace the present wooden trestle and tank, has been awarded to the Jenks-Dresser Co., Sarnia, at $4,325, for a 60-foot steel tower and steel tank of 100,000 gallon capacity.

The Regina Waterworks Committee accepted the tender of the Canadian Iron Corporation, Fort William, for 1,710 tons of 18-inch pipe at $40 per ton, 122 tons of 6-inch pipe at the same price, f.o.b. Regina, and 8 tons of specials at $65 per ton. The contract for valves was given to the Canada Foundry Co., Toronto, and the contract for lead piping, curb braces ,etc., to James Robinson, of Winnipeg.

Victoria will undertake a large number of sewer works which have been held up. At a recent meeting of the Streets, Bridges and Sewers Committee, the list of works was passed and work on the construction thereof will be proceeded with at once. The cost of the works will aggregate $40,825. There is now at the disposal of the city for sewer purposes about $60,000.

N. T. Cooper, chairman, of Clinton's (Ont.) Waterworks Committee, writes that contracts for waterworks have been awarded as follows: Pipe laying, T. M. Cullen, Huntsville, prices ranging from 18 cents to 30 cents per foot; cast iron pipes and special castings, Gartshore-Thompson Co., Hamilton, $32.20 per ton; construction of 80-foot stand pipe and foundation, Hunter Bridge & Boiler Co., Kincardine, $5,000.

The Montreal Water Committee have awarded the contract for 50 additional feet of concrete conduit to the shore end of the present conduit to P. McGovern, the present contractor of the conduit, for $9,950. The contract for six-foot steel piping to run out into the river for a distance of 60 feet, was awarded to the John McDougall Caledonia Iron Works Co., for $2,788. The contract for a sluice gate was awarded to the Coffin Valve Co. for $1,485.

Railway Construction.

The C.P.R. will spend $130,000 on terminal improvements at Sherbrooke.

Construction work has been begun on the last section of the Chilliwack extension of the B.C. Electric Ry.

The Montreal and Southern Counties Electric Railway will connect St. Lambert and Longueuil with Montreal.

The Lindsay Construction Company is to build a branch railway from Nictaux Falls, N.S., on the H. & S. W. Railway to the mines at Torbrook.

Berlin ratepayers have approved a by-law to raise $49,000 for double tracking a section of the street railway track between Berlin and Waterloo.

The C.P.R. will spend $75,000 on improvements at Aroostook Junction, N.B. Tenders for the extensions, which include a six-stall engine house, turntable and pit, will be opened shortly.

The B.C. Electric Railway Co. will shortly call for tenders for the grading and tracklaying on the Lynn Valley extension. It is hoped to have the extension in operation this autumn.

The C.P.R. will likely construct a line on the east side of the Fraser River from Cisco Flat coastward for 65 miles. This will give that railway a line on both sides of the Fraser. The route is also sought by the G.T.P. and C.N.R. for entrance to Vancouver.

A deputation of English capitalists visited Chatham recently, and in company with the directors made an inspection of the Windsor, Essex and Lake Shore Railroad. If they can be induced to put up the capital they talk of doing the road will immediately be extended to Chatham, and later it is the intention to build it on to London.

James J. Hill has men surveying the Crow's Nest coal field district, north from Flathead County, Montana, and there was filed with the Secretary of State a resolution by the directors of the Great Northern, announcing that company's intention to build northward into Saskatchewan.

The Canadian Northern have decided to construct a new main line to Edmonton, using their Winnipeg-Brandon-Regina route as the first section. From Regina the Prince Albert branch will be utilized to a point near Craik; from there a new line will be built crossing the South Saskatchewan at the Elbow and running northwesterly to Edmonton, and on to the Pacific.

The following plan of railway extensions in Alberta has been approved of by the Minister of Railways Canadian Pacific line from Langdon to a point 45 miles north and then to a point on their line between Penhold and Red Deer, and of the Canadian Northern from Strathcona southwest crossing the Calgary and Edmonton line just north of Red Deer, passing near Red Deer, and south to Calgary, and also of the G.T.P. from Riley on the main, southerly to near Pound Hill through Camrose, passing near, but west of Content and close to Three Hills, south of Calgary.

The survey work for the new Victoria and Barkley Sound Railway is progressing satisfactorily under the charge of C. Hoard, the engineer in charge. The new line is to go around the head of Esquimalt Harbor near the J. H. Todd cannery to Parsons Bridge, thence to Sooke Harbor, and so on up the coast to Barkley Sound. This railway will tap a very rich country both from an agricultural standpoint as well as the heavy timber, which alone will afford traffic for the railway for years to come. The construction and completion of this line will mean much to Victoria.

Electrical Notes.

Coaticook, Que., intends spending $17,000 on an electric plant.

The Ottawa Electric Co. will build a $20,000 addition to their Chaudiere power house.

Kamloops council is considering having a 35 arc light system instead of a 25 arc system.

Sherbrooke intends adding 1,700 h.p. to its plant on Magog river at a cost of $50,000.

The Manitoba Telephone Commissioners have 3,000 applications for permission to build rural telephone lines.

John Hayman, London, has the contract for the erection of the $40,000 Hydro-Electric power station at Dundas.

The rate of motor power on small motors in Lindsay has been reduced $15 a year by the Lindsay Light, Heat & Power Co.

The Bell Telephone Co. is planning to place its wires in London in conduits the cost of such work being estimated at $50,000.

The transformer station of the Cataract Power Co., at Dundas, was destroyed by fire recently. The damage is placed at $45,000.

Mr. Acres, hydro-electric engineer, stated that the work on the Dog Lake falls storage dam at Port Arthur was to be commenced at once.

The British Columbia Electric Co. has awarded to Malcolm & Dinsdale the contract for an addition to its plant at Victoria at a probable cost of $50,000.

The first sod of the Canadian Light, Heat and Power Company's new plant at St. Timothee, Que., was turned recently by the Hon. Rodolphe Lemieux.

The construction of a line to convey electrical energy for light and power has been commenced at Welland. The destination of this line is Fonthill and Pelham.

The Verdun, Que., council is considering the advisability of negotiating a loan of $150,000, the proceeds to be used for the installation of an electric light plant.

The Vancouver Power Co. has made application for power rights on the Indian river, and also ask permission to use 150 cubic feet per second from another stream flowing into the Indian river.

The Automatic Telephone Co. will install equipment at Lethbridge and East Calgary at the instance of the Alberta Government. Several other cities will also probably be similarly equipped during the summer.

The Simcoe Railway & Power Co. will soon proceed with the development of the Big Chute on the Severn river, thirty miles from Midland. It is expected that about 4,000 horse power can be developed and distributed in that vicinity.

The Dufferin Light and Power Co. is completing its transmission line from Shelburne to Orangeville, and installing a 100 k.w., single phase transformer at Orangeville. They are also increasing the generating equipment at Horning's Mill.

The machinery for the new steam power plant, which the B. C. Electric Co. is installing as an addition to its present steam plant on Store Street, Victoria, has arrived from Vancouver. The foundation has been laid for the new structure at a cost of about $20,000.

The establishment of an artificial ice plant at Montreal is the plan of a number of the local ice dealers to offset the advantage given J. T. Ewart by the leasing of the ice field about Sugar Loaf Island. The Montreal Light, Heat and Power Co. is behind the scheme.

Tenders will be called shortly for the construction of the hydro electric plant at Bracebridge, for which the ratepayers voted $45,000. Construction will proceed at once so that power may be delivered before December 1st. C. H. & P. H. Mitchell, Toronto, are the engineers.

The Wentworth county council recently passed a by-law giving permission to the Cataract Power Co. to erect a transmission line from the Horning mountain, along the Ancaster stone road, to the Binkley hill, and thence to Dundas. This construction has been necessitated by the destruction of the sub-station at Dundas recently.

The contract between Ville Emard, Que., and the St. Paul Electric Co. for the pumping of water from the city aqueduct has been slightly improved from a taxpayer's point of view. Hitherto the price paid was $2,000 per annum, but in future the work will be done at a rate of 4c. per 10,000 gallons.

The Montreal Light, Heat and Power Co. has announced that reductions will be made after October 1 next, in the charges for the supply of electric light. This is being done, on five-year contracts only, by increasing the rate of discount to thirty-three and one-third per cent. on every account irrespective of the amount of the bill.

Bids were recently received by J. H. Truesdale, city clerk, for one 500 k.w., 2,200 volt, 60 cycle, 150 r.p.m. two-phase generator, exciter and switchboard installed complete, and a 750 h.p., 150 r.p.m. vertical Corliss engine, with necessary condensing apparatus, installed complete. The contract has been awarded to the Allis-Chalmers-Bullock Co. Cost $6,860.

The Electric Light & Power Co. of North Hatley, Que., have been making extensive improvements in their plant on the Massawippi river, and when the work is completed the tail race will have a head of 19 feet, fully doubling the power at the disposal of the company, which supplies electric lights to many neighboring villages.

The Nipissing Power Co. is constructing a power plant on the South river, 19 miles south of North Bay, to supply North Bay and vicinity with electric power. The entire electrical equipment is being supplied by the Canadian Westinghouse Co., and the turbines by the Jenckes Machine Co. The president of this company is C. B. Smith. It is expected that power will be delivered in North Bay in December.

The Provincial Government at Regina has awarded the contract for the completion of the long distance telephone line from Saskatoon to Prince Albert to J. S. Bartleman, of Regina. The line will be completed by fall.

The Ridgeville Electric Light Co. are endeavoring to secure contracts for lights. They want enough business to pay running expenses and interest on their money. The company will secure their juice from the Falls Power Co. of Welland.

The formation of an electric lighting company and installation of an electric lighting plant in Shediac, N.B., is now practically assured. It is estimated that about $15,000 will be required to do the work. Competent engineers have estimated that the power obtained by damming the Scoudouc will be sufficient not only for lighting the town but also for supplying electricity for manufacturing purposes.

Active construction work on the proposed dam to be built across the Coquitlam river by the B.C. Electric Railway will soon be commenced. The object is to secure a greater head for power purposes. This company has also applied for water rights on Indian river, a stream of water emptying into the north arm of Burrard Inlet, a few miles from the site of the present power plant at Lake Buntzen.

It is reported that the London Electric Co. is figuring on buying water-generated power to fight the city's Niagara power plant. It is said the company is carrying on negotiations with the big electrical merger, which holds a charter for a line from Hamilton to Brantford, and Brantford to London. The merger will sell power to consumers and will supply the London Electric with current from the Cataract Power Co. at Hamilton or from the big private plants at the Falls.

The Nipissing Central Railway, which is to build an electric railway connecting Cobalt, Port Cobalt and Haileybury, expects also to furnish electricity for lighting. The company has an authorized capital stock of $1,000,000, and the officers are: J. W. Fitzpatrick, North Cobalt, president; P. L. Utley, Escanaba, Mich., vice-president; A. Jones, Haileybury, secretary; R. G. Stack, treasurer, and Clarence B. Henry, North Cobalt, electrical engineer and general engineer.

Engineers are engaged at the present time in surveying the Iroquois Falls on the Abittibi River, about twenty miles north of Matheson, said to be the greatest in the north country, with the object of ascertaining the feasibility of generating sufficient energy to electrify the T. & N. O. Railway. Twenty miles from the falls is where the Grand Trunk Pacific Railway crosses the Abittibi River. More than 5,000 horse power can be developed. Possibly the development could reach a maximum of 7,000 horse power.

A large contract has been secured recently by John Booth & Sons, constructional engineers, Bolton, through their London agent, D. C. MacCurrach, of Queen Anne's-chambers, Westminster. This was the order for the steelwork and erection of a generating station for the Northern Light, Power and Coal Co., Dawson City, in the Klondyke, who are starting a large electric plant, to supply light and power to the surrounding mining district. The material has been forwarded by the new route across the Isthmus of Tehuantepec, Mexico, to Salina Crux, where it will be reshipped and carried up the Pacific by special steamer to Skagway, Alaska. It will then be transferred to the White Pass and Yukon Railway for transit to White Horse, at which place it will be loaded into barges and towed 400 miles on the Yukon River to Dawson City.

A party of Owen Sound's leading financiers visited Eugenia Falls at Flesherton, recently, to ascertain the feasibility of harnessing the falls and supplying Owen Sound and villages in the district with electricity. Work with this object in view was begun four years ago by the Georgian Bay Power Co., the leading stockholders of which belonged to Toronto. In all, it is claimed, that company expended between $80,000 and $90,000 in purchasing rights and constructing a tunnel. Then the company came to the end of its resources and the work was brought to a standstill. Various engineers have reported favorably regarding the scheme, stating in effect that it would be possible to supply Owen Sound with 2200 horse-power for a ten-hours working day at a rate of $20 per horse-power. The present cost in Owen Sound is about $43. The idea at present is to consider the advisability of completing the work commenced by the Georgian Bay Power Co. To do this it will be necessary to invest a sum of about $200,000.

Structural Steel Notes.

Peterboro is advertising for tenders for the construction of the Smith Street Bridge.

The Stratford City Council are considering the erection of a new bridge over the Avon at Waterloo Street, to replace the present structure. The city engineer will submit plans.

Coaticook Council has accepted the Quebec Provincial grant of $2,000 towards an iron bridge to be known as the Beet Factory Bridge, across the Coaticook River, according to Government plans and specifications.

Work will shortly begin on the erection of the new steel framework for the Sherbrooke Stadium. The contract has been let to the Jenckes Machine Co., and the rink will be completed in time for skating in December.

The Algoma Steel Bridge Co., of Winnipeg, has secured the contract from the Rural Council for the erection of a steel and concrete bridge across the river at Macdonald, Man. The bridge is to be 30 feet in length and will cost in the neighborhood of $2,000.

The E. & N. Railway are to construct a bridge across Arbutus canyon. The bridge will be 1,500 feet in length, will take a year to complete, and will cost over $100,000. This is only one of the many improvements which will be done by the C.P.R. on the E. & N. Ry. which they have taken over.

The plans for the new bridge to be erected over the Don at Wilton Avenue, Toronto, the money for which was voted by the property owners, have been completed by R. Chadwick, who has charge of the bridge branch of the City Engineer's Department. Its total length between abutments will be 370 feet. About 500 tons of steel will be required to construct the bridge, which it is estimated, will cost $100,000.

The new steel and concrete bridge which was being built across the River de l'Isle, near Alexandria, collapsed recently. The bridge, which had a span of ninety feet, was being constructed by the Chatham Bridge Co., after plans prepared by M. J. McLennan, C.E., of Williamstown. The steel work of the bridge was in place, and the men putting in the concrete expected to finish their work in another two hours, when the first hint of trouble came in the buckling of the girder at the centre of the span, and the whole structure swayed to one side, finally settling down about four feet till it came to rest on the pier of the old bridge, which had been left in place. The specifications called for a bridge to sustain a weight of fifteen tons, in addition to its own weight. Including approaches, the total cost was to be four thousand dollars.

Planing Mill News.

A large planing mill will be erected at Montreal by Friedman Bros.

The Beaver Lumber Co. have purchased a site at Portage la Prairie for the extension of their plant.

The Chaleur Bay Lumber Company's mill in New Brunswick has been damaged by fire to the etxent of $100,000.

Fire totally destroyed the sawmill belonging to the Hocken Lumber Company at Otter Lake, Ont., on August 12.

The Mundy Lumber Co., Three Valley, B.C., will rebuild at once the mill recently burned and put it again in operation.

A new sash and door factory is to be built at Victoria, provided the necessary permit can be obtained. Burdick Bros. are the applicants for the permit.

The B. F. Graham Lumber Co. has announced its intention of constructing in the near future a sawmill with a daily capacity of 100,000 feet at Victoria.

Captain Mellon and associates will shortly erect a new shingle and lumber mill on Howe Sound, near Port Mellon, B.C. The mill will have a daily capacity of 20,000 feet of dressed lumber, ond 100,000 shingles.

D. G. Cooper is preparing to erect a new sawmill at Collingwood, on the site of the one destroyed a couple of years ago. A complete mill has been purchased on the North Shore, and will be removed and erected in Collingwood at once. The firm will be incorporated as the Kent-Cooper Co. It is expected that a couple of million feet of logs will be cut this fall.

Amalgamation is announced this week of the British Canadian and Western Canadian Pulp and Paper Companies, having offices in Vancouver and Victoria respectively. The former has a plant nearing completion on Howe Sound, while the property of the latter is on the west coast of Vancouver Island. According to present plans, the plant at Howe Sound will be manufacturing within a month or two.

Trade Notes.

The Waterous Engine Works, Brantford, have been awarded the contract for a new sewerage pumping station there at $3,315.

Ross & Howard, Vancouver, have the contract for supplying the four big steel pipes which will conduct the waters of Stave Lake through the Western Canada's Power Co.'s intake dam.

The Lethbridge City Council, acting on the advice of Smith, Kerry & Chace, their consulting engineers, and the local engineers, Arnold and Reid, gave the contract for the coal and ash conveyors for the new power plant to the Babcock & Wilcox people for $7,775.

T. McAvity & Sons, Ottawa, have just completed an improved style of railway standpipe for the Transcontinental Railway. The stand-pipe possesses several new features which those formerly supplied by this firm to the C.P.R. and I.C.R. did not have. The entire work was done at McAvity's foundry, and it is claimed that this firm is the only one in Canada that makes these fixtures. Four of the stand-pipes have been ordered, one goes to McGivney's Siding, in New Brunswick, and three to points in Ontario.

Building Operations.

The Morral Theatre Co., of St. Louis, Mo., will erect a $40,000 theatre at Saskatoon.

The Farmers' Elevator Co. purpose building an elevator at Carlyle, Sask.

J. E. Edwards & Sons, Toronto, are erecting a three-storey patent leather factory.

A new roundhouse will be built at Lindsay by the G.T.R.

The Alaska Bedding Co. will erect two large factory buildings at a cost of $60,000 at Winnipeg.

Getty & Scott will build a large addition to their shoe factory at Galt. Work will start at once.

The contract for the new High School at Edmonton was awarded to Carmel & Spencer, at $105,101.

The Barrie Carriage Works propose doubling their plant by erecting a new $30,000 building.

The by-law to loan $8,000 towards a mill and elevator has been passed by Nokomis, Sask., ratepayers.

Extensive additions costing $75,000 are planned for the Royal Columbian Hospital, New Westminster.

Snyder Bros., Winnipeg, at $98,269, received the contract for the construction of the new hospital at Regina.

The Toronto Bedding Co. has been granted a permit for a new factory building at that place, to cost $22,000.

The Edmonton Masonic Association will erect a four-storey temple building at an estimated cost of $125,000.

Geo. H. Hees, Son & Co., Toronto, are building a four-storey mill construction addition to their old building.

The McLaughlin Carriage Co.'s new addition to its plant will enable it to turn out 1,500 automobiles per annum.

The contract for building the collegiate institute at Saskatoon has been awarded to the Saskatchewan Building and Construction Co., of Regina, at $84,555.

The Hedley-Shaw Milling Co. will immediately commence work on the building of their new mill at Port Colborne.

The National Elevator Co. is arranging to construct a mammoth independent terminal elevator plant at Fort William.

The Winnipeg Public School Board have been granted a permit for the Salter Street School. The cost is estimated at $72,000.

The Norris Elevator Co., Winnipeg, will build five elevators this year on the line of the Alberta Railroad and Irrigation Co.

The contract for the new Galt Hospital at Lethbridge has been let to J. McDiarmid & Co., of Winnipeg. The building is to cost $60,000.

The Tobin Mfg. Co., a branch of a concern at Norwich, Conn., will build a factory for fire arms and hardware specialties at Woodstock.

The Toronto Ferry Co. will spend at least $500,000 on new buildings at Hanlan's Point this winter to replace the structures recently burned.

Extensions will be made to the Dowsley Spring and Axle Company's plant at Chatham, which was recently taken over by the Gananoque Spring and Axle Co.

The Winnipeg School Board at a special meeting awarded to J. H. Tremblay & Co., St. Boniface, the contract to erect the new Greenway School at a cost of $77,000.

The corporation of Quebec Technical Schools has accepted the plans prepared by R. Lemay, for the construction of their new building to be erected at Quebec City. Estimated cost $250,000.

The Manitoba Provincial Government has decided to give a grant of $250,000 to the Canadian Exposition and Selkirk Centennial, which will include the expenditure on the Provincial buildings.

The C.P.R. Co. have completed plans for the erection of an elevator at Victoria Harbor, Ont. It will have a storage capacity of 12,000,000 bushels, and will probably be the largest elevator in the world.

Clapp & Eatnough, who have been manufacturing tacks and nails in Galt for the last eight months, have organized the Dominion Tack & Nail Co., with a paid-up capital of $40,000, and will build a large new factory.

The Imperial Construction Co., Toronto, has been awarded the contract for the erection of a new Canadian Northern Hotel at Port Arthur. It will cost a quarter of a million.

The contract for the new building to be erected by the Trent Valley Woolen Mill at Campbellford, has been awarded to the Deacon Construction Company of Montreal, and the work will be proceeded with immediately.

A permit has been issued by the Toronto city architect to the Cummings-Lumsden estate to erect a ten-storey and basement office building at the northeast corner of Yonge and Adelaide Street. The building will be constructed of steel and brick and will cost $150,000.

General Manufacturing News.

M. Deysner, representing European capitalists, will build an assaying plant at Cobalt.

The Brodesser Elevator Co., Milwaukee, intends to establish a branch factory in Winnipeg.

The American Horse Shoe Co., Erie, Pa., may locate a Canadian branch at Port Arthur.

The Canadian Malting Co., Winnipeg, will build two concrete storage tanks at a cost of $30,000.

Two more new furnaces have been completed and are in operation at the Granby Smelter, Phoenix, B.C.

The Auto-Dustless Street Sweeper Co., capitalized at $40,000, is a new concern opening a factory in Berlin.

The Detroit-Milford Sanitary Mfg. Co., makers of plumbers' woodwork and sectional bookcases has opened a Canadian factory at Windsor.

A new company, an offshoot of the Sydney, C.B., Cement Co., has been formed at that place to manufacture bricks made from cement slag.

The Regal Automobile Co., Detroit, are looking for a site for a Canadian factory at Sarnia. They purpose turning out 1,000 cars a season.

An agreement has been reached between Aylmer and the Pump and Scales Co. whereby that industry will remain for the next five years at least.

It is reported that St. Thomas, Ont., interests have purchased the Horse Shoe Quarries in connection with a cement industry and propose to manufacture rock cement.

The Asbestos Mfg. Co. has taken over the Canadian Radiator Co.'s buildings at Lachine and will open them as a factory for the manufacture of asbestos, reinforced, corrugated and flat lumber, etc.

Parry Sound ratepayers have passed a by-law to loan $30,000 for twenty years to the Algoma Lumber & Chemical Co., for the purpose of assisting them to build a wood alcohol and charcoal plant.

A re-organiation of the Thermos Bottle Co. has been put through by which the business will be taken over by a syndicate of Ontario men, and the whole plant and offices removed from Montreal to Toronto.

The hot mills of the Sheet Steel Corporation, Morrisburg, have again commenced operation and they will now be run continuously. The new galvanizing machinery, with a capacity of 16 tons per day, is running, and still another galvanizer with a capacity of 8 tons is being installed and will be in operation in a few days. An order for another 16-ton galvanizer has been placed and part of the machinery for the three additional hot mills that are to be installed has been shipped.

The Acadia Coal Co., Stellarton, contemplate making exceptional efforts towards improvements to their collieries. They will build a new bankhead at their Albion Colliery and make other improvements. It is estimated that about $200,000 will be expended in improvements at the two collieries, the Albion and Allan Shafts, about $100,000 for facilities at each of these mines.

New Companies.

Cochrane Hardware, Ltd., Sudbury; capital, $250,000; to carry on hardware and contracting business. Incorporators, R. McKay, A. Dods and G. Grant, Toronto.

T. Woodbridge & Co., Toronto; capital, $40,000; to manufacture saddlery hardware. Incorporators, Thos. Woodbridge, M. J. Woodbridge and D. Grigg, Toronto.

Rhodes, Curry Co., Amherst, N.S., capital, $3,000,000; to smelt metals, build cars, saw timber, etc. Incorporators, E. Fabre, G. V. Cousens, and F. C. Clarke, Montreal.

J. A. French & Co., Toronto; capital, $40,000; to manufacture soaps, polishes and metal specialties. Incorporators, J. A. French, L. Sievert and W. A. Richardson, Toronto.

The Dominion Electric Co., Ottawa, capital $40,000; to manufacture electrical machinery, devices and specialties. Incorporators, T. A. Low, Robt. Hadley and W. T. Guest, Renfrew.

Armbrust Canadian Brake Shoe Co., Toronto; capital, $100,000; to manufacture and deal in railway supplies. Incorporators, W. C. Nunn, A. A. Dickson, Toronto, and C. W. Armbrust, Chicago.

Standard Supplies, Ltd., Ottawa; capital, $20,000; to manufacture and repair machinery, tools and implements. Incorporators, F. W. Musgrove, E. A. E. Robinson, and W. A. Wyman, Ottawa.

The Solo Saw Co., Ottawa, capital $20,000; to manufacture the Godfrey, Hugh Massy, Baker saw-feeding device. Incorporators, G. H. M. Baker, Wm. Anderson, and H. I. Thomas, Ottawa.

The Stepney Motor Wheel of Canada, Toronto; capital, $4,750; to manufacture motors, cycles, accessories, tools, etc. Incorporators, W. H. Davies, London, Eng.; Jas. Thomas and G. L. Smith, Toronto.

A. T. Short, Ltd., Cobalt; capital, $40,000; to manufacture machinery and hardware specialties and electrical appliances. Incorporators, A. T. Short, Cobalt; C. H. Andrews, Buffalo; and W. F. Carter, Cobalt.

Canadian Graving-Dock and Shipbuilding Co., Montreal; capital, $2,000,000; to construct and maintain docks, workshops and machinery. Incorporators, M. J. O'Brien, J. A. O'Brien, Renfrew, and F. W. Rons, Montreal.

The Laurentian Chemical Co., Montreal, capital, $590,000; to produce and manufacture wood-alcohol, turpentine, charcoal tar and other products. Incorporators, A. D. Gall, Westmount; R. Prefontaine, and F. E. Lovell, Montreal.

British Tools at Toronto Exhibition.

Crosier, Stephens & Co., 2 Collingwood St., Newcastle-on-Tyne, will have on exhibition at the Toronto National Exhibition specimens of their "Cromil" Polygon Shaping Machines and "Cromil" Polygon Grinding Machines, also a wide range of other handy tools. The exhibit will be in charge of Parke & Leith, Toronto, who are their Canadian agents.

Canada Producer and Gas Engine Co.

The works of the Canada Producer & Gas Engine Co., Barrie, are now ready for manufacturing. A 125 h.p. gas engine is being installed, the small machinery is installed and preparations have been made for the installation of the heavier tools. Patterns are being made and the foundry will start about October 1. The pattern shop is ready for the men to begin work, and in a month it is expected the patterns will be ready. The wood shop, tinsmith shop, tool and stock rooms and offices are upstairs, while the machine department is on the ground floor.

Toronto Machine Works.

The Toronto Machine Works have opened up a manufacturing plant at 64 John St., Toronto. The company consists of Messrs. R. H. Ford and C. B. Dickerson, formerly of St. Catharines, where they manufactured light machinery, and A. M. McGill, formerly a traveler for H. W. Petrie, Toronto. The company intend placing on the market a 20 in. drill, lathe, shaper and emery stand, making a complete equipment for small machine shops for light manufacturing, repair shops, garages, etc. The 20 in. drill is equipped with a positive power feed with four changes of speed or may be used as a hand feed. It has automatic stop, 16 in. table, occupies a floor space 15 x 48 in. and weighs 600 lbs.

New Rubber and Insulating Plant.

The announcement has been made of the incorporation of the Walpole Rubber Co., Ltd., with a capital of $250,000. The factory of the company at Granby, Quebec, is nearing completion; the general sales offices are in the Eastern Township Bank Building in Montreal. The officers and directors of this new company are for the most part officers and directors of the Massachusetts Chemical Co., operating the Walpole Rubber Works, the Walpole Varnish Works, and the Walpole Shoe Supply Works, at Walpole, Mass., U.S.A. The Walpole Rubber Co., Ltd., of Canada, will operate upon similar lines to the parent company, producing all kinds of rubber splicing, insulating and friction tapes and miscellaneous rubber sundries, together with the well-known varnishes and insulating compounds such as armalac, insulac, the celebrated Walpole hot water bottles under the Gleason fusible core process (patented), the cat's paw rubber heels, etc. Granby, beside from being the home of one of the directors, offers many inducements for such an enterprise, furnishing an excellent water power sufficient for all factory purposes and shipping facilities.

Mining by Electricity.

The plans call for the installation of one or two large electrically-driven air compressors and they undertake to supply the mines with compressed air as well as electrical power. The cost per h.p. will be about $50 per annum for a 24 hour service. It is expected that they will be serving their customers about October 31. There will be two intake pipes 8 feet diameter and an outlet pipe of 22 feet. The two inlet pipes will be steel lines. The blow off pipe will be 12 inches in diameter.

This plant is situated six and three-quarter miles south of the Kerr Lake siding of the T. & N.O.R.R. at Ragged Chutes on the Montreal River. They will charge 25c. per 1,000 cu. ft. compressed air at 100 pounds pressure and at a.t. This is on their metered air power contracts. Cobalt should at least get cheap power as there will be two companies in opposition and looking for a market for their power. At present some of the mines are paying $250 per drill per month on an 18-hour service. These two companies will do the same for less than $4 per day, or say $100 per month.

An immense and costly plant is to be erected on the property of the Cobalt Mines Power, Ltd., Cobalt. The various manufacturers of mining machinery in Eastern Canada are now bidding on the supply and installation of the machinery. This plant is an electrical one situate on the Matibitchewan River some 25 miles from Cobalt. The company has the right to raise lakes feeding this power 40 feet. They will have a head of 312 which will be brought to the turbines through two steel tubes 5 feet in diameter. The electrical installtion will consist of four generators 2,500 H.P. each or 10,000 in all. It is proposed to keep one unite in reserve. There will be two transmission lines to Cobalt to prevent any break down, the right of way will be 135 feet. The current will be brought into the camp at 44,000 volts, and the different mines will be fed at a voltage of 2,200.

CATALOGUES.

TRANSFORMERS—Circular 1079 from Canadian Westinghouse, Hamilton, Ont., illustrating and describing fully oil-insulated, water-cooled transformers. Among the illustrations is a view of 2000 kv-a, 50,000-volt transformers at Shawinigan Water & Power Co., Shawinigan Falls, Quebec.

BABBIT METALS — Booklet of babbit metals from Lumen Bearing Co., Toronto, describing their several brands.

BORING MILL—Gisbolt Machine Co., Madison, Wis., have issued an addition to their catalogue showing labor-saving attachments in the shape of micrometer index dials and automatic feed trips for their boring mills.

VISES—James Smart Mfg. Co., Brockville, manufacture iron workers' vises and patent steel yoke vises. A catalogue describes the products fully. Pipe vises and saw filers' vises are included in the catalogue.

CONVEYING MACHINERY—Booklet 29, from Beffrey Mfg. Co., Cote and Lagauchetiere Sts., Montreal, describes and illustrates fully methods for handling freight and packages. A post card will bring a copy.

FIREBRICK—The annual 1909 catalogue of Harbison Walker, Pittsburg, Pa., is a handsome volume, pocket size, bound in leather and complete in every dteail. Their lines of firebrick in various sizes are illustrated and listed, showing their application to various cupolas and furnaces. Some very useful information is included in the volume, making it a valuable one.

RIVETING MACHINES—A pamphlet from John F. Allen, 370-372 Gerard Ave., New York, tells of the Allen Pneumatic Compression Riveting Machines for structural, bridge and railroad work; boiler, tank and stack construction. These are illustrated and tables of sizes are given.

THREADING TOOLS—The American Tap & Die Co., Greenfield, Mass., have issued their 1909 catalogue, No. 3, of "Adamatine Threading Tools. The line of taps, dies, screw plates, hobs, reamers, etc., is complete, full information being given in regard to taps and dies, such as sizes made, length, number of threads and price. The cover design adopted is effective in setting forth the trade mark and products listed in the catalogue.

Machinery Markets

MONTREAL.

"Great, great!" was the way one dealer answered the question as to how he found last month's business in the machine tool line. "We have done just about double the business as during the same time last year." His sentiments were more or less heartily echoed by the other dealers in machine tools on whom we called. These men did not say this for effect. They meant it. Business is good—and that's about all there is to it.

The trade seems to have shaken off its habit of "fits and starts" which characterized it at the beginning of the year, and the growth of business is steady. Inquiries do not seem to be slackening up and the activity among possible and probable purchasers indicates a very good fall business.

Dealers handling tools made in the United States intimate a probable stiffening of prices, which is not unexpected. Deliveries are lengthening out further and further into the future, which demonstrates the fact that orders are piling up.

Power lines are strong and the larger prime movers are showing increased activity. The J. Eveleigh Co., makers of trunks and bags, are building a new factory, the power plant equipment of which will include two Goldie-McCulloch return tubular boilers, 66 in. x 16 ft. A feature of this instalation is the use of their patented shaving box by which the shavings are automatically fed to the fires. Two 11 in. x 12in. Robb-Armstrong automatic engines, belted to the line shafting will supply the power.

The Montreal L. H. & P. Co. have recently purchased from the Robb Engineering Co. three 350 h.p. Robb-Mumford water tube boilers for the extension to their gas works at Ilochelaga. Included in the equipment are two 9 in. x 5 1-2 in. x 10 in. Blake duplex outside packed plunger pumps and a 1,000 h.p. Robb closed feed water heater. The Robb people have also supplied to the St. Paul Electric Co., at Cote St. Paul, a 13 in. x 14 in. Robb-Armstrong horizontal automatic side crank engine and a 72 in. x 18 ft. return tubular boiler. The engine is belted to an 80 k.w. Allis-Chalmers-Bullock generator.

Electrical supplies are receiving much attention and sales are increasing with a steadiness that bids fair to reach a level even higher than ever before. Among the recent orders is one for the equipment of the Harbor Commissioners' new elevator with panel boards and steel cabinets at all the distributing points in the building. The Standard Construction Co. are erecting, and the Hill Electric Switch Co. are supplying this equipment.

The activity in leather belting is pronounced, and while there has, as yet, been no advance in prices, it is a foregone conclusion that the higher prices ruling in raw material will force the manufacturers to increase prices to cover themselves as soon as stocks, which were laid in at the lower level, are depleted. With the present activity in this line the advance would seem to be not far distant.

The J. C. McLaren Belting Co. has been reorganized under a Dominion charter, and will henceforth do business under the name

of the J. C. McLaren Belting Company, Limited, with the management unchanged.

There has been practically no change in the price of rubber belting, although throughout the trade the prices have been revised and the higher prices now holding show probabilities of an almost certain advance in the near future. This is but natural as the present prices of crude rubber are the highest in the history of the industry and the present demand is in excess of the visible supply. In connection with this it will be interesting to note the prices of the last 10 years as shown by the following table:

Year.	High	Low	Year.	High	Low
1900	$1.10	92c	1905	$1.36	$1.18
1901	.94	83c	1906	1.29	1.22
1902	.91	70c	1907	1.24	.82
1903	1.10	86c	1908	1.25	.67
1904	1.31	94c	1909	1.70	1.20

The price prevailing at the time of writing (August 21) is between $1.85 and $2.00. Within the past two weeks as high as $2.20 has been asked. It appears that the high water mark has been reached and that the price will come down nearer normal in the near future. Manufacturers are placing orders for "futures" at prices ranging as low as $1.55 and $1.60. The prices on "mechanical" rubber goods in the United States have been recently advanced from 10 to 25 per cent., and that this increase will soon prevail here is almost certain.

The cotton belt market is also up and will likely go higher. There is no indication that this is due to manipulation of the market, but the real solution is, no doubt, the increased demand for fabrics for the manufacture of automobile tires and similar lines. This is not surprising when one views the increase in the automobile industry for the past ten years. In 1898 there were not more than 200 automobiles made in the United States, and, it is safe to say, not one in Canada; the number in use at the beginning of this year is estimated to have been 184,030, with an output for this year of 82,000 cars and arrangements for an output next year of 200,000. The tires for these alone necessitate an enormous use of rubber and cotton duck, and the demand has increased so rapidly that the plantations are having difficulty in keeping step. In fact, at the present time they are lagging behind.

TORONTO.

The metal trade reports good business despite the fact that a number of the prominent metal men are holidaying. Buying is first-class taking into account that this is usually a quiet part of the year. The reviving industrial situation has made a good impression, and the outlook for the fall is more than fair. The 100,000,000 bushel grain crop in the west will help on the good feeling. Indeed, some metal men aver that the coming fall's business will not only be in excess of last year, but also in advance of two years ago.

Iron and steel continue to hold the front rank and trading in them is highly satisfactory. The new United States tariff, while it may not help the Canadian metal trade materially has a tendency to do so. The duty on pig iron has been reduced from $4 to $2.50, and iron ore from 40 cents to 15 cents a ton. Beams, boiler-plate and sheet iron are down 2-10 cent a pound; and about the same reduction has been made on tinplates and steel ingots. Tubes are cut from 2 to 1 cent, and wire from 45 to 35 per cent.

Railways are buying pretty freely in both Canada and the United States. A particularly pleasing feature being the placing of orders for rails and rolling stock by Canadian roads here in Canada. Structural material, too, is active.

Prospects are that there will be a rise in price in rubber belting ,gaskets, rubber packing, etc. The price of crude rubber has advanced to a point very much beyond that ever reached before. About a year ago fine Para rubber was 80 cents per lb. It has reached $1.92 and $1.95 per lb. in New York. Nearly all the ingredients used in the manufacture of rubber goods has also advanced materially. Preliminary advances have been made by Canadian manufacturers of rubber goods, including belting, packing, etc. Manufacturers generally are compelled to advance the price and unless there is an easing of the market, still further advances will be necessary.

One thing that shows the state of trade is the fact that the Union Petroleum Co., Buffalo, have had to purchase 80 miles of second hand pipe to carry oil from Chatham to Sarnia. This pipe purchased from the National Supply Co., Pittsburg, was made some 20 years ago and was laid in the Fort Wayne field of Ohio two years later. The pipe ranges from three to ten inches, and is in a perfect state of preservation.

Only two companies bid on the order, the National Tube Co., and the Wheeling Iron & Steel Co. Had this bid been put out last year every pipe-making concern in the country would have put in a bid on it. As deliveries had to be commenced during the week, the Buffalo company purchased second-hand iron pipe instead of new steel pipe.

Metal working tools are enjoying a very steady demand. The inquiries are increasing and a larger percentage is being turned into orders than formerly. Wood working tools are selling well and large shipments have been made to British Columbia by some eastern dealers. Foundries are busy, several of the jobbing foundries working to their full capacity.

VANCOUVER.

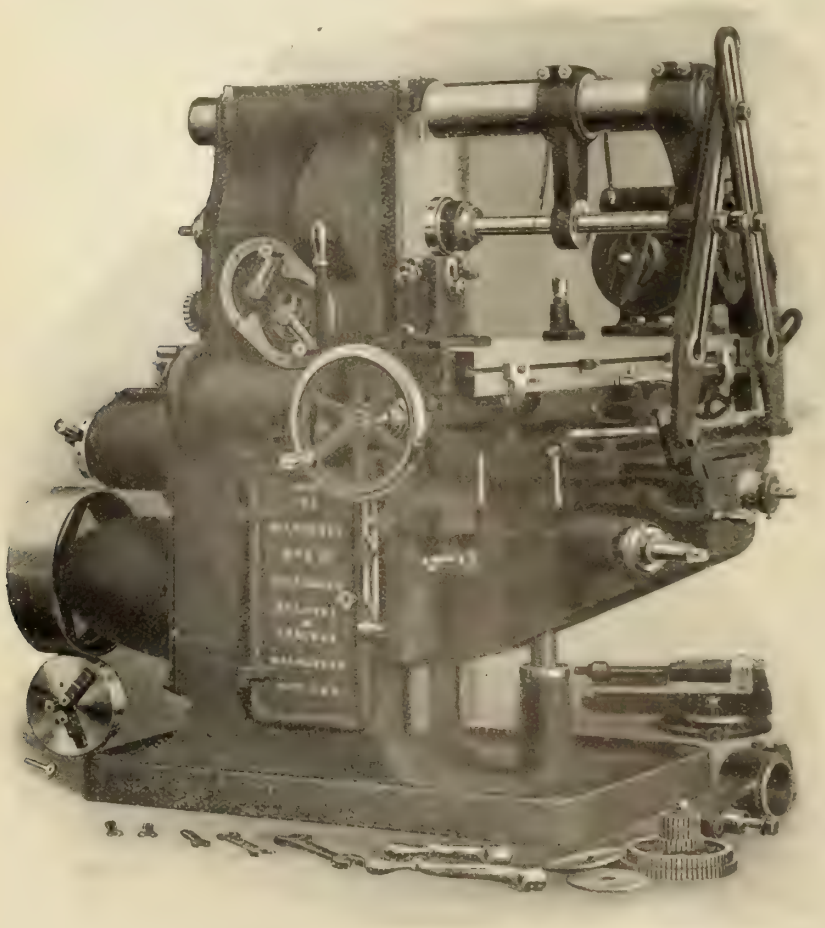
Development work on Vancouver Island is going on in good shape. Sawmills are being erected, coal mines opened and other work being done at places which were hitherto unknown and business generally is good.

Building is going steadily on, making plenty of work. Those who make a specialty of builders' materials find that department particularly busy.

With the object of saving money, the water committee of the city council has had estimates prepared of the needs of the water-works system for the next two years, instead of for the next year only. The amount is $370,132, and includes 4,000 new services; 200 new hydrants; 30 miles six-inch mains and laying; 15 miles eight-inch mains; 5 miles 12-inch mains; 2 miles four-inch mains; new valves.

The electrical process of smelting ore has just been inaugurated at the works of the Canada Zinc Company, at Nelson, B.C. The electricity for the furnaces is developed at the Bonnington Falls on the Kootenay River by an English company, and transmitted to the plat at 16,000 volts.

A company has been formed here to take over the business of McDougall & Jenkins, boilermakers, machinists and engineers, of Victoria and Vancouver. The new company, to be known as the McDougall-Jenkins Co., will erect a plant which will be unsurpassed in the Province. Machinery will be installed to enable the plant to handle all kinds of shipping and general engineering work, which is on the increase here just now. The former members of the firm will be retained. The Council of North Vancouver will give the company special consideration in the way of freedom from taxation for a period of years and a supply of water at a nominal rate, realizing the importance of an industry that will employ about 150 hands. The authorized capital is $50,000.



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

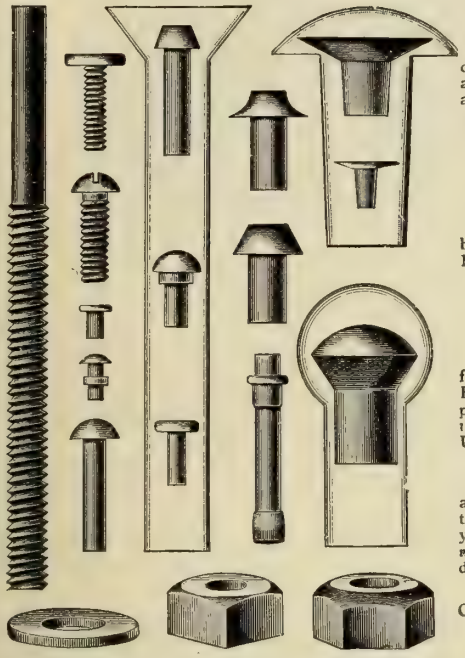
MACHINES FOR MAKING

Rivets, Nuts and Screw Blanks

BY THE "COLD PROCESS"



COLD HEADERS
of both the Solid Die and open die type for automatically making
Rivets, Bolts and Sorew Blanks

Maohines for Rolling Threads
by cold pressure up to 1⅝ diameter of shank.

Automatio Cold Pressed Nut Machines
for making Square or Hexagon Nut Blanks, pierced, chamfered and trimmed up to ½ inch, U.S. Standard.

Send us sample of article to be manufactured and we will tell you the type and size of machine best suited for doing the work.

Catalogues on request.

Distinctive Features in Construction

ARE FOUND THROUGHOUT

B. & S. Constant Speed Drive Milling Machines

As an example study the cut of the spindle speed gearing.

All gears have extremely large diameters, coarse pitches and wide faces. All bearings and shafts proportioned to give a maximum efficiency. Change gears are of hardened machinery steel and have pointed teeth to facilitate quick engagement when being thrown into mesh. No gears revolve in mesh that are not in actual use. 16 changes of spindle speeds obtainable by means of three levers, whose simplicity of manipulation positively cannot confuse operator. Tumbler gear mechanism one of the most rigid constructions designed.

Machinery Wanted and For Sale

It will pay you to watch our condensed column each month. There are many money-making propositions brought to your attention here. You may find just what you are looking for.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c. a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

AGENTS WANTED.

TO MACHINE TOOL AGENTS — DRILLING Machines — British firm, specialising entirely upon manufacture of Drilling and Boring Machines of highest class for high speed duty, is open to appoint sole agent for Canada. Agents of good standing, preferably having showrooms, are invited to correspond. Must be sound salesman, able to sell profit-making t ols on their merits as higher productivity machines, as being best class and superior materials thev cannot be sold purely on price. Addre.s to William Asquith, Ltd., Machine Tool Makers, Halifax, England. (8)

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and th- work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

FACTORIES FOR SALE.

IN the growing town of Welland, Foundry, Machine Shop and Carpenter Shop, with engine, boiler and line shafting; blacksmith shop, boiler shop, pattern and other s orehouses. Welland has cheap electric power, natural gas, sewers, fine railways and water transportation on Welland Canal. Apply M. Beatty & Sons, Welland, Ont.

VALUABLE Manufacturing premises in the town of Galt—Building is of stone, three storeys, equipped with boiler, heating and lighting pipes. Immediate possession. Apply to C. R. H. Warnock, Galt, Ont.

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

ONE 2nd-hand 60-lb. spring hammer. 1 24" x 24" x 7' 2nd-hand iron planer. Address J. D. Anderson, Box 203, Windsor, Ont. (8)

ONE 5 h.p. Cook vertical gasoline engine, double ignition, complete with tank, skids, and all accessories. A new engine at a bargain for quick sale. Kellogg & Co., 196 King St. West, Toronto.

FOR SALE AT A BARGAIN — An absolutely new Borden Power Pipe Threading Machine (3,000 lbs.), equipped w th adjustable die head. Threads 1" to 4" pipe; three step cone and countershaft; back geared; six speeds; Rotary Brown & Sharpe oil pump; write for further particulars. Borden-Canadian Co., 66 Richmond St. East, Toronto. (9)

POSITION WANTED.

BRIGHT YOUNG MAN wishes position in drafting office. Has just completed I.C.S. course in mechanical drafting. Address Box 89, CANADIAN MACHINERY, Toronto.

SITUATIONS VACANT.

MACHINERY SALESMAN, experienced in flour mill and transmission appliances. Reply, stating experience, Box 88, CANADIAN MACHINERY, Toronto.

WANTED - Two experienced machinery and mill supply salesmen. Applications to be made by letter only, with references, to the Canadian Fairbanks Co., Ltd., Toronto.

OIL ENGINE FOR SALE.

NINE Horse Power New Campbell Oil Engine, Electric Lighting type. Cheap. Most economical engine for small plant. Jones & Glassco, Montreal. (t)

MISCELLANEOUS.

AN EXTRA 1 PER CENT. PROFIT. A National Cash Register will earn at least an extra one per cent. profit for any retail merchant. The National Cash Register Co., F. E. Mutton, Canadian Manager, cor. Yonge St. and Wilton Ave., Toronto, Ont

AT THIS SEASON OF THE YEAR we hold a clearance sale of rebuilt Second-hand Typewriters; all makes represented; some relatively new and all are bargains; write for list. The Monarch Typewriter Company, Limited, 98 King St. West, Toronto, Ont.

OFFICE FIXTURES, PARTITIONS AND SHOW CASES. Send for illustrated catalogue. Jones Bros. & Co., Limited, 30-32 Adelaide St. W., Toronto, Ont.

THOUSANDS OF DOLLARS go astray in the mails every year. YOU should therefore insure against a possible loss by sending YOUR remittances by Dominion Express Company Money Orders and Foreign Drafts. If delayed, lost or stolen, a refund will be promptly arranged or a new Money Order issued without further charge. The D minion Express Company also transfers money by telegraph and cable and buys and sells foreign money. If you want to s nd money to any part of the world the Domini n Express Company will be pleased to accommodate you. Hundreds of agencies throughout Canada.

MISCELLANEOUS.

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employe s time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Limited. Office and factory, 27 Alice Street, Toronto. (tf)

WANTED—A splendid opportunity for dealers to handle the be t combination Duplicating, Addressing and Office Printing Machine on the market. Exclusive territory. Send name and address, giving occupation and references, to the Canadian Writerpress Company, Ltd., 33 John St., Hamilton, Ont. (tf)

ELLIOTT-FISHER STANDARD Writing-Adding Machines make toil easier. Elliott Fishe Limited, 513, No. 83, Craig Street W., Montreal, and 129 Bay Street, Toronto.

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling, and greatly facilitates the loading of cars, drays, etc., and for handling goods in and about the warehouse and factory reduces the cost of labor because far less warehouse help is required. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley St., Toronto. (tf)

HYDRAULIC ENGINEERING
By G. D. HISCOX
Price $4.00 Postpaid
320 Pages. 305 Illustrations.

JUST OFF THE PRESS—this comprehensive book of Hydraulics written by an experienced engineer. It is a practical treatise on the properties, power and resources of water for all purposes, including the measurement of streams, the flow of water in pipes or conduits; the horse power of falling water; turbine and impact water wheels; wave motors, etc. All who are interested in Water Works Development should have a copy.

They Save the Furnace

The COLLIAU CUPOLA BLOCK is made to fit any shell.

It is made of the toughest materials obtainable, and therin is its long life.

Therein, also, is the saving in repairs and in delays in shutting down for putting in a new lining; the actual cost, therefore, is not at the beginning but at the end.

The Akron Foundry Co., Akron, N.Y., order a new lining to-day and the former lining of these same blocks was bought in June 1906. There is evidence right from home.

Any fire clay may be made into blocks as easily as in fire-brick shapes,; just as there are cheap fire-brick and good fire-brick, so there are cheap cupola blocks and good ones, and the price differs as the quality differs.

The COLLIAU CUPOLA BLOCKS are both—the best and the cheapest—at the end.

I have fire-brick made from the same clay to resist high heats; for forges, etc.

If you have forges, core ovens, or if you need fire-brick and fire-clay for any purpose, make up a carload order, and take the advantage offered in the carload rate of freight.

Or, make up a mixed carload of cupola blocks, fire-brick, foundry facings and supplies; in that way you are saving money without effort.

These blocks outwear any other cupola block or fire-brick on the market and will fit any cupola. They are made of the toughest materials found anywhere.

THE SOLUTION OF THE PROBLEM

How to effect a real saving of 50% in FUEL, LABOR and CRUCIBLES is found in the

"ROCKER-COVER"

Crucible Original **'STEELE-HARVEY'** Tilting Furnace

Monarch Stationary

It has proved itself beyond all question the most economical and effective furnace ever invented for melting Copper, Brass, Bronze, Nickel, Silver, Gold, Cyanide Precipitate, Ferro Alloys, Iron, Steel. The fuel may be either GAS or OIL and AIR—no COKE or ASHES in any event. Hence there is no loss of metal in the pit. It can be instantaneously started or extinguished.

It is so simple and effective in operation that one man can easily handle several furnaces after watching our demonstrator.

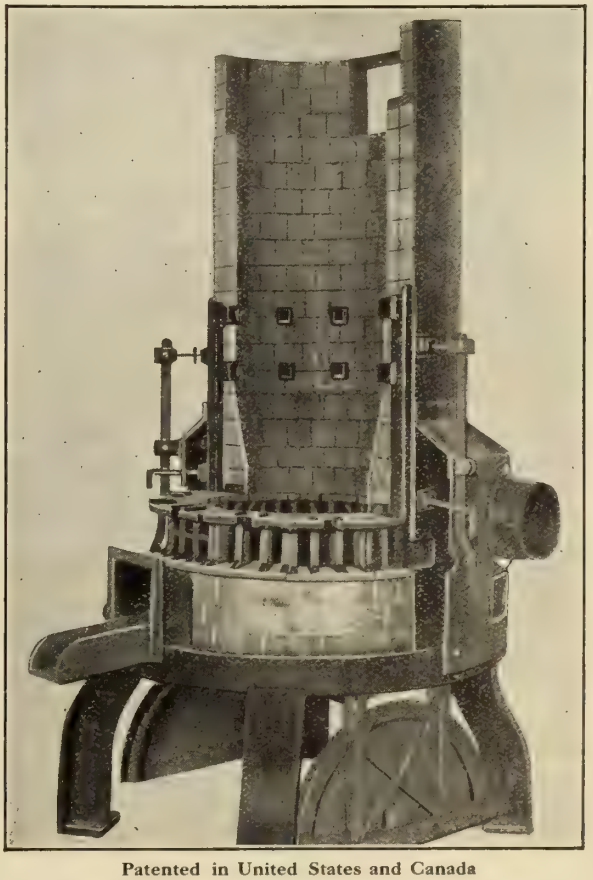
FOR SALE

The Canadian Patent Rights

OF THE

Knoeppel System of Cupola Twyers



Patented in United States and Canada

Or we are open to dispose of Shop Rights or the Right to Manufacture and Sell in Canada.

The principal features of The Knoeppel System are:—

A continuous twyer; large twyer area; maximum air delivery; lower blast velocity; air belt surrounding the back of the twyers; air supply flues above the melting point; adjustment of twyer area; adjustment for small diameters of lining; separate overhang plate; twyers projecting from 2 to 10 inches further into the cupola than any other; delivery of blast nearer the centre; can be applied to any Cupola in use.

There is a splendid opportunity for a pushful man with this greatly improved twyer system. For the purchasers of manufacturing or shop rights we will supervise the manufacture and installation of the first one made free of cost.

FULL PARTICULARS ON REQUEST.

The Knoeppel Company

577 East Ferry Street - - Buffalo, N.Y.

PRESIDENT TAFT'S GOOD EXAMPLE

By
A. B. LEVER

PRESIDENT TAFT of the United States believes in trade newspapers. He is such a thorough believer that when he wanted to make an announcement of particular interest to business men of the United States he selected a business man's paper as his medium. It was one of the first acts of his administration.

This is the era of the trade newspaper. At any rate it is the dawn of the era.

Business men the world over are gradually coming to recognize the fact that if they want to reach firms in their own particular line of business the best and most direct method is through the columns of the trade newspaper devoted to their particular interests.

Manufacturers who do not recognize this fact are obviously behind the times. Those who do not catch up are likely to be overtaken and lapped by their more progressive competitors.

This is an age of progressive business methods and those who are not progressive in advertising are like those who prefer to travel by the old fashioned ox team instead of by the swiftly moving express.

Surely if Mr. Taft from his presidential chair is awake to the importance of addressing business men through the columns of a trade publication, manufacturers should not be less awake to their opportunities.

Just as a well aimed rifle carries the bullet to the bull's eye, so the trade newspaper carries the announcement of the manufacturer direct to the customer whom he desires to reach.

No manufacturer can carry on an effective advertising campaign that does not include the use of the trade newspaper.

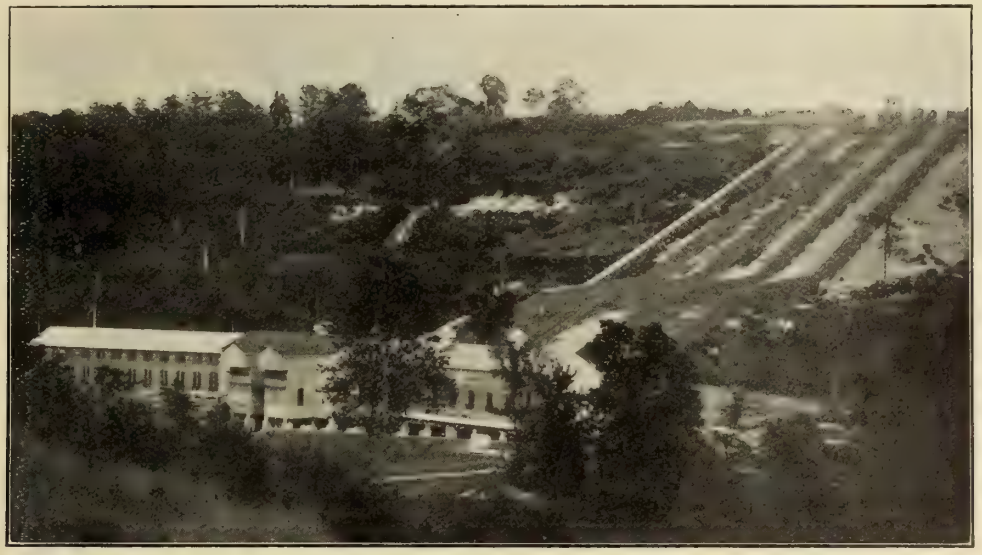
LOCATE AT

St. Catharines

Ontario - Canada



Power House at Decew Falls of Dominion Power and Transmission Co., Ltd., and Lincoln E. L. and P. Co., Ltd.
2½ miles from St. Catharines, 100,000 H.P.

WHY? BECAUSE—

1. TWENTY-EIGHT PLANTS have located here for good reasons—most of them Metal-working Industries.
2. ELECTRIC POWER is cheaper here—right where it is made—than elsewhere. Less than one-third the cost of steam.
3. WATER SUPPLY is from Lake Erie, with a head of about 200 feet.
4. FREIGHTS are as cheap here as if we had 100 railroads. BESIDES, you can use our port for water shipment to all great lake points and to salt water.
5. LABOR—Good supply of skilled mechanics and laborers. Most workmen own their own homes. They come to stay.
6. SITES are available for YOU to choose from, all good ones, and to be got at figures and terms which are big inducements.
7. INCIDENTALLY—We are one hour (by electric and steam railways) from Niagara Falls and Hamilton.

ALSO—St. Catharines is the market and shipping point for Canada's Greatest Fruit District——

Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

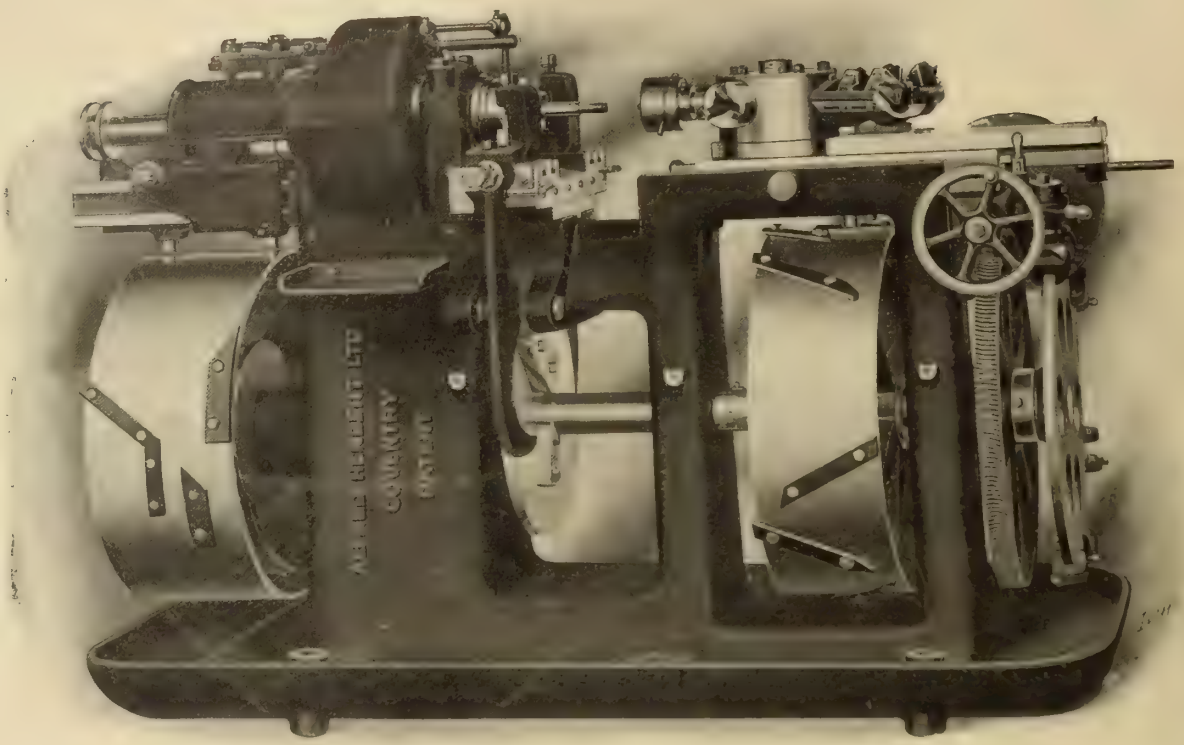
AUTOMATIC SCREW MACHINE

Made by Alfred Herbert Ltd., Coventry, England



These machines are made in 11 different sizes dealing with bars from 3-4 to 3 1-2, and are amongst the new machines installed in the Intercolonial Railway Shops at Moncton, N.B. They are also installed in the C.P.R. Angus Shops, C.P.R. Shops, Winnipeg, Canadian Northern Shops, Winnipeg, and many other smaller factories. The main frame is a rigid hollow casting which carries all the working parts of the machine.

CAPSTAN LATHES, HEXAGON TURRET LATHES and COMBINATION TURRET LATHES, manufactured in practically all sizes and to take bars from 9-16 to 5 3-4. These machines are especially suitable for locomotive building and repair shops aad are in use all over the world.

The 1909 design incorporates many new and valuable features which greatly increase the quantity and quality of the work produced. Descriptive matter free upon request.

We also carry a complete line of machine tools of every description aud can give prompt shipment on any class of machinery required

We also carry a complete line of ***high speed steel*** and steel for all purposes. Likewise a special ***high speed twisted drill*** which is made from special registered section steel of new composition, which we guarantee to give equal if not better results than any drill on the market to-day. Enquiries solicited.

Flat Work Ground

from 12 to 20 times faster on P. &. W. Vertical Surface Grinder than on any other grinder made.

Above illustration shows a few samples of automobile parts, ground at a great saving on a P. & W. Vertical Surface Grinder.

One concern states that these machines are saving them several hundred dollars per day over former methods.

Send us drawings or samples of your work which will be returned promptly with time for grinding them on this Machine.

Write for Illustrated Circular "The Vertical Surface Grinder."

Milling Slots with Closed Ends

The Spline Milling Machine is an entirely new machine for milling slots with enclosed ends, keyways, and an endless variety of other work, greatly reducing time and cost of production.

The great advantage of this tool will appeal to the manufacturer who has formerly been compelled to resort to expensive broaching operations or to hand milling for cutting keyways with closed ends, and tang slots which, owing to their depth, require extreme care in manipulation of tools as well as the continuous services of a skilled operator.

Write for Catalog "Spline Milling Machine."

(BOSTON)

Power Plate Bending Rolls

The cut below illustrates our Power Plate Bending Rolls made in various sizes to suit the work for which they are required.

The rolls are pyramided in form, the lower roll being driven by means of powerful gears. The gearing and standards are mounted on a heavy bed plate cast in one piece, which covers the foundation.

The top roll is raised and lowered by means of the screws shown and is counterbalanced so that the end bearing may be turned down, allowing the plate when rolled to a full circle being removed off the end of the roll.

All the rolls are steel forgings.

The two pulleys are engaged by means of frictions operated with the lever on front of machine, and run in opposite directions, which gives perfect control to the operator in starting, stopping or reversing.

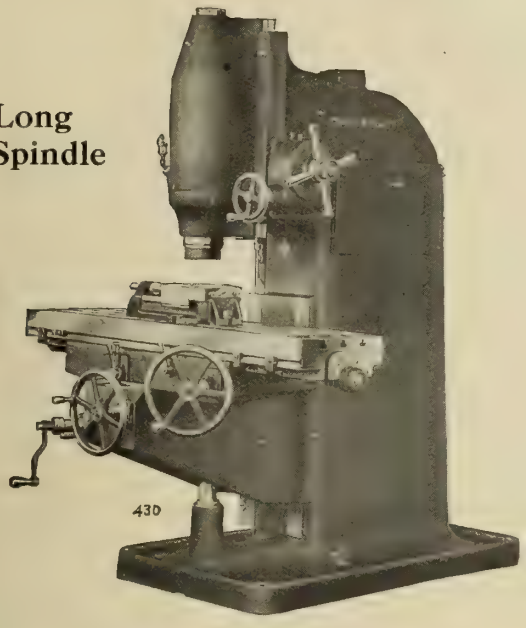
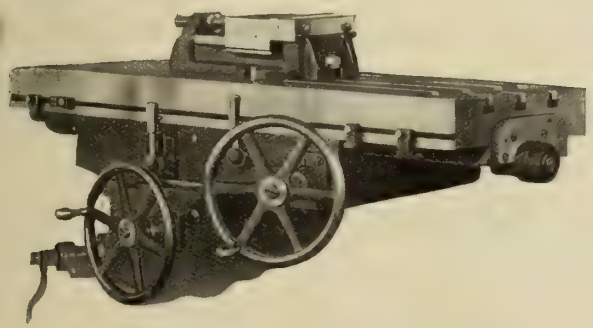
Cincinnati High Power Handiness

Long Spindle



Rear side. All the operating levers are in front within easy reach.



The Saddle, Table and front of knee. Note how rugged they are.

INDEX PATENT APPLIED FOR

FEEDS IN INCHES PER MINUTE.

1-AO	2-AO	3-AO	4-AO	1-AO	2-AO	3-AO	4-AO	1-BO	2-BO	3-BO	4-BO	1-BO	2-BO	3 BO	4 BO

LEVER POSITIONS.

The Feed Index. Notice how direct reading it is. The Speed Index is similar.

The table feed lever—cross feed lever and vertical feed lever on all our High Power Millers—Horizontal and Vertical—also controls the reverse. For example: To feed to the right, engage the feed by moving the lever to the right; to feed to the left, move the lever to the left. In the same way, raise the vertical feed lever to feed up, move it down to feed down and similarly for the cross feeds.

THERE IS NO INDEPENDENT REVERSE BY WHICH THIS SEQUENCE CAN BE DISTURBED.

The feed trip-clutch for ALL feeds is not on the feed screw, but on a shaft running ten times as fast, therefore providing a much more sensitive and quicker acting trip.

The SINGLE PLUNGER trip permits engaging any feed from a tripped position without running off the dogs by hand.

The feed screws are of large diameter, quick pitch, providing high efficiency.

Feeds not being used are *locked out*. Their gear trains do not run uselessly.

The table feed can be used in combination with either cross feed or vertical feed when desired.

ALL THESE ARE PRODUCTIVE FEATURES—

THEY ARE FOUND ONLY ON CINCINNATI HIGH POWER MILLERS

The Cincinnati Milling Machine Co., CINCINNATI, OHIO, U.S.A.

CANADIAN AGENT—H. W. Petrie, Limited, Toronto, Montreal and Vancouver.

It's no "Trick" at all

to change from the big Lathe to the small swing on McCabe's Patented

"2-in-1" LATHE

This means that the Big Lathe is not useless after it has done all the big work. Without the large swing, you have just an ordinary 26-inch Lathe.

A big Lathe would cost a half more--the McCabe Lathe will do a half more. You profit to the extent of a Lathe's worth. Little book describes the Lathe in which you realize more than you are led to expect.

Doing Small Work on the same Lathe--26-in. Swing.

The Patent "Dreadnought" Milling File

will make a surface on Steel, Brass or anything, that it looks as if it were burnished, after cutting so rapidly that it will astonish you, on Steel or Cast Iron, and then again on Brass or Bronze, without apparent loss of cutting power. This will make you think. It made the British Government Think. It made the Krupp Co. Think. Made them think that it would pay to use the Dreadnought in every department, and now that they are using them extensively, their "think" has turned to a certainty "that it does pay them to use the Dreadnought." And in our own Canada they are rapidly being adopted by the largest consumers.

JUST THINK—This file *can be re-sharpened many times* without drawing the temper, thus making it **"absolutely the cheapest file that can be procured anywhere."**

JUST THINK—If you try a sample order and are not perfectly satisfied you may return the goods. We want your business and are determined to satisfy you, if you but give us a chance.

The accompanying cut shows our

Wet Tool Grinder

of modern design and heavy construction.

¶ A vertical centrifugal pump furnishes a constant supply of water, the propeller being so loosely fitted that it does not touch the case at the nearest point; there is, therefore, no wear of parts, nor is the grinder affected by grit or dirt. ¶ A sleeve cap prevents leakage, without the use of packing.

This is a most efficient tool, and may be run constantly if desired, as it is fitted throughout with self-oiling bearings. We guarantee complete satisfaction with this grinder.

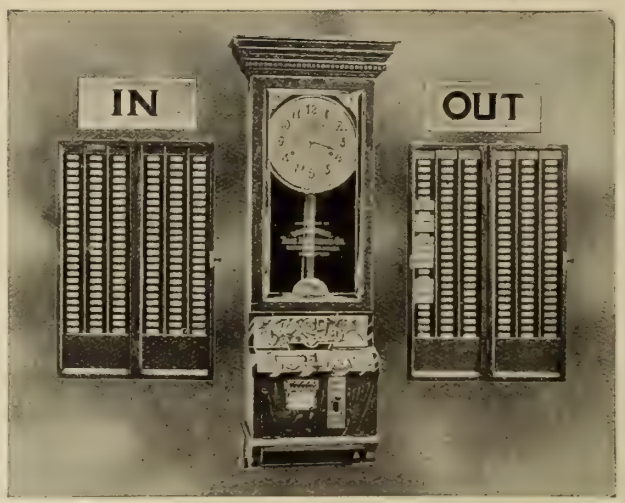
LABOR TIME RECORDING

The chief item in the expense account of the average business concern is the cost of labor. Labor cost represents Time for which the employer pays Money. It naturally follows that an efficient system of checking the time given by employees in exchange for their employers' money is essential to the proper conduct of business. No system that is in the least dependent for its operation upon the honesty or energy of a clerk will give very satisfactory results. A clerk is only human. He has his likes and dislikes; his fits of laziness; of indisposition; of carelessness. The perfect system is the



International Rochester Card Time Recorder

This system is entirely automatic and is the very acme of simplicity. It consists of a clock with a special mechanism, two card racks and sufficient cards of a simple ruling, as shown in the above illustration.

When ringing "in" the employee takes his card (designated by name and number) from the "out" rack, stamps it on the clock, and places it in a corresponding pocket on the "in" rack. On his card the exact time of his arrival—day, hour and minute—has been recorded. He repeats the operation whenever going in or out. At the end of the week your card racks contain an absolutely accurate record of the time worked by every employee. This system cannot err or be manipulated. Its records are absolutely indisputable. Could anything be more satisfactory ?

We are also manufacturers of the well-known

Dey Dial

another entirely automatic time-recording system, manufactured in eighty-eight different styles.

No matter what the nature of your business may be, or how large or small its size, we can supply you with a time-recording system at a fraction of the cost of a human time-keeper and with infinitely better results.

We solicit your enquiry

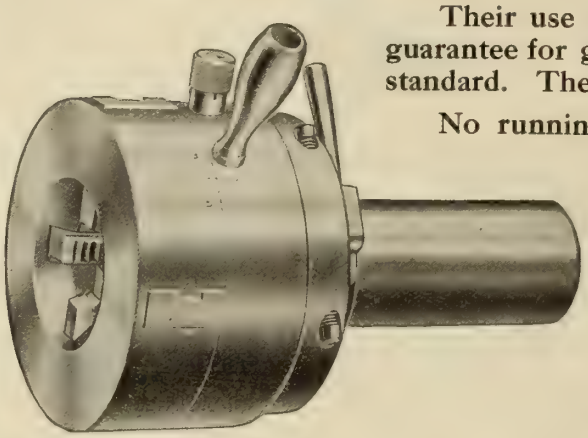
When are you going to decide to get rid of your threading troubles?

Now that business is again in full swing, it is time to think of buying labor and cost saving tools, and a good beginning towards this end is to instal an equipment of GEOMETRIC TOOLS.



Their use on Screw Machines or Turret Lathes is a positive guarantee for greater profits, increased output, and a higher quality standard. Their action is automatic.

No running back after each cut; they are Self-Opening and Adjustable.

Will cut any diameter from the smallest screw up to 4½" bar, right or left hand threads, standard or special pitch, to any length.

Try them; they'll reduce the cost of thread cutting to a minimum. Tell us the range of thread cutting to be done, also diameter of turret holes, and we will recommend the proper tools.

FACTORY HEATING AND VENTILATION

BY

The Simplest and Most Economical System Known

The SHELDON FAN SYSTEM

CONSISTING OF

A Pipe Coil Heater, using exhaust or live steam, or both, which can be arranged for gravity return to a boiler located on the same floor.

A Blower, fitted with Sheldon Multivane Runner, which can be operated by any convenient power, most economically by a Direct Connected Engine, the actual operating cost of which amounts to only a small percentage of the heat in the steam passing through the fan engine, the remainder being utilized in the heater, into which the engine exhausts.

Fan, Heater and Engine are centralized in one compact apparatus.

The Fan can be so arranged to take all or any part of its air supply from outside or inside the building, as desired.

The warm air is conveyed through ducts or flues and distributed throughout the entire building.

Let us tell you more about it.

SHELDONS LIMITED, :: Galt, Canada

THE WATER TEST

Packard

Type "D" Motor

Reproduction from an actual photograph, showing the "Water Test" as applied to a Packard Type "D" Motor.

shown in the picture, proves one of the many points about the PACKARD Type "D" Motors, that combines to make them peculiarly adaptable for severe operating conditions.

The test consisted of a submersion of the motor in a tank. Connection being made to the circuit, the motor was allowed to run—completely under water—for several hours at a time—and, after repeated tests, the insulation was found to be in no-wise affected.

Could you ask better proof of the **ruggedness of design** and **careful construction** of the motor; or of the success of our Vacuum process of insulation?

TALK 3

BELTING

vs.

INDIVIDUAL ELECTRIC DRIVES

¶ The ideal of an individual drive shop is one in which not a belt is to be seen, and a few years ago much was made of installations of this kind. They have been found to be very expensive, inefficient and liable to break down.

¶ Horse-power generated at a central station and then distributed to different shop prime movers is convenient but not cheaper than a detached power plant for each shop.

¶ The objections that apply to detached steam engines do not apply in the same degree to isolated and detached natural gas, crude oil, or engines using producer gas.

¶ When motors are used it is better to have each motor serving a fairly large group than it is to have individual drives for each tool.

¶ Group drive is preferable to individual drive and also preferable to having one large motor only as prime mover for the shop.

Next month we will show why group drive is superior to individual motor drive.

RENOLD SILENT CHAIN DRIVES

Will Overcome Transmission Troubles

Montreal, Feb. 8th, 1909.

Messrs. Jones & Glassco,
334 Notre Dame Street West, Montreal.

RE RENOLD SILENT CHAIN DRIVE.

Gentlemen,—In reply to your inquiry of Jan. 30th, I may say that the Renold Silent Chain Drives we have installed are giving every satisfaction.

Our first drive was installed to replace a 12-in. belt which was giving us trouble on account of short centres; this chain has run continuously for four years without the slightest trouble.

Our second drive was installed on a mixing machine doing heavy duty and which had previously broken up two sets of spur gearing; this chain has run over three years with no sign of wear yet.

Our third drive was installed on a calendering machine after breaking two sets of helical gears. and this has been so successful that we are now installing two more similar drives.

I would be perfectly willing to make an appointment with any person genuinely interested and show him the drive in operation.

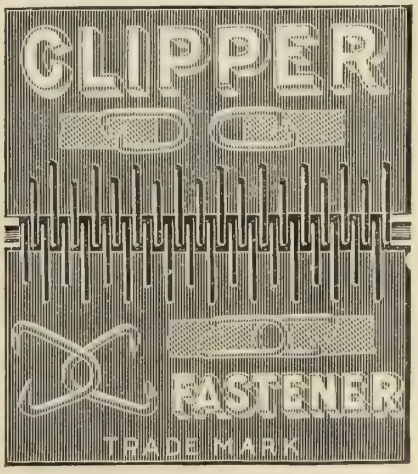
THE

"CLIPPER" BELT LACER

Saves time and money, and does the work better than other systems.

A FEW FEATURES:

Laces both sides alike.
Same tool laces both single and double belts.
Tool holds hook perfectly while inserting it.
It is not necessary to remove belt from shaft.
No cutting of belt half in two, as with other makes.



Certainly this is the machine you are looking for. It makes a perfect flexible joint, with no chance for crystalization. Very inexpensive. You can have one on each floor.

Several Practical Pointers on Commercial Grinding

From the Experience of the Brown & Sharpe Co., Providence, R. I., who have Manufactured Grinding Machines for the Past Forty Years. Grinding is Now an Important Factor in the Production of Machine Tools.

By JOHN J. THACHER

Successful manufacturers realize that one of the factors standing well to the front in achieving their success, is their ability to produce machine parts in duplicate and economically in large quantities. The grinding machine is one of the more modern machine tools, pereminently fitted for producing accurately finished parts in large quantities in a minimum of time.

Fig. 1 illustrates the general type and proportions of what is known as the Universal grinding machine. Work is ordinarily carried on two dead centres and is reciprocated in front of the abrasive wheel by the table, which traverses on ways extending the entire length of the bed. The abrasive wheel and the work are both revolved by power. The work is reciprocated by power or hand, and the feed of the wheel to the work is automatic and is automatically stopped when work is to size.

When using these machines for commercial manufacturing it is well understood by those familiar with actual practice that absolute accuracy is never attained, but there are limits within which pieces produced are perfectly satisfactory and for all practical purposes are duplicates.

For ordinary commercial grinding, a limit of half a thousandth of an inch (.0005-in.) is close enough. A limit of half a thousandth (.0005-in.) means that a piece of work will pass inspection if it is not more than a quarter of a thousandth (.00025-in.) larger or smaller than the specified dimensions. Special cases require special degrees of accuracy, such as some ball bearings, standard plugs, etc., where a limit of one ten-thousandth (.0001-in.) is maintained, while in cases where parts are ground for looks only, no arbitrary limits are established.

The grinding machine not only produces very accurate dimensions on the work ground, but incidentally produces a better finish than any other commercial process, and is the only successful method of finishing hardened steel parts. By good finish we mean that the work shall be perfectly round, calipering the same diameter its entire length; or, in other words, perfectly straight. A good finish means also that the surface shall be very smooth, as is illustrated in the accompanying cut, Fig. 2, at the right-hand half of the piece shown. This finish is superior to the best that a lathe can produce, which is shown in Fig. 3, right-hand half. The actual difference is much more apparent on the pieces from which the cuts were made, but the cuts serve to illustrate the difference between a bearing surface produced on a lathe by an expert mechanic; and on a grinding machine by an operator that is not a mechanic. The greater ease of running and the extended life of a machine when its bearings are ground is apparent to any engineer or mechanic. The grinding process produces more nearly that glazed condition on the steel member of a bearing, which is produced on the cast iron member of a bearing after it has been in use some time—a bearing well known as having remarkable wearing qualities.

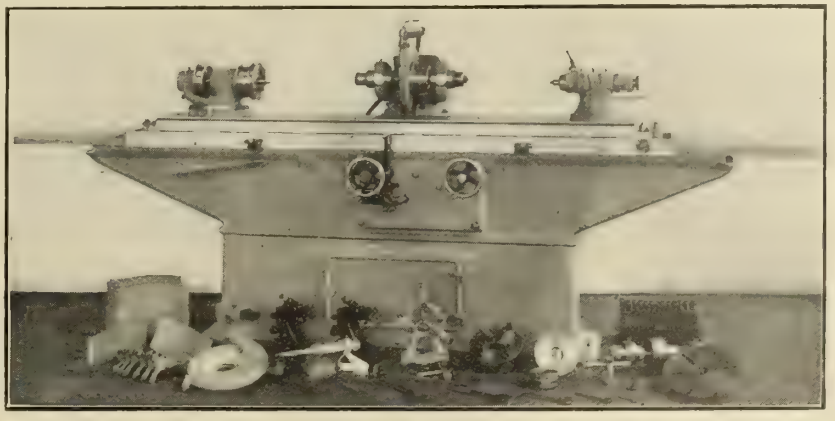

Fig. 1.—No. 4 B. & S. Universal Grinding Machine, Showing Attachments.

Speed is Important.

Quite important in producing the best results in grinding is the speed at which the work is revolved, as it is brought into contact with the abrasive wheel in the grinding machine. This is well illustrated in Fig. 2. The piece of work there shown was ground its entire length in the same machine with the same wheel; the noticeable difference between the finish on the two havles was produced by the relative difference of speed at which the surface of the work was brought into contact with the wheel. The finer finish was produced with a surface speed of the work of about 60 feet per minute, and a surface speed of the wheel of about 8,000 feet per minute. The rougher cut on the left-hand end of Fig. 2 was produced by a very much slower speed of both wheel and work, the work speed being about 10 feet per minute. This, incidentally, shows very plainly that poor results on the grinding machine are not always the fault of the machine itself or the abrasive wheel, and very often wheels not just suited to the particular material to be ground may be made to do very creditable grinding by changing the speed of the work or the wheel, or sometimes both. It also shows that slower speed and diminished output do not necessarily mean better quality of work, on the other hand, that the best work can be produced when running at high efficiency.

The piece of work illustrated in Fig. 3 was produced on a lathe and the rough turning on the left-hand end, illustrates what is considered good enough to send to the grinding machine from the lathe; as the grinding machine will remove all grooves at the first traverse of the wheel across the work. Owing to a certain amount of pride, which seems to be general with lathe operators, it is very difficult to get such rough quick turning as this cut shows, but from a commercial point of view, this represents the highest efficiency of both lathe and grinding machine. The introduction of high-speed steel lathe tools brings about the greatest efficiency when work is afterwards brought to size by the grinding process.

Several experiments recently conducted at the works of the Brown & Sharpe

Mfg. Co. tend to prove that it is not generally successful to grind castings or forgings from the rough, especially if accurate results are desired. A grinding machine cannot remove all the scale from a surface in a single cut unless greater pains is taken with centring the work than is consistent with economy. If the scale is removed on one side and left on the other, as is surely the case with ordinary centring, there are un-

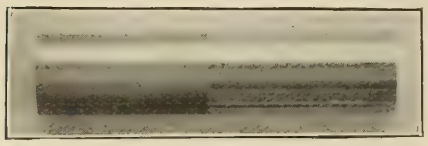

Fig. 2.—Sample of Work.

equal strains which will cause the work to spring out of true. It has proven more economical to remove the scale with a lathe, using a cut at least one-sixteenth of an inch deep, then transferring the work to the grinding machine for finishing. When work in large lots is handled in this way the lapse of time between the two operations gives the

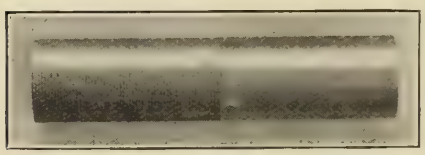

Fig. 3.—Sample of Work.

work a chance to "set," relieving any strains caused by the lathe work, thus ensuring permanency in the ground piece.

Work, where accuracy of the ground surface is not of prime importance, may be ground from the rough, and this may be necessary if the work is hardened, but the wear on the abrasive wheel when cutting through the scale is excessive and generally proves very costly.

CANADIAN MANUFACTURERS' ASSOCIATION.

The thirty-eighth annual convention of the C. M. A. was held in Hamilton, Sept. 14, 15 and 16. Robert Hobson, president of the Hamilton Steel & Iron Co., and president of the association, presided at the meetings.

Among the interesting subjects for discussion, were the permanent tariff commission, technical education, insurance, trade and commerce, etc.

Technical Training.

The report on technical education was presented by Mr. C. L. McCullough in the unavoidable absence of Mr. J. F. MacKay, convener of the committee. At the last annual meeting the association had authorized the appointment of a commission on technical education, and an appeal to the Provincial Governments for assistance in carrying the undertaking through.

It was pointed out that Quebec was proceeding with the establishment of technical schools sufficient in number and adequate in equipment for the needs of the Province of Quebec, at an outlay of $3,000,000. The committee interviewed the Governments of Ontario and Nova Scotia, and received encouragement from both sources.

The Federal Goverment intends collecting facts and statistics on technical education for the use of the Provincial Governments.

In view of the association's suggestion that an effort shold be made to have technical education taken up vigorously in all parts of Canada as a purely provincial issue, a summary was included in the report showing what the various provinces have done to date, and their plans for the future. From the west there was practically nothing to report, and very little has been done in Prince Edward Island and New Brunswick. In Quebec there are 11 schools of arts and manufactures, employing 50 teachers, and giving instruction to 2,502 pupils. The subjects taught include drawing, decorative painting, modelling, lithography, joinery, plumbing, shoe paterns, cutting, sewing and music.

It is most gratifying to note that there has been a marked advance in some centres in Ontario towards industrial training of a more definite and practical character, such as metal work, forge shop practice and mechanical drafting. This has been particularly noticeable in Sault Ste. Marie, Woodstock, Stratford, Berlin, Hamilton and Brantford.

The Department of Technical Education has been organized in Nova Scotia for two years. There have been established technical schools in 21 industrial communities. These schools may be divided into four classes—schools for coal miners, schools for stationary engineers, schools for craftsmen and schools for fishermen. The coal mining instruction is the most widespread on account of the great importance of that industry to the province.

Uniform Boiler Law.

A joint meeting of the engine and boiler and engine and thresher sections, was held on Wednesday, Sept 15. William Inglis, Toronto, chairman of the engine and boiler section, presided.

J. W. Harkom reported on the position of the various provinces in regard to a uniform boiler law.

At the present time the laws in the provinces of Manitoba, Alberta, British Columbia, etc., are different, putting a great handicap on manufacturers, and restricting interprovncial trade. It is proposed that uniform regulations for the construction and inspection of boilers. This is only reasonable, and the legislators should see the fairness of the request. Users will then know that if a boiler is built in one province, it will be acceptable in any province.

The following resolution was drawn up and presented to and passed by the C. M. A.:—

"Whereas, the several provinces, under the powers vested in them, have in the past formulated regulations governing the construction and inspection of boilers.

"And whereas, owing to the fact that each province through its staff acting alone, the resulting regulations differed in many respects, causing much confusion, annoyance, and loss to user and builder,

"And whereas, uniform regulations providing for the safety of the public, including users and builders, are highly necessary and desirable,

"Be it resolved, that the Canadian Manufacturers' Association in annual convention assembled does herein urge the different Provincial Governments to accept the principle of uniformity, and to adopt the suggestion offered that a conference of representative officials from the several provinces be held in such place as may be found convenient at the earliest possible date to make recommendations for a uniform measure of this nature."

The following officers were re-elected for the ensuing year: — Chairman, William Inglis; Vice-chairman, J. M. Jenckes; Executive, George W. Watts, R. O. McCulloch and J. J. Main.

New Officers C. M. A.

The following were declared elected officers of the association: — President, John Hendry, the B. C. Mills, Timber & Trading Co., Vancouver; First Vice-Pres. W. H. Rowley, E. B. Eddy Co., Hull; Ontario Vice-Pres., J. P. Murray, Toronto; Quebec Vice-Pres., W. A. Marsh, Que.; B.C. Vice-Pres., W. H. Barker, Vancouver; Man. Vice-Pres., T. R. Deacon, Man. Iron Works, Winnipeg; N. S. Vice-Pres., J. N. Edwards, the Londonderry Iron & MiningCo., Londonderry; N. B. Vice-Pres., James Fleming, St. John; P. E. I. Vice-Pres., Hon. F. L. Haszard, Charrlottetown; Alberta and Saskatchewan Vice-Pres., P. Burns, Calgary, Alta.

Protection of Life and Property, Cutting Factory Costs

Some Devices for the Protection of the Factory, which Saves Dollars of Fire Losses—Schemes for Reducing Costs in the Machine Department.

Fire insurance can often be materially reduced by the adoption of equipment which will reduce the fire risk. The instalation of a sprinkler system is one scheme for lowering it considerably. In connection with this a fire curtain will almost completely shut off the

Fig. 1.—Plant Equipped With a Water Curtain Which Reduces Fire Insurance.

building from adjacent buildings. This is clearly shown in Fig. 1 where the Gazette Building, Montreal, is cut off from the lumber storage yard adjacent to it.

The curtain is illustrated in operation. The pipes extend across the top of the windows. These are supplied with water under pressure by two risers which divide the building in thirds. Each riser supplies half the building with water.

Fireproof Doors.

A scheme that is used by the Frost & Wood Co., Smith's Falls, and which a number of manufacturers use in their plants is a fireproof door as shown in Fig. 2. All openings in the brick walls between departments are closed with automatic fire doors. These are three inches thick covered with sheet iron. The door is hung on a single rail so that if the link is melted the door closes by gravity. Every care should be taken to see that material is not piled against the door.

Clothes and Waste.

In the G. T. R. shops, Stratford, lockers similar to those shown in Fig. 3 are used. Besides adding to the appearance of the shop by not having clothes hanging on every post, there is no chance of fire starting from oily smocks and overalls hanging in the shop over night.

Another method of lowering insurance risk is by taking proper care of oily waste. All oily waste, rubbish and loose material should be deposited in waste tins and removed at night. In the Frost & Wood Company's works these are located in every department in convenient places and cleanliness is

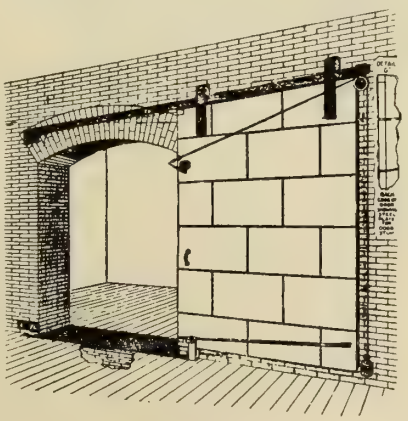

Fig. 2.—Fireproof Door.

insisted upon. The oily waste is carried out and used to start the forges in the smith shop, or for the generation of power under one of the boilers.

Other Savings.

There are some other methods used in a number of shops for reducing costs in addition to insurance. These take a great number of varying forms, all with the same object in view—economy.

A feature in Frost & Wood's shops is the number of trucks used. When work is brought to a machine hand, it is placed conveniently for him. The mechanic puts the finished pieces into another truck and this is removed to make way for another. No time is lost loading trucks as it is as easy to place the machined pieces in a truck as to throw them on the floor.

Automatic Machinery.

An interesting machine in the machine department of the Frost & Wood's shops, is a National Acme automatic screw cutting machine. On this are cut large quantities of screws entering into the make up of binders, mowers, etc. It is worked in connection with a turret lathe and the same man looks after both. Once the proper tools are placed in position on the automatic, the only attention it requires is the feeding of stock. The saving effected by this machine is between $5 and $6 per day over old prices.

Grinding Tools Automatically.

In the G. T. R. shops, Stratford, two William Sellers machines are installed for grinding tools. These are similar to that shown in Fig. 4 and have results so tabulated that even an

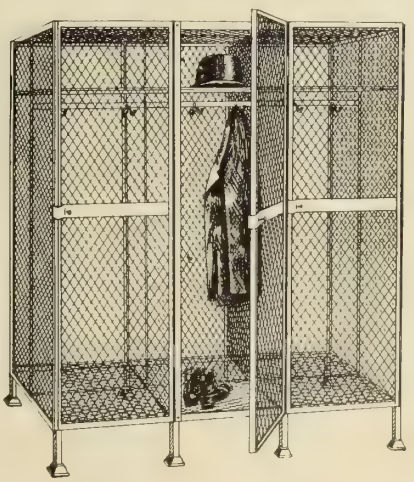

Fig. 3.—Lockers for Employes.

unskilled workman can grind tools for planers, lathes, shapers, boring mills, etc.

By standardizing the shapes of cutting points on all tools in the shop one man may keep all the tools in the shop in good cutting condition. It has been

found to give better satisfaction to have one man take care of all the tools.

Information concerning the proper method for grinding each cutting point is tabulated and mounted in a frame which is held in a convenient bracket. This makes accessible exact directions so that the operator can grind each tool accurately if he follows instructions.

Factory Intercommunication.

In both the G. T. R. shops, Stratford, and the works of the Frost & Wood Co., telephone systems have been installed connecting the various departments and offices.

The nature of the modern machine shop organization with its many departments covering a large ground area, demands that some quick method of communication be installed that will put every department in close touch with any and every other department. It should not be necessary for the foreman of, say, the tool room to go to the foundry to ascertain why certain pattern castings required for a rush order have not reached him. His time is too valuable to be thus wasted. Again, the shipping department, located perhaps in a remote part of the works, should be in as close touch with the superintendent as the departments close to his office.

Notwithstanding the many advantages of the telephone in saving time of men such as foremen and superintendents, there are many plants, otherwise up-to-date, which are sadly deficient in any modern method of factory intercommunication. A considerable saving could be made by the instalation of a telephone system at a comparatively small outlay.

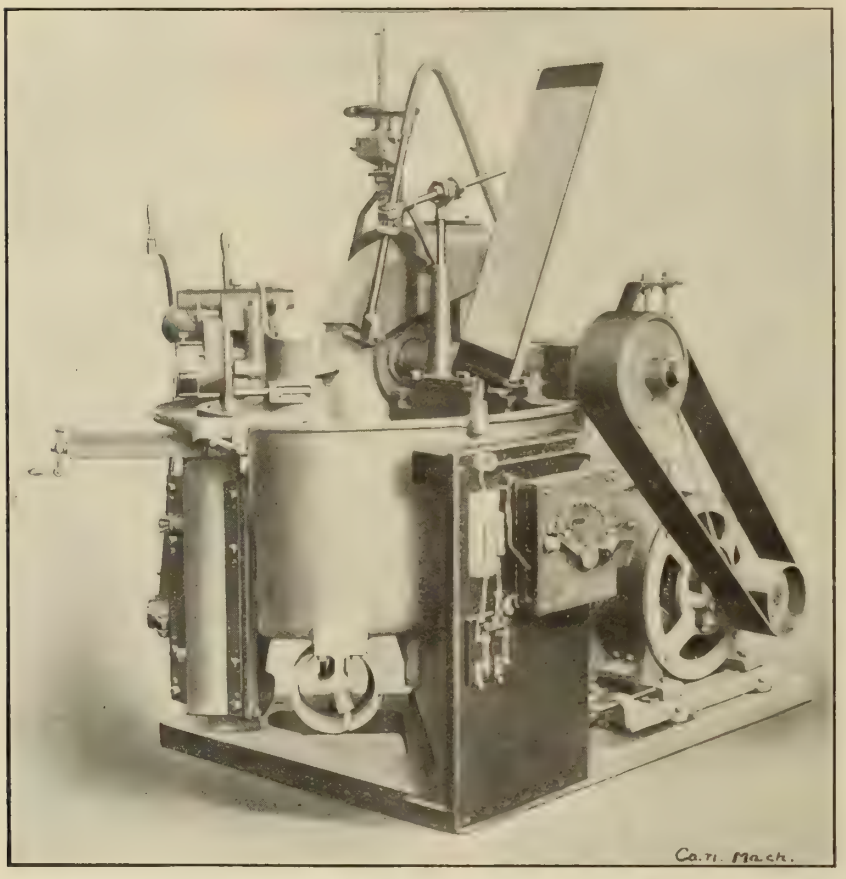

Fig. 4.—A Tool Grinding Machine, With Operations so Tabulated That an Unskilled Man Can Grind Tools For the Shop Accurately.

TESTING FILES AND TOOL STEEL.

Edward G. Herbert read a paper on "The Testing of Files and Tool Steel" at a recent meeting of the Manchester Association of Engineers. The author said that file testing was of considerable importance in workshop economy, as vast differences of efficiency were quite common among the various files on the market. Among the results of the file testing machine, none had aroused more interest than the discovery that the two sides of a file were seldom equal in efficiency or durability. Tests made upon two sides of a file showed that one accomplished three and one-half times as much work and made four times as many strokes as the other before becoming so blunt as to be useless. Extreme variations were now much less frequent than before the first tests were made, and it was clear that with reasonable care it was possible to produce files which were practically equal-sided. The file testing machine had also demonstrated the great differences in efficiency and total output of work which might be caused by minute variations in the shape of file teeth, variations which could scarcely be detected by examination, and which could only be eliminated by extreme care in all the processes of manufacture. In this connection the cut had a far greater influence than the quality of the steel.

The chief factors determining the cutting efficiency of a file were sharpness of teeth, slope of the front face of the teeth, slope of the back face of the teeth, angles at which the two cuts lay relatively to the axis of the file, pitch or coarseness of cut, and ratio between the pitch or number of cuts per inch in the "up cut" and "over cut."

Systematic investigation was now being made in several works as to the best value of any of these seven factors. It had been generally assumed that a good file was good for all classes of work, and a series of experiments was planned to ascertain whether there was one particular cut which was best for all metals. The results went to show that there would be great economy in having files cut specially for the various metals and keeping them to their appropriate work. Speaking generally, files which did well on one particular metal were very inefficient on other metals, and many files sent in by engineers for testing on cast iron and steel were very inefficient on both metals as compared with correctly cut files. It was for the engineer to make the first move, but the difficulty shown to exist might be met to some extent by specialization, and the increase of efficiency would be out of all proportion to the increase of cost. A badly cut file was the most wasteful tool which could be placed in the hands of a workman. A new form of tool-steel testing machine could be pressed into the service of the investigator, as the cutting tool could be made to imitate very closely the action of a single file tooth, and simplify the work of research. Some of the results arrived at with the file testing machine had been confirmed, and it had been shown that the chief factor influencing durability and output of work was the clearance angle or slope of the back of the tooth up to 25 deg. clearance.

The man who is worthy of being a leader of men will never complain of the stupidity of his helpers, of the ingratitude of mankind nor of the inappreciation of the public. These things are all a part of the great game of life, and to meet them and not go down before them in discouragement and defeat is the final proof of power.—Elbert Hubbard.

CANADIAN NATIONAL EXHIBITION, TORONTO The New Transportation Building.

EXHIBITS AT CANADIAN NATIONAL EXHIBITION.

The Canadian National Exhibition, Toronto in point of size and attendance surpassed any previous year. While there were few exhibits of heavy machine tools or machinery, there were some interesting ones showing lines of power machinery. The following are a number of the exhibits :—

Machinery Hall.

R. H. Buchanan, Montreal—Power supplies.

Chapman Double Ball Bearing Co., Toronto—This is a very interesting exhibit, a linen thread driving a countershaft with three pulleys, and a motor wheel is driven from one of these pulleys by friction. In the Transportation Building the application of the bearings to various vehicles is shown.

Canada Metal Co., Toronto—Babbit and metals.

Canada Steam Boiler & Equipment Co., Toronto—Improved Cyclone grates, vacuum valves and Standard Crown valves, manufactured by the Standard Engineering Co., Toronto.

Philip Carey Mfg. Co., Toronto—Pipe insulation materials.

Crescent Oil Co., Hamilton—Lubricating oils.

Dominion Belting Co., Hamilton—Maple Leaf and stitched cotton belting.

Dymond Gas & Engine Co., Toronto—Weber gas engine and Dymond producer.

Ferranti Co., Hollinwood, Eng. Ferranti meters, represented by George C. Royce, Toronto.

Dodge Mfg. Co., Toronto—Fine display of their well-known pulleys.

Goold, Shapley & Muir, Brantford—Gas engines.

Gilson Mfg. Co., Guelph—Air-cooled cylinder gas engines.

Kellogg & Co., Toronto—Gas engines, drills, etc.

E. Long Mfg. Co., Orillia, Ont.—Water turbines.

Lunkenheimer Co.—Steam fittings of all kinds, including valves, whistles, oil cups, force feeds, etc.

D. K. McLaren, Montreal and Toronto—Oak-tanned leather and waterproof cement.

Smart-Turner Machine Co., Hamilton—Boiler feed pumps and pumps for heating systems.

I. E. Shantz & Co., Berlin and Toronto—Diamond grate bars.

Waterous Engine Works, Brantford—Road roller and boilers.

Dudbridge Iron Works, Stroud, England An exhibit of oil engines.

Fitz Water Wheel Co., Hanover, Pa., were introducing Fitz water wheels to visitors at the Exhibition.

Garlock Packing Co., Toronto—Garlock packing for steam engines, air compressors, etc.

Jones & Moore Electrical Co., Toronto—Electrical equipment, motors, in all sizes both D.C. and A.C., etc.

Robertson & MacGavin, Toronto—Steam specialties and engineers' supplies.

R. Williams Co., Toronto—The largest exhibit of metal working machinery. They exhibited lathes, shapers, etc., in working order. The exhibit fronted the main entrance of Machinery Hall and came in for considerable favorable comment.

Walter Green, Peterborough—They displayed saw mills, lath mills, shingle mills, shingle packers, saw jointers, saw gummers, double edgers, wood sawing machines, and a general line of mill machinery.

Brown, Boggs Co., Hamilton—A complete line of presses was exhibited, one having the Jones Patent Safety Device attached.

Parke & Leith, Toronto—All kinds of aluminum cables, etc., the products of the British Aluminum Co., were shown.

"Cromil" Polygon shaping and grinding machines, manufactured by Crosier, Stephens & Co., 2 Collingwood St., Newcastle-on-Tyne, were on exhibit. They also had tin plates, tubes, acetylene lamps, etc.

Murchy Machine & Tool Co., Detroit—The new threading machine with automatic opening die heads was on exhibit.

John H. Hall & Sons, Brantford A new cold saw was on exhibit in the booth of Kellog & Co., Toronto.

Hammond & Ritchey, Toronto—Agents for Weldarine for welding and brazing castings.

Ambrust Brake Shoe Co., Hanover, Pa.—The exhibit shows engine and car shoes, also electric railway shoes, as well as samples of worn out shoes. The shoes are made with a steel connector cast in the Spacing Lugs, but not in the body of the shoe, and scrap at about four pounds.

Francis Hyde, Montreal—King crucible and rivet furnaces with Jacobs burners, were shown using oil as fuel.

Philips' Pressed Steel Pulley Works, Philadelphia—A full line of pressed steel pulleys was shown at the booth of D. K. McLaren, Montreal and Toronto.

Cowan & Co., Galt—Woodworking and pattern makers machinery.

Canadian Hart Wheels, Hamilton A full line of emery wheels.

N. J. Holden Co., Toronto—Pneumatic tools, electrical apparatus, railway supplies and air compressors.

Sterling Electric Co., Toronto—Electrical supplies, including tungsten lamps, etc.

Industrial Building.

Butterworth Foundry Co., Ottawa—In addition to other products of their works, such as stoves, etc., they exhibited Fleming grate bars.

Electrical Specialties, Ltd., Toronto—Batteries in all sizes and electrical supplies.

J. A. & W. Bird & Co., Boston—Cotton belting, represented by T. R. Flint, Toronto.

S. F. Bowser & Co., Toronto—Oil storage tanks.

Canadian Westinghouse Co., Hamilton—Small motors, Nernst lamps and electrical fixtures.

James Morrison Brass Mfg. Co., Toronto—An attractive exhibit of brass goods, such as steam specialties, brass fixtures, steam gauges, electric light fixtures, etc.

H. W. Johns Manville Canadian Co., Toronto—A fine display of all kinds of insulating materials for steam pipes, packings, etc.

Northern Electric & Mfg. Co., Montreal and Toronto—Motors, electrical fixtures, factory telephones for interfactory communication, etc.

Tallman Brass & Metal Co., Hamilton—Metals and babbits, including Arctic metal.

Canadian Sheet Steel Corporation, Morrisburg—This company's exhibit of sheet steel and tin plate along with a series of photographs showed the products of their works and the facility they have for turning out the work.

The Carborundum Co., Niagara Falls—The exhibit of grinding wheels and grinding materials was very complete and received much attention from interested visitors to the Exhibition.

B. Greening Wire Co., Hamilton—All kinds of wire screening were shown, together with wire cable.

Northern Aluminum Co., Toronto—Aluminum materials, including cables.

Rice Lewis & Son, Toronto—In addition to several lines of hardware specialties, mechanics' tools, etc., were displayed.

Manufacturers' Building.

Canada Rubber Co., Montreal—Mechanical rubber goods, etc.

Dunlop Tire & Rubber Goods Co., Toronto—Mechanical rubber goods, etc.

Gutta Percha & Rubber Mfg. Co., Toronto—Mechanical rubber goods, etc.

(To be added to.)

Implement Building.

W. D. Beath & Sons—Transmission supplies, expanded metal, etc.

Metal Shingle & Siding Co., Preston Metal roofing for factories.

BOOK REVIEWS.

ENGINE LATHE WORK—By Fred H. Colvin, published by the McGraw-Hill Book Co., New York, 180 pages, 4½ x 7 ins., illustrated. Price $1.00, postpaid.

This is a book of practical suggestions which will give the young machinist or apprentice the foundation principles of engine lathe work. Every good machinist becomes acquainted with these rules and applies them as a matter of course. This book will give the younger apprentices a chance to become acquainted with the foundation principles.

There are fourteen chapters dealing with different phases of lathe work. Chapter 1 deals with the engine lathe and carriage; 2, centering lathe work; 3, driving the work; 4, tools and turning; 5, face plate work; 9, taper turning; 10, thread cutting; 11, test indicators and their use; etc. The headings of these chapters will serve to show the thoroughness with which the subject is treated. All points in connection with lathe work are carefully illustrated making the treatise very complete.

MACHINE SHOP DRAWINGS—By Fred H. Colvin, A.S.M.E., F.I. Published by the McGraw-Hill Book Co., New York, 139 pages 4½ x 7 ins., illustrated.

One of the weak points in many apprenticeship systems is teaching the apprentice to read drawings, make machine shop sketches and lay out work. This book by Mr. Colvin, takes up the subject in a comprehensive manner and will be a great help to the mechanic or apprentice who studies it. The book gets away from those books for mechanics, which teach them to draw and fills a long-felt want by teaching them to read drawings. It shows how seen and unseen portions are represented, and how to secure a correct idea of the shape of the piece represented.

Attention is also given to laying out work. Chapters 4, 5, 6 and 7 are devoted to this, 5 treating of spur gears, 6 of bevel gears and 7 the worm and worm wheel. Chapter 8 is devoted to sketches. It is most important that a mechanic be able to sketch, especially those of an inventive turn of mind. The whole idea is to give an idea of how to read drawings and it is done very thoroughly.

WOULDN'T MISS AN ISSUE.

Editor Canadian Machinery.

I regret very much having overlooked my subscription to Canadian Machinery so long, and I thank you for still sending it as I do not want to miss one issue. I look forward to its monthly visits with a good deal of pleasure, and enclose $1, which you will please place to my credit. Wishing you continued success.

W. DALGHEISH.

Employees' Benefit Societies in Manufacturing Plants

First Aid to Injured at John Bertram & Sons Co., Dundas—Employees' Benefit Societies at Waterous Engine Works, Brantford, McClary Manufacturing Co., London, John Bertram & Sons Co., Dundas, and Goldie & McCulloch, Galt.

In a number of industries, associations have been established for the benefit of the men and they have been found of inestimable benefit to the men. A reflex action has also been felt by the companies. In those societies selected for description, it has been found that in addition to the benefits the men obtain, the men are more contented. Both employer and employes will find it to their advantage to establish benefit associations.

The growth of industry has greatly increased the risk of injury on account of the application of electricity in many lines of industry, unprotected machinery, the rush of competition, etc. The establishment of Benefit Societies, subscribed to by the men themselves and aided by the manufacturers in whose works they are established will be found to be an excellent system from an economic standpoint.

The following systems employed by several large Canadian manufacturers, are found to interest and benefit the men and to be of great value to companies in whose works they are established.

First Aid to Injured at John Bertram's.

A branch of the St. John's Ambulance Association has been established in the works of John Bertram & Sons Co., the principal aim being to render first aid to the injured. The class was organized in September, 1907, several men taking the course prescribed by the St. John's Ambulance Association, Dr. Langhand being secured to deliver the lectures.

Some of the things taken up in the course of lectures were, fractures, sprains, electric shock, burns and scalds, etc. Examinations were held and the papers were sent to London, Eng., to obtain certificates from the St. John's Ambulance Association.

The books of instruction and the kits came from London, Eng. The latter were supplied by the John Bertram & Sons Co. The kits are placed in convenient positions in the various departments and are in charge of the graduates. The kits contain needles, pins, bandages, splints, batting, plasters, liniments, etc. The foundry kit has balm for burns, carron oil, etc. Supplies are kept by the storeskeeper who give them out to the graduates.

In the office a large special kit is kept for the use of the doctor when he is summoned. Stretchers are also in readiness in the office and foundry.

Waterous Engine Works, Brantford.

The Waterous Engine Works Co. Factory Employes' Mutual Sick Benefit Society was inaugurated about twenty years ago.

Its management is exclusively in the hands of the employes of the factory. The company acts as its treasurer and Walter T. Mair serves in the capacity of secretary. The result of this arrangement is that the employes are relieved of any accounting and the real handling of the funds. The company subscribes to the society annually a fixed sum and there are assessments levied upon the employes at such intervals as may be necessary, although under the by-laws, an assessment can be levied twice each month. This year up to the present it has only been necessary to levy nine assessments. These assessments are of three amounts viz. 10c, 15c and 20c based upon the rate of wages in each class. The benefits paid are also in three classes, viz., $2, $3 and $4 per week of six days. The maximum benefit to be paid in each year is for twelve weeks. There is also a funeral benefit of $30.

Membership in the society is compulsory, in so far as the moment a man enters the employ of the company he becomes a contributor to the benefit funds.

The assessments collected are paid into the credit of the society and are withdrawn in a very simple manner. The foreman reports to the visiting officer that a man in his department is absent through illness, giving the date of such absence. The visiting officer then investigates the matter and reports to the directors of the department affected that he has visited the person named and that he is entitled

to receive sick benefits from a certain date. An order on the secretary is then signed by the two directors to pay the benefits and an order is then made by the secretary upon the company for payment of the amount. A cheque is issued to cover all the benefits to be paid and the currency is handed to the visiting officer for distribution among the beneficiaries and a receipt is taken for the amount so paid. For convenience this whole performance is confined to a single sheet.

As the funds of the Sick Benefit Association can only be used for the purpose of paying sick benefits, it was decided a few years ago to inaugurate another fund, which is used for the purpose of relieving special cases of distress among the members of the society. This fund is at the disposal of a special committee of five who can disburse it through the same medium as the regular funds are disbursed. This has eliminated entirely the necessity of taking up subscriptions among the men or the passing of the hat for monies to relieve distress.

The operations of the society have been very successful. All the members seem to be perfectly satisfied with the way it is conducted and the benefits are paid very promptly after the 1st and 15th of each month. The policy, in paying the benefits has rather been liberal than otherwise. No medical certificate is asked for except in cases where fraud is suspected and these are a very rare occurrence. The beneficiary in every instance is given the benefit of a doubt.

McClary Mfg. Co., London.

The McClary Mfg. Co. Employes' Benefit Society was founded in 1882. The membership is optional, but about ninety-five per cent. of the employes are members. In case of illness, or accident, they are allowed $3 per week for ten weeks, and half benefits for a further ten weeks, for which they contribute to the society, ten cents a week. In the case of boys and girls making less than $6 a week, they pay in half this amount, and receive half benefits. Twenty-five dollars is paid in case of death.

Two doctors are elected annually, and paid out of the funds of the society.

There is also a special fund set aside for extraordinary cases, and out of this, special contributions are made in case of urgent necessity. This is known as the "Concert Fund" and its revenue is derived from entertainments. The expenses of an annual picnic are also drawn from this source.

A new department is being established in connection with it, known as the "Welfare Department," and a trained nurse will be employed to visit those who are seriously ill, supervise and recommend sanitary arrangements, provide recreation for the girls, attend and assist at the dining rooms, (of which we have separate ones for the men and girls), give instructions in "First Aids," and also cooking classes in the winter evenings.

The income already stated is sufficient to pay running expenses and accumulate a healthy reserve, which is placed to the credit of the society in the bank in case of any possible epidemic, such as occurred a few years ago when la grippe was so prevalent.

Mutual Benefit Society at John Bertram & Sons' Co.

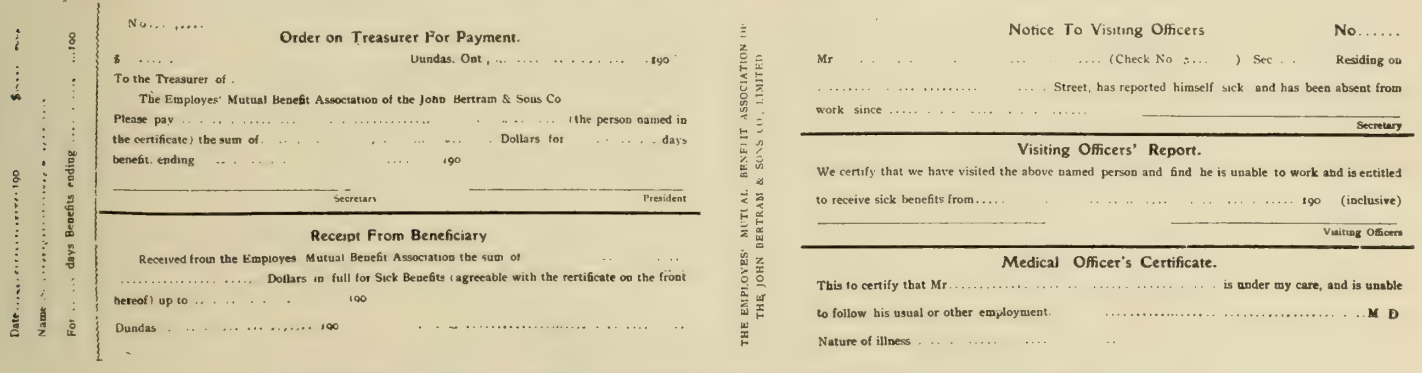
The Mutual Benefit Society in the works of the John Bertram & Sons Co., was organized in 1904. Its aim was to establish a fund for the relief of sick members. The membership is open to all persons in the employ of the company and very few have not joined the association. Benefits are paid with the least possible restrictions, all that is required from applicant is a certificate from some registered physician and the report of a sick visiting committee that the sickness or accident is not occasioned by immoral conduct or the use of strong drink.

Members of the association quarantined on account of infectious diseases receive the same benefits as if sick.

No initiation fee is charged, but each member is assessed 40 cents per month and receives $4.00 per week in case of sickness or accident, and this may be continued for 13 weeks in any one year if necessary, and even then the executive committee may grant special relief if deemed advisable.

The affairs of the association are governed by a Board of Management, consisting of a president, vice-president, secretary, treasurer and fifteen representatives representing all departments of the works. These officers and representatives are elected by ballot at the annual meeting of the members in whose hands is the entire control of the association.

The actual running expenses of the association including salaries, printed matter, supplies, expenses of annual meetings, etc., up to April 30th, 1909, amount to only $164.85, an average of $32.97 per year; this does not include the salaries of officers for last year as these items did not pass the committee till after the close of the year.



Order on Treasurer For Payment.

Nature of illness .....

Both Sides of Form Used by the Mutual Benefit Society, John Bertram & Sons Co., Dundas.

Three hundred dollars is the maximum the association can carry, for when that is reached the assessments cease on all members who have been in the association six months or over until the amount drops to $200.00, when all assessments are resumed, thus preventing the accumulation of a large fund, yet keeping a sufficient amount in the treasury to meet all requirements.

The officers of the present year are:

President—Alex Bertram, superintendent.

Vice-President—D. M. Finlayson.

Secretary — J. A. Thompson, cost keeper.

Treasurer—S. Briggs.

The association is independent of the company, being controlled by the employes. Every possible assistance is given by the company. One way it has assisted is in the matter of collections. Mr. Henry Bertram offered to have the time clerk deduct the assessments from the envelopes and this proposition was accepted by the men. By this method, collections are kept up-to-date and the members do not feel the assessment.

A member must be in good standing in the association for six months to secure benefits. This association have found it advisable in a small town not to employ a doctor, but rather to let each beneficiary employ his own doctor and pay the higher benefits necessary under such conditions.

The secretary and treasurer are both on bond, the cost of the bond being paid by the association.

This association has been successful and there are at least three reasons for its success,—1. It is an employes' society controlled by them ; 2. It has the hearty co-operation of the company ; 3. It is well managed.

Last year the society successfully financed an enjoyable and elevating entertainment at which the ladies were present. This is to be made an annual event. For one assessment a member was given a ticket for himself and lady. The cost for the best talent, orchestra, lunch, etc., was about $70. The object was to give the employes something edifying and from this point as well as financially, it was a success. There was enough funds left to turn into the association, after the outing, to make another assessment for benefits unnecessary that month.

Forms are reproduced showing the necessary steps in securing the benefit. There is doctor's report, visiting officers' report, etc. The report properly signed is sent to the treasurer, who makes out the cheque and secures the receipt for filing.

Goldie & McCulloch, Galt.

The Dumfries Foundry Benefit Society of the Goldie & McCulloch Co., Limited, Galt, has been in existence for the past twenty-five years, having been first organized in the year 1883. The success and popularity of this society has gradually increased until at the present time the society is one of the most successful Employes' Benefit Societies in Canada. The membership averages 300. During the twenty-five years that this society has been in existence they have paid out :—

For sick and funeral benefits	$15,002.27
For medical attendance	2,731.25
For dividends	10,165.30
For general expenses	1,557.00
Making a total paid out of..	$29,456.19

The management of this society is vested in a president, secretary and treasurer, with an executive committee of eight, one from each department of the works. At the end of each year the monies in the treasury is proportionately divided among the members according to the period of membership, the sum of fifty dollars only being retained as a society fund.

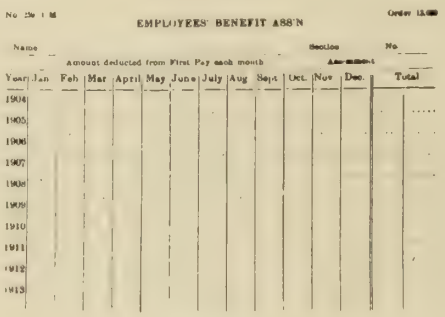
Every person who is an employe of the company is considered eligible to become a member, irrespective of age or sex so long as they are in good health and of strictly moral character.

Every member on admission must pay the entrance fee of twenty-five cents and the regular monthly dues of thirty-five cents. Forty cents paid at the beginning of each year or within one month after joining will provide free medicine for the year.

Each member unable to follow his trade or any employment by sickness or accident, providing he has notified the secretary through the committee men, receives a daily allowance of fifty cents for the first thirteen weeks, thirty-three cents for the next thirteen weeks, and twenty-five cents for the next twenty-six weeks. A funeral benefit of twenty-five dollars is also paid at death to help defray funeral expenses.

The shop doctor is always at the service of sick or injured members without charge.

The society hold annually, a most successful excursion, and in addition to



Card for Tabulating Assessments

this, an annual picnic. These two occasions result in considerable revenue for the society's funds.

The firm is very liberal in their donations to the society and care of its members. They donate each year one hundred dollars towards the funds and also one hundred dollars towards the annual picnic.

Twelve medical cabinets which are placed in the different departments equipped with stretchers, splints and all necessary appliances and medicines necessary in the keeping up of these cabinets for accidents and sickness, are also supplied by the firm on the condition that a committee of two members of the society be appointed to look after and keep in condition each cabinet.

The average sick membership annually is about 10 and the average annual payment of benefits runs 1,000 to 1,200 days.

The dividend which is declared at the end of each year amounts in some years to almost the total amount paid in. This of course depends greatly on the amount of sickness and the number of deaths during the year.

THE HARE ASH AND COAL HOIST.

With the expansion of the traffic of the railways throughout the country, it is becoming increasingly necessary to provide at the various terminal points, more rapid and economical methods for removing the ashes from the incoming engines.

For many years during the early development of the country the usual equipment for this purpose consisted in a long deep pit excavated between the rails of the "incoming" track, and over which the engines would pass on their way into the roundhouse. This pit, while being extremely simple and cheap to construct, is open to many serious objections, especially at terminal points where a large number of engines must be taken care of. In the operation, the engine would be placed over the pit, and a man underneath would rake out the ashes from the ash pan, allowing them to fall in the pit. When the engine has moved off the ashes are shoveled out of the pit onto the level ground, by hand, and from there into an ash car, which would be standing near on a parallel track. With this arrangement it is impossible to handle many engines, as unless the pit is very long the following engine must wait until the pit has been cleaned or else it must dump its ashes on top of that from the first engine. This soon fills up the pit, and makes it absolutely necessary to clean out before handling another engine. If the ashes are thrown out after each engine, the operation of the pit is very slow and causes delays. Again, the ashes when thrown out of the pit and piled at the side of the track must be wetted down to prevent the dust blowing over the engines in winter. If not removed at once, the ashes soon freeze, making it very costly to clean up.

Improvements to this style of pit have been made in various ways, such as placing the ash track which parallels the incoming track on a lower level so that the height to which the ashes must be thrown is reduced, but this, while making it easier for the laborer, and therefore somewhat cheaper, introduces the element of different grades in the same yard, which is objectionable. Sometimes one side of the pit is excavated, and one rail of the incoming track carried on a light girder and the ashes when dumped into the pit are pulled out at the side. This feature allows one engine to follow another as it permits the cleaning of the pit, while an engine is discharging. At the same

time this is only partly true, and if engines follow one another quickly the side pit soon fills up, or else the pit must be very long, and well manned. This calls for a corresponding number of ash cars standing alongside the pit, while water pipes must be laid throughout the whole length, so as to command the entire pit, which are always liable to interruption from freezing, etc. Breaks and leaks are not uncommon, and this means that the pit is soon flooded and frozen up.

This type of ash pit can clean an engine for 35.7 cents, when handling in the neighborhood of 60 engines per day.

*The cost divided as follows:—

	cents.
Fixed charges	4.8
Labor	26.1
Power, supplies, etc.,	1.2
Pro rata charge	4.8
Total	36.9

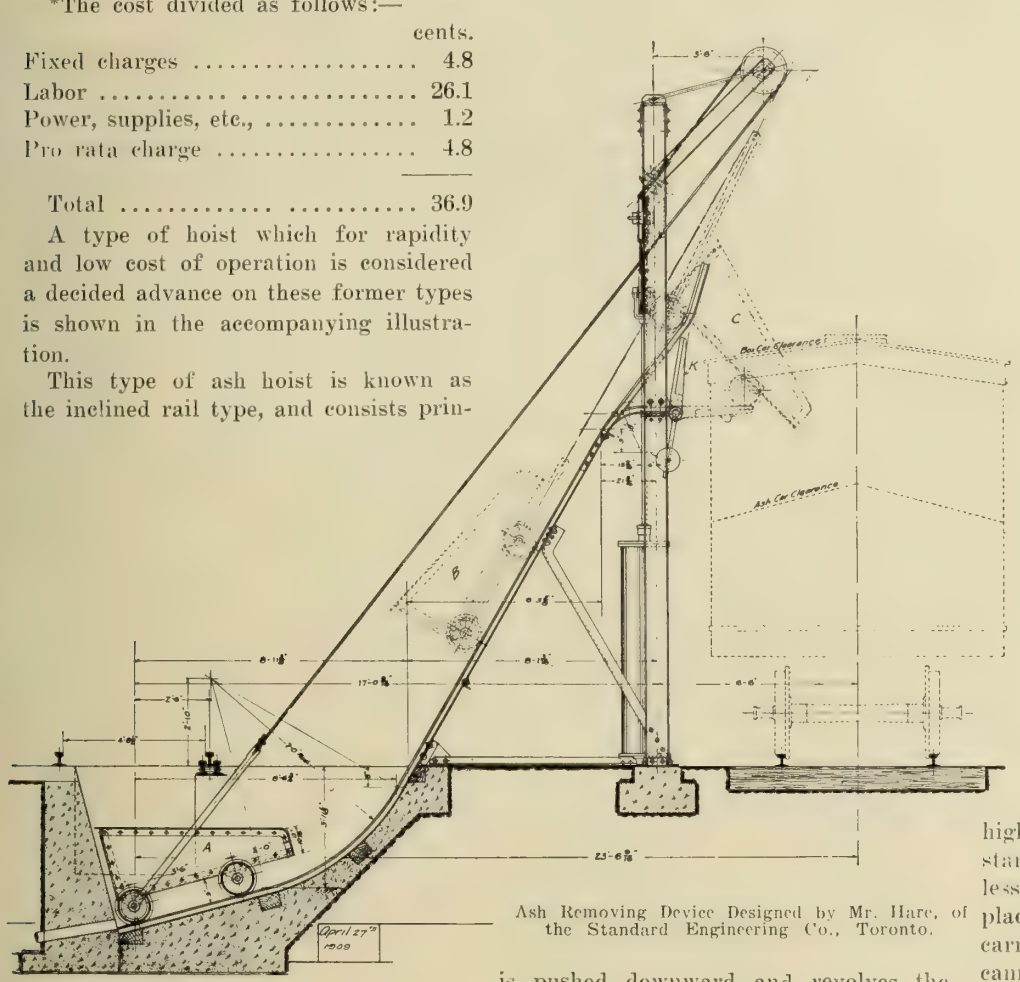
A type of hoist which for rapidity and low cost of operation is considered a decided advance on these former types is shown in the accompanying illustration.

This type of ash hoist is known as the inclined rail type, and consists principally of a steel hoist tower, supporting the inclined rails, which extend into the track pit under the incoming track. On these inclined runs a skip car, built substantially of steel plates and fitted at the back with a perforated panel to allow for drainage of water. An air cylinder capable of lifting the fully loaded skip car with a moderate air pressure, is connected to the skip car by a steel cable through suitable sheaves, and a steel bail pivoted on the back axle of the skip car.

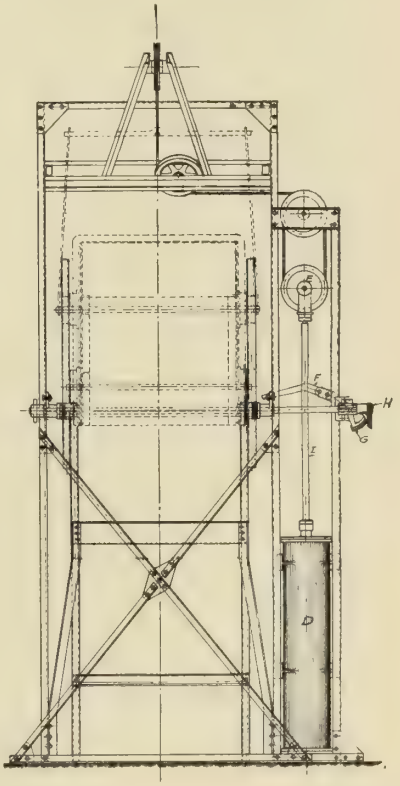
*C. F. Whitton, "Handling of Locomotive Ashes."—Trans. Can. Soc. C.E.

The distinctive feature of the hoist is shown in the way the skip car is carried over the top of the ash car when in the dumping position "C." The inclined rails are in line with two extension rails, which are keyed to the steel cross shaft shown. This shaft is operated through the segmental gears "G" and "H" from the lever "F," which in turn is actuated by the projecting end of the pin on which the sheaves "E" revolve.

When the skip car is filled, with ashes, the air is turned on the cylinder, depressing the piston and rod "I." When the sheaves "E" in their downward movement reach the lever "F," the lever is pushed downward and revolves the shaft and gear "G" and gear "H," which revolves the cross shaft, thus lowering the extension rails "K" to the horizontal position "J," thus allowing the front wheels of the skip car to roll outward carrying the lip of the car over the top of the ash car, and allowing the contents to be dumped in the centre of the ash car.



Ash Removing Device Designed by Mr. Hare, of the Standard Engineering Co., Toronto.



When the ashes have been discharged, the air in the cylinder is released allowing the skip car to fall back on the incline and so downward to the position "A" in the track pit. Where the piston "I" in moving upward passes the lever "F" the counterweight shown on the cross shaft falls, and in doing so revolves the cross shaft and raises the extension rails again to the position "K."

It should be noticed that this movement of the cross shaft takes place every time the skip car is raised or falls on the incline, and consequently the extension rails are never projecting over the ash car, except when they are required to be in that position to support the skip car, and that they are at all times positively operated, coincedent with the motion of the skip car on the incline.

This arrangement is a decided improvement over hoists in which the incline rails extend across the ash track, and thus prevents the passage of any high rolling stock on that line. Instances are not wanting where a careless crew when shunting at night would place a box car on the ash track, and carry away the entire structure. This cannot possibly happen with this hoist.

The capacity of this hoist can be made to suit any particular specifications, but will easily carry 1,800 pounds of ashes at a time. By the novel design of the skip car, it is possible to use an incline at the angle of 60 degrees from the horizontal, while the top of the car is only 45 degrees, or within the angle of rest of damp ashes.

The operation of this hoist is rapid, and the total cost of removing ashes from engine to ash car in a moderate sized terminal will not exceed 15 cents per engine, which is less than half the cost for the open-sided hand-operated pit.

This design of hoist is particularly

adapable to the coaling of locomotives as there is nothing to prevent an engine passing in front of the hoist, and at the same time the skip car is projected forward in dumping, thus placing the coal in the centre of the tender hopper without undue breakage. In this case bins are constructed over the receiving end with drop bottom transfer cars running underneath, which in turn dump into the skip car, the whole forming a most rapid and effective coaling station at moderate outlay.

The Hare Ash and Coal Hoist is the ininvention of Mr. W. Almon Hare, manager of the Standard Engineering Co., Ltd., Toronto, for whom patents have been applied in Canada and principal foreign countries.

CHEAP ATTACHMENT FOR THE UNIVERSAL MILLER.

By Philip G. Hall.

This attachment was made primarily for nicking the teeth of some large milling cutters, and was fitted on a Brown and Sharpe universal milling machine (No. 2 size). It may be very well used for other jobs, such as rack-cutting, etc. Figs. 1 and 2 will make the arrangement fairly clear. A is a grey iron casting, bored out at the top a sliding fit on the overhanging arm of the miller B; the lug is afterwards split, and holes drilled for locking bolts as shown. The bottom part of the casting is bored at right angles for a steel bush, the latter being kept from rotating by a sunk key. The lug C and bush are then split and a set-screw fitted so that the bearing may be adjusted as the bush wears. A pair of bronze bevel wheels (not necessarily machine-cut) are bored and turned, the one fitting a short mandrel placed in the machine spindle, and the other the bracket A, the latter being screwed out a left-hand thread (14 per inch) to carry the short cutter mandrel, and fitted with an adjusting nut D, kept in place by a "grub" screw.

In using this attachment the bracket A is so placed on the overhanging arm that it brings the two bevel wheels into gear. It is then securly locked by the two bolts in the top lug.

It may be of interest to some readers to know why this attachment was made. Usually, roughing cutters for "slab" millers (as the one shown in the sketches) have a coarse pitch thread cut on the blanks, before the teeth are milled out, the obvious reason being to break up the chips, and so relieve the machine of a considerable amount of strain. A glance at Figs. 3 and 4 will show why this thread is not nearly so efficient as the "nicks" cut out with the above attachment on the miller.

Suppose the feed of cutter is 5-16 in. per revolution; this means (as there are 20 teeth in the cutter) 1-64 in. for each tooth; and referring to H, Fig. 3, we see the appearance of the job after one tooth has passed over it, the projections being left by the "nicks" in tooth face. Now, taking an individual tooth of the cutter, its motion is very similar to that of a planning tool, the only difference being that it has a circular instead of a straight line motion; if, therefore, the "nicks" are cut on a lathe (in the form of a thread), it is evident that one side will have an excessive, and the other a minus, clearance (see Fig. 1), so that as the tooth passes over the work, it will have to shear off a portion of the projection shown in Fig. 3, causing unnecessary friction, and tending to dull the corner which has no clearance. With a straight "nick" (as made by the attachment), Fig. 1, this is entirely absent, and the cutter will therefore keep cooler and last longer without regrinding. It might here be pointed out that the "nicks" may be placed on the cutter blank to form any spiral (or pitch) required, that shown in Fig. 1 corresponding to an 11 in. pitch thread with ten starts. The method of obtaining this is simple. The teeth are first milled out in the blank as desired, then the attachment is put into position, and the "nicking cutter" brought to the end of the blank. The leading screw of the machine is now given four turns (it being of ¼ in. pitch), and the knee raised to stop, thus cutting a "nick" 1 in. from the end of the mill. After lowering the table, the screw is given four more turns, and the second "nick" cut, this being repeated until the tooth is finished. As the table is advanced the cutter blank is rotated by the gears (used for the spiral flutes) acting through the dividing head, thus keeping the relative positions of the tooth and nicking cutter the same. In nicking the second tooth, the dividing head is turned through 1-20th of a revolution (it being indexed for 20 teeth), and the leading screw given two turns for the first "nick" and four for the rest, thus generating the 11 inch pitch spiral required.—Mechanical world.

CENTRAL RAILWAY AND ENGINEERING CLUB.

The regular monthly meeting of the Central Railway and Engineering Club, Toronto, was held in the Prince George Hotel, on Tuesday, Bept. 21. A paper was read on "Care and Washing out of Locomotive Boilers," by J. V. Jackson, Boiler Inspector, G.T.R., Montreal. The paper showed the difficulties to be overcome and gave the easiest and quickest way to clean locomotive boilers. Mr. Jackson pointed out that boiler scale not only greatly increased the fuel bill, but when the scale was heavy became a source of danger. He recommended frequent cleaning of boilers.

The discussion brought out a number of excellent points in regard to the removal of scale, compounds, etc. It was pointed out that soda in some form was the best scale loosening compound. President C. A. Jeffries, master mechanic, Consumers' Gas Co., occupied the chair.

The next meeting is on Tuesday, Oct. 19, when Mr. Shales of the Elevator Specialty Co., Toronto, will read a paper on "Care and Maintenance of Elevators."

C. H. Temple, formerly master mechanic of the central division, C.P.R., has been appointed assistant superintendent of motive power, with office at Winnipeg.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

EVERLASTING LUBRICATION.

By E. Crabtree.

The necessity of proper lubrication for high-speed machinery is acknowledged by all machine builders and users, and although various devices have been applied in the shape of automatic oilers,

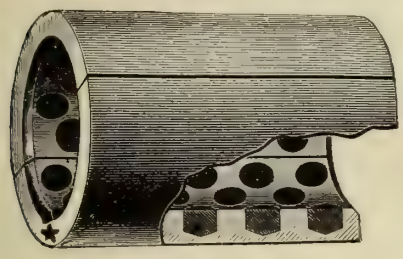

Fig. 1.—Lubricating a Bearing.

grease cups and ring oiling bearings, these have all got their drawbacks inas-much as should a careless apprentice fail to keep these devices filled with lubricating product, the machine is left to take care of itself and a lack of lubrication is not realized until bearings become heated or the machine refuses to run.

A very successful and most economic way of overcoming any defects such as the above has been in the bearings themselves being so constructed as to produce enough lubrication to last out the life of the bearing itself without even the application of oil or grease, or any attention whatever, especially in machines where bronze bearings are used.

The principle as applied is to first bore out the bearings the required size to suit mandrel, then take and drill several rows of holes from end to end of bearing, size of hole varying according to size

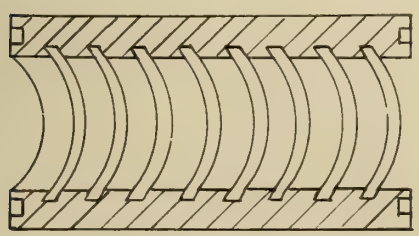

Fig. 2.—Section of Round Bushing With Square Thread Filled With Graphite.

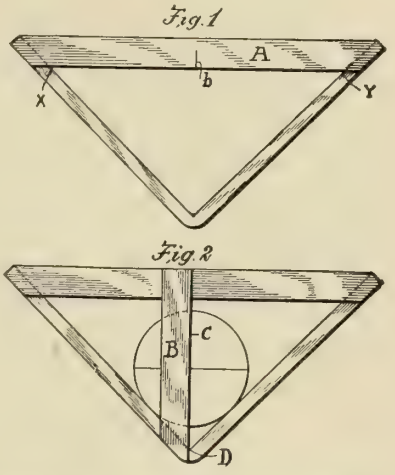
of bearings, drill these holes with the second and following rows of holes directly under the spaces of the previous row of holes, thus the shaft or mandrel gets lubrication the entire length of bearing, (see Fig. 1). In a bearing, say 6 in. long, holes need to be about ⅜ in. diam. and drilled as deep as possible without going right through casting, afterwards taking off the burrs round the holes and leaving a space about ⅜ in. between each hole. Then fill each hole as tight as possible with a good quality of graphite. The bearing is then ready for use and will need no further attention. One supply of oil when machine is first started, is all that is required and will insure a cool, steady running machine.

Cast iron bearings are excellent. Without attention, bearings quickly heat and usually the spindle or shaft tightens as to be almost inseparable. The above method of placing holes in such bearings, fitted with graphite will be found to overcome this difficulty, and give every satisfaction. The use of graphite as a lubricant for bearings is of very great importance as applied to pulleys running either vertically or horizontal, and where it is difficult to get at them to apply oil or grease. The best method of fixing pulleys with graphite bearings is to procure a brass bushing, having hole bored to fit shaft. The inside may either have holes bored through as in bushings before mentioned, or two threads (square) may be put inside and the grooves and holes filled with graphite. Where two pulleys run together the bushing can be grooved at the ends and filled same as the holes (Fig. 2). The bushing is then forced into the pulley as tight as possible and pulley will need no lubrication as long as bushing lasts, besides being always clean and very economical.

DEVICE FOR FINDING CENTRES OF ROUND WORK.

By F. D. Sweet.

This little device if carefully made will engble one to accurately determine the centres of round bars, disks, and in fact any object of a circular form. A piece of 3-16-inch square brass rod about eight inches long is bent to form approximately a right angle, both legs being of equal length. A strip of brass, A, about ⅜-inch wide and 1-16 inch thick is soldered to the ends of the legs. Equidistant between points X Y make a mark b. Another brass strip B of same size as A is soldered in place as shown, being careful to have edge C exactly on the line b and over the angle D. Fig. 2 shows method of using the device. Simply place it on the end of the bar or shaft ; make a



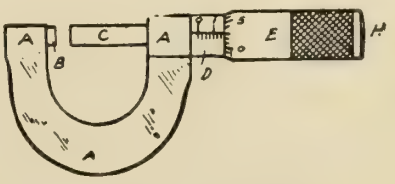
Device for Finding Centres of Round Work.

mark with scratch awl ; give a quarter turn, and make another mark. The intersection of the lines will give the exact centre.—Scientific American.

TO READ A MICROMETER.

Every apprentice and mechanic should be able to read quickly and accurately a micrometer. The techical World Magazine explains fully how a micrometer is read.

The cut shows the usual form of a micrometer, the parts of which are as follows : A—frame, B—anvil, C—spindle, D—sleeve, E—thimble. The spindle is attached to the thimble at the point H, and the part of the spindle which is concealed within the sleeve and thimble is cut to fit a nut in the frame. Now, holding the frame stationary, the thimble is revolved by the thumb and finger and the spindle being



A Form of Micrometer.

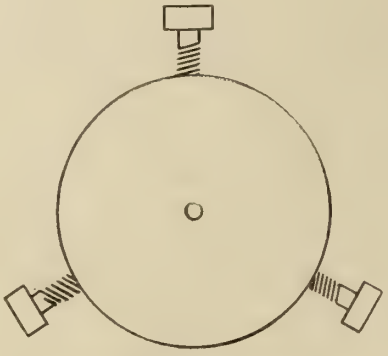
attached to the thimble revolves with it and moves through the nut in the frame, approaching or receding from the anvil. The article to be measured is placed between the anvil and the spindle and measured on the opening

between the anvil and the spindle, as shown by the lines and figures on the sleeve and thimble. The pitch of the screw thread on the concealed part of the spindle is 40 to 1 inch. One complete revolution of the spindle, therefore, moves it longitudinally 1-40 of an inch which equals twenty-five thousandths of an inch. The sleeve is marked with 40 lines to the inch according to the number of threads on the spindle. When the micrometer is closed the beveled edge of the thimble coincides with the line marked zero on the sleeve and the zero line on the thimble agrees with the horizontal line on the sleeve. Open the micrometer by revolving the thimble one full revolution or until the zero line on the thimble again coincides with the horizontal line on the sleeve. The distance between the anvil and spindle is then 1-40 or .025 of an inch and the beveled edge of the thimble will coincide with the second vertical line on the sleeve. Each vetical line on the sleeve indicates a distance of 1.10 of an inch. Every fourth line is made longer than the others and is numbered 0, 1, 2, 3, etc. Each numbered line indicates a distance of four times 1-40 of an inch or 1-10 pf an inch. The beveled edge of the thimble is marked in 25 divisions and every fifth line is numbered from zero to 25. Rotate the thimble from one of these marks to the next, moving the thimble longitudinally 1-25 of twenty-five thousandths or one thousandth of an inch. Rotate it to the division indicating two-thousandths, etc. Twenty-five divisions will indicate a complete revolution or 1-10 of an inch. The method of reading a micrometer is, therefore, to multiply the number of vertical divisions visible on the sleeve by 25 and add the number of divisions on the bevel of the thimble from zero to the line which coincides with the horizontal line on the sleeve. For example, in the cut 7 divisions are visible on the sleeve. Multiply this number by 25 and add the number of divisions shown in the thimble which is 3. This will give 7 X 25 which equals 175. 175 plus 3 equals 178. The micrometer is open one hundred, seventy-eight thousandths.

DEVICE FOR THREADING LARGE PIPE.

By K. Campbell.

The device illustrated herewith, is used to turn a thread on a large pipe in a lathe. The one illustrated has a small hole in the centre in which the lathe centre rests. This hole can be made larger and threaded. It can then take the place of the face plate. It is a much easier matter to centre the pipe in the lathe when this latter method is followed. The screws hold the pipe in the lathe tight enough to prevent the pipe turning on the studs when the pipe is being threaded.



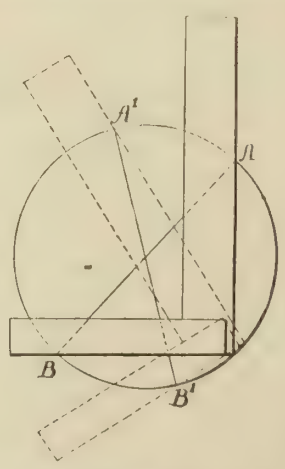
Device for Threading Large Pipe.

In the tailstock end, a V-shaped casting can be used, a centre being turned to take the place of the lathe centre. When the pipe is tightened in the lathe this cast iron centre brings the pipe at once to the centre.

QUICK MEANS FOR FINDING THE CENTRE OF ROUND SHAFTS.

By Albert Prather.

In illustration the circle represents a section of a shaft, the centre of which it is desired to find. The corner of a square is placed on any point of the circumference. The points A and B are the intersections of the outer sides of the square with the circumference. Draw



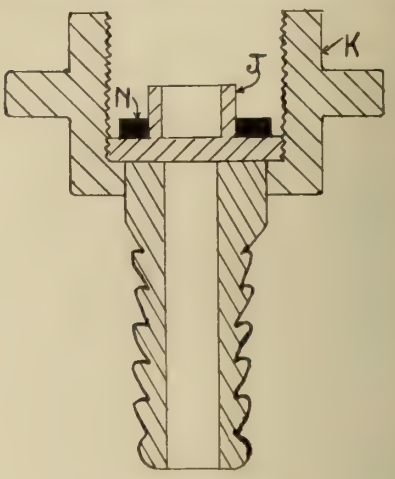
Method of Finding Centre of a Circle.

a line from A to B. Now shift the square a little, as represented by the dotted square, and with the corner on any other point mark the intersections A' and B', then connect A' and B', and the intersection of A B and A' B' will be the required centre. It is necessarily the centre, for it is the intersection of two diameters.—Scientific American.

AUTOMATIC VALVE FOR USE WITH PNEUMATIC TOOLS.

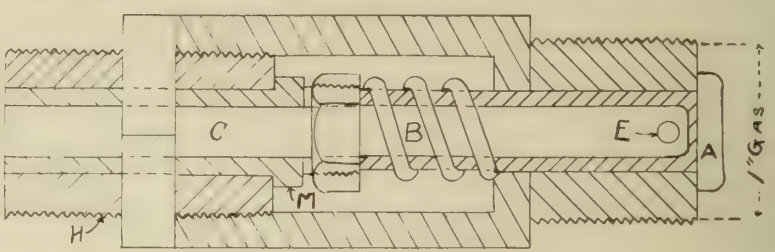
By S. B. Kennedy.

The accompanying sketch shows an automatic valve slightly different from



Hose Connection.

a type I have seen in use. The ones I refer to, are minus the spring and some-



Automatic Valve for Air Hose.

times give trouble by refusing to close after the hose nut is unscrewed. A glance at the sketch will show how it operates. When hose nut is screwed on to nipple (H) the spigot (J) inside of nut makes contact with carrier (C) which lifts the valve (A) and allows the air to enter at (E). These valves are very handy where several branches are needed for you can have a stop-cock on the service pipe and as many branches as you wish working independent of the stop-cock.

(E)—$3\frac{1}{4}$ in. holes through which air will pass when valve is raised by coupling an air hose.

(B)—Spring to ensure valve closing.

(J)—Spigot (J) makes contact with carrier.

(C)—Raises valve when hose nut (K) is screwed on to nipple (H).

(N)—Leather washer.

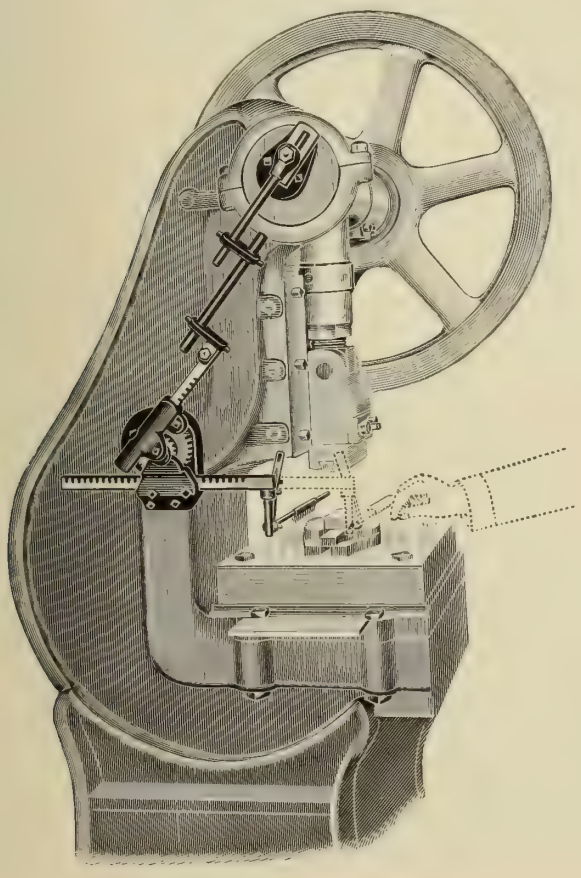
DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

JONES SAFETY DEVICE.

The device shown in the illustration, attached to a Brown, Boggs Press, is one of a number of devices manufactured by the Jones Safety Device Co., Hamilton, for jointers, saws, shapers, presses, etc. The guard was shown at the Canadian National Exhibition and received considerably attention.

This guard is positive in action, which renders it a most effective guard for presses. It is easily attached to any press, and is readily adjusted to meet all requirements. The return movement of arm, in a great variety of work, brushes off from the die the part stamped, thus increasing output. The simplicity of this guard, and the positive and automatic action, makes it a reliable safe-guard for all concerned, by making it impossible for accidents to happen when this guard is in operation.



Jones Stamping Press Guard.

The following are the directions for attaching stamping press guard:—Attach metal box holding toothed wheels to side of machine frame so that long rack arm will be about six inches above, and parallel with bed plate of press; holes for attaching this box should be tapped one-half inch. Attach disc to end of shaft above, by using a three-eights inch tap, in such position that its mate when placed on it will have its slot in line with the short rack arm below. In setting guard to die always keep guard arm as close as possible to back of die; then set stroke to suit work.

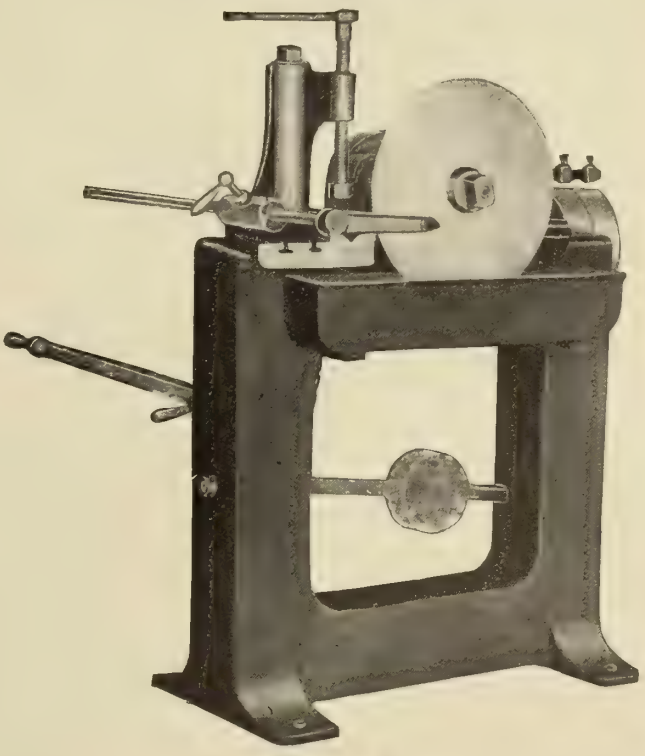
For style of press in which the end of shaft faces the operator, and wheel is at back of press, the guard is attached to wheel end of shaft and alongside of frame of machine. For this style of press, it is necessary to know the horizontal distance from end of shaft outside of wheel to back edge of bed plate.

HALL CUT-OFF SAW.

The cut-off saw here illustrated is for cold sawing bar iron and steel, round, square and other shaped stock up to four inches. The saw is driven through hardened steel gears, hardened steel hobbed worm-wheel and hardened steel worm, supplied with splined worm shaft. The saw carriage is gibbed to frame, and latches when clear back. It has gravity feed, adjustable by moving weight out on lever, The tight and loose pulleys on worm shaft run 600 r.p.m. Weight, 385 lbs., skidded. The machine is built by John H. Hall, Brantford.

LARGE SLOTTER FOR RAILROAD WORK.

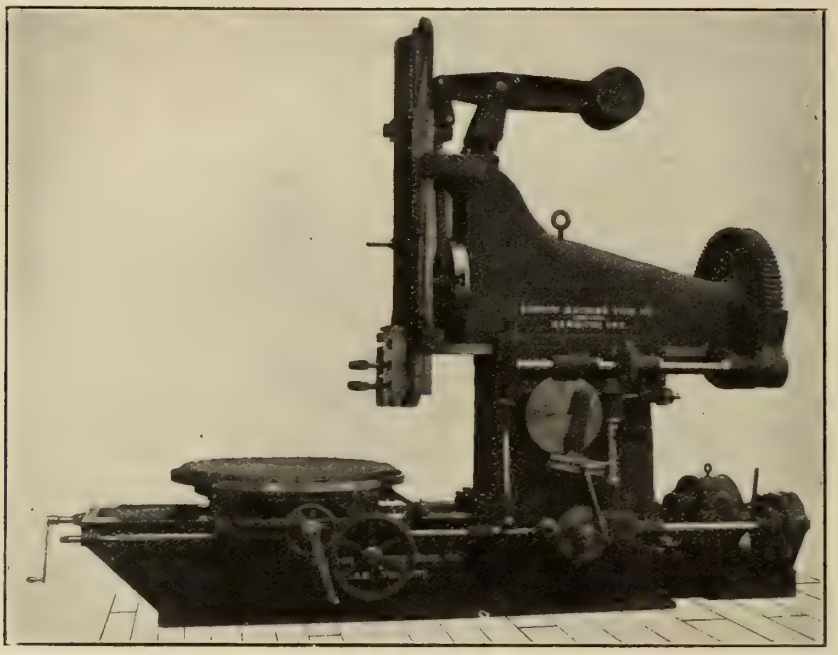
In the design of this slotter advantage has been taken of the experience of many of the largest users of slotters, particularly in railroad shops, where the heaviest service is required. Weak spots have been eliminated, many conveniences have been added, and simplifications have been made in construction.



Hall's Cold Cut off Saw.

The essential features in design are the movable head and the quick power adjustments to head and to all motions of table. Coupled with these are the minor improvements of extra quick return to ram, stroke indicator, automatic throw-out to feed, etc.

The traveling head is the striking feature of this machine, and its great value is very apparent, especially on large work, where the work cannot be readily moved. This construction also makes it possible to do work requiring a great reach. This construction at first hand is criticized on account of the spring of head under heavy work. In actual practice this spring is found under same conditions to be very small, owing to the fact that the upper thrust is taken by two massive bolts running clear through and anchored in base. Also the column is made very deep and heavy, and the head being well scraped thereto, makes spring practically impossible. Moreover, when the head is close back to column the maximum stiffness in any slotter construction is reached.



Large Slotter Built by London Machine Tool Co., Hamilton, for I. C. R. Moncton.

The quick power traverse and adjustment to head and table can be thrown in and out while the head is running or standing, as described. It is claimed that the quick power feature on certain classes of work means an increase of 200 per cent. in output. By this feature as a general proposition this machine will do 50 per cent. more work than a standard machine. The quick return is of special construction, giving remarkably even cutting strokes, with very fast return. An indicater is provided, showing amount of stroke.

Feeds have a wide range and are operated without cams of any description, are adjustable and reversible while machine is in operation. A safety device automatically throws out feed in case of any obstruction.

The table is large and of heavy pattern and clamped by means of four corner bolts. Circular table is graduated in degrees. Cross slide and bottom slide are of large size and accurately scraped and gibbed to place. Cutter bar has square bearing in guide, to which it is accurately scraped. It is conveniently raised and lowered by crank handle working into screw. It is also provided with relief apron hinged to ram.

The gearing is all of wide face and coarse pitch, cut from the solid, making it possible to take enormous cuts at high speed. All shafting is carefully turned and ground and made of special high-carbon steel. Slotter is arranged for belt or motor drive. If motor drive is used a 3 to 1 variable speed motor is preferred.

Maximum stroke—24½ inches.

Will cut to the centre of a circle 7 ft. 6 in. dim.

Will cut to the outside of a circle 9 ft. 2 in. diam.

Diameter of table, 4 ft. 6 in.

Distance table to head, 2 ft. 5 in.

Adjustment of ram, 2 ft. 8 in.

Strokes per minute, 7 to 34.

Horse-power of motor recommended, 10 (3 to 1 variation).

Countershaft pulleys, 24 in. dia. by 6 in. belt.

Speed of countershaft pulleys, 200 r.p.m.

Weight, 32,000 lbs.

The slotter illustrated is for the I.C.R. shops, Moncton. They are being manufactured by the London Machine Tool Co., Hamilton.

R. McDOUGALL 16-IN TOOL ROOM LATHE.

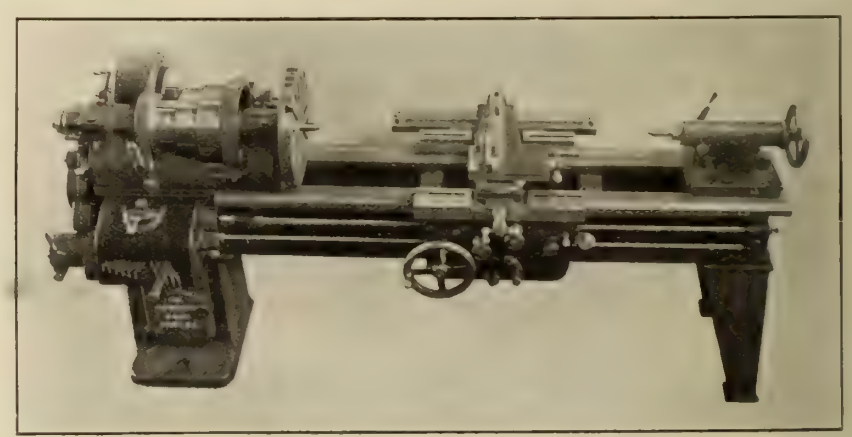
The accompanying cut shows a tool room lathe, being one of the latest productions of the R. McDougall Co., Galt. The special features of the lathe are the quick change gears and double back gear.

The table attached to the speed box shows notches in which to put levers for cutting different threads. Speeds can be changed from 2 to 128 by the operation of the two levers. This construction allows a quick change of gears without changing the gears at the end of the lathe.

The head is made with a three-step cone and the double back gear gives more changes of speed.

The carriage has a screw-cutting index so that the lead screw may be dropped into the right notch when the carriage is brought back by hand instead of waiting for it to be carried back by power.

Each handle on the rest has a micrometer gage and the whole lathe with its massive build, is fitted for tool room work, for which it is designed.



R. McDougall 16" Tool Room Lathe.

IMPROVED NO. 3 CHICAGO (DUPLEX) HAND MILLER.

The hand millers manufactured by the Chicago Machine Tool Co., Chicago, Ill.,

are of the duplex type, so called since a vertical attachment is furnished with each machine. This combination of both the horizontal and vertical spindles on

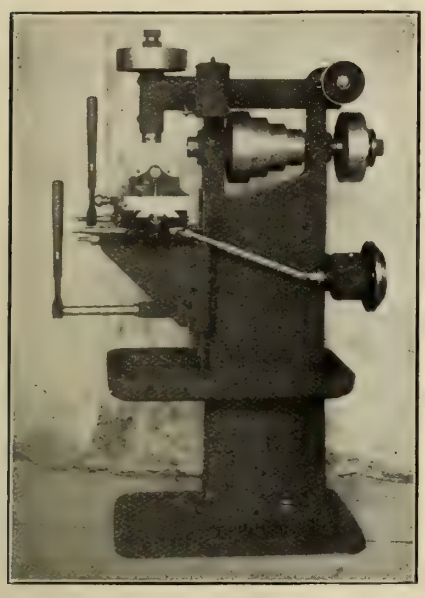


Fig. 1.—No. 3 Machine With Vertical Attachment in Place.

the same machine, adapts it for the quick handling of a large variety of work. The builders have lately made some notable improvements in the No. 3 size of the machine, which makes it adaptable for doing a lighter class of work than that ordinarily performed.

Fig. 2.—Parts of Attachments.

In Fig. 1 is shown the No. 3 machine, with the vertical attachment in place. This vertical attachment is among the important features of the machine, making it particularly adapted to the tool-room purposes, as well as for brass work-

Fig. 3.—Parts of Horizontal Spindle.

ers, and manufacturers of small parts, such as locks, typewriters, guns, sewing machines, speedometers, spark coils, etc. As may be seen, the machine is strongly constructed throughout. The table has an extra wide bearing on the saddle, insuring absolute rigidity, an essential feature in a machine of this kind.

Fig. 2 shows parts of vertical attachment. The spindle is bored for a No. 9 Brown & Sharpe taper. This spindle runs in a split bronze bearing. The latter has a slot cut through it running the entire length of the bearing, and in this slot is laid a wick. The casing, which contains the spindle bearing, spindle and parts, is split and provided with screws for taking up any wear in the bearing. In this casing is an oil reservoir. The ends of the wick, are dipped into this reservoir, which contains enough oil for about a year's running. In Fig. 2 also, may be seen the drawbar, the sleeve and the collet. End mills are held in place in the vertical attachment by a drawing in collet, the collet being interchangeable on the vertical and horizontal spindles.

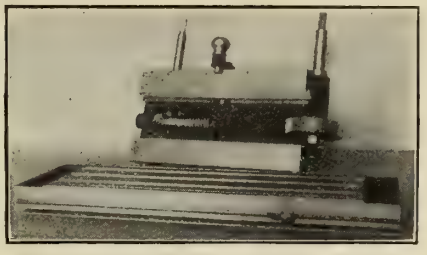

Fig. 4.—Spiral and Worm Gears.

Fig. 3 shows the parts of the horizontal spindle, the spindle proper, and the bronze bearings, which are fitted to taper bores in the column. It will also be noticed in this engraving that adjusting collars are provided for taking up any wear which may occur in the bearing.

The power feed is taken from a cone pulley on the rear end of the spindle to a three-step cone pulley on the rear of

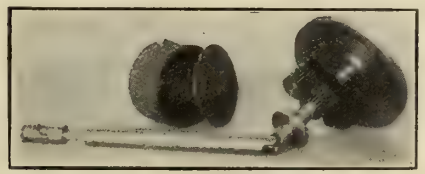

Fig. 5.—Gear Feed Box and Universal Shaft.

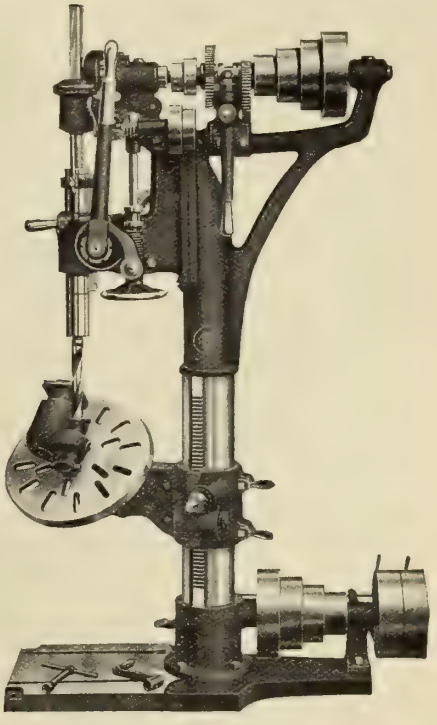
the gear box. From the gear box the drive is through a universal joint shaft to a pair of 45-degree angle spiral gears in the saddle. As shown in Fig. 4, a worm is fastened in the same shaft with one of the spiral gears, the pair of spiral gears and the worm being held in the rocker. This rocker throws the worm in and out of mesh with the rack in the table.

The arrangement of the feed gear box and the universal shaft, which transmits the power feed to the table may be seen in Fig. 5.

The feed gear mechanism consists essentially of a set of planetary gears through which the desired reduction of the spindle speed is obtained to give the proper transmission of power to the table. The cone pulleys, which transmit the power from the spindle to the feed gear box are interchangeabile, giving in all six changes of speed.

ROBERTSON 21-INCH DRILL.

The drill illustrated herewith is a new machine, having a tilting table. The knee of this tool is made in halves with planed surfaces, tongue and grooved and bolted together. At right-angles to the column bore is a large bearing, receiving a swivel stem in which the table stem is set. This swivel stem, in the knee,



Robertson Improved 21 Inch Drill.

has a cut worm gear, in which engages a worm having a square-ended stud extending on each side of the knee, for operating the table to either side by wrench. Both the swivel and knee have a flanged face, which is graduated from 0 to 90 degrees.

A gas engine cylinder is shown clamped to the table, which has been swung at the desired position so as to drill a side outlet at the proper angle. The table can be swung into a vertical position and can then be turned on its centre bearing so as to bring any desired portion of the work under the drill. As there is almost no limit to the way in which the work can be held for drilling, many different uses for it will be found in almost every shop.

This tool is also furnished with a very convenient form of back gearing, a movement of the lever to either side changes from belt to back gearing, while the machine is in motion or a half movement can be used as a stop motion.

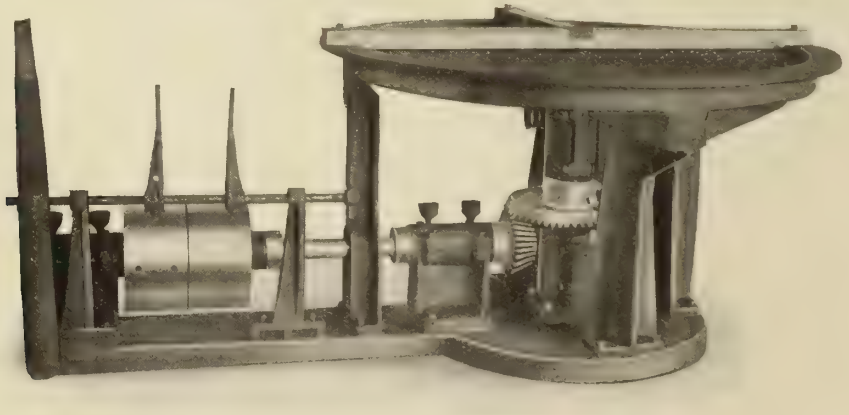
The Robertson Drill & Tool Co., 1848 Niagara Street, Buffalo, N.Y., are the manufacturers of this drill.

BESLEY HORIZONTAL DISK GRINDER.

The accompanying illustration shows a new 48-inch horizontal disk grinder brought out by Charles H. Besley Co., 15 So. Clinton St., Chicago, Ill. This machine is designed for grinding large surfaces such as fire doors, door jams of furnaces, stove doors, and large gear case covers for automobiles.

The method by which the machine is driven is clearly shown in the illustration. The belt runs on a 12-inch diameter pulley from which the power is transmitted to the grinding wheel spindle by means of a 2-inch horizontal shaft and bevel gearing. The vertical spindle, to which the large bevel gear is attached, is 3 inches in diameter at the bearings and 6 inches in diameter at the wheel collar, and is provided with a pilot 2 inches in diameter for holding and centering the disk wheel. The thrust is taken by two hardened tool steel blocks, one of which is secured to the lower end of the spindle and rotates with it, while the other is secured to the bed plate. Proper attention has been given to the lubrication of this thrust bearing.

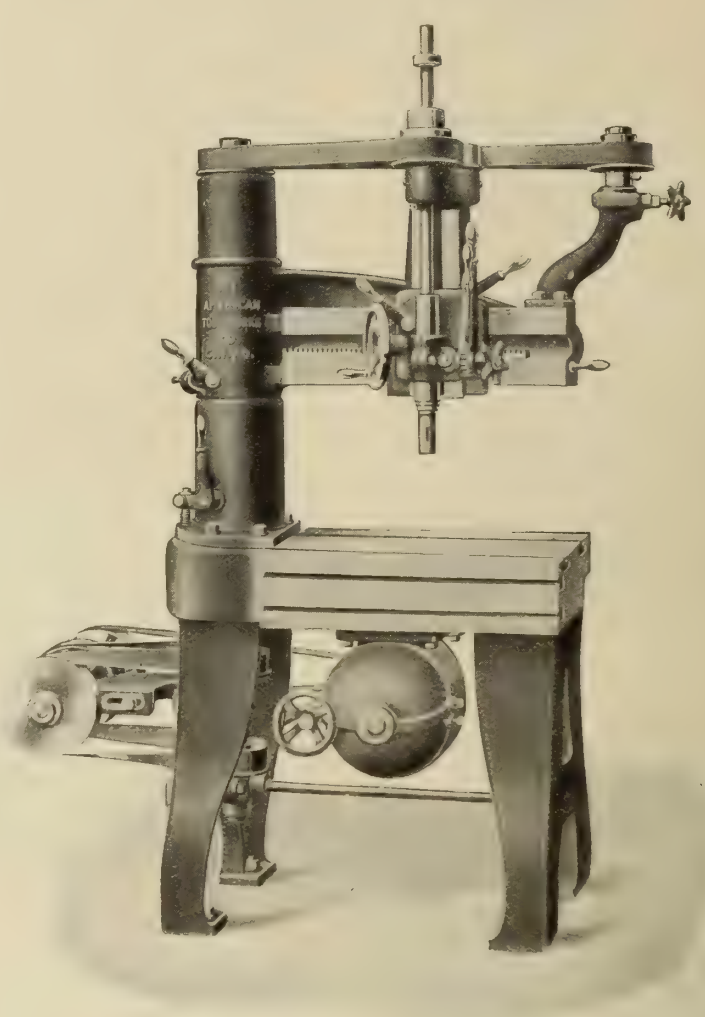
The spindle and driving-shaft bearings are 9 inches long and are of the split type, babbitted and reamed. The disk wheel is 18 inches in diameter and provided with ribs radiating from the hub to the outer rim. The thickness at the hub is 2½ inches, between the ribs ¾ inch, and at the rim 1½ inch. A guard ring is provided around the disk wheel, projecting ¾ inch above the face of the wheel. This prevents the work from flying off the disk wheel while being ground. The top surface of the guard ring is machined true with the face of the disk wheel, so that bars, jigs, etc., for holding the work to be ground can be secured to it. The speed of the disk wheel is 100 r.p.m., and the bevel gearing being in the ratio of 1 to 2, the driving shaft should run at 800 revolutions per minute. The machine can be driven either direct from the line-shaft or from a countershaft as required.



Besley No. 19, Forty Eight Inch Horizontal Disk Grinder.

HIGH SPEED SENSITIVE DRILL.

In connection with the High Speed Sensitive Drill described in the April issue of Canadian Machinery, the American Tool Works Co., Cincinnati, have brought out some special designs in addition to the original product.



High Speed Sensitive Radial Drill.

The illustration represents the 2-ft. motor driven drill, with tapping attachment, which machine has attracted great attention among the master mechanics and master car builders at their June convention at Atlantic City.

The motor is mounted beneath the box table, and is direct connected to tapping attachment, driving shaft by a belt. The motor is a Lincoln variable speed, 3 to 1, with speeds 525 to 1,275 r. p. m.

This drill will handle high speed twist drills up to 1 inch diameter and will take care of 1 inch taps.

A further development of this drill will appear in the November issue of Canadian Machinery.

VERTICAL TYPE KEY-SEATING MACHINE.

This machine is designed for general key-seating, and although being very simple in construction and operation, it is entirely automatic, having automatic feed, automatic release for the cutter and automatic stop for any depth keyway required.

The machine has a tilting table for cutting tapered keyways when required. The cutter might be called a broaching bar, carrying 10 teeth cutting their proportional part at each action of the bar. This bar having a series of teeth cutting together to each action of the bar reduces the number of strokes to accomplish the work over ordinary key-seating machine using a single cutter.

The work to be done is first put on to a so-called work bushing fitting the hole in the work and fastened down by means of a clamping arm, one end resting on the work and the opposite end on a post adjustable to the height of the work and fastened down by means of a screw and having hand wheel to operate same.

The machine is then started by means of the lever, marked No. 1 on print, and the depth desired to be cut is regulated by means of the depth regulator, which is set in any of the holes in the index plate, and as the index plate revolves when the machine is in operation the depth regulator or finger comes in contact with a cam on the operating lever which stops the machine. The index plate has a division of 40 holes graduated for depth of .010" between each hole, so that the depth regulator can be set for any depth desired and will stop the machine automatically when coming in contact with the operating lever.

The cutter is fed by means of a wedge sliding on the back of the bar, automatically advanced to every motion, and automatically released on its return by allowing the wedge to drop back half the distance of its advance. By this movement the cutter can be released from rubbing on the work on its return. This movement of the wedge by advancing and returning half way is continued until the machine is automatically stopped to the depth desired. The movement of the bar is so arranged to have a quick return.

The machine is so arranged that it can be operated by hand when desired. It has tight and loose pulleys so that it can be belted direct to jack or main shaft, requiring no countershaft. The loose pulley is provided with a self oiling bushing which will run for a year or more without any attention.

It is manufactured by the Lapointe Machine Tool Co., Hudson, Mass.

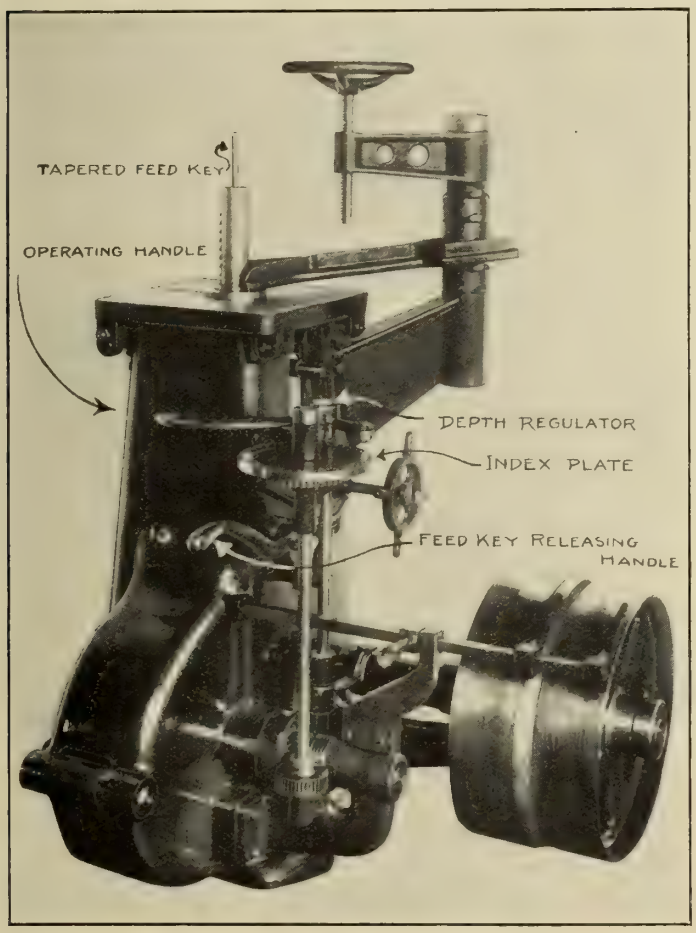


Fig. 1.— Lapoint Keyseater Side View.

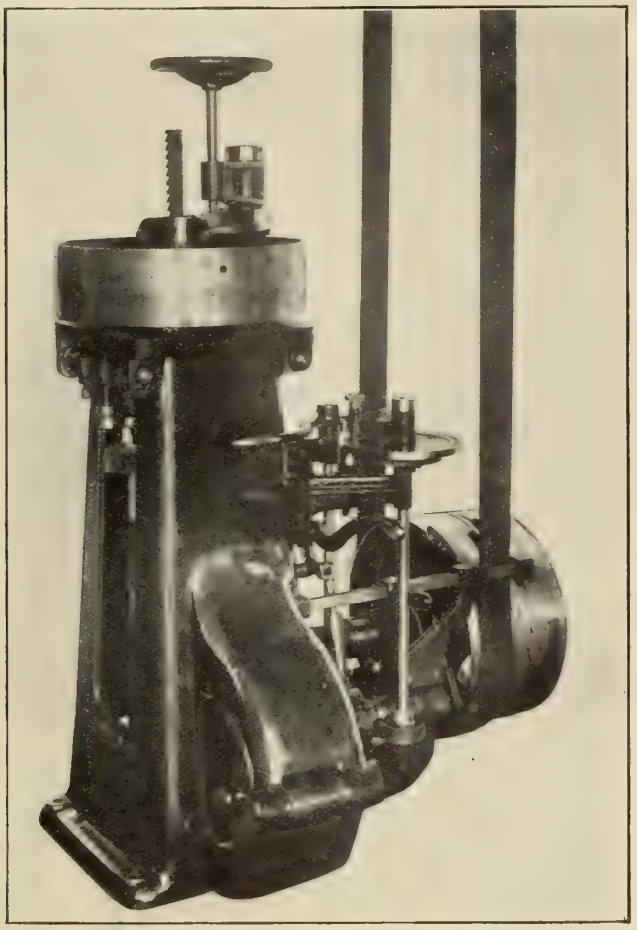

Fig. 2.—Lapoint Keyseater Back View.

Interesting experiments have been made by the railway commission at Ottawa with fireproof paint as a means of protection for wooden trestles and bridges. After the trestle had been painted with fireproof paint, an engine was run slowly over it and ashes shaken out. Nothing resulted. The engine was then brought to a standstill in the centre of the bridge and red hot cinders shaken in a heap on the painted ties. The fire practically went out in a few minutes. In another case treated similarly, the paint was burned, but no fire resulted. There will be further experiments.

Smoke prevention is possible. There are many types of furnaces and stokers that are operated smokelessly.

In an acetylene-gas compressing plant, the job that is refused by the man who knows might be readily accepted by the man who doesn't.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

NEW MACHINERY HALL NEEDED AT THE CANADIAN NATIONAL EXHIBITION.

No annual feature in the life of the Dominion is greater than the Canadian National Exhibition. Whereas other countries hold at wide intervals and in honor of some special event or anniversary great displays which are dubbed "world's fairs," and which, on account of their infrequency and irregularity, have little influence on national life, Canada has in the National Exhibition a great national fair, which is the result of years of development and which therefore has all the characteristics of a national event. It is as unique a feature as the great fair of Nijni-Novgorod, which is typically Russian, just as this is typically Canadian. They are both merely the perfection of the ordinary county fair, and this gives them all their beauty and their value.

The thirty-first season of the great Exhibition now belongs to the past and this year it was a greater success than ever before. In fact, the growth of the Exhibition becomes more remarkable with every time it is held. There are no signs that it has yet arrived at anything like its full growth. On the contrary, everything seems to point to its great development into the greatest annual fair in the world, a position it is already the second largest institution of the kind on earth, and it begins to be doubtful if even the great fair at Nijni-Novgorod surpasses it materially. But mere size is not everything. Even if there were many fairs surpassing in extent the Canadian National, this would not lessen its great national value. It would still serve as the great meeting place of Canadians from all parts of the Dominion. It would still bring them together as nothing else can do; and it would still make them acquainted with one another and with distant parts of their country in the best possible way—that is, through their productions. This is the great value of such an institution as this Exposition, and this is why Canadians of every province unite in "booming" it. They all realize that the Fair has grown beyond mere local restrictions, and that it is in every sense a national event.

The exhibits from the various provinces of Canada are always one of the features of the Exhibition. They stand in silent testimony to our vast wealth-producing Dominion and show the possibilities of a country, the resources of which are practically unlimited. Fruits, grains, mineral products, manufactured goods and products of the sea all combined to demonstrate the variety of the resources included between the Atlantic and the Pacific.

British Columbia, Alberta, Saskatchewan and Manitoba came from the west, and Quebec, and the Maritime Provinces from the east, combined with Ontario, and the result was the finest display of natural products that one would desire to see.

The growth of the Exhibition has necessitated the erection of new buildings. For several years manufacturers have been asking for a new Machinery Hall, and until it is built, one phase of Canadian life will be lacking at the convention. Three years age the exhibits of metal-working tools were greatly in evidence. This year there was one large exhibit. Interviewed by Canadian Machinery, machinery men were as one in the statement that lack of space and the cost of exhibiting were the reasons for not exhibiting, and this can only be overcome by the erection of a new Machinery Hall.

Dr. Orr told Canadian Machinery that we do not want dealers to exhibit. We do want dealers. We want every machine tool manufacturer and dealer in the Dominion, who can possibly attend, to have an exhibit. The Exhibition will never be complete until we have a complete line of machinery.

Each year some improvement has been made in the way of a new building and each year Machinery Hall has been neglected. A new Dairy Building was put up a few years ago, also a new Art and Natural History Building, a Process Building, Horticultural Building, new Grand Stand and a Transportation Building, all of which are a credit to the Exhibition. The progress of Canada along machinery lines and the interest machinery men of Great Britain and United States are taking in the development of Canada, is a living protest against the scant attention which has been paid to machinery at the Exhibition. Canada is a country of national resources, and one of the chief agents in the development of these resources is machinery. Canada is blest with enormous water powers waiting to be developed, the chimneys of large works are to be seen everywhere, and yet the largest manufacturers of, or dealers in, machinery in Canada are absent from Machinery Hall.

The educational value of a large exhibit cannot be overlooked. We are spending large sums of money on technical education, and here is a chance to give an excellent lesson and let mechanical men see the development in machinery lines at a small cost.

The fact is, that until a new Machinery Hall is built, manufacturers of machinery will have to use the blue sky for a covering, and this at a large expense, or else stay away from the Exhibition altogether. A building should be provided with a spur track running into it, permanent shafting, and an overhead crane running the whole length of it, so that the heaviest machinery could be easily transferred to its proper place. It was hoped by the manufacturers that this year would see some

betterment of the situation, but matters are getting worse. More manufacturers wish to display their machinery, and to do so are compelled to take space wherever it could be had, some erecting tents, so that they might have a place at the Canadian National Exhibition.

The whole issue may be summed up, that a modern Machinery Hall is needed at the Exhibition and that this hall can be made one of the best investments that the management could have. With such, manufacturers of and dealers in all lines of machinery will not only occupy space, but will go to sufficient expense to make the exhibit of decided educative value. For instance, one dealer intimated that he was willing to spend $2,000 a year if he could secure space at the Exhibition. It will, therefore, be seen that, though the building will be erected only at considerable expense, the returns for that expense will be sufficient to justify the expenditure. The question should be looked at from all points, the educational value, the greater attraction for mechanical men, manufacturers who require machine tools, etc. If this is done, it will be seen that a very liberal policy would be the best policy. Surely the Toronto Board of Control, and Council will see the value in taking the step immediately to erect the new building, as a great percentage of the people of Canada are engaged in the practical end of manufacturing. We are in hopes that before the opening of the Canadian National Exhibition in 1910 we shall be able to announce that a new, spacious and well-equipped Machinery Hall, equipped with cranes, permanent shafting, and a railway siding, has been added to the fine array of buildings.

THE SECRET COMMISSIONS ACT.

To prevent the payment or acceptance of illicit or secret commissions, an Act has been passed by the House of Commons at Ottawa, amended and approved of by the Senate and is now in force. It is to be known as The Secret Commissions Act and is applicable to the business of travelers or agents and manufacturers who employ them.

The Act is known as Bill 31 and reads as follows :

Everyone is guilty of an offence and liable upon conviction on indictment to two years' imprisonment, or to a fine not exceeding two thousand five hundred dollars, or to both, and, upon summary conviction, to imprisonment for six months, with or without hard labor, or to a fine not exceeding one hundred dollars, or to both, who,—

(a) being an agent, corruptly accepts or obtains, or agrees to accept or attempts to obtain, from any person for himself or for any other person, any gift or consideration as an inducement or reward for doing or forbearing to do, or for having after the passing of this Act done or forborne to do, any act relating to his principal's affairs or business or for showing or forbearing to show favor or disfavor to any person with relation to his principal's affairs or business ; or

(b) corruptly gives or agrees to give or offers any gift or consideration to any agent as an inducement or reward or consideration to such agent for doing or forbearing to do, or for having after the passing of this Act done or forborne to do, any act relating to his principal's affairs or business, or for showing or forbearing to show favor or disfavor to any person with relation to his principal's affairs or business ; or

(c) knowingly gives to any agent, or, being an agent, knowingly uses with intent to deceive his principal, any receipt, account, or other document in respect of which the principal is interested and which contains any statement which is false or erroneous or defective in any material particular, and which, to his knowledge, is intended to mislead the principal.

(d) Every person who is a party or knowingly privy to any offence under this Act shall be guilty of such offence and shall be liable upon conviction to punishment hereinbefore provided for by this section.

The latter clause was an amendment to the original bill which passed the Senate on March 31st last. After being amended it was sent back to the House of Commons and agreed to on April 21st and was finally sanctioned by the Senate.

The Practical Meaning.

The Secret Commissions Act, as its name infers, prevents the giving of secret commissions, rebates or considerations.

A traveler who sells an article to a company cannot legally give that company any secret rebate or commission to induce the latter to purchase from him. If the goods are sold for less than the manufacturers' price in the ordinary way, the sale will of course be legitimate in the eyes of the law ; but if the goods are sold for the manufacturers' price and the salesman puts his hand in his pocket and gives a rebate or commission to the purchaser then the sale is illicit and that salesman, if convicted, is liable to imprisonment for two years, or to a fine not exceeding $2,500, or both, as mentioned above.

One way that this has been done in the past was by the agent or traveler giving a purchaser the secret rebate in order to get his business and then charging up the rebate to his employer or the firm he represented as road expenses. The new bill makes such an act contrary to the criminal code.

In the event of the traveler or agent selling below the manufacturers' price and doing so openly that traveler or agent does not commit a breach of the law. The manufacturer, however, has the privilege of determining to whom his goods shall be sold and at what price and in such a case if he desires may refuse his goods to the house whose travelers or agents cut down his price.

A Concrete Example.

In the case of an article such as a machine, the giving of the secret commission could, up to the present, be easily accomplished. A traveler may probably have difficulty in selling a company a machine, but he knows that if he allows that company a rebate, he can sell him the machine. To get his business he does so by personally paying him a rebate. He gets his money back from his house in his expenses.

This system is sometimes used by a house anxious to get business and when the traveler for the house who does business "on the square" comes along, he finds he is up against a competition that he cannot legitimately meet.

Clause (d) in the above bill is the amendment that was made to it after it had reached the Senate. It makes the purchaser just as liable as the traveler or house he represents who is guilty of a breach of the act.

UPWARD MARCH OF CANADA'S TRADE.

In his presidential address to the Canadian Manufacturers' Association, Robert Hobson, president of the Hamilton Steel and Iron Co., made reference to the trade situation. He said:

"To appreciate the sharpness of the decline from which we temporarily suffered, it is only necessary to glance at the trade returns, and measure our purchasing power by the extent of our imports. For the twelve-month period ending June, 1907, our imports of merchandise were valued at 345 millions; last year they dropped to 323 millions, while this year they went as low as 303 millions. This represents a decrease of 42 millions in two years. More striking still is the comparison afforded by the twelve-month period ending March, which perhaps corresponds more closely to the period of the depression itself. Comparing 1909 with 1908, on this basis, the import figures show a falling off of 64 millions in the one year, with a corresponding decrease in customs collections of 10 millions.

"It is gratifying to note, however, that, judged even by this barometer, business is again on the mend. More recent returns, when compared month by month with the returns for 1908, show a decidedly upward tendency, the increase in imports of merchandise for June alone being seven millions. Statistics gathered from other sources only serve to confirm the belief that the worst is now well over.

"There are, of course, exceptions, for in some few industries the effect of hard times is still being felt. But, broadly speaking, the situation is improved; the trend of business is markedly upwards, and ere another year has passed I trust tne clouds will all have disappeared and we will again be enjoying the sunshine of prosperity."

As if to corroborate Mr. Hobson's remarks the August trade returns just published, show an increase of eight millions for the month, over last year's figures. The total trade for the month was $55,869,031, an increase of $7,761,972 as compared with August of last year. Imports of merchandise totalled $30,241,376, a gain of $7,189,371. Exports of domestic products amounted to $23,537,330, an increase of $626,791. Exports of foreign products totalled $1,726,311, an increase of $186,040. Customs duties for the month were $5,351,157, an increase of $1,170,970.

For the first five months of the fiscal year the total trade of the Dominion has been $217,788,335, a gain of $36,130,252, or about seventeen per cent. as compared with the corresponding period of 1908. Imports of merchandise entered for consumption have totalled $142,033,218, an increase of $29,566,672. Exports of domestic products were $96,935,925, an increase of $6,820,301. Exports of foreign products were $8,098,417, an increase of $2,100,303.

The August bank statement shows deposits on demand payable in Canada to total $228,397,679; deposits on notice, $472,591,818; deposits elsewhere, 81 in Canada, $70,807,662. The amount of call and short loans in Canada is $56,680,172, elsewhere $120,659,509; current loans, total, $543,154,663 and outside Canada, $30,661,437.

The production of pig iron in Canada for the first half of 1909, as reported by the American Iron and Steel Association, was the largest ever reported in a similar period; it was greater than the make of any full year prior to 1905. The details of the production, as compared with the first half of 1908 are as follows:

	1908	1909	Chg's.
Foundry and forge	51,640	84,890	I 33,250
Bessemer pig	60,225	99,639	I 39,414
Basic pig	195,209	165,112	D 30,097
Total	307,074	349,641	I 42,567

The total increase this year was 13.9 per cent. Of the iron made in 1909 there were .347,482 tons made with coke or bituminous coal as fuel, and 2,159 tons with charcoal. The coke iron includes a small quantity of ferrosilicon made in the electric furnace. The total production for four years past has been in long tons:

	First Half.	Second Half.	Year.
1906	282,010	259,947	541,957
1907	270,100	311,046	581,146
1908	307,074	256,598	563,672
1909	349,641	.....	.....

This year there was a decrease in basic iron and a gain in bessemer pig. The proportion of basic to the total was 47.2 per cent., and of bessemer, 28.5; against 63.3 and 19.6 per cent., respectively, last year.

MANITOBA'S LICENSE ACT UNPOPULAR.

A contagious form of indignation is spreading rapidly in the Province of Manitoba on the event of it becoming known that on November 1st, an act licensing all extra-provincial corporations goes into effect. Those who represent outside firms in Winnipeg and throughout the Province of Manitoba are the ones who are chiefly concerned, and since the act referred to was assented to on March 10 last, and only a comparatively short time remains to offer any resistance, it cannot be wondered that the feeling against it is keen. To a casual observer the introduction of this act would be a direct blow to the resident agent or broker doing business for an extra-provincial firm. Upon inquiry, however, it is learned that the sole purpose is to increase the revenue of the province. The purpose is quite legitimate should it be executed in such a way as not to be detrimental to other interests. No citizen of this province is going to complain about the Government endeavoring to collect revenue, provided it is justly exacted, since increased revenue means general material progress. This act as it is outlined, however, may and will undoubtedly increase the revenue, but that which the province will gain thereby, it will lose perhaps tenfold.

It is impossible to definitely ascertain what the direct effect will be should it be enforced in its present reading. But anyone, who is in any degree familiar with the business situation in Manitoba, must surely know that those who will be affected most, are men whose commercial interests in this province are widespread, and further that they are the men who form the major part of the industrial and commercial life of the province. If there is any province that contains and maintains by means of its peculiar commercial situation, resident brokers and commission representatives whose principals are incorporated in perhaps every country in the world, it is the Province of Manitoba. And for any Government to pass such an act as the "Extra-Provincial Corporations Act" in Manitoba is to strike a dearth-blow at the heart of the commercial life upon which the existence of that province most largely depends.

All extra-provincial corporations not already chartered to do business in Manitoba will be compelled to pay a license, which will be levied according to its capital stock.

or discontinue its business with the resident agent or broker under a penalty which is specified in the act—a fine of fifty dollars a day. Whether this is the act in force in Ontario or not, for Manitoba, at any rate, it is manifestly unjust and unfair.

The resident representatives are already paying their business tax, which, in itself, should be sufficient to enable them to carry on their business, irrespective of the firms they represent. And for a further tax to be levied upon the firms outside looks like a double tax. And again, is every firm which is represented here by a broker going to submit—according to the formalities of the act—a copy of its financial statement annually, which may or may not become public property? And this is only one of the many ridiculous requests. What will be the result? Corporations hitherto represented by a commission merchant will either withdraw altogether or have themselves represented by travelers. Can Manitoba afford to have any one corporation leave the field? The answer is emphatically NO, from every sane business man who believes in competition, and in having as many manufactured articles as possible in the province.

Several companies have intimated that they will withdraw from the field if forced to pay the license fee. At the present time the Manitoba Board of Trade, the Manufacturers' Association, and the Grain Exchange are working in harmony with the Brokers' Association, in the preparation of a concrete statement which will show the peculiar injustices of the act in the hope that with the aid of the Attorney-General, the date of the enforcement might be postponed in order to make the necessary amendments to suit requirements. The Attorney-General has already expressed himself as opposed to the measure.

ADVERTISING, A WISE INVESTMENT.

Quite recently an advertising solicitor for Canadian Machinery called upon an advertiser for a renewal order. The advertiser was not disposed to renew, declaring that he had received no replies to his advertisements, mentioning that they had been seen in Canadian Machinery. Failing to gain his point, at this juncture the solicitor requested to be shown through the shops, as he was particularly interested in the class of goods being produced there. While wandering with observing eyes through the various departments, the solicitor asked his companion how he happened to get in touch with the manufacturers of such a splendid selection of machine tools, which included presses, lathes, drills, threading machines and attachments.

"Oh," answered his companion (the managing director of the company) "I have been a reader of Canadian Machinery for years and always kept familiar with the new lines advertised."

"Did you mention that you had seen their advertisements in Canadian Machinery when writing to manufacturers," asked the solicitor.

The managing director turned on his heel and started for his office a smile passed over the features of the solicitor as he followed the retreating form of his companion into his private office where the renewal order was signed and handed over without a word.

The publishers' millenium will arrive when readers can be induced to mention the paper in answering advertisements. The more advertising a paper carries, the more can be spent in securing the best editorial matter. One way to help is for every reader of Canadian Machinery to mention the paper when writing for a catalogue reviewed in the editorial columns, or in answering an advertisement. It is a poor crosscut saw that does not pull sawdust to both sides of the log. In this case the advertiser will feel satisfied that the paper is doing him a good service and continue his patronage. The reader will reap his benefit in the quality and quantity of editorial matter the publishers will be able to secure with the increased funds at their disposal.

TOPICS OF THE MONTH.

A Canadian manufacturer who has just returned from England discussed the matter of a representative exhibition of Canadian manufacturers in London, with the commercial agents in England. The latter are favorable to this suggestion and Canadian manufacturers who are looking for export trade should take this matter up.

* * *

Some time ago the MacLean Publishing Co. announced that W. A. Gay, who has been doing work in British Columbia, was unauthorized to take subscriptions for the MacLean Trade Papers and Magazines. It should be understood that this is not Robert Gay of Toronto, or any relation of Robert Gay, who has been a faithful employe of the MacLean Publishing Co. for the past twenty years and is likely to remain for another twenty.

* * *

The Manitoba Government has announced, that in accordance with the arrangement made at the last session of the Provincial Legislature, it has appointed the commission to consider the matter of the Workmen's Compensation for Injuries Act, and report as to whether it would be a measure best suited to the Province of Manitoba. The commission consists of three—Hon. Justice Locke, Morden, Chairman; A. W. Puttee, who will represent the workmen, and T. R. Deacon, manager of Manitoba Iron Works, representing the manufacturers.

* * *

The annual convention of the Canadian Independent Telephone Association, held in Toronto September 8, has served to show that the independent systems will play an important part in effecting the transfer to public control in Ontario and Quebec. There are now between 26,000 and 27,000 independent telephones in use in Canada. At present the greater number of these are used in public service and rural districts. The independent telephone would be the proper one for factory intercommunication, the expense of a "central" being entirely eliminated.

* * *

The committee selected to solve the Quebec bridge plans met in Montreal on September 7. It was decided to call for tenders for both the cantilever and suspension types of bridge, and the final choice will then be determined by the relative cost and the time required for building. Several important changes were decided upon. The new bridge will be 150 feet above high tide for 600 feet in the centre of the river; it will also be 24 feet wider than the old bridge, which was only 61 feet wide. The centre span will be reduced from 1,800 to 1,715 feet by building a new pier 100 feet farther from the north shore than the present pier. On the south side the present pier will be widened and strengthened, so as to bear the greater weight. Nickel steel will be used in the eye bars and for compression members, and, in brief, the new structure will be made as safe and strong as human ingenuity and skill can make it. It is expected that a start will be made very shortly, as this meeting has removed many of the causes of delay.

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical.
Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

TRANSMISSION OF POWER BY ROPES*

Rope drive is applied to the driving of machinery when the motion is not constant. By a simple combination of fast and loose sheaves, this is most effectively carried out in large cotton factories. The power is carried from a line shaft running the whole length of the room to numerous ring frames by means of ropes. The ropes are only 13-16 in. in diameter and the flange is not more than 1 in. in thickness.

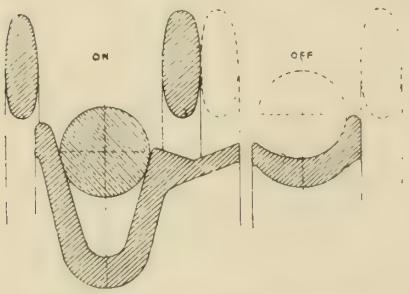

Fig. 1.—Section of Combination.

Besides being extensively used in the cotton trade, fast and loose rope pulleys are also attached to the overhead gearing of lathes, to mortar mills, to milling and in fact almost every class of machinery requiring inconstant rotary motion.

Fig. 1 shows an approved section of this useful combination, which is protected by Royal Letters Patent, by William Kenyon. it will be observed that a shallow intermediate groove is turned

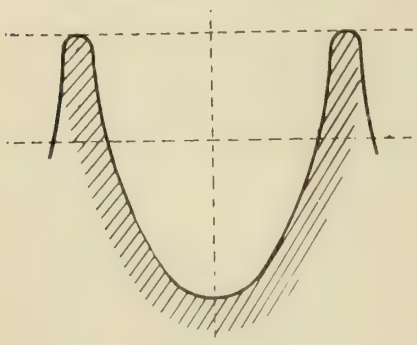

Fig. 2.—Curved Groove.

upon the fast pulley in which the rope gains a revolution before passing to its work. This insures a gradual start or knock-off when required and provides a most sensitive action. The position is also indicated of the rope shifter or fork which generally takes the curve of the pulley, allowing just sufficient room for clearing the rim in passing. In the frames shown in the first articles the forks are operated from the side of the guard boxes.

* Third article of a series describing the system of rope drive used by William Kenyon & Sons.

Grooves.

One of the most important items in rope transmission, as far as mechanical arrangements are concerned, is the construction of the grooves. Many and varied are the shapes and angles which have at different periods been submitted for guidance in the selection of suitable sizes of ropes, represented by badly-cut templates in wood, tin, cardboard, and the like, which have served rather to baffle than enlighten the judgment of the manufacturer. When templates of existing grooves require to be taken, the most correct, as well as the easiest method, is to obtain a plaster cast, which when trimmed off, gives an exact impression. Before making the mold, it is advisable to clean and grease the groves.

At one time engineers thought grooves should bear some resemblance to the rope itself and curved sides were introduced as Fig. 2. Where grooves of this description are employed, it is generally found necessary to increase the diameter of the rope to the utmost limit, not only to make up for the loss of power but to prevent as far as possible, the rolling action often induced thereby.

The angular groove is the proper groove. For all sizes below one inch, a 30 degree groove should be used and 40 degrees for all sizes above one inch diameter.

Setting Out 40 Degree Curve.

Instead of commencing with a circle to which the groove sides are merely tangent, it is always as well to presuppose the wedge shape, and build up the grooves with a view to preventing the rope reaching the bottom, or any part of the curve with which it terminates. Credit is due to Mr. William Kenyon for discovering a method of setting out a groove, which is both simple and accurate.

Referring to Fig. 3, it will be seen that the first process is to draw a circle representing the diameter of the rope through which the vertical and horizontal centre lines are projected. Afterwards the chord of the arc "A B" is marked off. This becomes the standard of future measurement, and points the centre of the curve terminating the groove from the centre of the circle, and when repeated downwards, fixes the apex

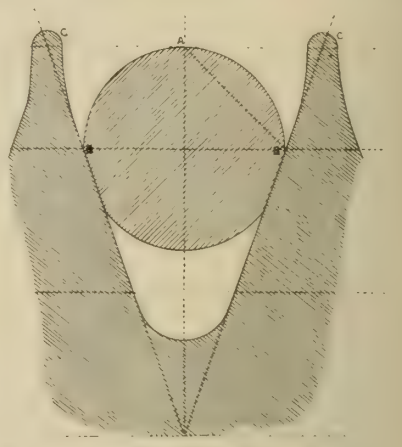

Fig. 3.—Laying Out a 40-Degree Groove.

of the angle, which always comes out at 40 degrees whatever the size of the rope may be. Extend the lines of the angle through the point "B B." cutting off segments of the circle on the way, until they intersect the upper horizintal line at "C C," which points fix the radius of the flanges from "B," and also ascertain the thickness of the metal. Thus the wedge, plus a little elongation due to pressure, is anticipated.

In many large installations, the flanges at "C C," which are designed to save width, are entirely discarded, and the

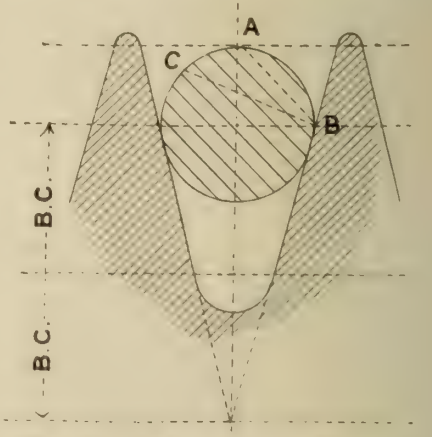

Fig. 4.—Laying out a 30 Degree Groove.

groove angle is carried forward to the terminals which are simply rounded off. Flangeless grooves allow a wider range of rope diameters, which may be increased to the utmost limit of the angle,

initial energy and pulley sizes permitting, thus securing an accession of transmitted power.

Laying Out 30 Degree Groove.

The same formula may also be applied in the construction of a 30 degree groove, Fig. 4. But for the more acute angle a longer measuring staff is required, and this is indicated by a 45 degree set square, making the chord of the arc "B C," doubling which fixes the apex of the angle.

Lubrication is best effected during the making, and is seldom necessary afterwards unless the ropes are running in an unusually dry atmosphere; even then a moderately hard composition lightly applied is all that is necessary. Soft greasy compounds only tend to damage the ropes, fill up the grooves, and induce slipping. When ropes have been so treated, or should they be splashed with oil from the bearings, a liberal application of whiting is advisable, which after absorbing the superfluous grease, will peel off in scales. After this the grooves should be thoroughly cleaned

Compressed Air and Vacuum Cleaning System

The Toronto Street Railway Use the McCabe Combined System with Great Success—Description and Tests of the Compressor and Equipment

In the McCabe system, in permanent instalations, compressed air is laid on by a suitable compressor in a convenient place in the building with piping, usually consisting of one small pipe usually ¾ in. running from compressor tank to top storey and dust discharge pipe running similarly from top floor to basement, with suitable valves at each floor, or where there is no portable plant, air is obtained from a portable apparatus and led by a pipe to the room or article to be cleaned.

The vacuum apparatus is then attached. The essentials of this apparatus are roughly a short pipe in which a nozzle is fixed so that it points (parallel with the pipe) toward one end, known as the discharge end, and the nozzle is then connected with the compressed air pipe. The compressed air discharging out of the nozzle into the pipe drives the air in the pipe towards the discharge end, creating a vacuum at the inlet or vacuum end, thus causing a current of air to move at a high velocity in at the inlet past the compressed air nozzle and out at the discharge. The pipe and compressed air nozzle are specially designed to give this result, and this pair is usually known as the vacuum machine. Its closing weight is about sixteen pounds. By closing the discharge end and coupling the proper nozzle to the inlet end, the operation is reversed and air is blown out under 60 pounds pressure, thus giving the compressed air feature of the system. For portable use the air compressor is mounted on a suitable carriage and the compressed air pipe can then be led to any point several hundreds of feet away (¾ in. pipe sufficient) and the vacuum machine or compressed air nozzle attached.

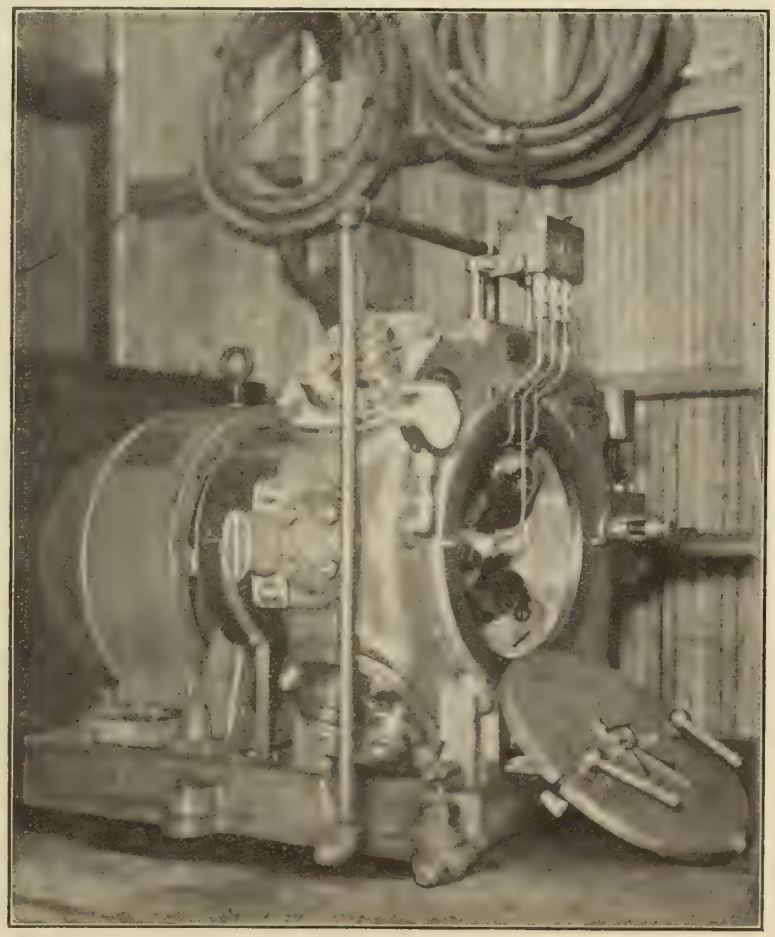
Record of Tests.

The following is a record of air compressor tests made on June 25th by Mr. McRae and Mr. McCabe, of the Toronto Street Railway Co., assisted by Mr. Reavell and Mr. Vandeleur, representing the makers of the compressor. The following gentlemen were present: C. H. Sweetlove, foreman electrical department; Chas. Deacon, foreman machine department; H. McCarthy, assistant inspector of compressors.

Description.

The compressor is one of Reavell's single-stage, water-jacketed type, designed to deliver 60 cubic feet of free air per minute and for a working pressure up to 100 lbs. per square inch. It is driven through rawhide gearing by a Laurence Scott motor, coupled on the same bed plate. The compressor is installed on a wagon, arranged to run on the street railway system, and the wagon is also fitted with necessary electrical equipment and an air receiver piped up to the compressor.

The motor was designed to run on 500 volts, giving a compressor speed of 300 r.p.m. At the car barn where the test was made, however, the voltage was 600, instead of 500, thus increasing the speed of the compressor and also its capacity. Three tests were made, the first to determine the speed of the compressor in the increased voltage; the second to determine the mechanical efficiency, and the third to determine the volumetric efficiency.



Motor and Air Compressor Set for Cleaning Cars—Toronto Street Railway.

Test 1.

The compressor was run on the line voltage of 600 volts, and the speed of the motor taken. This was found to be 930 r.p.m. The designed speed of the

motor at 500 volts was 850 r.p.m. The normal speed of the compressor being 300 r.p.m., its actual speed during the time of the test was:

$$\frac{300\times930}{850}=328 \text{ r.p.m.}$$

It is now required to find what the capacity of the compressor would be under these conditions. The piston displacement capacity of the machine at its normal speed is 66 cubic feet per minute. The increased capacity, due to the increased speed, will then be

$$\frac{66\times328}{300}=72 \text{ cu. ft. displacement.}$$

Test 2.

A test was made now to ascertain the mechanical efficiency of the system. The compressor was run with the air blowing off at 80 lbs. pressure, when the electrical readings were as follows:

Voltage, 600
Amperes, 17
Resulting kilowatts, 10.2
} Resulting electrical h.p., 13.7.

The electrical input into the motor was, therefore, 13.7.

It is now required to determine the work done in horse power in compressing the air. The following formula was used:

$$\frac{C\times144\times P}{33000}=\text{H.P.}$$

In this formula "C" signifies the displacement capacity of the compressor in cubic feet per minute, i.e., 72. "144" signifies the number of square inches in a square foot. "P" equals the mean effective pressure against the piston of the machine. This could not readily be obtained by indicator diagrams and consequently the average figure assumed by makers of standard compressors for the mean effective pressure due to 80 lbs. delivery pressure was taken. For authority see Hiscox's book on "Compressed Air," page 142, table 18. The mean effective pressure there taken is that based on the pressure being able to absorb four-tenths of the heat of compression, which is the average figure obtained in straight line machines. This means effective pressure for 80 lbs., working pressure is 37.28 lbs. The formula, therefore, appears as follows:

$$\frac{72\times144\times37.28}{33000}=11.7 \text{ indicated h.p}$$

The test, therefore, showed that with an input in electrical energy of 13.7 h.p., the compressor was actually giving an indicated horse-power of 11.7 in the air which it delivered. The efficiency, therefore, would be,

$$\frac{11.7\times100}{13.7}=85.5 \text{ per cent.}$$

In other words, the only losses in the machine were 14½ per cent., representing the combined losses of the motor, the gearing and the mechanical losses in the compressor. The rest of the energy put into the machine appeared as indicated horse-power on the air delivered.

Test 3.

This test was directed to finally determine the volumetric efficiency of the compressor. The air receiver of the truck was two feet internal diameter by six feet long, its cubic capacity, therefore, would be $3.1416\times6=18.8496$, or say, 18.85 cubic feet.

The equivalent free air capacity to fill that air receiver at 90 lbs. pressure would be,

$$\frac{18.85\times80}{15}=100 \text{ cubic feet.}$$

As the compressor at its full speed was 72 cubic feet, the time required, assuming 100 per cent. efficiency, would be one minute 24 seconds to fill the receiver. A test was taken to fill the air receiver from atmospheric pressure at 80 lbs. per square inch, and to ascertain the time actually required. The time was taken when at the instant the motor was started and it was found that the machine took exactly one minute twenty-six seconds to fill the receiver, to a gauge of 80 lbs. per square inch.

The volumetric efficiency, therefore, was represented by the ratio of 84.86, or expressed in percentage would be,

$$\frac{100\times84}{86}=97\tfrac{1}{2} \text{ per cent.}$$

The water jacketing of the compressor was most efficient, as the air leaving the compressor to enter the receiver was just a comfortable temperature to the hand, as far as could be judged by the delivery pipe; no thermometer temperature, however, could be taken.

COLLINGWOOD'S SHIPBUILDING INDUSTRY.

By W. M. Brown, C.E.

Collingwood shipbuilding yards have for years been the scene of activity. The yard is fitted with the most recent types of ship machinery for the execution of all kinds of construction work.

On the northwest side there is a large building which contains the machinery for preparing the plates, while upstairs is the pattern shop, where a number of men are employed making patterns for vessels upon the stocks, or which may be under contract. At the north side is the building for the wood-working machinery, and which contains the latest improved planers for preparing the timber parts of the vessels. The large foundry, built of brick, is on the south side of the yard. The molding shop, where all kinds of castings are made for vessel construction, is at the east end of the building, and fitted with a large cupola.

The machine shop is at the west end of the yards, and which has all kinds of modern machinery for the thorough execution of the work. Another large building at the west end is the boiler shop. Here not only are made the boilers for the vessels they build, but many others, which are shipped to various parts of the country. At their busy time, the shipbuilding company give employment to about seven hundred men, including all departments. The machinery and plant equipment of the establishment represent the expenditure of about six hundred thousand dollars.

In connection with the shipbuilding it will be interesting to note a few details regarding the harbor and docks. Some years ago the Dominion Government entered into a contract for deepening the channel in this port, which has now, since its completion given sufficient depth of water to float the largest vessels that ply upon the Great Lakes. This channel has been constructed about one and a quarter miles long, and two hundred and twenty-five feet wide, with a depth of twenty-one feet of water, and having its outer end in the deep waters of the Nottawasaga Bay. The direction it takes is to the south for more than half its length, and then it has a gradual curve towards the east to the elevator and Grand Trunk wharves, the new cement dock and the dry dock. There is a basin about 600 feet wide within the harbor, and greater possibilities may yet be developed. There is also a basin which covers about 60 acres, and which may yet be adopted for shipping purposes, in that part of the harbor which extends to the west of the deep-water channel. The bottom of this basin consists of a soft, white clay to a depth of about 21 feet, underlaid by a shoal, so that there would not be much difficulty experienced in dredging to a sufficient depth for heavy-draught vessels.

The dry dock is considered as one of the largest on the lakes, its dimensions from dock sill to cope stone being 524 feet; length on keel block, 515 feet; width of entrance on top, 60 feet; width of entrance on bottom, 54 feet; depth of water over sill, 16 feet; width of dock on top, 78 feet; width on bottom, 60 feet.

There is a new dock now under construction which will be between six hundred and seven hundred feet long, with sixteen feet of water on the sills, and which is expected, when completed, to be one of the largest in the Dominion.

FOUNDRY PRACTICE AND EQUIPMENT

MONARCH PORTABLE CORE OVEN.

The core oven illustrated in the accompanying half-tones, is so arranged to be operated with oil or gas, using a Monarch burner, with a very low consumption of fuel. The shelves are arranged to obtain the benefit of the full space and size of the shelf for baking. With this construction, the contents are heated uniformly from top to bottom, the flame being so regulated inside to give this effect. The oven is arranged with two vents, is lined inside with sheet asbestos and can be constructed in any size desired.

In Fig. 1 all of the drawers are shown removed or drawn forward. It will be noted that at the back of each shelf there is a sheet-iron shutter which closes the opening in the front of the furnace when the shelf is drawn forward, so that when one or more shelves are drawn out for receiving or discharging cores, the heat in the oven is prevented from escaping by the shield at the back of the shelf.

In Fig. 2 the oven is shown with one shelf drawn forward, but the construction makes it possible to draw out as many shelves at a time as it may be desired.

The oven will take care of all classes

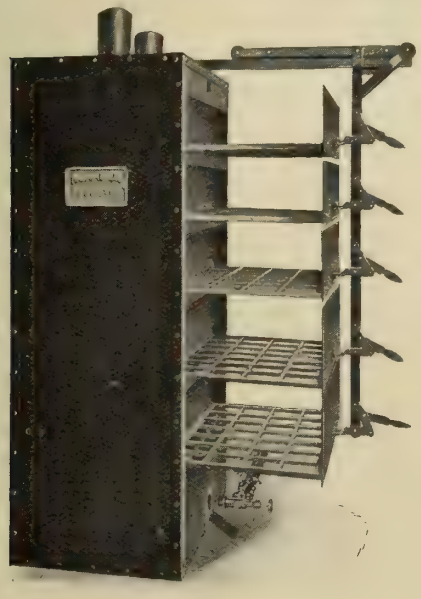

Fig. 1.—Monarch Core Oven With All Trays Drawn Forward.

of foundry work and will be built to a larger scale, if desired. Though designed for oil, it can be built to use coal or coke. The core oven is neat and compact, the one illustrated being 2x3x6 ft. They are built by the Monarch Engineering & Mfg. Co., 1200 American Bldg., Baltimore, Md., U.S.A., who are placing them on both the United States and Canadian markets.

MODERN CUPOLA PRACTICE*.

By John C. Knoeppel, Buffalo, N.Y.

When we look about and see the progress that has been made in our industry of recent years, we have reason to congratulate ourselves. The fact however, remains that our old friend "The Cupola" has not come in for as much attention in proportion, as have the other lines.

Foundry owners frequently wonder why they are having trouble with their iron, blaming almost everything but their management of the cupola. This has not received the attention that it should, and as a usual thing the cupola is considered fool-proof, in fact is expected to run itself. Good work with the cupola is first of all dependent upon a thorough knowledge of the cupola and its performance while working under the blast. The construction must next be such that the proper amount of air can actually get in, and in such a way that the temperature conditions are as uniform as possible, so that cold spots are avoided. The tuyere area must be of such a size and so arranged that the blast enters the cupola without undue friction.

The ultimate shape of the cupola lining, if allowed to take its own course, will be found to be slightly built out above the tuyeres, and this is an argument that if left that way, it is most desirable for efficient work. Hence in chipping the cupola and daubing up, it were best left so that only the refuse matter and iron above the tuyeres is taken away, but that this natural shape is left intact. The daubing can be very light, and cracks filled with small broken fire brick or flat brick, as the condition may require it. As the heat at this point becomes very intense, there is a tendency for the daubing to crack off long before melting is in progress. This material falls into the stock and retards melting afterwards.

Bottom is put in so that the surface while dipping from back and sides to the spout, does not fall too steep, as the melted material will run downward with too much force causing trouble in tapping during the heat. It should be so made that the iron will lie quietly on it, and not injure or break through it. The necessary shavings and kindling are now put in, the latter being laid by a man in such a way that when burning it will do so evenly, and without injury to the bottom. Coke is now thrown in and allowed to burn through evenly. When up to proper height as indicated by a wire gauge or other suitable method, charging may begin.

Charging should commence at least two hours before the blast is put on, so that the stock may become well heated through, and the time for lighting up should be arranged accordingly. There should be neither too much or too little coke on the bed. Oftentimes the cupola man is allowed to take all he wants, and the result is a prolonged heat, with dull iron instead of the expected hot material. The iron charged should be of medium size, especially in small diameter cupolas. There should not be too many openings for the free passage or rather escape of the blast. In large cupolas while the stock can be larger, it should not be charged in too compact a way, thus retarding the blast.

The amount of the bed of fuel for a

*From a paper read before American Foundrymen's Association.

cupola is determined by a number of factors. The diameter inside the lining, the height of the tuyeres, blast pressure, class of work, etc. For light work, with practically continuous melting and pouring, the tuyeres should be set low, thus saving fuel for the bed. The bed should extend from 20 inches to 24 inches above the top of the tuyeres, whether one or two sets are used—above the top of the upper if the latter. On the other hand, the tuyeres must not be set too low, otherwise if any iron is to be held, it will be chilled if remaining in too long. From 12 to 16 inches from the bottom plate to the bottom of the tuyeres would seem about right for ordinary practice, the bottom being from 4 to 6 inches thick.

Slagging when the tuyeres are very low often does more harm than good, it retards melting and is destructive to the cupola lining. If the heats are heavy, so that slagging must be resorted to, it is better to put the tuyeres up higher in the first place. The slag hole should not be opened until the slag is high enough to reach it, usually ten tons or so of metal will have passed out by that time.

In large cupolas for medium heavy work, the tuyeres are usually set from 18 to 24 inches from the bottom. The higher they are set, the more fuel is required for the bed. More air must be forced through or else melting is unduly slow. High melting zones and blast pressures have a tendency to harden the iron, make more slag, and give trouble generally.

The charges of iron should be uniform, the first being as large as the last. While undoubtedly more iron could be carried on the first charge, it would mean lowering the bed unduly with subsequent trouble, as the coke charge coming down will not restore the bed to its full height again. It is the best kind of practice to maintain the bed at its proper height at all times, and this can only be done by small and equal charges of metal and the proper proportion of coke between them.

In long heats of high tonnage, it is oftentimes a good practice to help build up the bed by adding additional coke at intervals. Experience will show this best. The writer has always had better results with such small charges. The melting was more uniform and more rapid, with hotter and better iron. With heavy charges, the melting difficulties result in giving metal with compositions different from the expected, and the chemist gets the blame which really belongs to the foundry manager.

The construction of the cupola should be such that the air entering has great volume at low pressure rather than vice versa. Good lining material should be used, preferably double up to the charging door, and single from there upward. The clay-wash should be mixed a day previous to use, and the addition of a little salt helps to tighten the joints. Space is left between the lining and the shell—about half an inch and this filled up with a grout of old fire brick ground up, and clay. The lining at the melting zone, as stated previously is allowed to take its own shape during the heats, being originally straight like the rest of the construction. If this is done the melting capacity will be found increased. While this is the experience of the writer, he does not wish to be understood as advocating a contracted hearth construction.

The tuyere arrangement is also not considered as it should be. On one occasion the superintendent of a large foundry stated that he had cut out all the so-called fancy tuyeres and put in what he called a "cheese-box." In the course of conversation it crept out that he was having some trouble with his iron, as in some cases he lost 60 points of silicon. His cheese-box, combined with a heavy blast pressure, doubtless was to blame. Another prominent blast furnace man complains that many a foundryman blows the life out of his metal in the cupola.

An experience that once happened to the writer may be of interest in this connection. An accident which took a long time to correct disabled the blower and the cupola had to be banked when in its full charged condition. It was nineteen hours before the blast was put on again, but the heat went out all right. On another occasion one of the cylinders of the engine running the blower blew out, and the cupola heat was taken off with but 1 to 6 ounces pressure on, the heat being about eight tons. The iron while coming down slower, was hotter and had better life than with the higher blast pressure carried regularly. In another case the writer was called into a foundry where they were getting out 10 tons of metal in six hours with a cupola 60 inches inside the lining. Here he found the coke ratio one to five for the first four charges, and a little better later on. A clear case of waste and consequent bad iron. A reduction in the coke quickly straightened matters out.

Fuel that burns up fast, such as coke, must necessarily be supplied with a sufficient amount of air in quick time. The design of the tuyeres therefore plays an important part in this. The writer has found that a continuous tuyere, of proper design, gives the most uniform distribution to all parts of the cupola furnace. The velocity of the air is reduced, and the best kind of melting obtains. When it is considered that to melt ten tons of iron about 300,000 cu. ft. of air must be admitted into the cupola for that hour, it will be seen that the tuyere conditions must be such that a minimum obstruction shall take place before the blast actually is doing its work in the charges.

The coke below the tuyeres serves simply to hold the iron and support the stock. The temperature is far below that of the iron, and hence every pound thus used, unless for special reasons, is a direct waste. If the iron is held in the cupola too long, the blast strikes over the top and injures it. Hence, while on general principles low tuyeres are advisable, they should not be so much so that the metal is damaged when carrying out the daily practice.

The charging door should be as high as conditions will permit above the bottom, so that the fuel will receive the benefit of the heat otherwise wasted. Ten to fifteen feet is the usual custom, though the distance is often made greater. Where a very high stack and charging door is used, it is sometimes advisable to put in an intermediate door, so that in charging the first part of the heat, the bed is not damaged. Further it allows a more even charging. This intermediate door should be sealed up when the charging has reached that point, and then the upper door is used. The charging floor would naturally have to be constructed accordingly.

In every cupola, under the same conditions, there is a fixed melting zone. Below and above this the metal can not be melted successfully. In either case the metal would be dull and damaged. This zone is determined by the cupola conditions and the volume and pressure of the blast. If the iron comes down within ten minutes of the putting on of the wind, it would indicate that the bed was of proper height. If it takes longer, then the bed was too high. The excess of fuel must be burned away, and in doing this the iron is melted slowly and comes dull instead of very hot. The melting zone is usually a space across the cupola about 4 to 8 inches high. Where the blast is heavy, this is sometimes greater. A double set of tuyeres sends the melting zone up higher than is the case with one row.

Regarding the fuel ratio this much may be said. What is economy in one foundry becomes a waste in another. The high melting ratios published are oftentimes very misleading. For general purposes 7 to 8 lbs. iron to one of fuel is very fair. With the same sized small metal charges, the coke between charges generally works out at 1 to 10. This can often be cut a little on the coke end, if the bed is ample, especially at the end of the heat. As this work should not be left to the ten-

der mercies of the cupola man, it is a good plan to hang up a chart of sufficient size in the charging room, on which every charge is marked plainly, so that it can be followed without difficulty. All stock should be weighed, as even the coke will not run uniform in weight if measured in a basket. This is not with the idea that the fuel should be skimped, but simply to have the conditions in charging as perfect as possible, so that the best results may be expected and obtained.

For twenty years the writer has advocated the use of small charges and as mild a blast as possible, and he is glad to note that others are beginning to agree with him. The question of the tuyeres has been his special study, and he hopes that the system bearing his name may have helped to make the work about the cupola easier and the results surer. The cupola is not merely a vessel into which any old thing can be thrown and good results obtained, but it may be come a money maker or loser just as one pleases. In these days of keen competition, it becomes a problem not only to melt iron properly and economically, but to turn out a product that will give the smallest percentage of scrap castings.

EXPANSION AND CONTRACTION OF METALS FROM A PRACTICAL VIEWPOINT.

By J. H. Hart.

This subject covers practically all branches of mechanics, but perhaps the foundry is the place where the most difficult problems arise. The numerous castings after becoming cool have little hollows and blow-holes and what not.

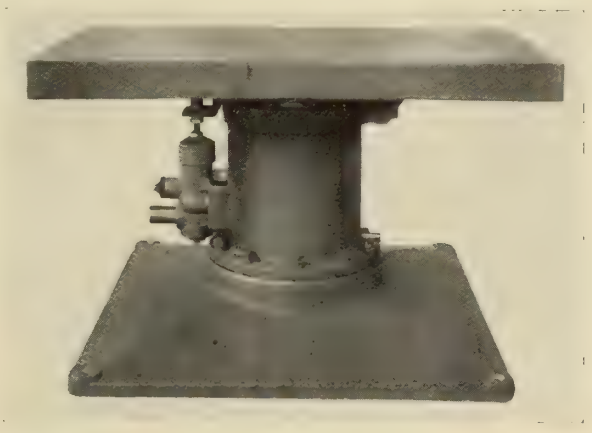
Expension and contraction are universal in nature. Even the plants expand in the hot rays of the summer sun and contract at night when it becomes cool. Even living beings are not exempt from the universal law. And when it comes to the applied arts it is found at its height. This in railroads, houses, bridges, even in musical instruments. All this in the ordinary variation of the year's temperature. How much more in a foundry or shop. The study of this subject is absolutely invaluable to every man who works with metal of whatever description. Losses resulting from ignorance of the simple laws of expansion occur in thousands every day. A man will make a valve of two metals which expand differently and it leaks and proves worthless. An engineer places rails too close together, they expand and press one another outward or upward, and a wreck is caused. Bear in mind though that expansion has its uses, as in the compensating pendulum of a clock, or of the balance wheel of a watch.

Rails are generally in 18 ft. lengths and they should be placed at least 3/8 of an inch apart. In the tropics the distance is increased to fit in with the increased heat.

The design and thickness of a casting are important factors. If one end cools very much quicker than the other, a break occurs. If a piece is very thick and bottom and sides cool before the top, there will be a sink in the top due to accommodation to the size of the rigid part. Generally in metals the shrinkage is proportional to the density. Thus iron with four per cent. carbon will shrink less than iron with three per cent. carbon. Steel, which is a product of iron, will shrink even less. In the mint, why are the coins of gold and silver and copper stamped instead of moulded? Because if poured into a mould, on cooling they would shrink and cause an imperfection either in the roundness or in the design. An explanation of the phenomena of expansion and contraction would seem not to be amiss here. All matter is made up of molecules which at all temperatures are supposed to be in rapid motion. It can certainly be proven that matter is made up of extremely smally bodies with spaces between, for water has been forced through lead and iron. These little bodies as has been said are active at all temperatures, but when an increase of heat is applied they jump around more and through lerger distances, thus knocking one another aside more and more, each one hitting his neighbor until we come to the outside ones. As they are the only ones free to move outward without being interfered with, that's just what they do, and consequently we say the metal "expands." We know that no weight has been added to the body, as a hot-body weighs no more than the same body cold. Therefore thus must be the explanation. Now take the breaking of a lamp chimney. One part is accidentally heated more than another part, and those little bodies jump around more until their movements overcome the force of cohesion and the glass breaks. A thin chimney should not beak as easily as a thick one for the thin one is more elastic and can accommodate itself by reason of its elasticity to different shapes.

Castings are made to-day all in one piece which a few years ago were separately cast into three or even more pieces. Just where to put the blame, in the pattern room or the shop is a moot question. If proper care is taken at all times however, the liklihood of imperfect castings is small. Some are lifted from the sand too soon or too late. The former on account of the premature exposure to the atmosphere shrinks on the outside before internal shrinkage has had time to take place, thus condemning the piece to a short life. Castings left too long in the sand become decarbonized, and instead of getting a polished castings with a bright lustre we get a dirty speckled looking article which is often of very little use, that is, if it belongs to the anti-frictional grade of castings.

For metals have various habits under different conditions, and a study of the subject will repay any man working in metals or metalloids of any description.



Osborn Plain Jolt Machine.

PLAIN JOLT MACHINE.

The Osborn Manufacturing Co., Cleveland, are building a line of Plain Jolt Machines that is attracting a great deal of attention. The distinguishing feature of the Plain Jolt Machine is the variation of the length of stroke that may be obtained. This variable length of stroke is controlled by a traveling valve, which is adapted to be set to give any stroke required from 3-16 of an inch to 1½ inches. The ability to change to different lengths of stroke will be found of great advantage in foundries molding a variety of castings, and where there is a variation of the air pressure. This principle of a variable-controlled stroke was first shown in use on this company's

Rockover Jolt Machine, at the Cincinnati convention of American Foundrymen and Manufacturers' Supply Association.

These machines are designed to withstand hard usage and to work accurately. The cylinders are large in diameter. This means great stability and accuracy of stroke.

The Osborn Jolt consumes a small quantity of air per pound lifted. This result is accomplished by the use of an ingenious blocking device in the air chamber. These machines are made with the following lifting capacities:—

1,000, 1,5000, 2,000, 5,000, 10,000, 15,000 and 20,000 lbs.

Coremaking: Logical Beginning of Molder's Trade

The Best Molder also a Good Coremaker—A Short Experiencc of the Apprentice in the Core Department will be of Great use in Future Work.

In recent years the iron molding trade, like all the others, has undergone the changes attendant upon the movement for rapid production. Among the most important developments, or we might call them reforms, is that which made for the improvement of the molders' surroundings; more space in place of crowded shops; better light; better appliances, etc. It is rather astonishing, therefore, in view of all these improvements in the foundry proper, that the improvement in the lot of the coremaker has lagged behind. Perhaps the reason for the inattention from the "powers that be" towards the core department is due to the fact that its production is not salable and generally regarded as a nonproductive expense and as such charged up to profit and loss.

Molders are given helpers to do the unskilled work for them, are allowed the best material and necessary tools to increase their production. What about Mr. Coremaker? "It doesn't make much difference what the quality of material or tools, he will only do so much anyway," so he is permitted to use floor sweepings wet down with a little cheap molasses—as little and as cheap as possible to save expenses. Usually core plates are furnished, but to save the molders' time these are the same size and the coremaker must make the best of it.

Like most adjuncts to any of the trades, coremaking is an evolution depending upon the particular trade to which it is an adjunct, viz., the foundry trade. True it is that the use of cores is as old as the trade itself, and there was a time when a molder considered coremaking a part of his trade. However, improvements both in molding and coremaking have been so rapid and varied that to-day the coremaker has a real value as a specialist and as such has assuredly come to stay. If this be the case then the core maker should receive more consideration instead of being treated with scant courtesy as one having no rights about a foundry worthy of respect. Often the cry comes down from the cost department that "the cores are costing too much" and the screws are put down, say on the quality of raw material (if possible) and on other "ingredients." Molders would have fewer waits for cores if more unskilled help were added to the core room to mix paste, hunt up rods, get sand ready and other routine work that is usually done by the coremaker himself.

A curious fact pertaining to core makers is that no distinction is made to different classes of core makers but a number of molders may work in a foundry, for instance, a heavy work molder, a light work man, or a bench man, while Mr. Coremaker must be the whole shooting match in his department.

Above, it has been stated that coremaking has come to be a speciality, a trade in itself for coremakers alone. Nevertheless, if a molder, when entering his trade looks to the time when he will be in line for a position as foundry manager, he ought to spend at least six months in the core department, and so familiarize himself with the working of this department which is so vital to the rest of the foundry. Some of the very best molders cannot make a core, nor, what is worse, do not know how they are made, because they never had the opportunity to learn or refused to take it if they had.

By making his start in the core room the insight into coremaking that he would acquire, would, in after years enable him to better the conditions and increase the output of the core room, should the power ever come into his hands. If the molder would be a competent foundry manager he must know the fundamental principles of the different branches of the trade, such as tending cupola, melting brass, making cores, ramming dry or green sand, etc.

In beginning work in the core room, one of the most important things to learn is to get the sand mixed the same every day. If careless in this respect the cores will have hardly a crust on them and on other occasions will be all right. Mixing sand should have the same attention and care as mixing iron in the cupola. If too much sharp sand is used the air and moisture will escape too rapidly in the drying process, whereas, if there is too much loam, the core is usually made so light that the outer surface has become hardened before the inside has had a chance to dry. The result of this is the cores swell and crack. If these cracked cores were discarded there would be no harm done but the trouble is that they are used. The unconscientious coremaker generally daubs up the crack and sends the core out and the molder will lose the casting or the machine shop will discover that the metal is too thin to work and scrap the piece. A piece of work may be lost by a molder time and time again and there is not very much said about it, but if the trouble can be traced back to the coremaker—poor fellow! Unfortunately, if the cause of the trouble is carelessness or the molder's fault, he will do his best to blame the coremaker. If the foreman has made cores himself, he would be able to lay the blame at the proper door by examining the castings himself.

ALLOYS AND FLUXES.

A uniform grade of metal with a uniform color, strength and good casting qualities is the desideratum of every brass or bronze founder. The necessity of using up the borings, gates and scrap of previous melts introduces an element of uncertainty into the mix, to overcome which purifiers have to be added and corrections made.

The United States Alloys Co., 1206 American Building, Baltimore, Md., have prepared a series of fluxes and alloys for cleansing the metal of impurities, by converting them into fusible slag, which rises to the surface and can be skimmed off.

After the impurities have been removed and thrown into the slag the corrections may be made. If it is desired to increase the strength of the metal, a little manganese copper may be added in amount up to say 5 per cent. The action of manganese copper is similar to that of phosphorus with the distinction that an over dose of the same does not make the metal brittle like phosphorus would do. Manganese does not combine well with alloys containing more than 2.5 to 3 per cent. of tin.

Silicon-copper is the alloy they recommend for fine castings, thin sheets, rods or ornamental work.

The road to success is none the less worth traveling on because it is not short or easy.

Method Used for Developing Involute Gear Teeth

Involute System Being Most Simple and Serviceable is in More General Use than any Other, Especially where Gears are Interchangeable.

By J. H. R., HAMILTON

If two cylinders A and B, Fig. 1, are kept in contact by pressure exerted on their bearings, as shown at P.P., and one of the cylinders is revolved in the direction of the arrow, the other cylinder will revolve in the opposite direction at a surface speed equal to that of the other, and will make as many revolutions in inverse proportion as the driver. But if slipping occurs the speed of the driven wheel would vary to such an extent that a positive drive could not be depended on.

Therefore, to have a positive drive, teeth must be cut or cast on the edge of the cylinders to prevent the possibility of slipping.

If pieces like p p and grooves like g g, be fastened and cut on the two cylinders, as shown on Fig. 2, slipping would not occur, the number of revolutions would be in inverse proportion to the diameters, the same as in Fig. 1, but the speed at the circumference would vary, as the shape of the teeth would cause an unsteady motion.

Therefore, the teeth must be so designed that the pitch circle or pitch line of the two gear wheels will have the same relative velocity as two cylinders kept in contact and revolving without slipping.

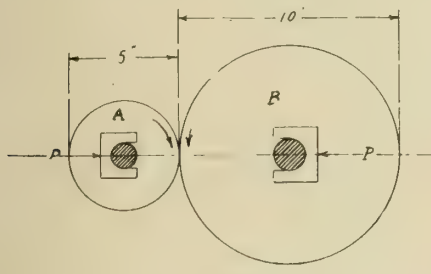


Fig. 1

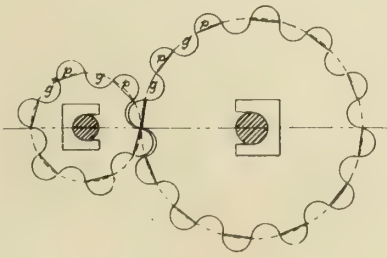

Fig. 2

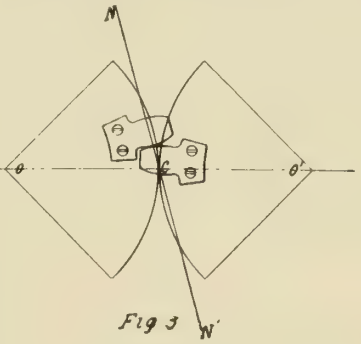

Fig 3

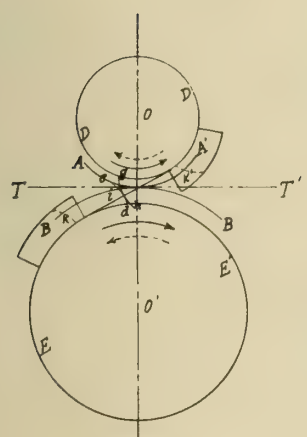

Fig. 4.

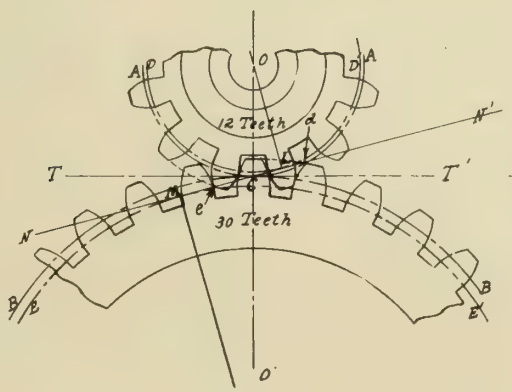

Fig. 5.

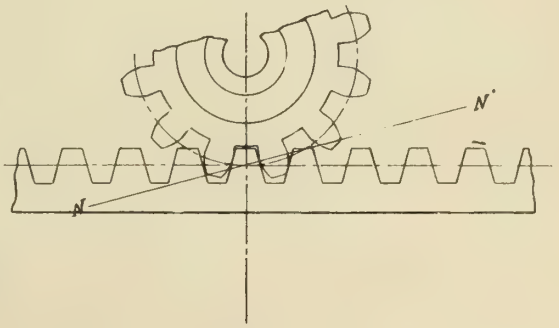

Fig. 6.

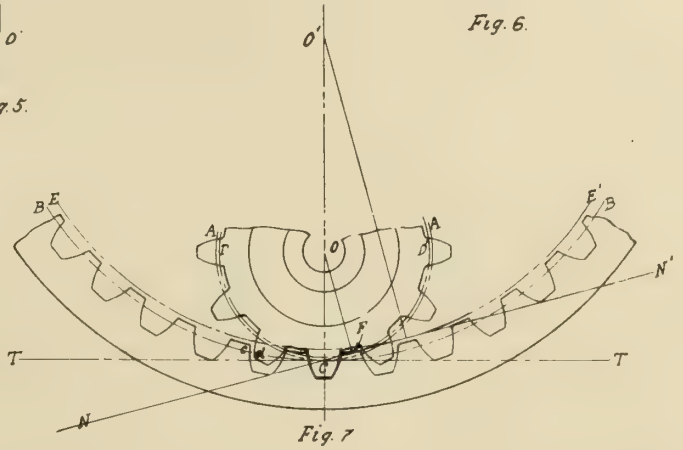

Fig. 7

The pitch point of two gears is the intersection of the line of centres with the pitch circles of the gear, shown at C in Fig. 3.

The point of contact is the point where two teeth touch each other.

To have a uniform motion at the pitch circle of two gears in mesh, the tooth curves must be of such a shape that they will be at right angles to a line NN1, drawn through the pitch point and point of contact, as shown in Fig. 3.

This line is known as the common normal to the tooth curves.

The path of contact is the curve described by the point of contact during the entire action of a pair of teeth. The angle through which a wheel turns during the path of contact is known as the angle of action.

The angle of approach is the angle that the wheel turns between the time the teeth come in contact until the point of contact coincides with the pitch point C. From the point C to the moment that the teeth are no longer in contact the angle is known as the angle of recess. The corresponding arcs of these angles are called the arcs of action, approach and recess.

The arc of action must at least be equal or greater than the pitch, so that one pair of teeth will remain in contact until the next pair begin to act.

Fig 4 shows two cylinders placed a short distance apart and connected by a string wound several times around each cylinder. If one cylinder is revolved, a point on the string connecting the two cylinders will gradually recede from one cylinder and approach the other. Now, if a piece of paper is fastened to the bottom of each cylinder so that it will clear the other one and a pencil inserted in the string at the point where the

string leaves the circle E E1, and the circle D D1 revolved in the direction of the full arrow, the dotted curve K will be drawn on the paper attached to the circle E E1. If the operation is reversed the dotted curve K1 will be drawn on the paper attached to the circle D D1.

Now, if a cut is made along the curves K and K1 and the outer part of the paper removed, the cylinders revolved until the curve K corresponds with the line ed, and the curve K1 corresponds with the line gh, the cord will be at right angles to the both curves K and K1, therefore the curves are suitable for tooth curves, providing the cord passes through the pitch point. To have it do this, through the intersection of the cord and line of centres draws the circles or arcs A A1 and B B1, with O and O1 as radii. These circles would represent the pitch circles of the gears, and the circles D D1 and E E1 would be the base circles.

The angle that the cord makes with the line T T1 is called the angle of obliquity.

Standard Interchangeable Gears.

In standard interchangeable gears, based on the diametral pitch this angle of obliquity is taken at 15 degrees.

Fig 5 shows a pinion of 12 teeth and a gear of 30 teeth (6 pitch) in mesh. The angle of obliquity TCN equals 15 degrees.

The common normal N N1 must pass through the pitch, point C, which is the intersection of the line of centres O O1, and the two-pitch circles AA and BB.

The base circles D D1 and E E1 are found by drawing circles tangent to the line N N1, as shown in Fig. 5.

The curves of the teeth outside of the base circles are involutes, and the flanks from the base line to the root of the teeth are radial lines.

To find whether a pair of involute gears will work well together without interfering at any point during the time of contact, draw the radial lines O L and O1 M perpendicular to the line of action N N1. If the intersection of the addendum circles (shown dotted) and the line N N1 fall between the points L M. as at e, there will be no interference or crowding, but if it falls outside, as at d, the teeth of the gear will interfere.

This objection can be remedied by slightly rounding the corners of the larger gears.

Fig. 6 shows an involute pinion and rack in mesh, the sides of the teeth on the rack are straight lines, making an angle of 15 degrees, with the pitch line or perpendicular to the line of action N N1.

Fig. 7 shows a pinion in mesh with an internal gear. The angle of obliquity TCN equals 15 degrees.

The pitch circles must pass through the pitch point C, and the base circles are drawn tangent to the line of action N N1. If the addendum circle of the internal gear is drawn through the intersection of line of action and perpendicular OF, the teeth of the wheel will have no faces, while the teeth of the pinion will have very little or no flanks. If the pinion is very large in comparison to the gear, the points of the teeth c and d may interfere, which may be avoided by slightly rounding the corners.

Drawing Profiles Graphically.

To draw the profiles of the different shapes of teeth graphically will now be described.

If a circle is rolled without sliding on a straight line a point on the circumference of the circle will describe the cycloid curve.

This circle is known as the generating or describing circle. The manner of drawing the cycloid curve is shown in Fig. 1a. O is the centre of the generating circle, P is the point on the circumference used in generating the curve. A B the straight line on which the circle is rolled, being equal in length to the circumference of the circle.

The generating circle should be placed so that its centre is above the centre of the line AB. Divide the generating circle into any number of equal parts, say twelve, as P, 1, 2, 3, etc., and through these points draw lines parallel to AB. Divide the line AB into the same number of equal parts, as A, 1, 2, 3, etc. Erect perpendicular lines from these points, cutting the line GH at the points 1-1. 2-1, 3-1. etc. With these points as centres and radius of the describing circle draw arcs cutting the horizontal lines at P1. P2. P3, etc. Through these points draw the curve APB, which will be the cycloid curve.

If the above operation is performed on the outside of the circumference of a circle, the point P will generate a curve called the epicycloid curve.

Fig. 2a shows the manner of drawing such a curve, AB is the arc on which the generating circle is rolled, its centre being at S. 6A and 6B each represent one-half of the circumference of the generating circle. Divide the arc A6B and the generating circle into the same number of equal parts, in this case twelve, as P, 1, 2, 3, etc., and A, 1, 2, 3, etc. With S as centre draw arcs through the divisions on the generating circle as C D, EF, GH, etc., and radial lines from the centre S to the line mn, cutting the line mn at 1-1, 2-1, 3-1. etc., with these points as centres and radius of the generating circle, describe arcs cutting the arcs KL, IJ, etc., at P1, P2, P3, P4, etc. Through these points draw the epicycloid curve APB.

The hypocycloid curve is generated in the same manner, only the generating circle is rolled on the inner side of the circumference of the arc AB, instead of on the outside.

The manner of drawing such a curve is shown in the lower half of Fig. 2a, in which the same figures and letters are used as in the upper half.

If a string is wound upon a cylinder and then unwound, keeping the string tight, the end of the string being at P Fig. 3a, the point P will describe what is known as the involute of the circle, or simply the involute. Divide the circle into any number of equal parts in this case twelve, and using one-half as shown. From the divisions draw lines, tangent to the circle, as 1P-1, 2P-2, 3P-3, etc. Make 1P-1 equal in length to the arc 1P, 2P-2 equal in length to the arc 2P, and so on. A curve drawn through the points P, P-1, P-2, P-3, etc., will be the involute of the circle.

Application of Profile Curves.

The uses of these curves in drawing the profiles of gear teeth will now be more clearly shown.

In Fig. 4a is shown the method of drawing the profile of a gear tooth on a spur wheel by the use of the epicycloid and hypocycloid curves, the former being used for the faces of the tooth and the latter for the flanks, and is known as the cycloidal or double curved teeth.

Let AB be an arc of the pitch circle of the gear, and OP equal the radius of the pitch circle. For the diameter of the describing circle use a diameter equal to one-half the diameter of the smallest gear in the set, in this case say 2⅝ ins. From O draw a straight line cutting the arc AB in P, and produce it. Let SP and S1P each equal the radius of the generating circle.

For the face of the tooth roll the outer describing circle along the arc AB in the direction of the arrow and the point P will describe the curve required for the face of the tooth. For the flank of the tooth, roll the inner describing circle on the inside of the arc AB in the direction of the arrow and the point P will describe the curve required for the flank of the tooth.

Find the different positions of P on the curves of the tooth by the method shown in Fig. 2a

Make EF=.3p=.3×1.375=.4125=the addendum. With OF as radius and O as centre draw the top of the tooth HG. Bisect the arc GP by the line C C1, and with trial centres as 1, 2, 3, etc., find a radius that will correspond as near as possible to the curve of the face of the tooth, as OP. With O as centre and a radius of OQ describe a circle, and on this circle will fall the centres of the arcs necessary for the faces of the teeth.

In a similar manner the curve for the flank of the tooth is found by the construction of a portion of the hypocycloid curve, and a radius found by bisecting the curve PG-1, and on this line find a radius that will describe an arc corresponding nearly to the hypocycloid curve. With OQ1 as radius and O as centre describe a circle, and on this circle will fall the centres required to draw the

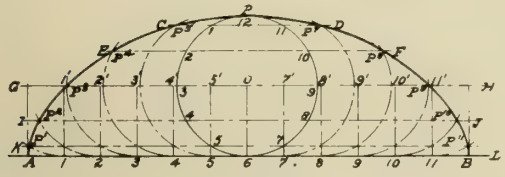

Fig. 1.a

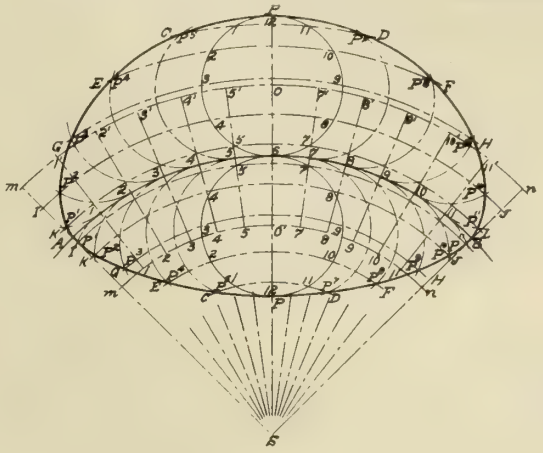

Fig. 2.a

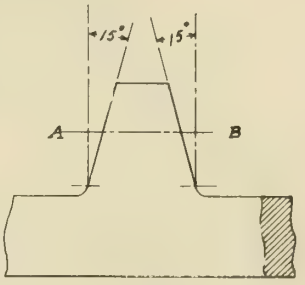

Fig. 7.a

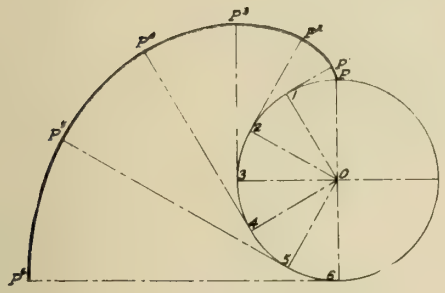

Fig. 3.a

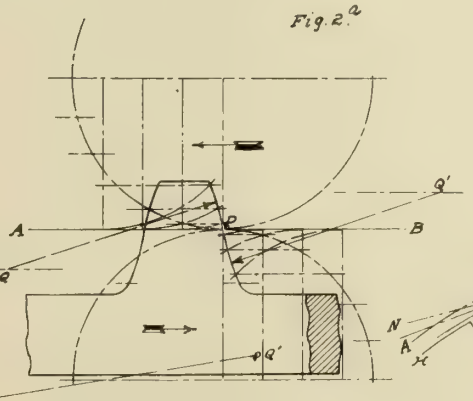

Fig. 5.a

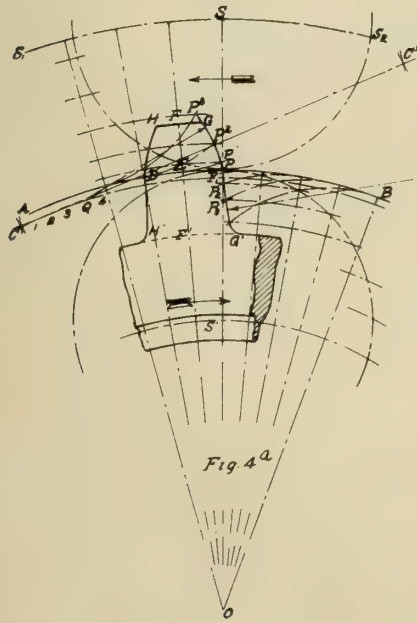

Fig. 4.a

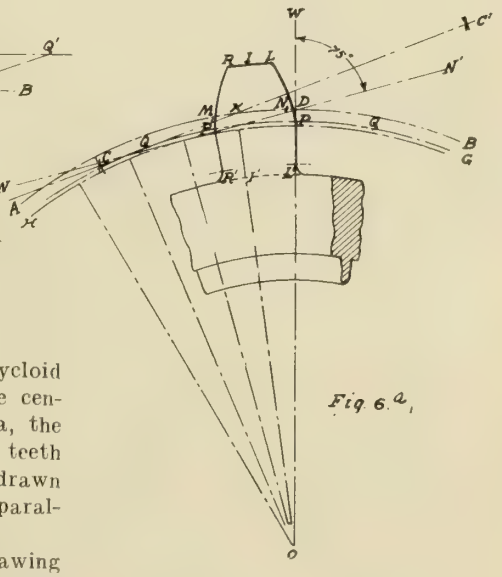

Fig. 6.a

flanks of the teeth. On the pitch circle lay off PD=width of tooth=.48p=.48× 1.375=.66 inches and from D repeat the operations, only in the opposite direction, or with the radius QP reversed draw the left side profile of the tooth, and with radius Q1P reversed draw the left side profile of the tooth flank.

It is a usual custom to leave a small fillet in the corner at the root of the teeth, as it makes it stronger and less liable to crack when being cast.

In Fig. 5a is shown the profile of a rack tooth developed by the use of the cycloid curve, shown in Fig. 1a.

The generating circle is revolved or rolled on the upper edge of the pitch line, to form the faces, and the lower edge of the pitch line for the flanks of the teeth. Approximate curves are drawn by finding radii that will correspond as near as possible to the cycloid curves. The method of finding the centres, being the same as in Fig. 4a, the various centres for the different teeth will be found, on a straight line drawn through the points Q and Q1, and parallel with the pitch line AB.

Fig. 6a shows the manner of drawing the profile of the involute or single-curve tooth. The profiles are formed by a portion of an involute and a part of the radius of the pitch circle. The involute is drawn from a circle called the base circle, which is found as follows. Draw an arc of the pitch circle A B and produce a radius O W, cutting the pitch circle at the pitch point D. Through D draw a straight line N N1 at an angle of 75 degrees, with the line OW.

With O as a centre draw an arc of a circle tangent to the line N N1. This circle is the base circle which cuts OW at P. On this circle, using the method shown in Fig. 3a, draw a portion of an involute with OI as radius, equal to one-

half the outside diameter of the gear draw the arc RIL, forming the top of the tooth. Bisect the curve PL by the line C C1 and on this line find a centre with radius QP that will draw an arc corresponding as near as possible to the involute curve. This is the approximate method of drawing the faces of the teeth. With O as a centre and OQ as radius draw a circle on which will be found the required centres from which to draw the faces of all the teeth. The flanks PL1 and P1R1 are portions of radial lines drawn from the base circle to the roots of the teeth.

Small fillets are left at the roots of the teeth as shown.

Greater accuracy is obtained when drawing these profiles, by dividing the describing circles and base circles into a greater number of equal parts.

The profile of the involute rack tooth is shown in Fig. 7a, the sides of the teeth making an angle of 15 degrees with a line drawn perpendicular to the pitch line AB.

STARRETT'S NEW TOOLS.

Fig. 1 shows a universal bevel protraction with vernier. The verniers are so placed with relation to the graduated half-circles as to make the protractor readable by vernier in any position. The protractor stock is 4 in. long and has either a 7 or a 12-in. blade, ½-in. wide. With the 7-in. blade the tool weighs but six ounces. The disc is graduated in degrees from 0 to 90 each way and rotates the entire circle on a central stud inside the case. The blade,

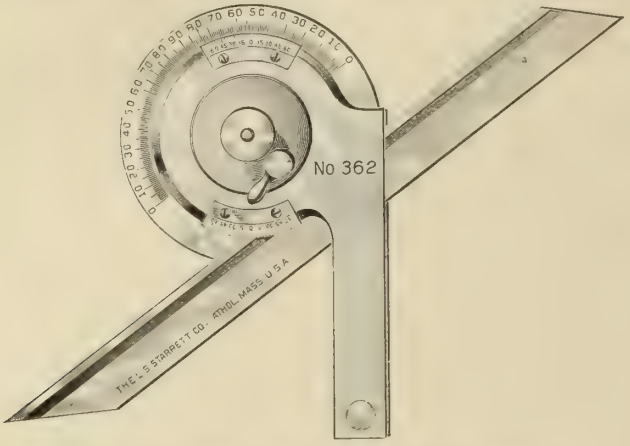

Fig. 1.—Universal Bevel Protractor With Vernier.

Fig. 3.—Toolmaker's Buttons with Screws and Washers for Jig Work.

clamped by an eccentric stud against the edge of the disc, may be slipped back and forth its full length, or turned at any angle around the circle and firmly clamped at any point. The figures on the vernier are placed close to the protractor. By a slight turn of this nut the protractor is firmly held in position.

The level sight attachments, Fig. 2, are made to slip on and off the top side of iron levels and are held in place by set screws. They have hight holes—one with a cross wire of line accurately from top of and parallel with level. Sighting through the holes will

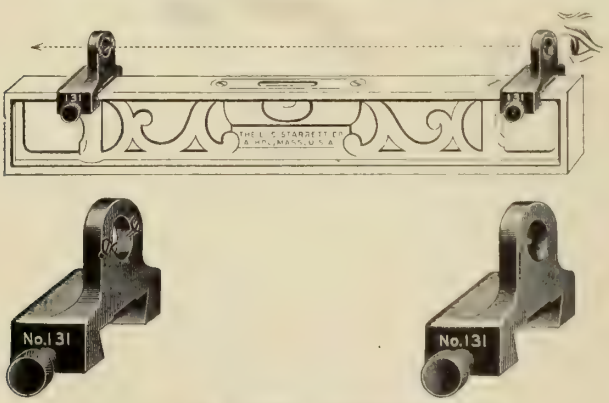

Fig. 2.—Level Sight Attachments.

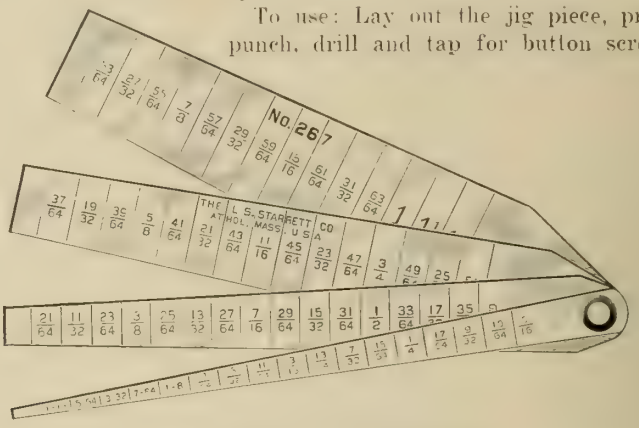
lines, thus making it easy to read the tool when taking measurements. There is a central locking nut on this pro-

enable one to use the common level for leveling a plot of ground from a fixed point at long range.

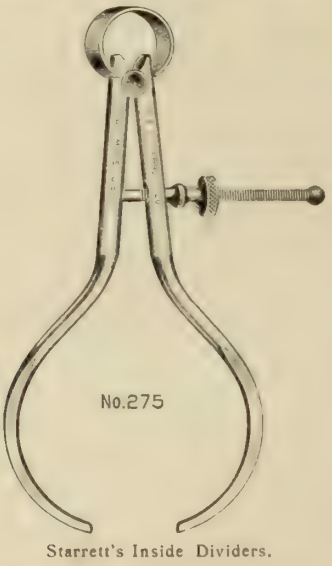
Fig. 3 shows tool-makers' buttons with screws and washers for jig work. These buttons are hardened and ground to standard size, .400x1-2 in. and are used to locate holes to be chucked and bushed for jigs where positive accuracy is required.

To use: Lay out the jig piece, prick punch, drill and tap for button screws

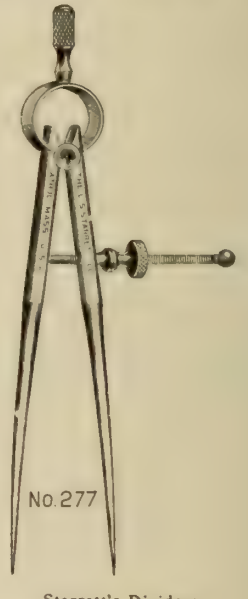


Starrett's New Taper Gage.

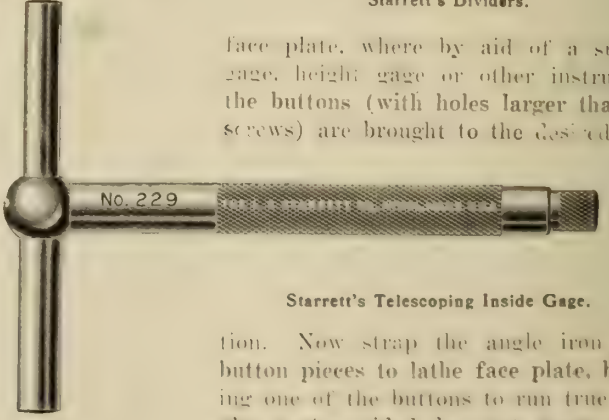
and smooth off burr raised by tapping. Fasten on the buttons, strap the pieces to an angle iron, place same on a surface plate, where by aid of a surface gage, height gage or other instrument the buttons (with holes larger than the screws) are brought to the desired location. Now strap the angle iron with button pieces to lathe face plate, bringing one of the buttons to run true with the centre aided by test gage. This done, remove the button and chuck and ream the hole. Repeat the operation with the other buttons until all the holes are chucked.



Starrett's Inside Dividers.



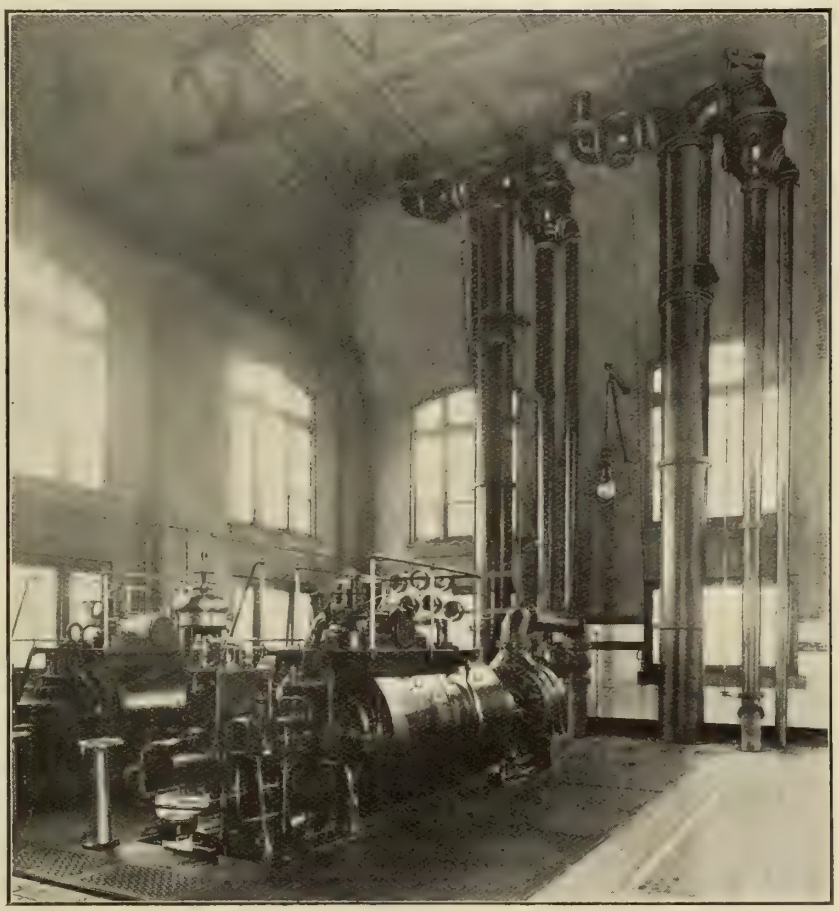
Starrett's Dividers.

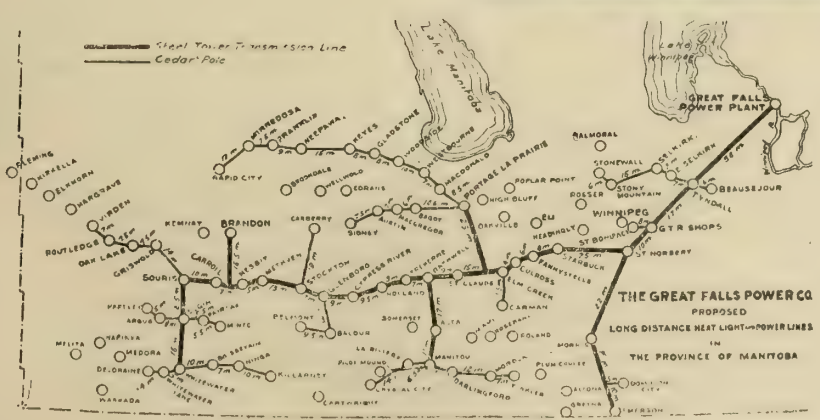


Starrett's Telescoping Inside Gage.

Miniature of Winnipeg Power Development scheme. This was shown at the Industrial Exhibition, Winnipeg, and at the Canadian National Exhibition, Toronto.

Toronto has been instaling some large pumping machinery. The accompanying illustration shows two Westinghouse-Parsons turbines, direct connected to two centrifugal pumps, operated with Worthington Barometrie Condensers, in the John Street pumping station. The capacity of each unit is five million gallons in twenty-four hours.





The Great Falls Power Co. is contemplating a power transmission scheme in Manitoba, which will be equalled in Canada only by the Ontario Government's power scheme.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

The Ontario Bennett Tunnel Machine Co., Galt, have obtained a charter.

The Caledonia Foundry, Ottawa, was partially burned on Sept. 3. The loss amounted to $2,000.

The proposed iron and steel enterprise at Vancouver, represents an investment of nearly $3,000,000.

The work of the new repair shops of the Waterloo Mfg. Co., at Portage la Prairie, is now nearing completion.

The G.T.R. have removed their shops from East Toronto, and repair work in future will be done at Mimico, Stratford and Belleville.

The work of constructing the $75,000 machine shop and 44 stall round house for the G.T.P. at Edmonton has commenced. Work will not be completed for two years.

The Electrical Products Co., of which Fitzgerald & Bennie, Niagara Falls, N.Y., are the principal owners, will locate a factory at Chippewa. Building operatiosns will commence at once.

The plant of the Canada Brass Foundry Co., Toronto, which has been idle for some years past is to be reopened within the next few weeks. The business will hereafter be known as the Ontario Brass Co.

For the reported sum of $350,000 the Albion iron works property at Vancouver has been sold to a railway company, the identity of which real estate men can only guess at in the absence of an authoritative statement.

A. E. Hamilton, St. John, has been awarded the contract for the new I.C.R. repair shops to be built near the Gilbert's Island round house. A large building with corrugated iron roof will be erected and Mr. Hamilton is arranging to begin work at once.

The Hamilton Foundry Co., Hamilton, have under construction a foundry 57 x 82 ft. at the corner of Ruth and Clinton Sts., Hamilton, which will be equipped for general foundry work. A cupola of six tons capacity has been installed and other equipment will be added as required.

The Malleable Iron Works, in Amherst, N.S., which suspended operations about eighteen months ago, have been taken over by the Rhodes-Curry Co., and will resume active work at once. The Malleable Iron Co., when re-opened, will give employment to about one hundred men.

The Martin Mfg. Co., Whitby, has purchased the foundry premises lately occupied by the Farmers' Co-operative Harvesting Machine Co., now being wound up. The company has in view the manufacture of the cloth used in horse blankets, also the felt required in the harness trade.

Gordon Laws' machine shop, Ottawa, known as the Caledonia Foundry was damaged by fire on September 3. The loss amounted to about $3,000 and affected the pattern shop where a great many patterns were destroyed. The firm was very busy at the time, having several weeks' work ahead, but every effort was made to cope with all business in spite of the unfortunate hindrance.

The Dominion Bessemer Mines Co. is commencing operations on an extensive scale on the iron properties at the head of Thunder Bay, twenty two miles from Port Arthur. The company is building docks, and it is expected that shipments will be made next season by boat direct from the properties. It is believed the St. Anthony mine in the Sturgeon Lake district will reopen shortly.

The open-hearth furnaces of the Nova Scotia Steel & Coal Co., at Sydney Mines, after being closed for re-lining and repairs, has resumed at full blast. It is understood that they will commence operations by turning out steel for the Dominion Iron & Steel Co., the inference being that the demand for the finished product of the latter is so active as to exhaust their capacity in the matter of raw material.

The Doty Engine Works, Goderich, have recently completed a number of additions and improvements to their plant. Two new workshops have been completed, and the installation of machinery is now in progress. When the work is completed, the floor space of this factory will have been quadrupled over what it was a few months ago. The company has a large number of orders in hand, particularly for the west.

The Edge Tool Works at Galt will be reopened. The new manager of the firm is Allan Hills, a Britisher of wide experience in this line. In addition to having considerable finances himself, it is understood that Mr. Hills has unlimited British capital behind him. A gang of men is now at work preparing the factory for re-opening and it will shortly be running full blast. In the neighborhood of one hundred hands will be employed and the factory will turn out immense quantities of edge tools, hammers and other articles.

Brantford has secured another industry through the newly-formed publicity and industrial department. The Brantford Steel Range Company has been organized, with a capital of $40,000, the applicants being John Muir, W. D. Schultz, J. H. Ham, E. L. Goold, J. H. Sanderson, W. H. Wilkes, W. Stanford, F. W. Ryerson, P. Verity, and W. T. Henderson. Temporary quarters have been secured, but as the industry develops, a move will be made to larger quarters. The product will be a cooking stove, of which W. Stanford is the patentee. It is very economical of fuel, and so arranged that meat can be cooked in one oven, and cakes or such in the other.

Municipal Enterprises.

A modern waterworks plant to cost over $20,000 is proposed for Fernie, B.C.

About $00,000 is needed to complete Markdale's, Ont., waterworks system.

A by-law will be introduced to raise $275,000 for waterworks purposes at Richmond, B.C.

The ratepayers of Cranbrook, B.C., will take over the waterworks system at a cost of $40,000.

A by-law authorizing the borrowing of $115,000 for civic purposes has been ratified at Hull, Que.

Waterworks extension, costing in the vicinity of $11,000, will be commenced at Portage la Prairie at once.

Exeter, Ont., ratepayers have approved of a by-law to raise $22,000 to instal a waterworks system.

Yorkton, Sask., ratepayers recently voted in favor of a by-law to raise $20,000 for water works extensions.

The Canada Iron Corporation, of Montreal, has been awarded the contract for 1,942 tons of cast iron pipe at $40 per ton, and specials $65 per ton, all f.o.b. cars Regina.

The town council of Taber, Alta., are asking the ratepayers to support a by-law to raise $55,000 by 20 year debentures for the purpose of the erection and construction of a stand-pipe, water mains and hydrants.

The London Water Commissioners have selected a site for the combined water and power station. The council have finally passed the water by-law to expend $123,700 for the artesian wells, pumping and power distribution plants on Horton Street, effecting a saving estimated at $4,000 per annum.

The Clinton, Ont., waterworks committee have awarded contracts for waterworks as follows: Pipe laying, T. M. Cullen, Huntsville, prices ranging from 18c to 30c per foot; cast iron pipes and special castings, Gartshore, Thompson Co., Hamilton, $32.20 per ton; construction of 80-foot stand-pipe and foundation, Hunter Bridge & Boiler Co., Kincardine, $5,000.

The construction at Winnipeg of a 5 mile pipe line from the Red river, to provide a sufficient quantity of water for the great shops being erected for the G.T.P., in Springfield, has been decided upon. Tenders for this pipe will be called for shortly. A pumping station will be erected, capable of forcing the water through the main at high pressure, and in connection with the large reservoir to be erected at the shops, there will be a settling basin.

Contracts for part of Orillia's new waterworks system amounting to $34,109 have been awarded to J. A. Mellwraith, Collingwood, for sanitary sewers at $11,815; T. Clement, Orillia, receiving basin and pumping house, $6,175; Canada Foundry Co., force mains, $8,125; Jno. McDougall & Co., Montreal, for machinery, including two large centrifugal pumps, 30 h.p. motor, switch board, all electric equipment, gasoline engine, setting and installing machinery and all expenses in connection with operating for two weeks, $4,166.

Contracts for the new waterworks and sewer system at Cobalt have been awarded as follows: Contract "A," supplying cast iron pipe and special castings, Canada Foundry Co., $1,842.40; contract "C," supplying steel stand-pipe, Canada Foundry Co., $2,540; contract "D," supplying vitrified tile pipe and junction, Toronto Sewer Pipe Co., $1,800; contract "E," cast iron manhole covers, London Foundry Co., $526.50; contract "F," labor and certain materials, William Newman & Co., Winnipeg, $38,584.10. Contracts "B" and "G" for supplying hydrants and valves, and for supplying and erecting pumping machinery, were not awarded.

Railway Construction.

It is announced that construction on the new Transcontinental terminals at Sillery, Que., will be commenced shortly.

The contract for the laying of fifty miles of track on the G.T.R. branch from Tofield to Calgary has been sublet to Geo. H. Webster. Work will begin at once.

In exchange for giving the Great Northern Ry. 61 acres of tideflats the railway will expend about $3,500,000 on its False creek terminals near Vancouver.

The Rainy River Radial Railroad Co. is seeking a charter to build several electric car lines between Fort Frances and the American boundary, near International Falls.

The International Electric Railway Co. will soon commence the construction of its proposed electric railway from a point in the municipality of Surrey to a point at or near Port Kells, B.C.

The British Columbia Electric Railway Co. has just let the contract for constructing four miles of single track lines in South Vancouver to Christian, Hartney & Christian. Operations will begin immediately and the lines are to be completed well before the end of the year.

The Grand Trunk Pacific has awarded to Foley, Welch & Stewart a new contract for the second section east of Prince Rupert. It will be 140 miles from Copper river, east to Aldermere. This leaves a gap of less than 500 miles, and contracts for this may be let before the end of the year. The new contract was for approximately $10,000,000. There are several long tunnels, one half a mile in length.

Electrical Notes.

The Brantford Street Railway Co will erect a power house in West Brantford.

The Cranbrook Electric Light Co. have decided to put in a new steam plant at a cost of $30,000 to $50,000.

Arrangements are being made by the Durham-Northumberland Power Co. for the development of extensive water power in the vicinity of Port Hope.

A company headed by Walter U. Homfray has been formed at Kamloops and has secured water rights on Louis creek. The company will be known as the North Thompson Power and Development Co.

Renfrew council will develop the water power which it recently purchased for $7,000, and has engaged John B. McRae, of Ottawa, as engineer. The town wants electric power for the operation of waterworks machinery and the lighting of the streets.

That there is at the very least ten thousand horse power in the river Saskatchewan awaiting development, and that the energy can be developed at a comparatively reasonable cost is the statement made by Engineer C. H. Mitchell, Toronto, who has been down at La Colle Rapids laying out the plans for the proposed Prince Albert plant.

The by-law ratifying the agreement with the B.C.E.R. Co., under which Victoria agrees not to enter the power business without first offering to buy the company's plant, was carried by 150 votes over the three-fifths necessary of the total vote cast. The company in return

agrees to spend $1,500,000 in installing a power plant at Jordan river.

The B.C. Electric Railway Co. are to commence work at once on the Jordan River power project, the company's engineer being already in town in connection with this work. The first unit of power will be ready in about one year, the remainder of the work will take about another two years to complete. The whole work will cost close to $2,000,000.

A new company known as the Ridgeville Electric Light & Power Co., has been recently formed. Capital $40,000. Incorporators, George Arnold, Ridgeville; H. A. Rose and F. W. Houston, Welland; J. C. Stoat, Fenwick, and H. S. Arnold, Toronto. The object is to supply electric light and power to places in the townships of Thorold, Pelham and Gainsboro.

The Commissioners of Queen Victoria Niagara Falls Park have given permission to the Ontario Power Co., to spend over a million dollars in laying another pipe from the gatehouse to the power house. The new pipe is to be the same diameter as the old, eighteen feet, but instead of being steel encased in concrete, will be wholly of reinforced concrete. It is anticipated that the work will be completed in six months.

Work has been commenced on the erection of the power station, dams, etc., of the Calgary Power & Transmission Co., at Bow River, 45 miles from Calgary. 3,000 h.p. have already been contracted for with the Western Canada Cement & Coal Co., Exshaw. Smith, Kerry & Chace, engineers for the company, have awarded the contract for two 2,000 k.w. generators of the 300 r.p.m. waterwheel type to the Canadian General Electric Co., of Toronto. The balance of the tenders will be shortly awarded.

The report of the gas and electric inspection branch of the Inland Revenue Department for the last fiscal year shows that 359,283,286 kilowatt hours were generated for export from Canada, as compared with 135,079,688 kilowatt hours for home consumption. The Canadian Niagara Power Company exported 221,927,240 units and produced 5,405,760 units for home consumption. The figures for other companies are as follows: Electrical Development, home consumption, 85,515,480 units; export, 4,680,500 units. Ontario Power Company, home consumption, 44,150,580 units; export, 131,833,782 units.

The following contracts for the Ontario hydro-electric line construction material have been awarded: Bissell Company, 1,200 thirty foot six inch top poles for $2,640; 1,200 thirty foot, seven inch top, poles for $3,600; 300 forty foot seven inch top, poles for $1,710; 300 fifty foot, seven inch top, poles for $3,150; 2,000 four-pine crossarms at $510; 2,500 six-pin crossarms at $737.50. London Bolt & Hinge Works, 9,000 braces, ¼ by 1¼ braces for $423.90; bolts, screws, and washers, $317.88. Northern Electric Company, 20,000 locust pins for $320. The Locke Insulator Manufacturing Company, 20,000 deep groove double porcelain insulators for $640. The Wire & Cable Company, Montreal, 53,000 pounds solid "T.B." weatherproof wire and 5,000 lbs. weatherproof wire at $9,292.

No less than three companies, millions of dollars, and at least two thousand men, are concerned in the competition to be first in the camp with the energy to drive Cobalt's drills and operate her hoists and pumps. The great factor in the development of Cobalt, the Montreal River, will supply the power for all three companies. The Cobalt Hydraulic, a New York concern, with considerable La Rose and Nipissing capital behind them, now have their millions of pounds of steel tubes,, twenty inches in diameter, all imported from Germany, laid and connected up, and they are busy completing their power plant at Ragged Chutes. They are going to supply compressed air only. It will be the largest compressed air plant in the world. The Mines Power Co. started later in the race than the Cobalt Hydraulic, but they have infused any amount of energy into their operations, and are even now building sub-stations at Cobalt and Kerr Lake to accommodate the enormous air compressors and electric transformers. The Beach Bros. are generating power at Hounds Chutes, and though their undertaking is not on the immense scale of the two other companies, it is further advanced.

Structural Steel.

The Saskatoon city council has decided to build a subway at 22nd Street in that city at a cost of $70,000.

A by-law to raise $7,800 for the purpose of erecting bridges in the township of Amaranth, Ont., has been passed.

Contractors Robert Clark & Son are making splendid progress with the work on the new Waterway Bridge on the flats at Petrolea.

The work of building the bridge across the First River, near Port Arthur, the contract for which was let to Pease Bros., has been commenced.

At a special meeting of the Stratford city council it was decided to call for tenders for a three-span steel and a reinforced concrete bridge on Waterloo street.

The Western Bridge & Equipment Co., Chatham, Ont., has closed three contracts for steel and concrete bridges on the Romney town line, the price being $2,500. The same firm has just secured contracts for two bridges at Green Valley, Renfrew Co., cost $3,600.

The steel railway bridge over the Speed river on the Dundas road, at Guelph, recommended by the chairman of the Ontario and Municipal Board, on the strength of a report from the Board's engineer, is to be built without any further delay. Engineer Malcolm's plans were accepted.

The Peterboro Council has approved of the Board of Works' recommendation that the contract for the Smith Street Bridge be let to Geo. A. Begy & Co., of St. Catharines. The bridge is to be of reinforced concrete, at a cost of $30,000. Work will likely be commenced in a short time.

Tenders were recently opened at Baden, Ont., for a new steel bridge at Wilmey. The bridge is 100 feet long with concrete floor and reinforced concrete abutments, all according to plans prepared by Bowman & Connor, of Berlin and Toronto. The steel work was awarded to the Hamilton Bridge Works Company at $2,291.

To secure a traffic section on the C.P.R. high level bridge between Edmonton and Strathcona the railway company will be required to be paid for the steel and concrete work alone $586,646 by the cities of Edmonton and Strathcona and the local and federal governments. This amount is exclusive of the cost of the approaches which will bring the figure to be paid for traffic facilities alone on the bridge over the Saskatchewan close to the million dollar mark.

Planing Mill News.

The Riverside Lumber Co. will build a factory two storeys in height, and to cost $13,000, at Calgary.

The sawmill of the W. F. Hunting Lumber Co., Vancouver, which was burned on Aug. 15, will be rebuilt.

A permit has been issued for the erection of a planing mill at Riverside, B.C., for H. N. Sereth. The new building is to cost in the neighborhood of $15,000, and work on the new structure will be commenced immediately.

Marvin Millar, London, has completed arrangements with the Raymond Mfg. Co., of Guelph, for the manufacture, under royalties, of his electrical appliances at their factory in Guelph. He has been engaged to superintend their manufacture.

Heaps & Co., who have in operation large lumber mills at Vancouver and at Ruskin, at the junction of the Stave and Fraser rivers, intend to open a branch at New Westminster at an early date to handle the logs from their large limits on the Fraser river.

The expanding business of the Brantford Emery Wheel Co. has necessitated the erection of a new factory. The contract was secured by Schultz Bros. Work on the structure has already commenced and every effort will be made to have it completed early in October.

Over $20,000 loss was caused by fire which started at the Niagara Falls Planing Co.'s mill, on Sept. 15. The mill and offices were completely destroyed and lumber which can be realized on amounts to only about $2,500. The stock and building were not fully insured.

J. S. Colton Fox, an English capitalist, has purchased the works of the Crystal Glass Co., at Sapperton, B.C. He will instal new machinery and reopen the plant. The Crystal Glass Company was organized by Vancouver people three years ago, but its operations were not successful, and the plant has been closed down for about a year. Mr. Fox will also establish a chemical works near the glass manufactory.

Trade Notes.

Peacock Bros., Montreal, have moved from their old offices in the Canada Life building to new quarters at 68 Beaver Hall Hill. Francis Peacock sailed for Canada on September 27th.

The Sterling Electric Supply Co. have opened up offices at 369 Yonge St., Toronto, and will supply electrical contractors and central stations. Complete electrical lines will be carried, including the "Just" tungsten lamp.

Chapman & Walker, Engineering Contractors, cor. Lombard and Victoria Sts., Toronto, have been awarded a contract for the instalation of a 100 h.p. electric lighting type gas engine and producer plant by city of Collingwood.

The Canadian Tungsten Lamp Co., Hamilton, has been incorporated with a capital of $300,000. They will operate the works of the Ontario Lantern & Lamp Co., Hamilton. These works have been enlarged to take care of the increased lines that will be manufactured. W. H. Ginder has been elected president; F. W. Gates, vice-president, and P. D. Crerar, K.C., secretary. The machinery for the manufacture of the tungsten lamps, comes from Johan Wremenezky, Vienna, Austria, who is one of the shareholders in the new company.

The Smart-Turner Machine Co., 191 Barton St. E., Hamilton, report the following recent orders for pumps:—Geo. Coultis & Sons, Thetford; Corporation Markdale; Cobalt Power Co.; Waterworks System, Clinton; T. H. Shepard, Orillia; F. Shoe, Cobalt; Fowlers Canadian Co. Hamilton; W. Hanna & Co., Port Carling; Adams Wagon Co., Brantford; two to the Corporation of Burlington; and Coniagas Reduction Co., Thorold. The Smart-Turner Co. also report the following cranes: 15 ton to Cobalt Power Co., Gillies Depot; 5 ton to Calgary Iron Works, Calgary; and 5 ton to T. & N. O Ry., North Bay.

Building Operations.

The E. Long Mfg. Co. has begun the construction of their new plant at Orillia.

D. Ouimet has secured a permit for a factory to be erected at Montreal at a cost of $7,000.

Barrie, Ont., ratepayers have passed a by-law granting a loan of $20,000 to the Barrie Carriage Co., for the extension of its plant.

The Sanford Mfg. Co., Hamilton, will erect a very large factory on a site just purchased at that place.

The Manitoba Gypsum Co. has a permit for the erection of a new two storey reinforced concrete factory at Winnipeg to cost $46,000.

The Tudhope Co., Orillia, whose premises were recently burned, will rebuild at once, and the work will be hastily rushed to completion.

A building permit has been issued to the Brantford Emery Wheel Company for the erection of a new factory on Pearl Street at a cost of $3,500.

The Winnipeg Ceiling and Roofing Co. is making arrangements for the erection of a large manufacturing plant at Vancouver to employ at the outset about 100 men.

The Canadian Niagara Power Co., Niagara Falls, have awarded to the Allis-Chalmers-Bullock Co., the contract for the installation of three 300 h.p. motor generator sets.

Plans are being prepared for the erection of a new separator factory at Renfrew. T. A. Low, M.P., is interested. The plant and building will represent an initial expenditure of $50,000.

Mitchell & Crighton have awarded the contract for the erection of a three-storey factory, with gas holder and oil tanks, 100,000 gallons capacity each, at Cote St. Paul, for the Blow Gas Co., to D. G. Loomis & Sons.

Negotiations are in progress for the securing of property in Edmonton, as site for the erection of a large cold storage plant, at an initial expenditure of $100,000. H. G. Nivin, of the Edmonton Produce Co., is at the head of the project.

Tenders will be received until October 14, by the city engineer, Toronto, for the following electric motors with exciters, switchboards, connecting material, etc.: Four 1,500 h.p. and four 500 h.p. and two 225 h.p. synchronous motors; two 1,500 h.p. and four 500 h.p. induction motors.

The following contracts have been closed by Regina's council: Canadian Westinghouse Co., one 500 k.v.a. low pressure turbine generator unit with switchboard panels and instrument, cost $15,000 f.o.b. Regina; Canadian Westinghouse Co., one exciter unit, consisting of Westinghouse horizontal turbine, direct connected to Westinghouse direct current turbo generator to cost $1,768; C. H. Wheeler Mfg. Co., one C. H. Wheeler improved surface condenser, $4,500.

To know every detail to gain an insight into each secret, to learn every method, to secure every kind of skill, are the prime necessities of success in any art, craft, or trade. No time is too long, no study too hard, no discipline too severe for the attainment of complete familiarity with one's work and complete ease and skill in the doing of it. As a man values his working life, he must be willing to pay the highest price of success in it,—the price which severe training exacts.—Hamilton Wright Mabie.

New Companies.

The Brantford Steel Range Co., Brantford; capital, $40,000; to make stoves and furnaces and do general foundry and machine work.

Dominion Tack and Nail Co., Galt; capital, $40,000; to make wire and wire nails, tacks, etc. Incorporators, John Sloan, J. Eatough, and J. Buchanan, Galt.

The Lyall Co., Montreal; capital $500,000; to carry on general engineering and construction business. Incorporators, R. Taschereau, R. Genest and J. Marier, Montreal.

The Whyte Railway Signal Co., Ottawa; capital, $300,000; to make Whyte railway protection and signal devices. Incorporators, J. A. Whyte, J. K. Paisley and W. J. Gerald, Ottawa.

The International Shoe Machinery Co., Montreal; capital, $400,000; to manufacture machinery for making shoes, belting, saddlery, etc. Incorporators, B. O. Beland, E. W. Gobeil, and W Johnson, Montreal.

Montreal Manufacturers Successful.

The Simonds Canada Saw Co., Montreal, Que., with branches at Vancouver, B.C., and St. John, N.B., have every reason to feel proud of the success of their entire line of saws, machine knives, etc., having received a telegram that their exhibit at the Alaska-Yukon Pacific Exposition, held at Seattle, Wash., has been awarded the grand prize. The four largest saw manufacturers on this continent exhibited, and they were the only one given the grand prize.

Electric Smelting.

Dr. Eugene Haanel, Director of Mines, Ottawa, states that arrangements are being made for establishing the first electric smelting plant in Canada, in connection with the Sault Ste. Marie iron and steel industries. The Lake Superior Co. is arranging for the construction of a number of furnaces similar to those now in successful operation in Sweden. A second electric smelting enterprise, involving the investment of about seven million dollars, is also contemplated for the treatment of iron ores on the Ottawa River at Chats Falls, where a splendid power site has been secured by a company headed by Mr. Louis Simpson.

New Canadian Agency.

Chapman & Walker have opened up offices at the corner of Victoria and Lombard Sts., Toronto, as contracting engineers. They represent some of the largest English companies including Crossley; Dick, Kerr; Henley; Nalder & Thompson, and "Z" Tungsten Lamp Co.

The Crossley Co. are manufacturers of the well-known Crossley gas engines, several installations having been made in Canada. Among these are instalations at James Smart, Brockville; Winnipeg municipal plant and a large plant in Cobalt.

Dick, Kerr are one of the largest British exporters of electrical machinery. They make a specialty of A. C. machinery. They have supplied a number of plants in South America. Among the Canadian instalations is a 5,000 k. w. generator for Vancouver.

Nalder & Thompson are manufacturers of ammeters, wattmeters for switchboards. Henly's are manufacturers of power and telephone cables.

B. Greening Co. Enlarging.

The B. Greening Wire Co., Hamilton, have instructed their architect, Mr. W. A. Edwards, of the same city, to prepare plans for a new wire rope factory. It will be a one story concrete and brick structure 124 ft. x 112 ft. with saw tooth roof construction. The flooring will be solid concrete so as to withstand the weights of heavy machinery and large reels of cable. It will be an up-to-date factory in every respect. Orders have been placed for additional rope machinery of the latest design. It is expected the new mill will be completed and machinery installed by first November next. The present rope mill will be used as an extension of the wire working branch of the business and will provide much needed room for the rapidly growing demand for their wire guards, garden fencing and bordering, factory lockers, etc.

CATALOGUES.

FLEXIBLE TRANSMISSION—Bulletin No. 22 of 66 pages on coated paper from Coates Clipper Mfg. Co., Worcester, Mass., describes the Coates Flexible Shaft and its application for transmitting power to various machines, such as drills of all kinds, boring machines, grinders for foundry work, finishing patterns, etc., polishing, hammers, etc. The catalogue is exceedingly interesting and is worth perusing.

The publishers will gladly send a copy on request if Canadian Machinery is mentioned.

FRICTION CLUTCH—A neat folder from the Carlyle Johnson Machine Co., Manchester, Conn., announces the opening of their new factory for the manufacture of the Johnson Friction Clutch for line shafting, countershafting in machine shops and for use on feed and speed changes in machine tools.

LOCOMOTIVES—Publication No. 100 from Milwaukee Mfg. Co., Milwaukee, describes gasolene driven locomotives. Full descriptions are given with illustrations showing their usefulness in manufacturing plants, mills, lumber yards, mines, tunnel and canal construction, etc.

GRINDING AND POLISHING MACHINERY—Catalogue from Webster & Perks Tool Co., Springfield, Ohio, describes a line of floor and bench grinders for buffing, polishing and grinding. The journals are equipped with automatic oiling devices. Prices are also included in the catalogue.

SMALL TOOLS—Catalogue 71 from Whitman & Barnes Mfg. Co., St. Catharines, Ont., 244 pages, coated paper, 6"x9". The catalogue is a very complete list of lawn mowers, tubular steel and wood frame grindstones, knife grinders, link chain belting, twist drills and reamers, hammers, spring cotters and keys, wrenches, oilers and other agricultural and machinists' supplies. Over 180 pages are devoted to small tools such as drills, reamers, etc., giving illustrations, sizes and prices. This catalogue should be in the files of every machine shop.

TOOLS—Sixty page catalogue on bond paper from James Smart Mfg. Co., Brockville, Ont., describes their hammers, hatchets and axes. The hammers are for carpenters, tinners, machinists, engineers, blacksmiths, etc. The line is very complete. The different hammers are illustrated and described and should be in the file for reference.

RENOLD SILENT CHAIN Circular No. 5 from Jones & Glasseo, Montreal, illustrates the Renold chain and shows several installations attached to pumps, motor to line shaft, etc.

DRILL GRINDING—The Cleveland Twist Drill Co., Cleveland, O., has issued a pamphlet showing how to properly grind a drill. It shows the concise form and proper methods for grinding both the flat and the milled drill. A copy will be sent to any mechanic on application.

MUFFLE FURNACES—Circular No. 5 describes the Rockwell Muffle Furnaces manufactured by W. S. Rockwell Co., 50 Church St., New York. These are adapted for assaying and other work using oil or gas as fuel. Installations have been made in the Royal Mint, Ottawa.

MOLDING MACHINES—A catalogue issued by the Turner Machine Co., 2049 North Second St., Philadelphia, describes their molding machines, showing by illustrations its operation. The pattern plates, flasks, etc., are also described. The catalogue also describes the Turner Automatic Cock Grinders with four and eight spindles.

SAND SIFTER AND SPRUE CUTTER—A pamphlet from Turner Machine Co., 2049 N. Second St., Philadelphia, describes a sand sifter which both mixes and sifts the sand at the same time. Included in the pamphlet is a description of a sprue or gate cutter made specially for this work.

POWER TRANSMISSION—Catalogue No. 1 from the Hill Clutch Co., Cleveland, deals with the subject of power transmission and describes their line of gears, bearings, clutches, etc.

SMOOTH ON This is a chemical iron compound used for smoothing over and filling up blowholes in iron or steel castings. It is fully described in the 8th edition of the Smooth On Instruction Book issued by the Smooth On Mfg. Co., Jersey City, U.S.A. Its use in foundry work, piping and boiler construction is fully explained and many interesting uses are described. This instruction book will be sent for the asking.

DISC GRINDERS—The Gardner Machine Co., Beloit, Wis., have issued a handsome catalogue printed on bond paper. The single sheets are bound within double covers. In addition to description of Gardner grinders for tool room and other work, F. R. Gardner, who is the inventor of the disc grinder, gives a treatise on disc grinding, incorporating tests for several grinding jobs. The data included in the catalogue is valuable, giving a good idea of what a disc grinder will accomplish.

TAPS AND DIES—Illustrated catalogue from Murchey Machine & Tool Co., Detroit, Mich., describes the tools manufactured by that company. They include automatic collapsing taps, automatic opening die, threading machines, pipe cutting off machines, tapping machnes, tapping chucks, grinders for cutter wheels and pipe dies, tapping machines, double head push nipple lathe for constant radius nipples for radiators and boilers, etc.

TURRET MACHINERY AND TOOLS—The Garvin Machine Co., Spring and Varick Sts., New York, have just issued an illustrated catalogue E, being another of the series dealing with the products of the Garvin Machine Co. Edition E deals with Turret machinery and tools, including screw machines, monitor or chucking lathes, automatic chucks (stop and open), screw head shaving machines, double turret screw machines, screw machine tools and attachments. The catalogue is printed on coated paper, 92 pages, 6x9, in English, French and German, and is well and carefully illustrated throughout.

HYDRAULIC BEAM SHEARS—Catalogue 74, from Watson-Stillman, 50 Church St., New York, deals with the Watson-Stillman hydraulic beam shear and hydraulic coping machine for shearing and trimming structural iron sections, bridge parts, ship sections, flat bars, small plate metal parts, etc., hydro-pneumatic accumulators for use in connection with the beam shears and coping machines are also illustrated.

SUPPLY CATALOGUE—The A. R. Williams Co., Toronto, have issued catalogue No. 25 containing over 600 pages, 6 x 9 ins., of machine shop supplies. The A. R. Williams Co., Toronto and Williams & Wilson, Montreal, act as Canadian selling agents for a number of United States and Canadian houses, complete lines for the machine shop being carried in stock. These include bearings, babbitted, roller and ball bearings, pulleys, belts, oil pumps, etc., traps, power plant supplies, drills, die stocks, wrenches, vises, grindstones, toolroom supplies, etc. The catalogue does not attempt to list heavy machinery but small supplies are illustrated and described. Tables of prices are also included.

ELECTRICAL TOOLS—The Dominion Foundry Supply Co., Montreal, as the exclusive Canadian agents for the Cincinnati Electrical Tool Co., are distributing their new catalogue of Peerless portable electrical drills, reamers and grinders.

FOUNDRY EQUIPMENT Catalogue from the Dominion Foundry Supply Co., Montreal, descriptive of the various foundry requisites which they handle. Everything needed in the foundry.

CHUCKS The Skinner Chuck Co., New Britain, Conn., 1909 Price List, 4 x 7½, 48 pages. Lathe, drill and planer chucks, face plate jaws, reamer and assembling stands, and drill press vises. Each different style of chuck is illustrated by use of fine half tone cuts on pure white stock. The company also makes special chucks for holding automobile gears and parts, in addition to chucks shown in price list. This list is sent free to anyone interested.

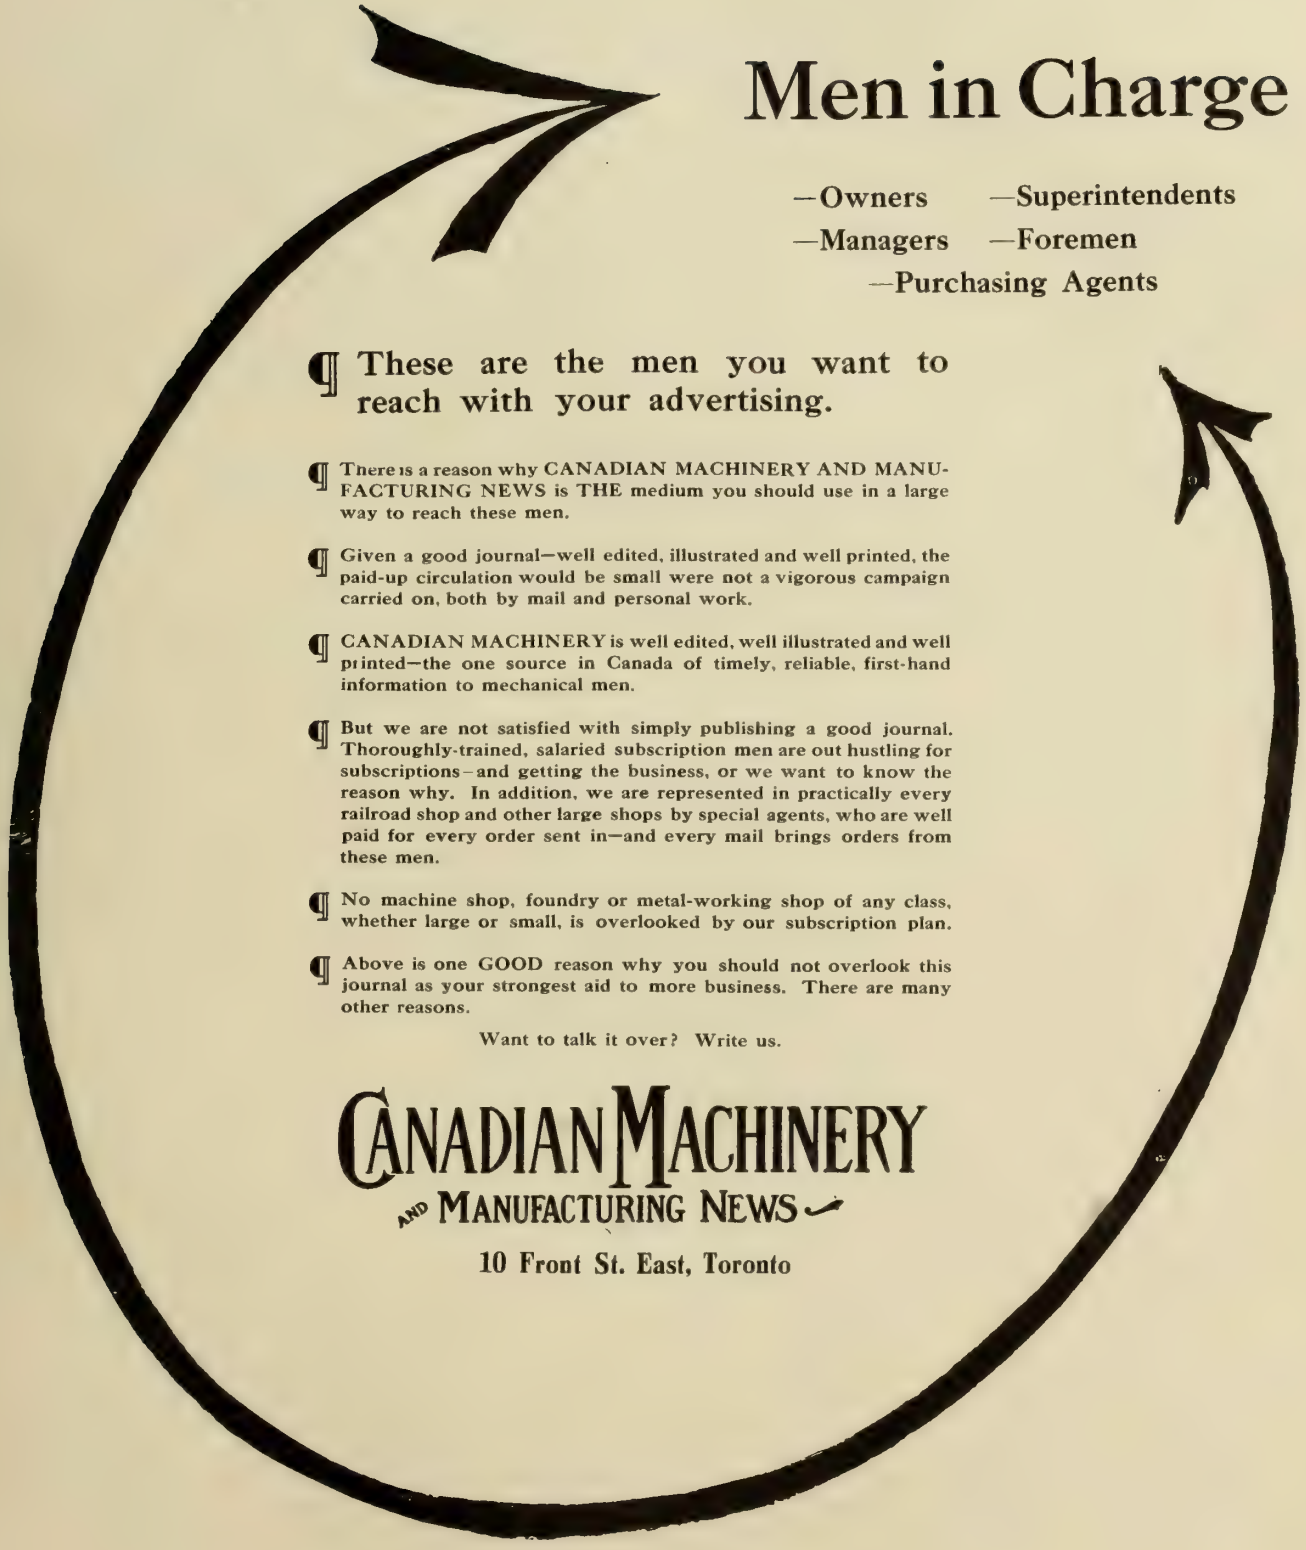
Canadian Machine Tool Markets

METAL MARKETS.

Metal orders have swung in well during the month, and there is a good tone to the markets. But for the fluctuations in the primary markets, quotations would have been very firm with a decided tendency to advance. But weakness in London and New York is bound to affect Canadian prices, no matter how good trade may be, unless of course there is a spot scarcity for a time. The jobbing trade have bought well, although from hand to mouth. All the metal ordered however is used, and the markets are in the strong position of having no stocks to face. The larger metal buying interests have placed some heavy contracts to cover their winter requirements, and those who were short last year are making no mistake this time. This is especially noticeable in imported pig iron.

Inquiries show that much greater interest is being taken in the markets, and there is no doubt that when the primary markets give unmistakable signs of a steady advance that much more business will be done.

Tin has been a good seller all the way along and the jobbing price has ranged between 32c and 33c. A recent break in the English market cut prices ½c. Copper has kept its price very well around 14c. and 14½c. The metal has sold freely and little stocks are held. Unfortunately copper in the primary markets is not so well



Men in Charge

—Owners —Superintendents
—Managers —Foremen
—Purchasing Agents

¶ These are the men you want to reach with your advertising.

¶ There is a reason why CANADIAN MACHINERY AND MANUFACTURING NEWS is THE medium you should use in a large way to reach these men.

¶ Given a good journal—well edited, illustrated and well printed, the paid-up circulation would be small were not a vigorous campaign carried on, both by mail and personal work.

¶ CANADIAN MACHINERY is well edited, well illustrated and well printed—the one source in Canada of timely, reliable, first-hand information to mechanical men.

¶ But we are not satisfied with simply publishing a good journal. Thoroughly-trained, salaried subscription men are out hustling for subscriptions—and getting the business, or we want to know the reason why. In addition, we are represented in practically every railroad shop and other large shops by special agents, who are well paid for every order sent in—and every mail brings orders from these men.

¶ No machine shop, foundry or metal-working shop of any class, whether large or small, is overlooked by our subscription plan.

¶ Above is one GOOD reason why you should not overlook this journal as your strongest aid to more business. There are many other reasons.

Want to talk it over? Write us.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

10 Front St. East, Toronto

situated. Vast quantities of the metal is held in warehouses, and may be thrown on the markets at any time. This with record production going on, makes the future of copper not at all reassuring. Spelter is very strong and has maintained an unaltered jobbing price, of $5.75. Spelter has been very firm in London and St. Louis. Supplies are in strong hands, and there is a good demand from the galvanizing trade. Lead has proved weak and suffered one or two small cuts. Imported is selling around $3.45 and Trail at $3.35. The English market has been weak with too much metal in sight. The Canadian demand has shown improvement, but the metal has not been called for so much as the other ones.

Undoubtedly the best progress has been made in iron and steel. Canadian furnaces have been very busy, and prices have been stiff all the month. The conditions across the border help the local markets. Production and consumption steadily increase in the States. Pig iron has advanced, while consumers find it more difficult to get satisfactory deliveries. As scrap is firmly held and raw material advancing, prices for finished steel products will probably go higher.

F. J. A.

WINNIPEG.

The market continues strong for almost every kind of heavy machine tools. There is little activity in wood working tools or the smaller machine shop lines, but in other lines such as are used in power works and every kind of construction the trade is heavy. The railways are using much heavy machinery in railway construction. The demand for hoisting cranes and stationary hoisting engines and boilers is increasing for railway, bridge and all building work. Local machine men are of the opinion that manufacturers are gradually turning their attention toward Winnipeg and when much of the heavy work is over and cheaper power available, the field for every class of machine tool consumption will be unlimited. The prices at which power will be available in this city in a few months will be an incentive to every eastern manufacturer to open plants in this territory. The Stuart Machinery Co., of this city, have recently received the contract to supply about $75,000 worth of power machinery to the McArthur Bldg. here for lighting, heating, elevator power and ventilation. This is only one instance of how things are moving in a large scale.

Winnipeg citizens were somewhat agitated a few weeks ago over some statements that had been published in Kingston regarding this city as a manufacturing centre. The statements in part were these: "Winnipeg is in my opinion the most parasitic city on the continent. It exists in virtue of its power of taking toll on the incoming settler and his outgoing grain. It has no manufactures. The power to take toll depends on possessing a stand and its fortunes are inland and, therefore, to a certain extent unrealized."

The writer of these words received a volley of strong contradiction from the local press in all due promptness. No doubt the statistical matter which was furnished on this occasion by way of retaliation was quite a revelation to the one who began the inquiry as it was to many of the local business men including prominent manufacturers. It was clearly set forth that at the time the last census was gathered in 1906, Winnipeg was the fourth largest manufacturing centre in Canada, having an output of $18,983,290 for that year. It ranked next to Hamilton, with Montreal and Toronto respectively in the lead. In the following year, 1907, it was estimated locally that the output from Winnipeg would be approximately $25,000,000 and if the present rate of increase is maintained, the indications are that in 1911 when the next census is gathered Winnipeg will have passed Hamilton and to have moved up to third place.

Farquhar Robertson, president of the Montreal Board of Trade, who has just returned from an extensive trip through the west, is of the opinion that the members of the Montreal Board of Trade and Chamber of Commerce should make a tour of the Canadian west so as to learn the heritage Canada possesses in great markets for eastern manufacturers.

Tenders for the electrical machinery for the city's power plant at Point Du Bois were accepted at a special meeting of the city council a few days ago. They reach a total of $425,000.

The tenders were received some days ago and were referred to the board of consulting engineers, consisting of Prof. I. A. Herdt and Wm. Kennedy, of Montreal, and the city engineer, Col. H. N. Ruttan.

The following were recommended for acceptance:

"Section 5 and 6—Turbines, Jens Orten Boving & Co., London, England, $97,150 (includes $11,000 for erection.) Sections 7 and 8—Generators and exciters, Vickers, Sons & Maxim, Ltd., Sheffield, England, $93,080. (This price includes erection.) Sections 10, 11 and 23—Transformers, switching and protective apparatus: Canadian Westinghouse Co., Ltd., Hamilton, Ont., $150,000 (including spare parts.) Section 12—Light, heat and power system, generating station: Canadian General Electric Co., Toronto, $11,600. Section 25—Traveling cranes: Canadian Fairbanks Co., Ltd., Winnipeg (Niles-Bement-Pond Co.), $14,960 (including estimated cost of erection.) Section 27—Auxiliary apparatus: Canada Foundry Co., Ltd., Toronto, $27,520. Canadian Fairbanks Co., Ltd., $6,901. Allowance for contingencies and spare parts, about $20,049. Total cost, $225,000. Recommended tenders and estimates of the report of the board of consulting engineers, October 28, 1907, $582,480.

The Dominion Bridge Co., Montreal and Winnipeg, is being rushed to its utmost capacity to supply steel for the vast amount of work which they have on hand. The orders and contracts now in hand at the Winnipeg office call for over $20,000 worth of structural steel and the plant is being worked twenty-four hours per day. The magnitude of the company's operations in the west makes it necessary to so improve the local plant so that it will be second to none in Canada in point of equipment and capacity. At the present time an addition, 400 feet in length, is being built, and will be equipped with the heaviest class of steel working machinery.

TORONTO.

"Business has been increasing ever since March." This was the expression of one of the largest dealers in machine tools and was corroborated by all those interviewed. One manufacturer of machine tools pointed to a pile of orders which amounted to $10,000 which had been received in one day. That company was taking on all the good mechanics it could secure. This condition is not local. Foundries, machine tool builders and boiler makers, etc., are feeling the upward trend of trade. While there are a few who have not felt it, they are very few.

Prospects are bright for some large orders of machine tools in the near future. With two transcontinental lines under construction, large repair shops will necessarily have to be built to take care of the rolling stock. Both dealers and manufacturers are looking forward to seeing some up-to-date railway repair shops on both the G.T.P. and C.N.R. systems. There is some talk of a large C.N.R. shop being built in Toronto but Quebec is also after it.

The Ontario manufacturers of power machinery are reaping the benefit of industrial activity in the west. Many cities and towns in the several western provinces, have placed orders for boilers, dynamos, motors, pumps, etc., for municipal power schemes.

There is a heavy demand for leather belting. Prices are practically stationary. The price of rubber belting has taken an upward movement again, crude rubber in New York reaching $2.10, the highest price in the history of crude Para rubber. Lack of supply from Brazil is given as the reason, though there appears to be some market manipulation as well.

MONTREAL.

The feeling among machinery dealers still carries the optimistic tone that characterized our last report from this district. The general conditions of the trade here are very healthy and an increased activity is looked for by the first of the year. The heavy machines, such as planers, large boring mills, etc., are beginning to move in better style, while the demand for prices on the smaller general lines remains about the same. There seems to be quite a lull though in woodworking tools, the demand for these showing some let up in the past month. The lines of machinists' small tools, supplies, etc., are active and the demand is increasing. This is no doubt due to the gradual betterment of business throughout the country. Wherever one goes now is heard the remark that "Now that our record crop has been safely harvested the machinery market will stiffen up." About eighteen or twenty months ago one of our large railways had over two thousand idle cars, at present they are short two hundred or more, one of the best business barometers extant. Now that the majority of manufacturers are running full capacity the demand for machinery will no doubt increase. When a plant has a lot of machines idle there can be but little hope of that one purchasing new tools when there is no work to keep the existing ones busy.

Electrical machinery is enjoying a steadily increasing demand and the number of power development schemes that are contemplated and under way will give additional impetus to the movement in this line.

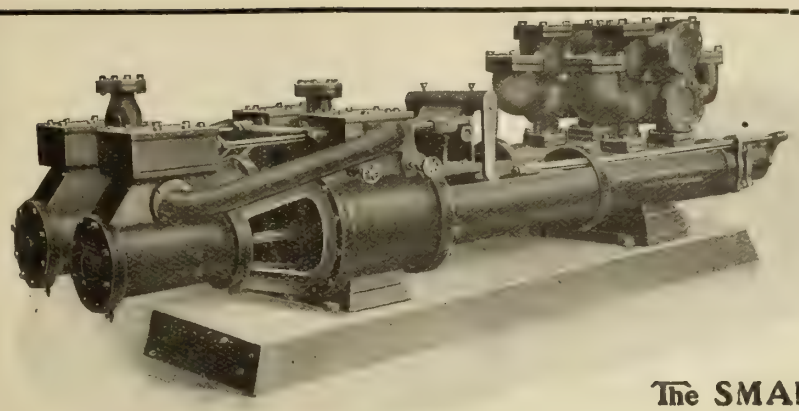
In mechanical rubber goods the basic article—crude rubber—has been enjoying some fireworks as regards prices. At the time of our last report it was quoted at $1.85. It touched the $2 mark and then during the first part of September dropped to $1.50. It is now being quoted at $2.05 to $2.08 (Sept. 25th) and the next move, whether down or up, is in doubt. There is a question as to the real cause of this. Of course the new crop is not in yet and there have been heavy calls on the existing stock but it is rather hard to believe that the erratic movement of the price of crude rubber is due to supply and demand entirely. It looks very much as though there is a good deal of reckless speculation going on. It is also hard to believe that manufacturers are buying rubber (which they cannot use until November or December) at as much as 35 to 50 cents per pound more than they might reasonably expect to get it by waiting. This will assuredly result seriously to the rubber industry and the continuance of the present prices will inevitably lead to the closing down of some and the strict curtailment in other factories. It seems as though it would be wise if manufacturers would use just as little rubber as possible for the time being.

Leather belting is still in active demand and the prices remain steady but with more of a tendency to increase than was felt last month.

OZONE WATER PURIFICATION.

Ozone is the best agent for purifying water, because it adds nothing except oxygen, which assists in aeration. An ozonizing plant has recently been installed at Saint Maur, near Paris, where the water of the Marne River was found to contain many disease germs, even after it had passed through sedimentation basins and sand filters. The ozone generators are of the Siemens type and are operated by a high-tension alternating circuit obtained by transforming the current of a 110-volt alternator, which is driven by a 44 horse-power steam engine. The total consumption of energy is 1 kilowatt hour for each 1,200 cubic feet of water, and more than half of the energy is employed in working the compressing pumps. The cost of sterilization is less than 5 cents per thousand cubic feet. The temperature of the water is lowered by the operation, and not a trace of nitrous oxide, chlorine compounds, hydrogen dioxide, or metallic salts due to corrosion of the apparatus can be detected in the sterilized water. Of the ozone absorbed, 73 per cent. is consumed immediately in sterilization, 7 per cent. remains diffused through the water and exerts a subsequent sterilizing effect, and 20 per cent. escapes into the atmosphere.—Scientific American.

Observations made in deep mines and artesian wells show that it gets about 1 degree hotter for about every 50 feet of descent. This increase is not regular, probably because different rocks conduct heat differently. In England the increase is 1 degree for 30 feet, but all over the globe where observations have been made the average is about 1 degree hotter for about 50 feet.



Steam and Power Pumps
Condensers

Travelling Cranes, Etc.

DROP US A LINE IF YOU REQUIRE ANY SUCH MACHINERY

The SMART-TURNER MACHINE CO., Ltd.
HAMILTON, :: ONTARIO

It is not possible for you to get a better quality of **High-Speed Steel** or **High-Speed Drill** than

BEARDSHAW'S "CONQUEROR" BRAND

And don't forget **our prices are in your favor.**

Alexander Gibb, - 13 St. John St., Montreal
GENERAL SALES AGENT.

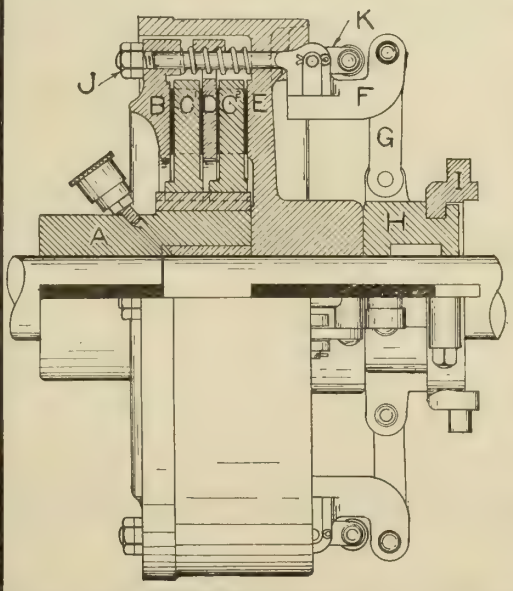
A good stoker or furnace poorly set is of less value than a poor stoker or furnace well set. Good installation of furnace equipment is necessary for smoke prevention.

The man who gets no time to read the journals devoted to the interests of his line of business need not be surprised at being left behind in the progress of industrial revival. The news of the special branch of industry in which one is engaged in these days of fierce competition is just as necessary a part of business life as is the daily paper to the man who would know what the world is doing in civil and political ways.

To Whom it May Concern

The Franklin Manufacturing Company of Syracuse, N.Y., have recently cancelled their contract with the Special Machinery Manufacturing Company, Limited, of Montreal, Canada, by which the latter firm has been acting as their sales agents for Die-Castings in Canada. In the future all matters pertaining to the sale of their Die-Castings will be handled by the main office of the Franklin Company at Syracuse, N.Y.

THE IDEAL CLUTCH



IS THE CLUTCH THAT GRIPS

Because it has Large Friction Surfaces and Powerful Lever Movements for size of clutch. Our Friction Clutch is made solid and split. It is also perfectly safe when out of gear, as it cannot start unexpectedly.

We make also a Hub Clutch especially for Counter Shafts or Gas Engines.

Write for full information and prices.

"MORSE" DRILLS

HAVE THEIR ADVANTAGES

They were first in the Market.

They are all that years of skilled labor combined with the best material can make them.

They are guaranteed against defects.

They are accurate to size.

They are efficient and economical.

They are made in many different styles and for many different purposes.

If these features appeal to you they can be obtained from all the principal dealers in the country.

They are made at New Bedford, Massachusetts.

Every user of tools should look for the name

"MORSE"

Makers of Drills, Reamers, Cutters, Chucks, Taps, Dies, Arbors, Counterbores, Countersinks, Gauges, Machines, Mandrels, Mills, Screw Plates, Sleeves, Sockets, Taper Pins and Wrenches.

Morse Twist Drill & Machine Co.

New Bedford, Mass., U.S.A.

Our goods are handled by Rice Lewis & Son, Limited, Toronto. Aikenhead Hardware Co., Limited, Toronto. Frothingham & Workman, Montreal. Mechanics Supply Co., Quebec.

CANADIAN MACHINERY BUYERS' DIRECTORY

To Our Readers—Use this directory when seeking to buy any machinery or power equipment. You will often get information that will save you money.

To Our Advertisers—Send in your name for insertion under the heading of the lines you make or sell.

To Non-Advertisers—A nominal rate of $1 per line a year is charged non-advertisers.

AWARDED
THE
GRAND PRIZE
AT THE
ALASKA-YUKON-PACIFIC EXPOSITION
SEATTLE, WASHINGTON

The fact that this Company was the ONLY one to receive the Grand Prize in these lines, although the largest makers of Machine Knives, Hack Saws, etc., on the continent were exhibiting, should be remembered the next time you are in the market for Hack Saws, etc. This award bears out our motto :—

"Simonds Saws are the Best."

THEY COST NO MORE
THAN INFERIOR MAKES
AND LAST MUCH LONGER.

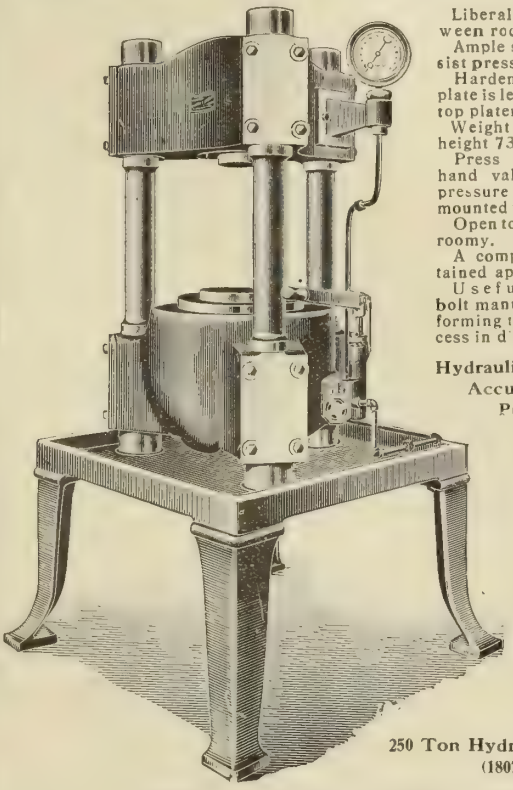
MONTREAL - - CANADA

Main Office and Works; COLUMBUS, OHIO

FOR HUBBING DIES OR EMBOSSING METALS



Liberal opening between rods 19¼ ins.
Ample strength to resist pressure.
Hardened tool steel plate is let into center of top platen.
Weight 4,060 pounds, height 73 ins.
Press hand pump, hand valve, tank and pressure gauge all mounted together.
Open to light and very roomy.
A compact, self-contained apparatus.
Useful to carriage bolt manufacturers for forming the square recess in dies.

The Operator Cannot Become Confused

When Changing Spindle Speeds On

B. & S. Constant Speed Drive Milling Machines

because a direct reading index plate plainly indicates how to manipulate the two levers and index knob in order to obtain any speed. There are no combinations of letters to figure out and the terms "right" and "left" are intuitively understood.

EXAMPLE: Wanted spindle speed of 116 R.P.M.

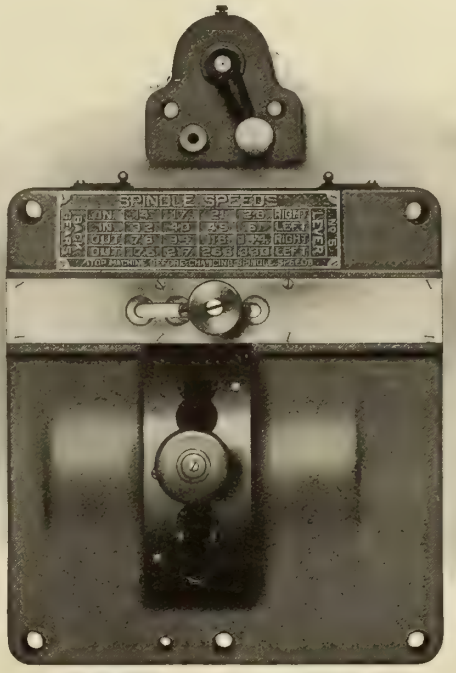
Throw back gear out, if necessary.

Turn upper lever to right, if necessary.

Drop tumbler gear lever (lowest lever in cut) to lowest position.

Slide index knob along until under column containing the desired speed.

Raise tumbler gear as far as it will go, when the tumbler gear will engage the proper gear. As soon as the lever is released it locks itself by sliding into a machined recess.



Send for our new booklet entitled, "Features of the Original Constant Speed Drive Milling Machine."

Machinery Wanted and For Sale

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

AGENTS WANTED.

TO MACHINE TOOL AGENTS — DRILLING Machines — British firm, specialising entirely upon manufacture of Drilling and Boring Machines of highest class for high speed duty, is open to appoint sole agent for Canada. Agents of good standing, preferably having showrooms, are invited to correspond. Must be sound salesman, able to sell profit-making tools on their merits as higher productivity machines, as being best class and superior materials they cannot be sold purely on price. Address to William Asquith, Ltd., Machine Tool Makers, Halifax, England. (8)

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

WANTED PATENTED ARTICLES

WHICH can be used in machine shop, boiler room or engine room. Must have merit. We possess finest facilities for marketing, having a large force of traveling men in this country, and agents in nearly every large city in Europe, who call upon steam users and machine shops. Liberal contract. Highest references. Address Power Specialty Co., 236-P Fort St. W., Detroit, Mich. (10y)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

MACHINERY FOR SALE.

ONE 2nd-hand 60-lb. spring hammer. 1 24" x 24" x 7' 2nd-hand iron planer. Address J. D. Anderson, Box 203, Windsor, Ont. (8)

FOR SALE AT A BARGAIN — An absolutely new Borden Power Pipe Threading Machine (3,000 lbs.), equipped with adjustable die head. Threads 1" to 4" pipe; three step cone and countershaft; back geared; six speeds; Rotary Brown & Sharpe oil pump; write for further particulars. Borden-Canadian Co., 66 Richmond St. East, Toronto. (9)

FOR SALE—New and second hand Curtis Multiple Spindle Automatic Screw Machines, covered by United States patent Nov. 4, 1902; Canadian patent Jan. 20, 1903; English patent Feb. 26, 1903, and Belgium patent No 167791. The John Morrow Screw, Limited, Ingersoll, Ont. (12)

A BARGAIN in a 22" Potter and Johns on Turret Lathe, slightly used, may be had if ordered at once. Address Kellogg & Co., Toronto.

ONE 5 h.p. Cook vertical gasoline engine, double ignition, complete with tank, skids, and all accessories. A new engine at a bargain for quick sale. Kellogg & Co., 196 King St. West, Toronto.

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

PATENTS.

THE PROPRIETOR of the Canadian Patent No. 83902 "Improvements in camdises for operating the exhaust valve in four-stroke combustion engines," is desirous of entering into arrangements, by way of license or otherwise, for practically working the patent. For particulars apply to "Reversator," care of S. Gumaelii, Annoncebureau, Stockholm, Sweden. (10)

POSITION WANTED.

YOUNG (Scotch) Engineer seeks position in drafting or commercial office of engineering firm. Mechanical and electrical experience. Apply Box 90, CANADIAN MACHINERY, Toronto. (9)

SUPERINTENDENT WANTED.

A PRACTICAL SUPERINTENDENT, experienced in the manufacture of Traction Engines and Threshing Machines, to take charge of plant Apply, stating experience, Box 91, CANADIAN MACHINERY, Toronto. (9)

MISCELLANEOUS.

AN EXTRA 1 PER CENT. PROFIT.—A National Cash Register will earn at least an extra one per cent. profit for any retail merchant. The National Cash Register Co., F. E. Mutton, Canadian Manager, cor. Yonge St. and Wilton Ave., Toronto, Ont

WE HAVE eight rebuilt Visible Oliver Typewriters for sale. The price is $30.00 each, and at that figure they are a bargain and should not be on the market long. Monthly payments can be arranged if desired. The Monarch Typewriter Company, Limited 98 King W., Toronto.

OFFICE FIXTURES, PARTITIONS AND SHOW CASES. Send for illustrated catalogue. Jones Bros. & Co., Limited, 30-32 Adelaide St. W., Toronto, Ont.

THOUSANDS OF DOLLARS go astray in the mails every year. YOU should therefore insure against a possible loss by sending YOUR remittances by Dominion Express Company Money Orders and Foreign Drafts. If delayed, lost or stolen, a refund will be promptly arranged or a new Money Order issued without further charge. The Dominion Express Company also transfers money by telegraph and cable and buys and sells foreign money. If you want to send money to any part of the world the Dominion Express Company will be pleased to accommodate you. Hundreds of agencies throughout Canada.

SIR GILBERT PARKER is to the fore again with his latest book entitled "Northern Lights." It pictures the life of that portion of our country upon which all eyes are now turned. The stories portray conditions in the Great West before and after the effects of modern civilization, and treat the subject with a master-hand. For sale at all bookstores. Cloth bound, illustrated, $1.50. The Copp, Clark Co., Limited, Publishers, Toronto. (t)

CASH AND PACKAGE CARRIERS, 20 years' experience inventing and building modern store service appliances. Our guarantee.—We will instal a system of our Carriers in your store; you use them ten days, and if you do not find that they give you better and quicker service than any other Wire Carriers, Pneumatic Tubes, Cable Carriers, or Cash Registers, we will remove them at our expense. Write for catalogue and testimonials from reliable houses using our Carriers. The Gipe Carrier Co., 99 Ontario St., Toronto, Canada. (tf)

JUST NOW we are holding a special sale of second-hand typewriters. All makes are represented—Underwood, Remingtons, Olivers, Empires, Smith Premiers, etc. They have been carefully rebuilt and are in good workable, wearable condition. The Monarch Typewriter Company, Limited, 98 King St. W., Toronto, Ont.

MISCELLANEOUS.

YOUR CHEQUE CAN'T BE RAISED to any amount above that which you intend it to cover if you use the PROTECTOGRAPH. This device stamps a line such as "Not over ten dollars, $10," with acid proof, indelible ink, which penetrates right through the fibre of the paper. This device is being used by 90% of the Banks of Canada and the United States, as well as the treasuries of both countries. Write for full particulars and price. W. E. Parker & Co., Sole Canadian Agents, 37 Yonge Arcade, Toronto, Ontario.

PEERLESS CARBON PAPERS and TYPEWRITER RIBBONS are unequalled in writing, manifolding and wearing qualities. Our "Klear Kopy" Carbon was awarded a contract over 43 competing lines by one of the world's largest governments. All up-to-date dealers in stationery, typewriters and office supplies handle our goods. Ask them or write us direct for prices and samples. Peerless Carbon & Ribbon Manufacturing Co., Toronto, Canada.

TAYLOR-FORBES COMPANY, LIMITED. Head Office, Works and Foundries, Guelph. Largest manufacturers of hardware in Canada. (tf)

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling, and greatly facilitates the loading of cars, drays, etc., and for handling goods in and about the warehouse and factory reduces the cost of labor because far less warehouse help is required. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley St., Toronto. (tf)

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employe's time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Limited. Office and factory, 27 Alice Street, Toronto. (tf)

ELLIOTT-FISHER STANDARD Writing-Adding Machines make toil easier. Elliott-Fisher Limited, 513, No. 83, Craig Street W., Montreal, and 129 Bay Street, Toronto.

THOUSANDS OF DOLLARS go astray in the mails every year. YOU should therefore insure against possible loss by sending YOUR remittances by Dominion Express Company money orders and Foreign Drafts. NO FOUNDRY CAN MAKE GOOD WITH POOR CASTINGS.

The advantages in the use of STEVENS' GENUINE EAST INDIA PLUMBAGO are all the possible advantages that come from the use of the very best facing known to Foundry Practice.

The price is never above the quality, and quality means saving all around—in time in finishing and dressing the mold—the casting coming out so clean that the cost of chipping and cleaning is saved, and so it goes right on towards pocket-book popularity.

The element of quality permeates everything I manufacture, and I manufacture FOUNDRY FACINGS and SUPPLIES, POLISHERS' COMPOSITIONS and PLATERS' SUPPLIES.

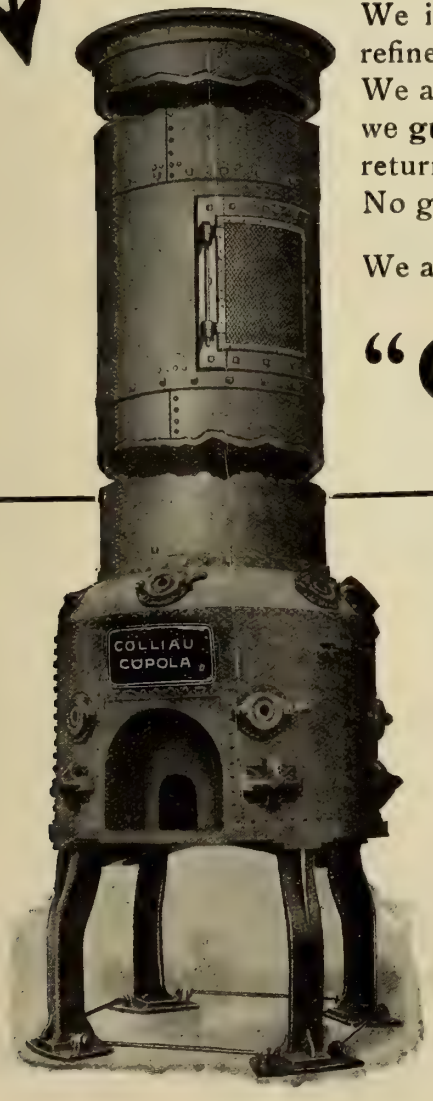
Everything for the Foundry from a Dust Bag to a Cupola

That's a large order to be sure—**but we can fill it all the same.** Our range includes every appliance used in modern foundry practice. We can fully equip a foundry from top to bottom, inside and out. We are the **only** manufacturers in Canada of

Foundry Facings



We import the genuine Ceylon Plumbago in large quantities, refine and grade it by our own specially designed machinery. We are so confident of the superior quality of our facings that we **guarantee** them to give **entire satisfaction** or they may be returned at our expense—**we paying the freight both ways.** No guarantee could be sronger than this!

We are now manufacturing the unbeatable

"Climax" Core Oil

in our Hamilton factory. It is quick drying; relieves freely from the casting; makes no smell; will not draw moisture; will mix from 40 to 75 parts of sand to one of oil according to sand used and strength required. Cores made with "Climax" oil will not break or blow.

WRITE FOR OUR NEW CATALOG

We are quoting interesting prices on Moulding Sand, Fire Brick, Fire Clay, Fire Sand, Cupola Blocks, etc. Write us for quotations on your requirements.

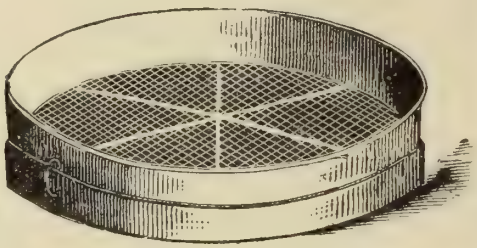
The Monthly Reminder

For Progressive Foundrymen

"IF YOU SEE IT IN 'THE REMINDER' YOU ARE GUARANTEED."



THERE ARE one or two considerations regarding foundry supplies that are important to a Foundryman.

One is **SERVICE.**

Have you ever lost a second or repeat order because you were held up by your supply house and were unable to get the first out on time?

If so, you will appreciate the facilities at the command of THE DOMINION FOUNDRY SUPPLY COMPANY, LTD. which enable them to give up-to-the-minute deliveries.

Another consideration is **QUALITY.**

As to that, our reputation stands behind every article we ship, from a chaplet to a cupola. Our reputation is our business life, and we mean to *stay* alive.

We design foundries. Did you know that?

PLUMBAGO—Our Ceylon Plumbago will surprise you with the smoothness of the casting. A big generous sample sent to any foundry on request.

CORE COMPOUND—We handle "KANTBEBEAT." The name is self-explanatory.

CORE-MAKING MACHINERY—Let us send you Hammer Core Machine on 30 DAYS' FREE TRIAL. If you don't consider it the best ever we will cheerfully take it back.

When in need of supplies write us anyway—just out of curiosity as to our prices. We can at least make "the other fellow" duck, which helps *your* pocket-book.

OUR NEW CATALOGUE OFF THE PRESS SOON—WATCH FOR IT

Pump Repaired with Smooth-on Iron Cement No. 1 six years ago, and still in use.

Write for circular showing how work was done.

SMOOTH-ON IRON CEMENT No. 1

is prepared in powdered form—for use mix with water. It is unequaled for stopping leaks of Steam, Water, Fire or Oil, because it becomes metallic iron that has the same expansion and contraction as iron, thus keeping tight at all temperatures. Engineers and Foundrymen use it where a smooth surface and metal-like hardness are desired.

Sold in Blue Label Cans.

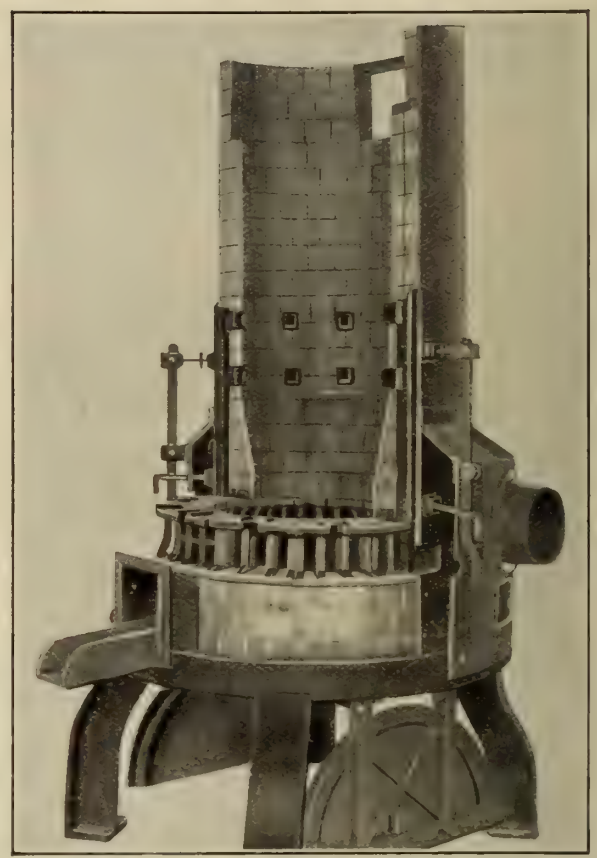
PATENT RIGHTS FOR SALE

THE OPPORTUNITY OF A LIFETIME



We offer the Canadian Patent Rights of the

Knoeppel System of Cupola Twyers

The Principal Features of this Improved System of Cupola Twyers are:

A continuous twyer; large twyer area; maximum air delivery; lower blast velocity; air belt surrounding the back of the twyers; air supply flues above the melting point; adjustment of twyer area; adjustment for small diameters of lining; separate overhang plate; twyers projecting from 2 to 10 inches further into the cupola than any other, delivery of blast nearer the centre; can be applied to any Cupola in use

There is Big Money in this for a Pushful Man

We are also open to consider offers for Shop Rights or Rights to Manufacture and Sell in Canada. Write us about it to-day; to-morrow may be too late.

LOCATE AT

St. Catharines

Ontario - Canada

Power House at Decew Falls of Dominion Power and Transmission Co., Ltd., and Lincoln E. L. and P. Co., Ltd.
2½ miles from St. Catharines, 100,000 H.P.

WHY? BECAUSE—

1. TWENTY-EIGHT PLANTS have located here for good reasons—most of them Metal-working Industries.
2. ELECTRIC POWER is cheaper here—right where it is made—than elsewhere. Less than one-third the cost of steam.
3. WATER SUPPLY is from Lake Erie, with a head of about 200 feet.
4. FREIGHTS are as cheap here as if we had 100 railroads. BESIDES, you can use our port for water shipment to all great lake points and to salt water.
5. LABOR—Good supply of skilled mechanics and laborers. Most workmen own their own homes. They come to stay.
6. SITES are available for YOU to choose from, all good ones, and to be got at figures and terms which are big inducements.
7. INCIDENTALLY—We are one hour (by electric and steam railways) from Niagara Falls and Hamilton.

ALSO—St. Catharines is the market and shipping point for Canada's Greatest Fruit District——

Pattern Making

By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

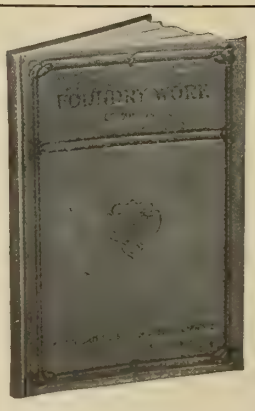
Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, Change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

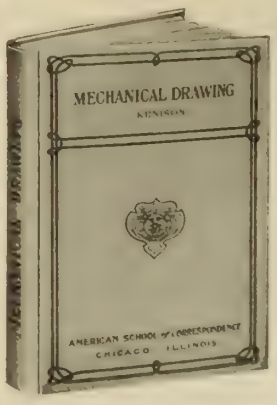
Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology



176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

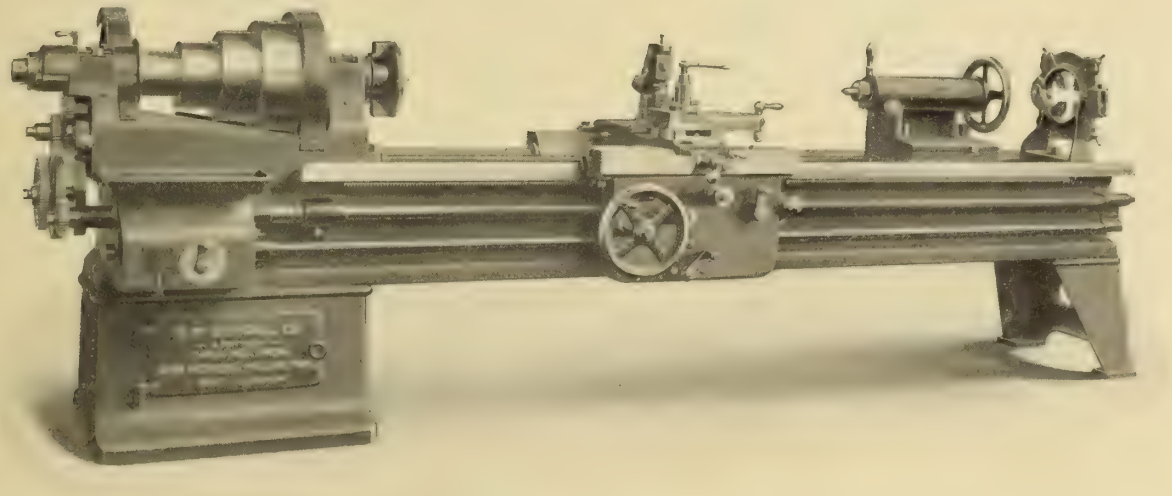
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe Screwing Machines

Comprise Our Whole Line



16, 18, 20, 24″ ENGINE LATHES

- Our machines, as illustrated, are of the most substantial design and workmanship and materials are the very best obtainable. They embody every modern improvement and the course of manufacture and inspection make for absolute accuracy.
- On all lathes 3 changes of feeds are instantly obtainable by the movement of one lever.
- Feeds are 1¼, 2½ and 5 times any thread which the machine may be geared to.
- Lathes are built with 4 step cones for single back gears.
  3 step cones for double back gears.
- Quick change gears, taper attachment, etc., readily attached.
- We invite comparison in design, quality and finish with the best foreign tools.
- Lathes are also made with gap beds in any length.

Write us for full particulars.

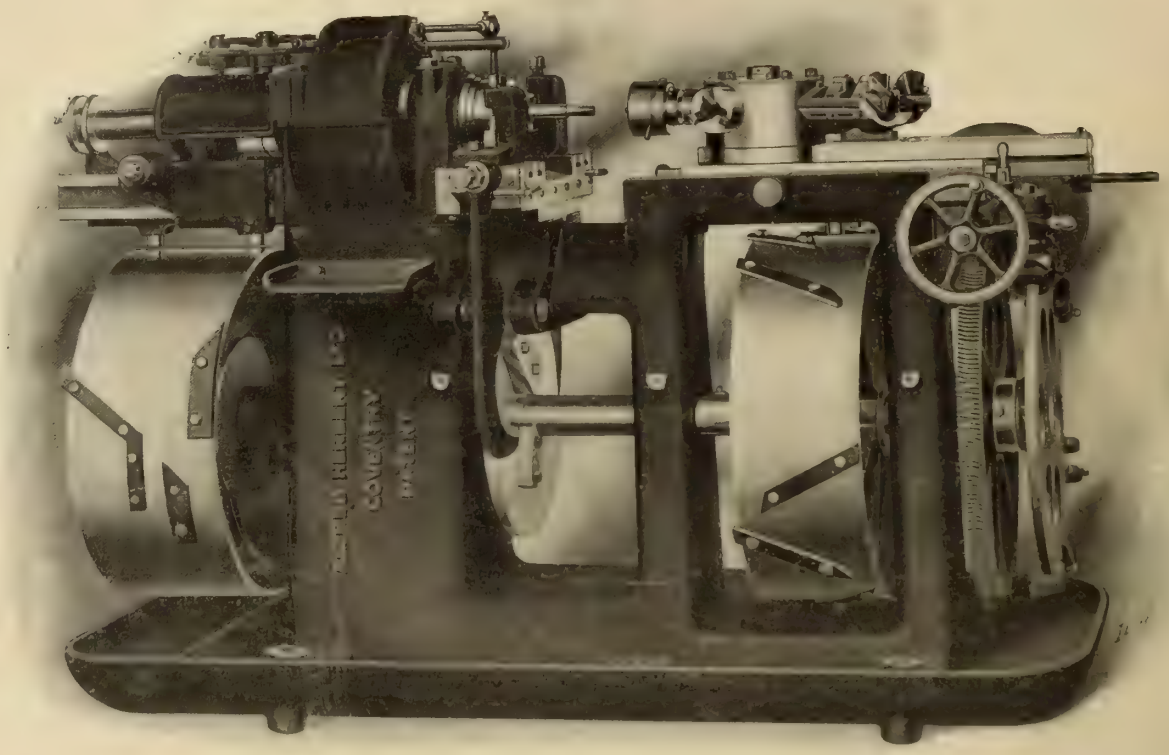
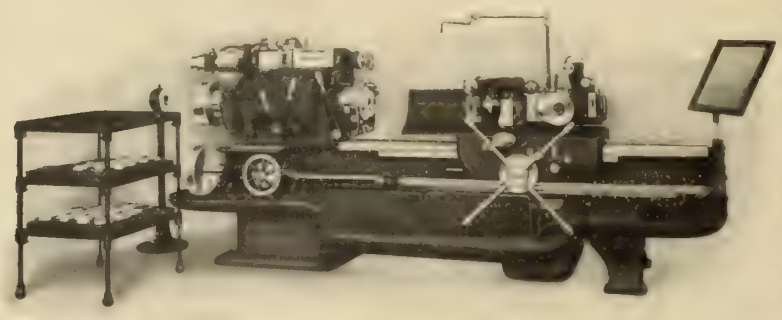
GALT, CANADA

AUTOMATIC SCREW MACHINE

Made by Alfred Herbert Ltd., Coventry, England



These machines are made in 11 different sizes dealing with bars from 3-4 to 3 1-2, and are amongst the new machines installed in the Intercolonial Railway Shops at Moncton, N.B. They are also installed in the C.P.R. Angus Shops, C.P.R. Shops, Winnipeg, Canadian Northern Shops, Winnipeg, and many other smaller factories. The main frame is a rigid hollow casting which carries all the working parts of the machine.



CAPSTAN LATHES, HEXAGON TURRET LATHES and COMBINATION TURRET LATHES. manufactured in practically all sizes and to take bars from 9-16" to 5 3-4". These machines are especially suitable for locomotive building and repair shops and are in use all over the world.

The 1909 design incorporates many new and valuable features which greatly increase the quantity and quality of the work produced. Descriptive matter free upon request.

We also carry a complete line of machine tools of every description aud can give prompt shipment on any class of machinery required.

We also carry a complete line of ***high speed steel*** and steel for all purposes. Likewise a special ***high speed twisted drill*** which is made from special registered section steel of new composition, which we guarantee to give equal if not better results than any drill on the market to-day. Enquiries solicited.

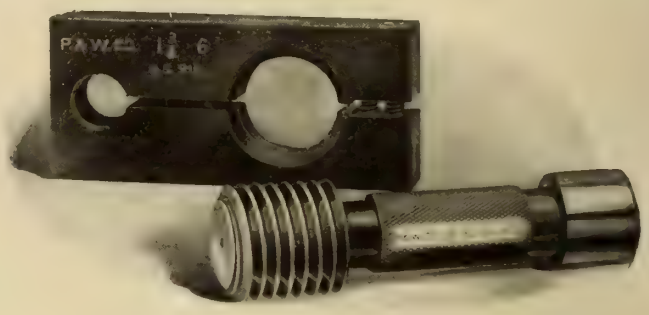
Gauges and Standards

Send for new catalog, "Gauges and Standards," now ready,

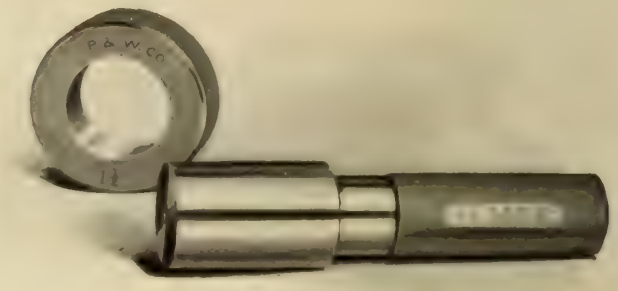
describing in detail thread gauges, plug and templet gauges, snap gauges, pipe thread gauges, taper gauges, end gauges, limit gauges, decimal gauges, star gauges, standard measuring machines, etc., etc.

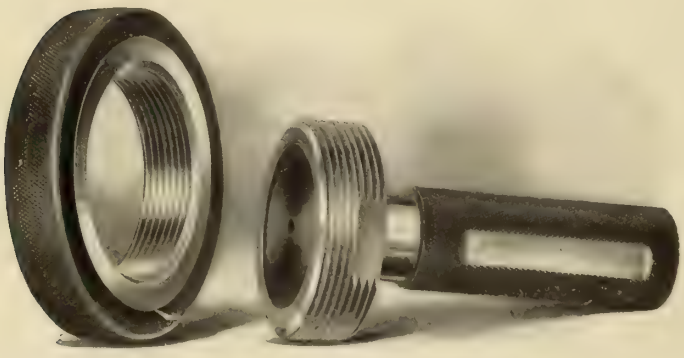
P. & W. External and Internal Thread Gauges are made in the following standards: U. S., International, French, Whitworth, British Association, Acme, A. S. M. E., P. & W. "V" Thread, A. L. A. M., etc.



P. & W. Snap Gauges in sets, varying by sixteenths, from $\frac{1}{4}$ to 4 in. This type of gauge occupies a very prominent place in works of manufacturers who are desirous of maintaining a standard of interchangeability in their product.

P. & W. Standard Cylindrical Size Gauges, Plug and Templet, in British or metric standards, in sets varying by any subdivision of an inch or corresponding size.





P. & W. Brigg's Standard Pipe Thread Gauges for pipes and fittings. These gauges come in sets from $\frac{1}{8}$ to 12 in. in different variations.

Right and Left Hand Gauges manufactured in all standard threads.

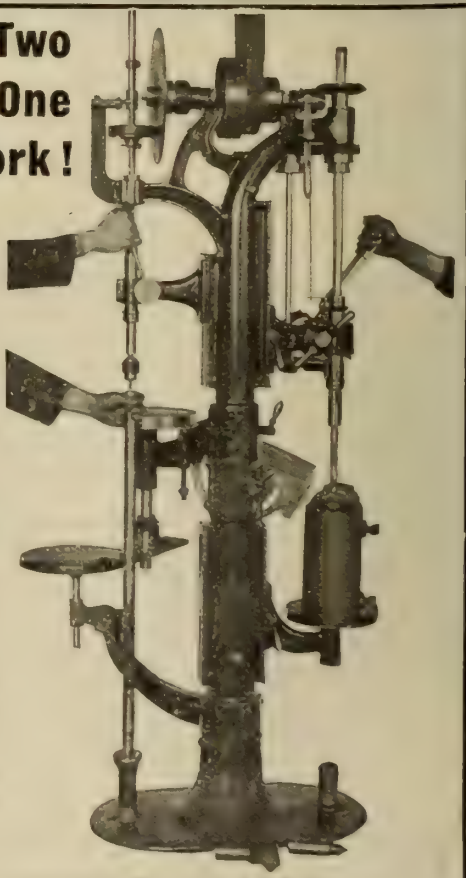
To Use Having Two Machines When One Will Do the Work!



An ingenious and high-grade machine.

Both sides independent.

One side, sensitive drill with variable speed friction drive. Capacity up to 7/16 inch.

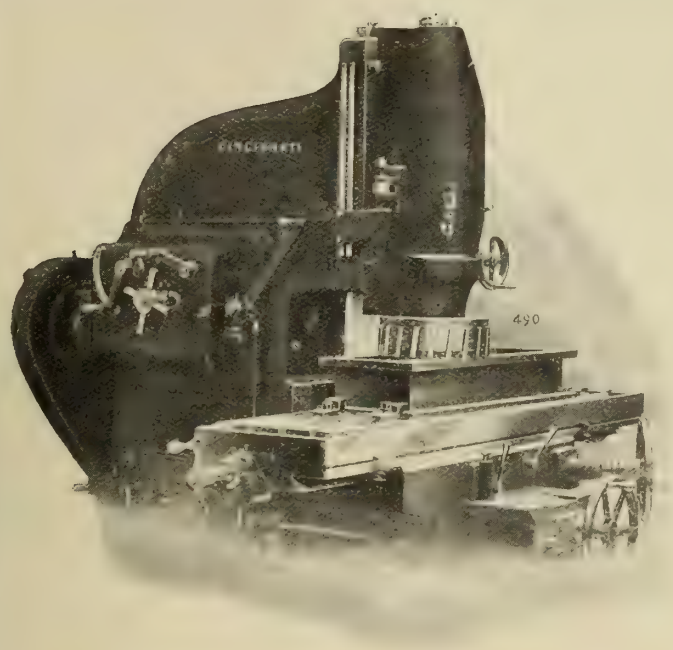
Other side regular power or hand feed drill. Capacity up to 1 inch.

Removable seat to be used on either side if desired.

Knee feed drill, sensitive drill, manufacturer's drill. It's all there.

Look at illustration and write us for more information.

LAPOINTE MACHINE TOOL CO. - HUDSON, MASS.



High Power Verticals

Their unusual rigidity enables them to finish, at fast feeds, product of unexcelled accuracy. The pieces shown are 12" x 36"—finished surface 2" wide, gray iron.

FIRST METHOD

Cutter 12" diameter takes roughing cut, then feed is reversed and finishing cut .010" deep is taken at 20" feed. Two pieces laid together show less than (.00025") one-quarter thousandth inch "out" in their length.

SECOND METHOD

A cutter 4" diameter finishes the same pieces, using cross and table feeds alternately, at 20" per minute. When laid together they show less than (.001") one thousandth inch "out" anywhere on their surface.

This is everyday commercial milling. A less rigid machine could not possibly produce this accuracy nor do the work this fast.

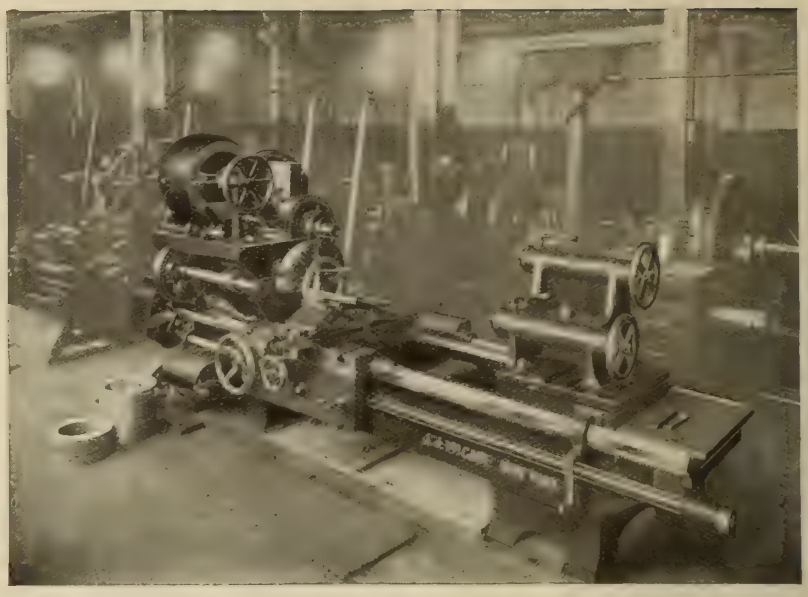
One in 63-

63 Lathe builders in this country---"authority" says so

For doing more than any other large Lathe will do, large and small work, McCabe is building the one lathe in the field for Railroad and other Repair Shops--McCabe's "2-in-one" DOUBLE-SPINDLE LATHE. Hundreds of shops using the Lathe is the "authority" that says so.

The constant working of a Lathe--the doing of double the work, brings its own recompense, It can't quit being a busy Lathe, because when you are through as a 48-inch, you have a 26-inch.



Doing small work on the 26 inch swing of McCabe's "2-in-1" Double Spindle Lathe. 26-48 inch swing.

Its capacity at once suggests the expensive, but it is a great deal less expensive than the regular big Lathe.

Time for a "showdown"--get the book.

J. J. McCABE

"The Double-Spindle Lathe Man."

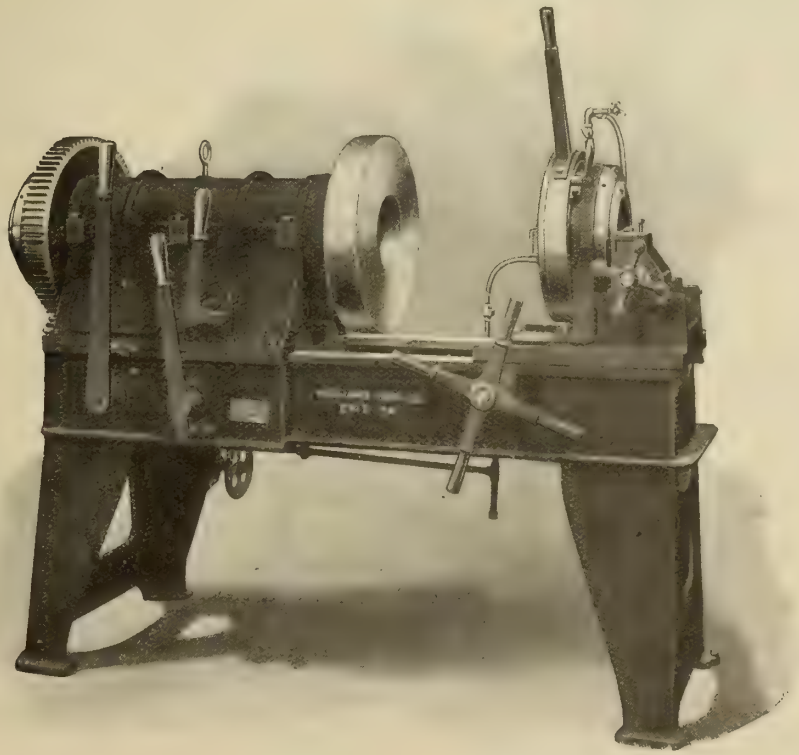
Williams Pipe Machine



Capacity for threading and cutting pipe $1\frac{1}{2}''$ to 6″ and bolts $\frac{3}{8}''$ to 2″.

We make five other sizes with capacities from $\frac{1}{8}''$ to 12″ pipe.

The Williams line of pipe machines is the natural outgrowth of 35 years' experience in designing and building pipe-threading machinery.

For efficiency, steady service and reasonable cost the Williams Pipe Machine is the best on the market.

Prices and complete details for the asking.

The Williams Tool Co.

Box 18, Erie, Pa. U.S.A.

The Patent "Dreadnought" Milling File

will make a surface on Steel, Brass or anything, that it looks as if it were burnished, after cutting so rapidly that it will astonish you, on Steel or Cast Iron, and then again on Brass or Bronze, without apparent loss of cutting power. This will make you think. It made the British Government Think. It made the Krupp Co. Think. Made them think that it would pay to use the Dreadnought in every department, and now that they are using them extensively, their "think" has turned to a certainty "that it does pay them to use the Dreadnought." And in our own Canada they are rapidly being adopted by the largest consumers.

JUST THINK--This file *can be re-sharpened many times* without drawing the temper, thus making it **"absolutely the cheapest file that can be procured anywhere."**

JUST THINK—If you try a sample order and are not perfectly satisfied you may return the goods. We want your business and are determined to satisfy you, if you but give us a chance.

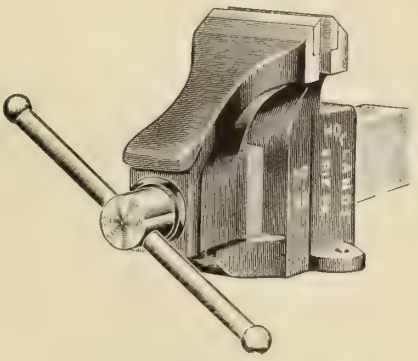
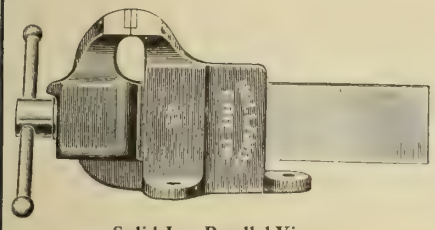
Combination Pipe Vise

Pipe Cutter

Our vises and tools are the product of twenty years' experience and are in use in many of the largest industrial and railway shops in the United States and Canada.

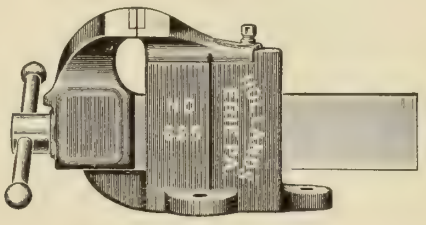


Woodworkers' Offset Jaw Vise



Solid Jaw Parallel Vise

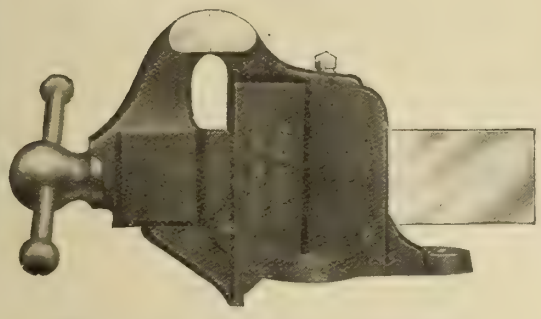
All our vises have cold rolled steel screws with electric welded steel heads. Practical tests have proved the superiority of this make of screw over the old method of using a cast iron head. : : :



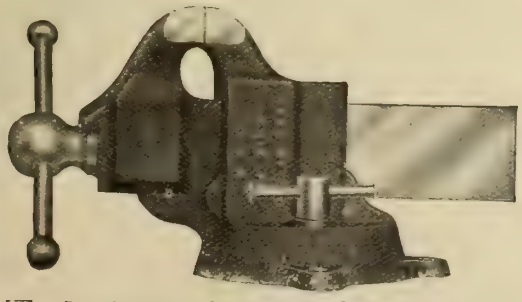
Swivel Jaw Vise

Hollands Manufacturing Co. - - - Erie, Pa.

REED SEVERE SERVICE VISES



Swivel Jaw Stationary Base type



Stationary Jaw Swivel Base type

We developed the design for our Vises by deliberately breaking them to see where they were weak and then strengthening them at these points. As a result we have Vises which will stand up under the roughest kind of usage and the heaviest kind of work. Then, too, they are made with such a degree of care and attention that they are adapted to the finest kind of work as well.

Every part of every tool which we make is rigidly inspected before it goes into the finished tool, to be sure that every tool which goes into our stock room is right in every little detail and point.

We make Swivel Jaw Vises of the type shown here, and also make Stationary and Swivel Jaw, Filers' and Woodworkers' Vises. We make, too, a large line of Stocks and Dies, Pipe Vises and Pipe Cutters.

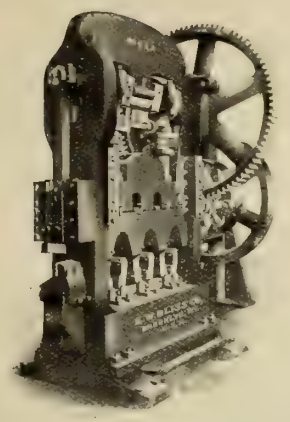
The Skinner Chuck Co.

112 N. Stanley St. - - - New Britain, Conn.



"BLISS"

DOUBLE CRANK FORGING PRESSES

These presses are for the manufacture of hammers, axes, pick-axes, adzes, mattocks hoes, etc. A series of dies are set side by side, and the article is forged in one or several heats by passing it from die to die. The slide can be quickly and accurately raised and lowered by means of an adjustment which is arranged to operate both crank connections simultaneously.

PICK-EYE FORGING PRESS, No. 6½ A, illustrated, is provided with three forged steel die carriers, having automatic side action so as to hold and shape the stock on the outside, while the eye is being prepared or punched. The rate of speed is about 50 strokes per minute. The average iron pick-eye may be punched and shaped in 2 strokes, a solid tool-steel pick-eye in 3 or 4 strokes, and a hatchet eye in 2 or 3 strokes. In most cases it is necessary to leave more or less "flash" or "fin," which must be removed after the forging. The shear attached to the outside of the left housing is used for cutting off the stock after or before the forging. The machine is so arranged that the dies and punches can be cheaply made and easily exchanged, without any special skill in the adjusting. Weight, 36,000 lbs

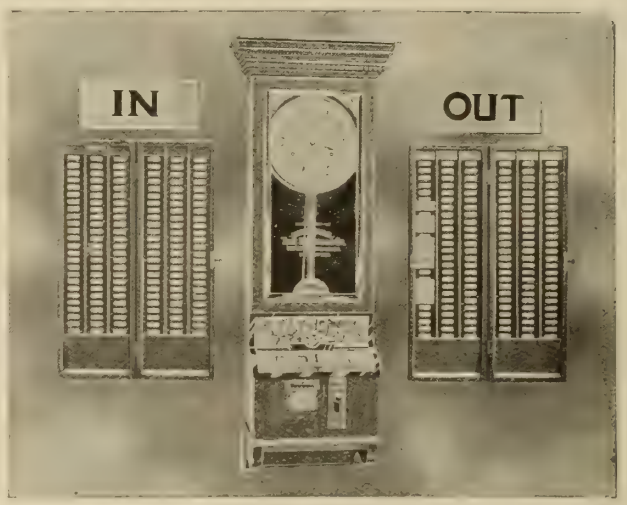
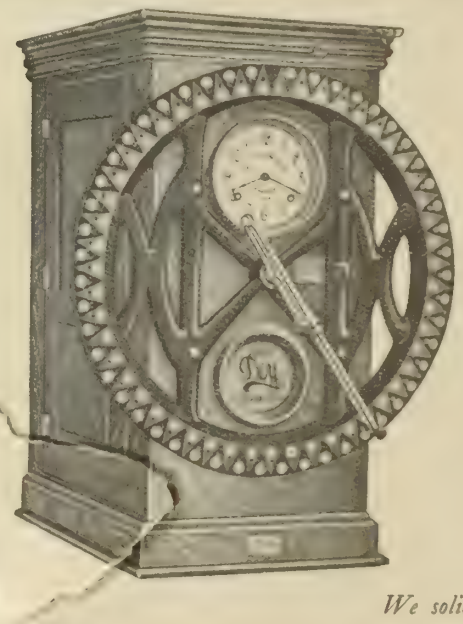
LABOR TIME RECORDING

The chief item in the expense account of the average business concern is the cost of labor. Labor cost represents Time for which the employer pays Money. It naturally follows that an efficient system of checking the time given by employees in exchange for their employers' money is essential to the proper conduct of business. No system that is in the least dependent for its operation upon the honesty or energy of a clerk will give very satisfactory results. A clerk is only human. He has his likes and dislikes; his fits of laziness; of indisposition; of carelessness. The perfect system is the



International Rochester Card Time Recorder

This system is entirely automatic and is the very acme of simplicity. It consists of a clock with a special mechanism, two card racks and sufficient cards of a simple ruling, as shown in the above illustration.



When ringing "in" the employee takes his card (designated by name and number) from the "out" rack, stamps it on the clock, and places it in a corresponding pocket on the "in" rack. On his card the exact time of his arrival—day, hour and minute—has been recorded. He repeats the operation whenever going in or out. At the end of the week your card racks contain an absolutely accurate record of the time worked by every employee. This system cannot err or be manipulated. Its records are absolutely indisputable. Could anything be more satisfactory ?

We are also manufacturers of the well-known

Dey Dial

another entirely automatic time-recording system, manufactured in eighty-eight different styles.

No matter what the nature of your business may be, or how large or small its size, we can supply you with a time-recording system at a fraction of the cost of a human time-keeper and with infinitely better results.

JUST OUT!

The Richmond Self-Opening Die

The most complete die made. Can be used on a Turret Lathe, Drill Press, Bolt Machine or Pipe-Threading Machine, with either the die or work revolving.

Simplest in construction, quickest to adjust, greater range of size, strong and durable.

Specially suited for cutting up to a shoulder. Chasers can be re-hobbed from 10 to 15 times. High-speed Chasers.

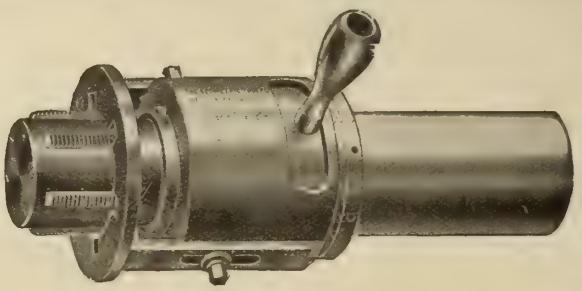
SOMETHING ENTIRELY NEW

THE WORTMAN & WARD CO. LIMITED
LONDON, ONTARIO, CANADA

The user of solid taps is wasting valuable time, which also means a waste of money.



The only way to overcome this is to instal an equipment of the

GEOMETRIC ADJUSTABLE COLLAPSING TAPS

These instantly collapse when the desired depth is reached, and can then be withdrawn without the chasers touching the work, which cuts the time down one-half. This does away with the damage to the threads and breaking of taps so objectionable in backing out solid taps.

The chasers can also be adjusted to tap slightly larger or smaller than the size for which the tap is made.

If you want a saving in your tapping cost, write us for particulars.

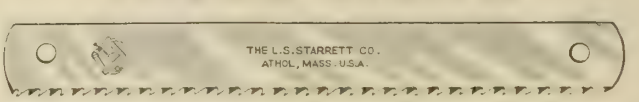
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

HACK SAWS



These blades are made of the finest grade of steel. The teeth are sharp, with square cutting points, and evenly set. They are tempered by our improved process, which leaves them hard and tough, so that they will not "shell off." They are too hard to file. The set of the teeth is just enough to ensure a free, smooth and rapid cut, removing no more stock than is necessary.

FACTORY HEATING AND VENTILATION

BY

The Simplest and Most Economical System Known

The SHELDON FAN SYSTEM

CONSISTING OF

A Pipe Coil Heater, using exhaust or live steam, or both, which can be arranged for gravity return to a boiler located on the same floor.

A Blower, fitted with Sheldon Multivane Runner, which can be operated by any convenient power, most economically by a Direct Connected Engine, the actual operating cost of which amounts to only a small percentage of the heat in the steam passing through the fan engine. the remainder being utilized in the heater, into which the engine exhausts.

Fan, Heater and Engine are centralized in one compact apparatus.

The Fan can be so arranged to take all or any part of its air supply from outside or inside the building, as desired.

The warm air is conveyed through ducts or flues and distributed throughout the entire building.

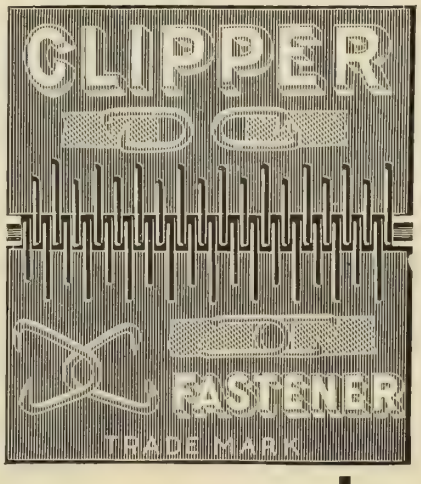
Let us tell you more about it.

SHELDONS LIMITED, :: Galt, Canada

THE

"CLIPPER" BELT LACER

is the simplest belt-lacing outfit, because—



It is not necessary to remove belt from shaft.

Tool holds hooks perfectly while inserting it.

It laces both sides alike.

The hooks are made of special wire, and there is no cutting of the belt half in two as with other makes. The same tool laces any width or thickness equally well.

We invite your investigation of the many special and exclusive features of the CLIPPER BELT LACER. Write for details and prices.

TALK 4

BELTING
vs.
INDIVIDUAL ELECTRIC DRIVES

Group Drive is better than individual drive, because :

1. The capital invested is much less. For instance: In a shop with group drive only one-sixth of the motor power per group of 30 tools was required that would have been necessary had each tool its own motor. A careful study of the operation of a big planer showed that in a job consuming 20 hours the tool was actually cutting during only 3.5 hours. The load required at reverse was 50 horse power, but only 10 h.p. while cutting. This machine individually driven would require at least a 30 h.p. motor, yet the machine actually used only 2 h.p. per hour. It will cost, therefore, for individual motors four or five times as much as to instal group drive with belts.

2. A 30 horse power motor, varying between 10 and 50 h.p., works at a **very low efficiency.** Why pay for this lost efficiency ?

3. Sudden strains are bound to occur. A cutting tool may get jammed, and something has to give. If direct connected to positive drive, the chances are the gears will strip, and zing !—the tool is out of commission a month or more. On a big machine worth $5.00 to $6.00 per hour to the shop, the loss due to this stoppage is of serious proportions. Belts will slip—or at the worst will break. The latter is easily repaired and the loss of time is negligible. It is, therefore, but common sense to interpose a transmission member which will relieve the strain of a sudden shock and is easily repaired. A belt fulfils both these essentials—but get a good belt, even if we don't supply you. Better get our prices, anyway. They are interesting.

Next month: The argument in favor of direct individual driving.

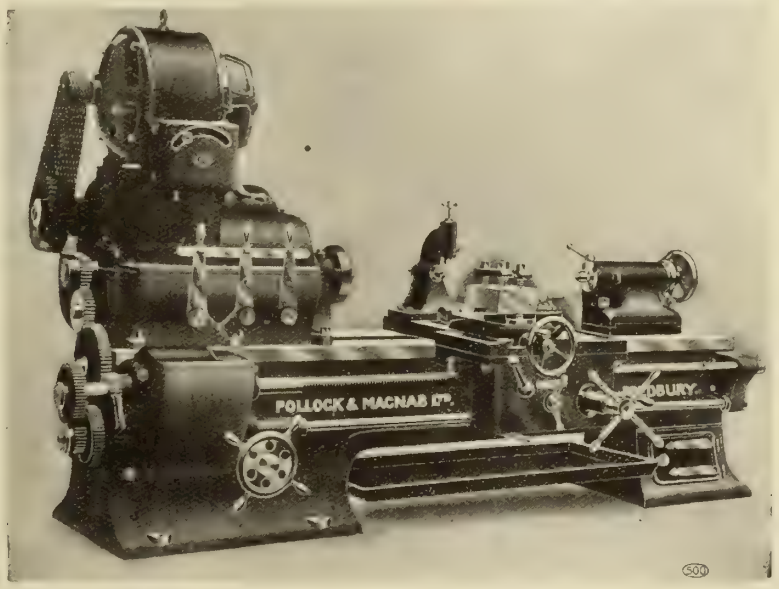
Silent Chain

Will Increase Production



To get the most from Modern Machine Tools and High Speed Steel a positive drive is necessary. If you use belts, just when the heaviest load comes on the belt is apt to slip, thus cutting down output, while with a chain drive and positive feed, larger cuts can be taken, the machine run at a higher speed, and 15 to 20 per cent. more work turned out. The Chain is more satisfactory than gears, as the load is distributed over a number of teeth, is silent, gives a smooth, steady drive, and the cutting edge on your tool steel will last very much longer, thus cutting down sharpening and tool steel costs. Write for Illustrated Catalogue of Machine Tool Driving.

THE MAKING OF A SKILLED MECHANIC

By F. C. D. Wilkes, B.Sc.

Complaints have been often heard, from the heads of manufacturing industries, of the difficulty of obtaining skilled labor. Some concerns have tried to meet this condition of affairs by recruiting skilled labor in their own plants, and at the present time a great deal of attention is being paid on this continent to industrial education. Some railroads and industrial firms have embarked upon elaborate schemes for the training of apprentices, and have gone as far as establishing separate and independent schools for training telegraphers, machinists, engineers, brakesmen, etc.

Unfortunately all educational schemes at present in operation on railroads (with one or two exceptions) lack continuity, for they leave off where they practically should commence and the apprentice or employee is turned out after a partial training and left to his own resources. The training offered by most companies to their employees is generally so unprofitably mismanaged by incompetent and untrained men that it is not surprising to find that managements view with suspicion any scheme put forward for raising the intelligence of their employees. It may be that this unprofitableness in many cases has been due to the fact that the recruiting or training of apprentices has been allotted to some officer of the company who already has all he can attend to. The result is a slipshod system, efficient only on paper. Another difficulty has been that in teaching the apprentice there has been but little attention paid to the difference between practice and theory, resulting in "half-wisdom" and, as every one knows, "a little knowledge is a dangerous thing."

Again, the most deplorable inefficiency of many officials and their ignorance of the economies of modern labor, probably accounts largely for the restless conditions existing to-day among employees. No heed is given to the morrow, officials give little or no thought towards making the task easier for those who have to follow them or for those who have to co-operate with them. This arises, in many cases, through incapability, for the official attains a certain standard and it is frequently found that it is impossible for him to assimilate the work of his co-officials. His deficiency prevents his further advancement and he therefore not only unconsciously hinders the work of those under him but also the work of his fellow officials. Thus it is that an official, minus early definite and concise training, becomes competent only at a large expense to the company employing him.

The ideal system of training is that one which allows an employee when he joins a railroad or other industrial corporation (provided he has the mental and physical qualifications) to be put through a systematic and continuous training which will enable him to qualify for minor positions. Then by further instruction he can consistently advance to the highest positions in the organization. The aim of any industrial system should be to create desire in the ambitious employee and enable him to rapidly and efficiently assume positions of trust and responsibility. The training of an employee should be continuous and not discontinued at the end of his apprenticeship as is often the case, the emp'oyee after desultory training being left to himself.

Foremost among our Canadian companies that have taken hold of the apprenticeship system in a rational, farseeing manner, is the Canadian Pacific Railway. They have now under way a most complete system of apprentice training which is being developed under the direction of Mr. H. Martin Gower. Mr. Gower is peculiarly adapted to this sort of work being an enthusiastic organizer and one who has made technical and industrial education his study. He served his apprenticeship in England in the employ of the London and North Western Railway as a locomotive apprentice and then worked as a draftsman with a firm of shipbuilders. He was also, among other things, assistant mechanical engineer Cardiff Collieries and holds Board of Trade certificates as a marine engineer. His position as principal of a large English technical school has given him wide experience in this class of work and the management of boys. He is a member of several British engineering societies and, incidentally, a graduate of London and Cambridge Universities.

At the back of this apprenticeship system inauguration is the personality of Mr. H. H. Vaughan, the energetic assistant to the Vice-President, and the rapid advance of the work is largely due to the broad-minded sympathy which he has with the advancement of the employee. His own advancement since he came to this continent an unknown stranger 18 years ago has been not a litt'e due to his concentration along such lines as are being laid down for the C.P.R. apprentices. He was born in England and graduating from King's College, London, served his apprenticeship and then worked as a machinist on the Sheffield and Lincolnshire and the London and South Western railroads. He came to the United States in 1891 and entered the employ of the Great Northern as a machinist. He became connected with the Canadian Pacific as superintendent of motive power, in 1904, coming from the Lake Shore and Michigan Southern.

Mr. Lacey R. Johnston, the assistant Superintendent of Motive Power, is an enthusiastic worker in the cause of the apprenticeship system and has always taken a considerable interest in all schemes tending to the training of the young man. When he was at the Carleton Junction shops and the old Delorimier shops in Montreal he entered the thin edge of the wedge and instituted evening classes for employees in his department. He has been with the C.P.R. for over twenty years in the steamship and motive power departments holding positions of locomotive foreman, master mechanic and

superintendent of steamships. He was appointed to his present position four years ago.

Fig. 2.—F. B. ZERCHER.
Superintendent Car Shops.

The Superintendent of the car shops, Mr. F. B. Zercher, is another devotee to the cause and has had a good deal of experience in railway work both on this and the other side of the line. He was born in Lancaster, Pa., and was with the Pullman Co., St. Louis, for seven years as foreman of the erecting shop. After serving with the New York, New Haven and Hartford Railway as inspector he came to Montreal and entered the employ of the C.P.R. as assastant general foreman.

Fig. 3.—LACEY R. JOHNSON.
Asst. Supt. Motive Power.

With these men in the work must be mentioned, Mr. R. W. Burnett, the General Master Car Builder for the whole C.P.R. system. Mr. Burnett is enthusiastic over the results of the apprenticeship work so far shown and thoroughly believes in its practicability.

Mr. Gower is assisted by a staff of instructors selected from men and foremen of high moral character. These men possess the knack of imparting their knowledge and skill and the faculty of instilling into the boys an interest in their work. They devote their whole time to the system and the keynote of their efforts may be found in Mr. Gower's own words when he says:

"A great deal of stress is being laid on the educational side, but to my mind the most important factor is the moral training, which it is essential our boys should receive, for, as we now train our boys, so will our men be in the future. Therefore every care should be taken to train them to become honest, straightforward, well disciplined and self-respecting men who will be conversant with shop organization and realize that foremen are appointed by employers, not for the purpose of standing over them to see that they do their work, but to allot and give out the work required by their employers."

Underlying all the best systems that were ever devised is the first essential that the apprentice should be taught to think in measurable quantities—in other words, think definitely. The priniciples of the trade in view should be carefully instilled into the boy's mind after which the details will not be hard to master. However, to do this properly the system should "make haste slowly" and should be designed to meet the requirements of the backward rather than the bright, capable lad, the latter will make his advance all right and by himself. Slowness in preparation is essential to the competent workman.

It is, generally speaking, upon these broad lines that the C.P.R. apprentice system is based. Besides the teaching, the company feel that it is also important how the men spend their time outside of working hours and with that end in view are always willing to assist in providing healthful recreation and opportunities for mental and physical advancement.

This is not the effect of a philanthropic view point. Not a bit of it. The company frankly admit that this considerate treatment and the large amounts of money spent on the apprentice system is in anticipation of large dividends on the investment. They recognize the policy of giving every chance to their employees to learn the business and to qualify for advancement to higher positions. Each year a larger sum of money is spent on special work for their men and the officials of the road are perefectly satisfied that this increasing expenditure is being abundantly justified from both the humanitarian and business standpoints.

Fig. 5.—Dining Room, Angus Shops.

The Synopsis of the System.

The first apprentice class was organized and held at the Angus shops in Montreal about eighteen or twenty months ago and at the beginning of this year the scheme was adopted in the Winnipeg shops. Here the same general lines as those in the Angus shops are followed although local conditions necessitate the modification of the details.

Every facility is placed in the way of the ambitious and intelligent employee to receive instruction from qualified and experienced officials in shop and railroad practice. The trend of this preliminary training has the tendency to create a desire to advance in the aspiring lad. The training is progressive—starting first with educational instruction for the young employees, then advancing to shop and educational instruction for the ap-

prentices and finally the journeyman receives educational facilities which enable him to qualify for minor positions on the staff.

Entrance Requirements for Boys.

Extracts from the "Regulations Governing the Services of Apprentices and Boys" show that it requires more than the mere application for admission befor a boy becomes a full-fledged apprentice. First of all he must pass an examination by the company's doctor, who sees that his eyesight, hearing and general health are good, after which all boys between the ages of 15 and 21 are accepted on approbation. When there is no vacancy for an apprentice, applicants are distributed through the various departments as drill boys, hammer boys, office boys, blue print room boys, etc., until such time a vacancy shall occur.

Apprentices are on approbation during their first year and at the end of the year are expected to pass an examination in: Reading and dictation, elementary arithmetic, freehand drawing of mechanical objects, Canadian history and geography.

In the latter class stress is laid upon the geography of the C.P.R. system and biographies of the chief officers and other eminent Canadians. This with the obvious end in view of making each boy thoroughly acquainted with the whole system so that he will have more conception of what and whom he is working for. Thus he will become a C.P.R. man in heart as well as in name. Besides this preliminary education they must show some aptitude for the work on which they are employed and their conduct, punctuality and attendance must be satisfactory, otherwise their services as apprentices will be dispensed with.

The Various Classes and Trades.

Irrespective of the trade the apprentice has in view, the first year's classes are the same for every boy.

These classes take up the preliminary work as outlined above. After the first year the boys are advanced to what is known as the general instruction class. Here the work is in freehand drawing, geometrical drawing (elemental), elemental projection and development, mechanical drawing and shop mechanics. This latter embraces the principles of friction, levers and simple machines. After this course is completed the boys are allowed to specialize along lines complementary to the shop practice of the particular trades which they are following.

Fig. 6.—Class in Drawing.

There are thirty trades to choose from of which the following is a list: Locomotive machinist, toolmaker, brass finisher, electric mechanic, boilermaker, silversmith, locomotive blacksmith, carpenter, locomotive draftsman, locomotive steamfitter, locomotive painter, patternmaker, air brake fitter, locomotive fitter, frog fitter, car machinist, tinsmith, coppersmith, car blacksmith, car plumbers, cabinet maker, upholsterer, moulder, freight car carpenter, car steamfitter, wood machinist, coach carpenter, car painter, car builder, car draftsman.

Shop Training.

An idea of the length of time spent on the various divisions of work which go to make up these trades is given by the following excerpt from "Regulations Governing the Services of Apprentices and Boys":

Machinists.

The five-year course for machinist apprentices will be as follows:

1. Experience on machines, 24 months.
2. Experience on bench work, 18 months.
3. Experience in erecting shop, 18 months.

In detail.

(1) Experience on Machines.

Shapers and slotters, 3 to 6 months; planers, 2 to 4 months; millers, 2 to 3 months; lathes, 4 to 8 months; drills, 1 month; other machines 2 to 4 months. Total, 14 to 26 months.

(2) Experience on Bench Work.

Class "A."

Truck work, main frames, brass work, smoke box doors, cross head work, marking off work, side rod work, air brake work, axle box work.

Fig. 8.—Apprentices at Work on Locomotive.

Class "B."

Axle work, motion work, valve work, cylinder work, brake gear work, marking off work, air brake work, brass work, side rod work.

Apprentices will follow either course

"A", or course "B," and will not work less than two months nor more than three months on any class of work.

Fig. 10.—Football Team, Apprentice Association, 1909.

(3) Erecting Shop Experience.

Brake, gear and spring work, shoes and wedges, 2 to 4 months; motion work, 3 to 5 months; steam chest work, 3 to 5 months; cylinder fitting, 2 to 4 months; valve setting, 2 to 4 months; pop setting, 1 to 2 months; boiler setting, 2 to 4 months; general engine work, 3 to 6 months. Total, 18 to 34 months.

Brass Finishers.

The five-year course for apprentice brass finishers will be as follows:

1. Experience on machines, 3½ years. 2. Bench work, 1 year. 3. Experience in plating and oxidising, 6 months. In detail.

Experience on Machines.

Drills, 9 to 12 months; millers, 9 to 12 months; lathes, 18 to 30 months. Total, 36 to 54 months.

(2) Experience on Bench Work.

Brass fitting and brass filing 9 to 12 months.

(3) Experience in Plating and Oxidising.

Plating, 2 to 4 months; oxidising, 2 to 4 months. Total, 4 to 8 months.

Experience in the plating and oxidising rooms will only be given to those apprentices who make the best progress.

Boilermakers.

The four-year course for apprentices will be as follows:

Light sheet iron work, 18 to 24 months; marking off work, 6 to 12 months; boiler staying, 2 to 4 months; riveting, chipping and caulking, 6 to 12 months; flanging 4 to 9 months. Total, 50 to 82 months.

All boiler maker apprentices will put in from three to six months as rivet boys before they are apprentices.

Pattern Makers.

The five-year course for apprentice patternmakers will be as follows:

General helping in pattern shop, 9 to 12 months; Foundry or molding floor experience, 3 to 6 months; bench work, 54 to 66 months. Total, 54 to 66 months.

Steam Fitters.

The four-year course for apprentices will be as follows:

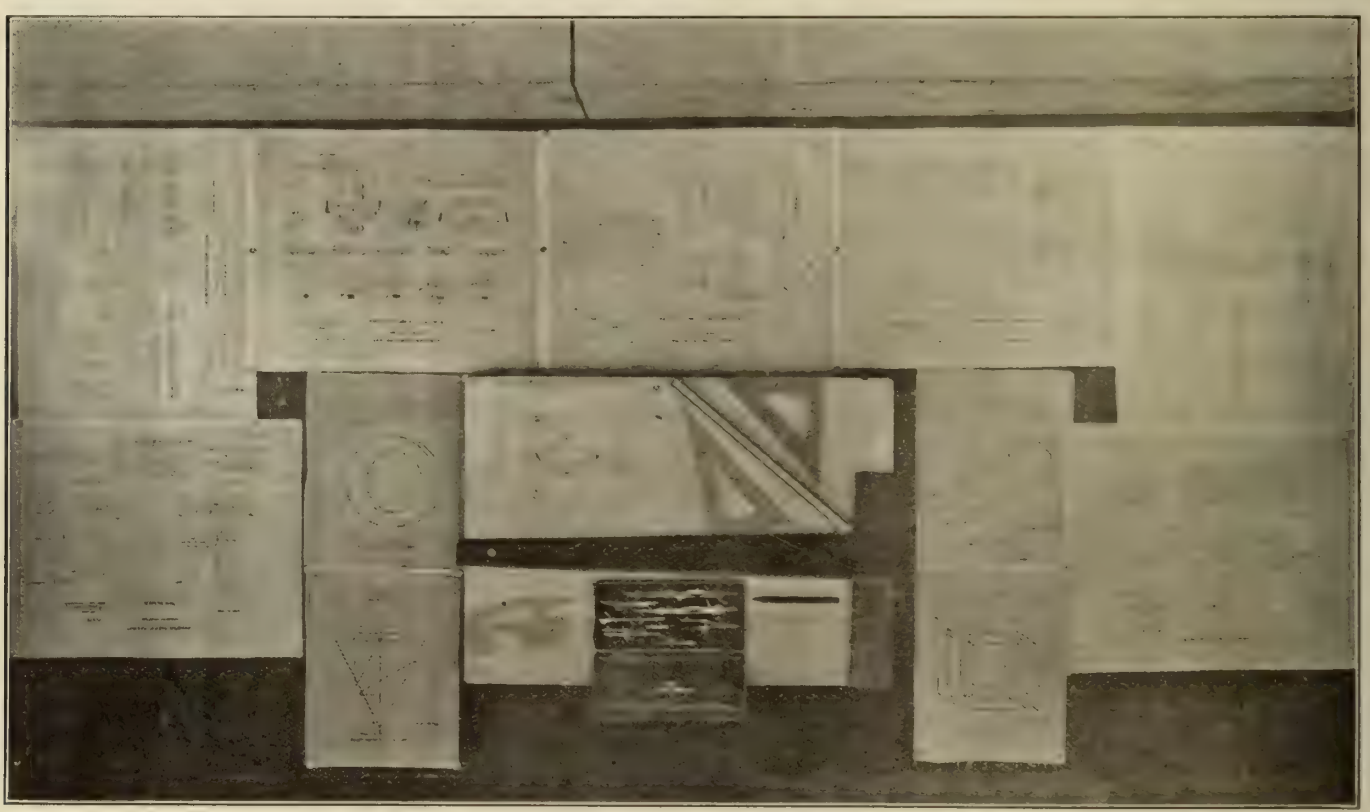

Fig. 11.—Instruments Supplied by the C.P.R. With Lesson Sheets in Various Departments.

General helping in steamfitters' shop, 6 to 12 months; injector and lubricator pipe work, 9 to 12 months; air brake pipe work, 12 to 18 months. Total, 36 to 54 months.

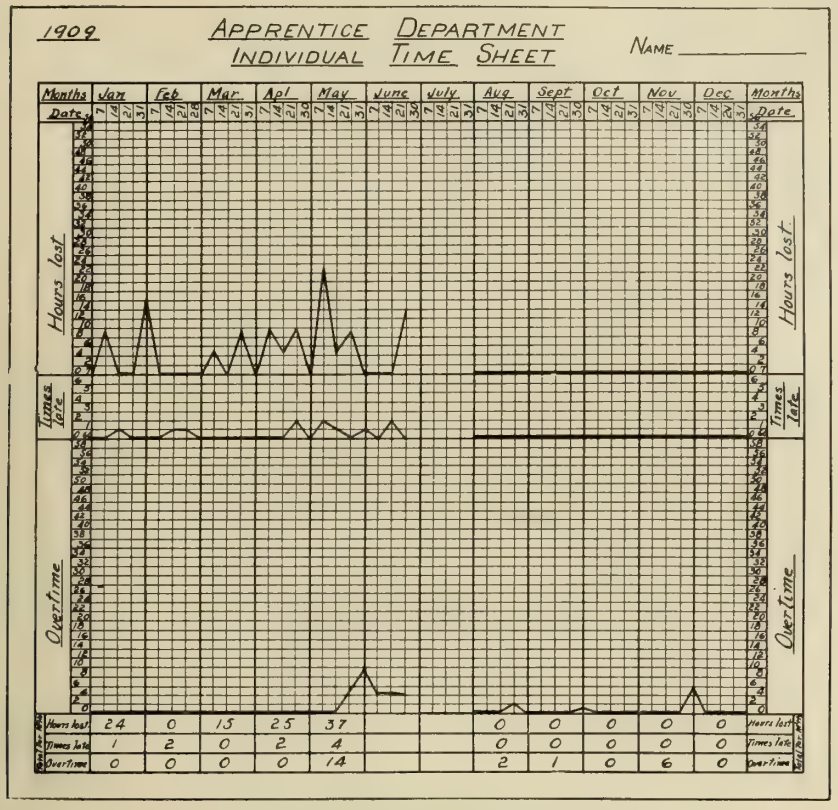

Fig. 12.—Apprenticeship Department Individual Time Sheet.

Painters.

The four-year course for apprentice painters will be as follows:

General helping and paint mixing, 9 to 12 months; rough stuff and plain painting, 9 to 12 months; graining, filling and polishing, 12 to 15 months; lettering, staining, striping, varnishing, 12 to 18 months. Total, 42 to 57 months.

Toolmakers.

The five-year course, for apprentice tool makers will be as follows:

(1) Experience on machines in machine shops, 6 to 12 months. (2) Experience on machines in tool shop, 36 to 54 months. (3) Bench work experience, 12 to 15 months.

In detail.

(1) Six to twelve months general machine shop experience

(2) Experience on machines in tool shop.

	Months
Small lathe (repair work)	4 to 8
Plain milling machine	4 to 8
Shaper	3 to 6
Cutter, grinder	3 to 6
Universal miller	4 to 8
Various lathes	12 to 18
Machine repair work	3 to 6

Total—36 to 66 months.

(3) Bench Work Experience.

	Months
Die, punch and jig work on bench	12 to 15
Machine shop work— (Lathe, bench, brass work, pipe work, drills)	12 to 18

Electricians.

The five year course for apprentice electricians will be as follows:

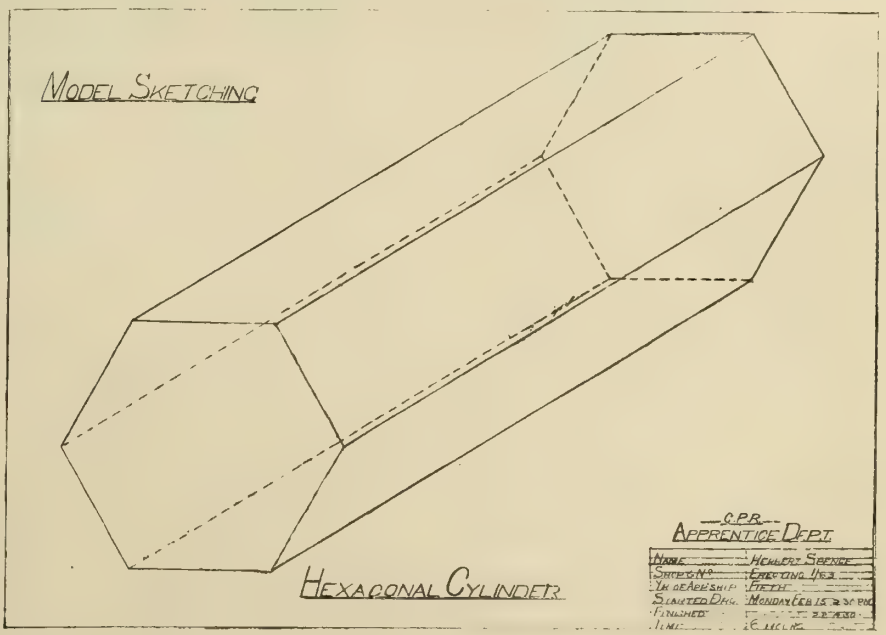

Fig. 13A.—Sample of Freehand Drawing.

Wiring—

	Months
(a) Small current work, (Telephones, bells, fire alarms, etc.)	3 to 5
(b) Power and lighting, (open, concealed and conduit)	3 to 5
(c) Outside line work	2 to 4
Repair work, (armature winding, transformers, motors, etc.)	8 to 12
Head lights (mechanical and electrical)	6 to 8
Instalation of electrical machinery	3 to 6
Motor crane and lighting operations	6 to 9
Reading instruments and testing	3 to 6
Power house work, (boiler-room, engine-room and switch-board experience)	4 to 8

Total—50 to 81 months.

Car Builders.

The five-year course for apprentice car builders will be as follows:

	Months
Helping bench carpenters	12 to 15
Construction of passenger and freight car trucks	9 to 18
Construction of passenger and freight car p'atforms—	
Iron	6 to 13
Wood	6 to 13
General car detail work	12 to 24

Total—54 to 101 months.

Molders.

The three-year course for apprentice grey iron molders will be as follows:

	Months
Helping around shop	3 to 6
Light work	6 to 9
Loam work and core-making	9 to 15

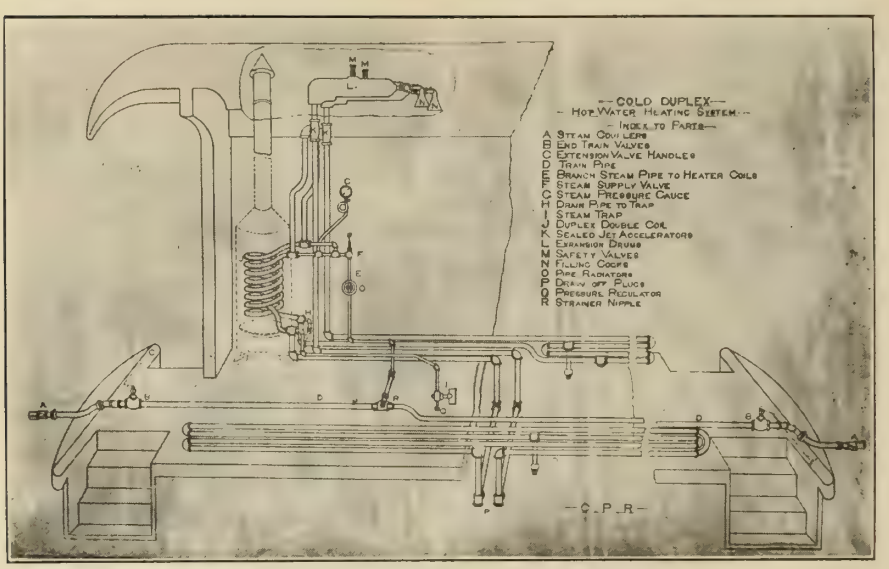

Fig. 13B.—Specimen of Mechanical Drawing.

Furnace work	3 to 9
Machine molding	6 to 12
General work	12 to 18

Cabinet Makers.

The four-year course for apprentice cabinet makers will be as follows:

	Months
Helping in cabinet shop	6
Bench work	30 to 40
Machine work	3 to 6
Outside work	6 to 12

Blacksmiths.

The four-year course for apprentice blacksmiths will be as follows:

	Months
Hammer and helping around shop	3 to 12
Light fire work	18 to 24
General work	24 to 36
Heavy fire work	6 to 12

Plumbers.

The four-year course for apprentice plumbers will be as follows:

	Months
Helping around shop	3 to 6
Helping plumbers	12 to 24
Jointing, bending, wiping, etc.	12 to 24
General plumbing	24 to 36

Carpenters.

The four-year course for apprentice carpenters will be as follows:

	Months
Helping around shops	3 to 6
Machine work	3 to 6
Bench work	18 to 24
Inside or outside car work ...	24 to 36

These schedules, which show the minimum and maximum amount of time the apprentice should be engaged on each

NOTES.

The above sketches show an ordinary back geared drill & a Plain Radial Drill By studying the sketches it will be seen how the power is transmitted from the countershaft to the drill & feed. It will be noticed that in the back geared drill the centre of the drill is stationary & the table is moved to suit the job, while in the radial drill the drill is moved along the arm & the arm swung around to suit the job the table being stationary.

General rules to be observed

All cuttings of different materials are to be kept separate. Machine to be cleaned thoroughly once per week in addition to daily cleaning. Keep working parts properly lubricated & avoid marking or defacing machine.

Tools required when drilling:-

Hand hammer
Centre punch, to mark centres of holes
Roundnose Chisel, for showing centres

Lubricant used

Oil soap & water boiled, usually prepared in shop.

Fig. 14.—Sample of Shop Practice.

class of work, are adhered to as closely as possible although the apprentice does not necessarily pass from one class to another in the order given. The variation, as shown above, is arranged to suit the progress made by the boy and therefore depends a good deal upon himself. The shop instructors make weekly reports of the work done by each apprentice under his charge.

Shop Work and Instruction.

In the shop the boys are grouped under the supervision of the different shop instructors. These men are expert machinists or carbuilders or whatever class of work in which they instruct, and their duties consist in looking after the boys under their charge, showing them how to set up their work. These men do not allot the work (the foreman does that), they merely stay with an apprentice until the lad understands the work thoroughly. Under the old system the foreman was supposed to instruct the apprentice. Sometimes he did and sometimes he didn't. It invariably happened that he would be interrupted several times, and the boy would get a jerky, disjointed explanation hard to understand and difficult to apply. Often the foreman would be called away in the middle of a demonstration, expecting, of course, to return and get the boy started. The chances were that the boy would be forgotten and left to shift for himself. Under the old way a boy might produce 50 per cent. of a mechanic's output after three or four weeks' work on the same machine, but under the new system, an apprentice can be put on an absent workman's work and, with the assistance of the instructor, the output suffers but little. Usually an apprentice under the new system turns out ¾ to ⅞ of a mechanic's output inside of three or four days. Thus is the work of the instructor productive of immediate returns.

In connection with the shopwork, considerable care is taken to see that the boy thoroughly understands the mechanism of the machine on which he is working. Of course, he doesn't take long to learn that a lathe, for instance, derives its power by means of a belt from a countershaft, and turns the work because the work happens to be fastened to the face-plate. But the company goes further and demands that the boys learn just how this power is transmitted and the internal arrangements of the machine they work on.

Blue print diagrams of the machines are furnished, which show the different methods of applying the laws of leverage and other mechanics. A boy is sometimes asked the shape of some internal part of a machine, and if he cannot give a rough sketch of it, is told to get a wrench, open up the machine and find out for himself, make a sketch and put it away. In this connection note boks are encouraged.

Testing Department.

Work in this department is not in the apprenticeship course proper, but on ac-

count of the easier and cleaner work is held out as a part of reward for merit. Boys in the 4th or 5th year of any of the courses are eligible, three at a time being taken for from four to six months.

The work consists of physical tests of merchant iron and steel and other general testing. These boys conduct tests of their own after having had the process explained to them, and help in any special investigations such as testing of springs, etc. They are encouraged to compile notes of the work done, in a convenient form of note book, but this is optional. However, most of the boys are wide enough awake to be aware of the value of such notes, and few there are who do not keep them. These boys are given access to text books on testing and the pamphlets on the subject, etc., issued by other railroads.

Sometimes the boys are called on to assist in testing lantern globes for strength and heat resistance. In the first instance the drop test is used, whereas in the latter the globes are heated (as when used), and sprayed with water, and the extent to which they withstand cracking is noted.

This department is under the charge of Mr. E. B. Tilt, the Assistant Engineer of Tests.

Methods of Class Instruction.

The class work is devised so that the class room has the closest possible connection with the shops, so much so that the drawings and lesson sheets are literally covered with the dirt and grease from the shops. Freehand drawing is taught from actual objects, a few of which are shown in the accompanying photograph. Each apprentice is kept at one particular object until his drawing receives the O.K. mark of the instructor. The accompanying photograph shows a drawing done absolutely freehand, and is one that many draftsmen could not improve on even with the aid of drawing instruments.

When drawing of actual machine parts are to be made, the apprentice is given the part he is to draw, and a blue print sketch with the dimension lines on it, but no dimensions. He then makes a freehand sketch of the object and takes his own dimensions of it after which he makes his mechanical drawing, putting in the dimensions as shown on the blue print sketch. The object of the blue print is merely a guide to show the correct way of dimensioning the drawing. In this way the apprentice is taught just what dimensions are essential and so there is no danger of the drawing being difficult to read on account of a mass of useless dimensions. The importance of this will be recognized by many a chief draftsman and machinist.

In connection with this work it is obvious that the instructor should be at once kindly, patient and withal firm. Discipline is not hard to maintain as the boys are paid for the time spent in the class room, but usually they are so interested in their work that little or no trouble is experienced along this line.

Considerable attention is paid to teaching the boys the use of the various

f
A
B
C
D
The above sketch shows a rectangular block of wood laid flat on a drawing board or table. If we trace its form on the surface we shall have a drawing showing the length + breadth of the block, as ABCD, + if whilst keeping it in the same position we trace its form on the wall against which the board or table is placed, we shall have a drawing showing the height or thickness (e f g h) which is called the elevation. The lines ABCD constitute the plan, + the lines e f g h the elevation. If the board is now swung around downwards until it rests against the wall it will be seen that the Plan ABCD comes directly under the elevation e f g h, thus showing that the plan is placed directly under the elevation

Fig. 16.—Sample of Projection Lesson Sheet.

scales. This takes the form of what might be termed "Practical shop mental arithmetic." They are led from the simple problem of "what is the half of ¼," etc., up to where they are asked to multiply and divide larger and more complex fractions. As the progress is very slow and all the fractions are the multiples of two, as used in the shops (1-16, ⅛, ¼, ½, etc.,) the result is thorough. The boys are encouraged in asking one another questions, and of course, each is anxious to puzzle the other.

The problem courses are based strictly upon the work with which the apprentice comes in daily contact in the shop. All useless and puzzling higher flights of mathematics are eliminated. The work in the shop is referred to even in the simplest problems of addition and subtraction. New principles are evolved gradually and here, too, the progress is slow and very thorough. The simpler principles of elementary mechanics, algebra, geometry, physics, etc., are taken up as the problems gradually become more difficult.

No text books are used in either the drawing or the problem courses, but as stated above the problems are arranged on sheets, and in being allotted a problem it does not always follow that each boy in the class is working on the same problem. As soon as he is finished with one he is given another.

In the apprenticeship classes, in order to stimulate enthusiasm and interest, the company donates each year 10 scholarships. These consist in complete courses in mechanical, boiler, car or electrical engineering following those of the International Correspondence Schools but taught by the company's own instructors. The two main scholarships are those which are given each year to sons of employees and which give the fortunate winners a full four-year course at McGill University, Montreal The holders of these are employed in the company's shops during vacation, receiving remuneration for their services.

Drawing Equipment Supplied.

The equipment furnished each boy consists of a pine drawing board 18" x 24" finished in shellac, a T square, 60 and 45 degree triangles, triangular box scale, wooden curve, file for sharpening pencils, pencils, pens, ink, necessary drawing and tracing paper, and a set of drawing instruments. All of this equipment is furnished by the company and thus the instruction does not cost the boys anything, either in the way of time or money.

French Apprentices.

The Angus shops being situated in Montreal and deriving a large proportion of the men from the French population, it was decided, last spring, to instal an instructor capable of teaching English to the French apprentices. Mr. Henry Vezina was given the appointment. Prior to this he had charge of the cabinet mill. In addition to his duties of instructing the French apprentices he also has charge of the practical work in

the car department. Each French boy who is unable to speak English receives, during working hours, two hours of instruction per week in reading, writing and conversational English. These French boys are taken into the shops on an equal footing with the English apprentices, but at the end of 12 months must pass a simple examination in the English language.

Fig. 18.—Class Work in Instruction Car.

Records Kept.

From the time an apprentice enters the service of the company until he finishes his apprenticeship a record of his career is carefully kept on file, in the office of the supervisor of apprentices. The front and reverse sides of one of these cards is shown. They are 8¼'' x 10½'' and contain the whole five years record on the one side of the card and general information relating to the boy on the other. This record is filled in every month from the monthly reports sent in by the different instructors.

The mark on workmanship is based on ability shown by the boy and the quantity and quality of work done in the shop. The same applies to the drawing classes, but here is taken into account the attitude of the apprentice towards his studies.

The personality or deportment mark is based on the attitude the apprentice takes towards his work, his willingness to serve and be instructed, his general character, and his ambition, i.e., whether or not he is doing his best.

The boys are allowed to see their marks at stated intervals by applying to the Supervisor, and are given a report at end of each year.

Another interesting record is the individual time sheet, kept by each apprentice by himself. On this sheet a sort of curve is made for hours lost, times late, and overtime, the points in the curve being put in at weekly intervals. The record of any apprentice's time can be read at a glance from these sheets, and the effect of their institution has been remarkable. Where there were from 100 to 200 lates per year, there are now hardly more than 2 per month, and the precentage of boys who are not late at all has been increased 30 per cent.

Application Forms, Etc.

When a boy makes application for position as apprentice, he fills in the following form:—

Apprentice Department.

Form to be returned to the Supervisor of Apprentices, Angus Works, Montreal.

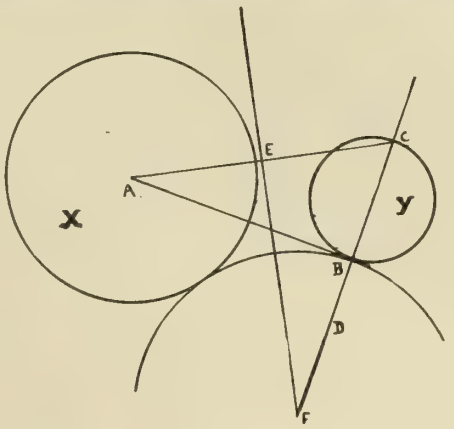
These two forms are type written and memeographed on foolscap paper in the company's office.

CANADIAN PACIFIC RAILWAY COMPANY.

APPRENTICE DEPARTMENT.

GEOMETRICAL DRAWING. 15 a G 2.

TO DRAW A TANGENT CIRCLE TO TWO GIVEN CIRCLES.



Let X and Y be the two given circles X having a radius of 2" and Y a radius of 1". Let the distance between the two circles be 4". It is required to draw a circle touching the circumference of the two given circles.

From the centre A in circle) draw a line at a tangent to circle Y touching the circumference in B.

From B draw C D perpendicular to A B.

Cut off B C equal to the radius of circle X. Join A C. Bisect A C at E and at E erect a perpendicular and produce it until it meets B D produced in F.

F IS THE CENTRE OF THE CIRCLE WHICH IS TANGENT TO THE TWO GIVEN CIRCLES.

Fig. 20.—Geometrical Drawing Instruction Sheet.

Then an agreement is entered into between the applicant's parent or guardian. This agreement is a printed form as follows:—

Apprentice Department.

.....190

The undersigned, residing at..... agrees that (his son, ward)..... shall serve the Canadian Pacific Railway at the ...., as a..... apprentice, for the full term of.....years, commencing.....Each year to consist of two hundred and ninety (290) working days, worked, and time lost from this must be made up before advancement to the next year.

He shall be subject to the rate of pay and rules governing the services of employes issued by the company.

He shall not be allowed to join any trades union until he has completed his full term of apprenticeship.

The Canadian Pacific Railway Company reserves the right to dismiss the apprentice for cause.

The company will, upon the completion of a satisfactory apprenticeship grant the apprentice a certificate of apprenticeship.

Samples of Examinations.

To give some idea of the scope of the classes, herewith is the Vice-President's Examination in Electrical Engineering for season 1908-9.

Students sitting for elementary examinations may send in answers to any of the questions, but no credit will be given to advanced students who send in answers to questions 1, 2, 7, 9, 10, 12.

Vice-President's Sessional Examinations for Evening Classes.

Electrical Engineering.

1 Explain the action of a simple voltaic cell. Give sketch.
2 Name 3 or 4 different kinds of cells, and explain fully the construction of one.
3 Name several kinds of galvanometers used in electrical work, and explain fully the construction of one.
4 A magnet is broken into four pieces. Sketch the pieces and show polarity.
5 What is the E.M.F. if an incandescent lamp has a resistance of 55 ohms., and requires 3.3 amperes ?
6 Write down the law of magnetic attraction and repulsion.
7 Show by means of a sketch the proper way of connecting the voltmeter to the line.
8 If a wire carrying a current from north to south is placed over a needle, how will the needle point ? And why ?
9 Sketch four cells in series and show direction of current. Also sketch four cells in parallel.
10 Show by means of a sketch how an ammeter should be connected in a circuit.
11 An arc lamp taking 10 lamps at 50 volts is connected across a 110 volt line with a regulating resistance in series with the lamp. How many ohms must this resistance be ?
12 What is the difference between a permanent magnet and an electro magnet ?
03 Write a brief description of a storage battery.
14 How many electric h.p. are needed to drive a dynamo supplying 120 sixteen candle power lamps, if the lamps take half an amp. each, and are supplied with 120 volts each ?
15 Write a brief description of the Cooper-Hewett Mercury Lamp and also of the Flaming Arc Lamp, and state which you would prefer to instal in a machine and loco. shop, the dimensions of the building being 500 ft. long by 50 ft. wide, the height of the traveling cranes from the ground being 30 ft.
16 Give a brief description of a Weston Indicating Wattmeter, and show connections. What is a multiplier, and how would you connect it in a circuit ?
17 The distance between a generator and motor driven by it is 600 ft. The line is number 0. If motor requires 200 amperes what is the voltage lost in the line ? If generator voltage is 250, what will it be at motor ? (No. 0 wire has a resistance of .10 ohm to 1,000 ft.)
18 A conductor in the form of a loop is moved across a magnetic field so as to cut the lines of force. Show by means of a sketch the direction of the induced current.
19 What is the essential difference between an A.C. and a D.C. generator ? Explain the action of commutation in the latter.

20 Name the chief parts in a D.C. generator and the use of each. In what two ways could the voltage of generator be increased under running conditions?

An example of sessional examination for evening classes is as follows:—

Vice-President's Sessional Examinations for Evening Classes.

Arithmetic and Mensuration.

1 Find the weight of a sheet of iron 6¼ ft. long, 3 ft. 4" wide, and ⅛" thick. (1 cu. ft. of iron weighs 480 lbs.)

2 A cistern has 5 water taps. The first will fill it in 1 hour, the second in 2 hours, the third in 3 hours, the fourth in 4 hours and the fifth in 5 hours. In what time will the cistern be filled when all taps are running at once.

3 A machinist apprentice can turn 20 large bolts in 3-5 of a working day. Another can turn the same number of bolts in ¾ of a working day. How long will it take the two apprentices working together to tusn out the 20 bolts. (Length of working day is 9 hours.)

4 How many round bars of iron are there in a triangular pile 49 bars at the base and 1 at the top.

Fig. 24.—Scholarship Apprentices.

5 How many sq. ft. are there in a board 20 ft long, 9" wide at one end, and 11" at the other.

6 Three air brake cylinders are the same length. Two are 10" in diameter and the third, 15" in diameter. Will the 15" cylinder have a greater or a lesser capacity than the other two combined. Compare areas and show working.

7 What would be the pressure on the piston of a 10" brake cylinder of a passenger coach in an emergency stop with a quick action valve, if the cylinder pressure is considered as 60 lbs. per sq. in.?

8 An apprentice planing wedges cuts ½" stock wedge. If the surface measures 5½ x 9½, what is the weight of cast iron cut from 50 wedges.

9 A 38 ft. tank car has a tank 30" in diameter and 33 ft. long. What is its capacity in gallons.

10 Add together, 7⅞", 1 ft. 1 5-16", 23¾".

11 Explain what is meant by the terms mixed fractions, proper, and improper fractions. Give examples.

12 Substract 8 15-16" from 1 ft. 8 3-32".

13 The numerator of the fraction is 28. The value of the fraction is ⅞". What is the denominator.

14 An iron plate is divided into four sections. The first contains 29¾ sq. in., the second, 50⅝ sq. in., and the third, 41 sq. in. The plate contains 190 9-16 sq. in. How many sq. inches are there in the fourth section.

15 The foremen of the north and south machine shops are paid $1,200 per annum. The Supt. of the shops offers them an increase in wages of $5 every half year or six months. The foreman of the north machine shop accepts this offer, but the foreman of the south machine shop objects, as he says it is too small, so the Supt. of shops gives him $20 per annum increase. Which is the best offer, and why. Show how much each foreman will receive in four years.

16 Explain the quick way of squaring numbers ending in ½ or ¼. Use the following examples:—(9½)2 and (6¼)2. Show your methods.

17 Multiply 234 by 254 in one line. Explain the principle.

18 Simplify. 2 23-32 x 9½—1÷ (3½ x 14⅛—5⅝.)

19 Reduce 1 ton, 4 cwt., 37 lbs., 8 oz. to a decimal of a ton.

The certificate of apprenticeship received at the end of a course is shown in the accompanying illustration.

Some Results of the System.

One economy that has so far resulted from this system is that there is less spoiled work, and the boys can use their knowledge of drawing to a great advan-

tage. This is shown in their greatly increased ability to read the shop blueprints. Many dollars are saved for the company through this ability, both in speed and elimination of spoiled work on account of misinterpretation of a blueprint.

The effect upon the apprentices is an enthusiastic endeavor to do better, which, of course, increases his skill and incidentially his output, increasing his value to the company.

It might be assumed that the rank and file of the men would be inclined to resent this innovation which so increases the efficiency of the apprentice. The opposite is the case, however, and they look with favor on the plan which will enable their sons to become skilled mechanics.

Here it may be mentioned that the company puts a great deal of emphasis upon the fact that they are endeavoring to turn out skilled mechanics, rather than superintendents, draftsmen, etc. The fallacy of many another elaborate system is the fact that they instil into the boys' minds the idea that they are on the way to the "super's" desk or that they will soon take charge of the road. The C.P.R.'s instructors combat that idea hard, wherever it shows the slightest tendency to appear.

Fig. 25.—Apprentices, Angus Shops.

The liability of prejudice among the older men is overcome by the organization of the evening classes spoken of later. Besides the instruction received these classes result in closer intimacy between men and officers and the shop organization.

The accompanying photo of the scholarship class of 1909, shows 9 apprentices representing the following shops:—Toolmaking, machinist, electrician, brass finishing, boiler making and coach carpenter. The picture also gives a good idea of the fine class of young fellows that the system is developing. The large group contains 171 apprentices and there are a good may absentees on account of vacations and other causes. This is the largest railroad apprentice group on this continent, and reflects great credit on the company.

The accompanying photo of the instructors shows the men who are carrying on this excellent work.

The system is attracting a better class of boys, and as a result the standard of the shops is being automatically raised. Parents are beginning to waken up to the fact that it is possible for their sons to receive a technical training while they are making a livelihood. A very large number of applications for apprentices for all trades have been received since the system's inaugauration. This speaks well for the attractiveness of the work, and the appreciation that has been shown in the work thus far established.

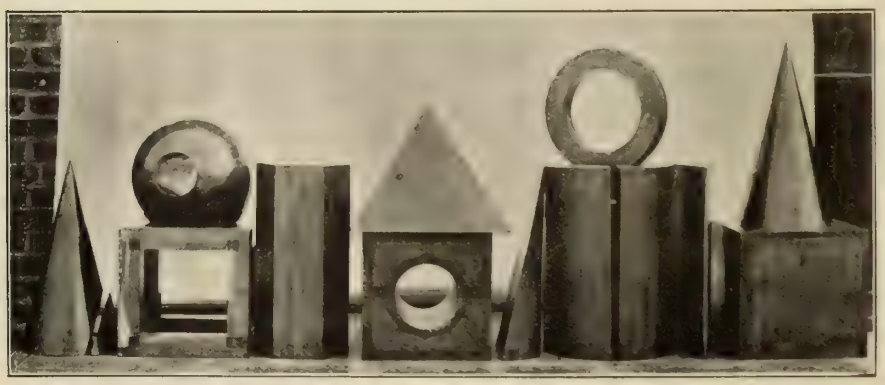

Fig. 26.—Freehand Drawing Models.

It might be said here that the company is a little reticent about prognosticating future results, but there can be only one outcome for a system laid down on such rational far-seeing lines, as is this one, and that outcome will, in all probability, be success.

Some Examples of Practical Results.

The efficiency of the apprentice under the new system has been increased beyond all estimation. The quality of the output of work is excellent and in many

cases the output itself of the apprentice equals that of the skilled journeyman. Because of lack of space only a few of the many cases quoted by Mr. Martin Gower are mentioned. The following

Fig. 28.—Models for Mechanical Drawing.

cases are excellent work and worthy of special mention.

A third year cabinet makers' apprentice is able to polish the inside of a first-class car, such as the veneer partitions, work which is generally undertaken by a skilled journeyman.

A tinsmith apprentise marked off and made, without assistance, some of the copper domes on the Company's new observation cars.

A third year upholsterer apprentice is capable of upholstering completely, a sleeper or a parlor car seat.

A third year car builder apprentice was selected to work on a carpentering gang, which usually consists of four men, having charge of the erection of the frame of the car and the outside finish.

A third year machinist apprentice, during the absence of the regular mechanic was able with the assistance of a younger apprentice to undertake the regular head-light repair work.

A second year machinist apprentice is capable of running a large vertical miller in the machine shops and turning out the motion work, under the piece-work system. This machine was formerly run by skilled journeymen.

A double headed frame stay slotter, usually handled by two mechanics is now run by a mechanic and one third year apprentice, without affecting the output of the work.

A third year machinist apprentice is capable of running a wheel quartering machine by himself.

Several third year machinist apprentices are able to fit up eccentrics, cross heads, pistons, and axle boxes from blue-prints.

A second year electrical apprentice is responsible for a great deal of the

are light work about the Angus shops, while a fourth year boy has entire charge of the installation and maintenance of the shops' telephone system.

Among the work taken charge of by fourth year machinist apprentices is that of squaring the locomotive frames and putting up the shoes and wedges, also the fitting and applying of new cylinders. Of course, in this heavy work the apprentice is assisted by laborers and helpers but he is the one in charge and upon whom the responsibility of the work rests.

The intricate Walschert valve gear is also set up in many cases by fourth year machinist apprentices.

Apprentice Association.

About the same time that the apprentice system was inaugurated, Mr. Martin Gower started the ball rolling towards the formation of an association, which would tend to promote esprit de corps among the boys. That this latter object might be accomplished it was necessary to make some arrangement, whereby the apprentices from the car shops could become acquainted with those from the steamfitters' department in the locomotive shops, etc.

The idea was taken up by the apprentices with a degree of enthusiasm, which has increased as the scope of the association become larger. The officers of the "Association of Canadian Pacific Railway Apprentices" are chosen from among the boys and those for the ensuing season are: G. W. Musgrove, Pres. (machinist apprentice); H. C. Harragin, Secy. (air brake apprentice); E. Storey, Treas. (machinist apprentice).

W. Gower
Shop Foreman.

William Walsh
Loco. Shops Apprentice Instructor.

Supt. of Loco. Shops.

This form to be filled in and sent to the Supervisor of Apprentices on the 1st of the month.

Fig. 29.—Monthly Shop Report.

The crest of the association is shown at the bottom of the large group photograph. It was designed and drawn by two of the boys themselves and submitted to the executive council. The crest embodies the company's beaver and shield and shows symbols of the work and play of the boys; a micrometer, calipers and square representing work, and a lacrosse stick, hockey stick and football standing for play.

CANADIAN PACIFIC RAILWAY COMPANY.

APPRENTICE SCHOLARSHIPS, JULY, 1909.

CHARACTER EXAMINATION.

Name of Apprentice .....

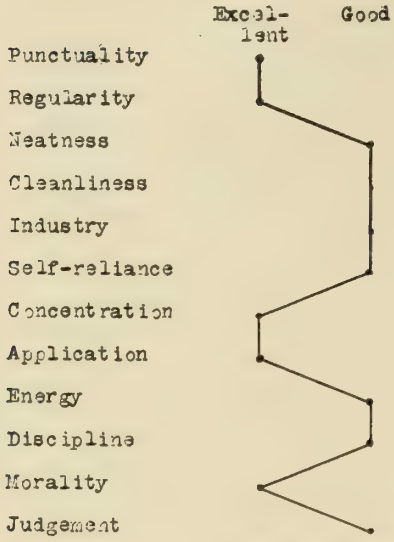

Fig. 30.—Character Examination.

Soon after the inauguration of the association the boys decided to hold regular monthly business meetings, and at these meetings either invite some official of the company to deliver an address or have one of their own number read a paper. The first address was given by Mr. Lacey R. Johnson, on "The C.P.R. in The West," which was made interesting to the boys by aid of lantern slides. This coming winter's program has already down on it several addresses by different well-known men, as well as promised papers on valves, etc., by members.

Another strong feature of the association is the development of good feeling among the apprentices through the agency of good healthy games and recreation. A football team was almost immediately organized by Mr. Martin Gower, who is deeply interested in athletics and a firm believer in the effect they have on the the young man morally, mentally and physically. A little difficulty was experienced on account of the novelty of the game, but at present there is material for four teams, and through the last season there were usually two teams pitted against other Montreal teams, every Saturday afternoon. The first eleven played about fifteen games, only losing one, and tieing two. A Harrier Club has also been formed, and several of the apprentices have made very good showings at the various athletic meetings in and around Montreal. Two teams have been entered in the Montreal water-polo league, playing against such teams as McGill, Montreal and Y.M.C.A.

Arrangements are being made to form a hockey and skating club in connection with the association, and it is planned to have a rink built close to the shops where matches can be played. The rink will be oval in shape, 150' x 100' with a 20-ft. pleasure skating space outside of this.

All the games are played on ground adjacent to the shop, which the company have, at their own expense, drained, leveled and fenced in.

The association of apprentices is managed entirely by themselves, the Supervisor contending that boys of 19 years of age and upwards and earning good wages are as thoroughly capable of running such an association as are university men. This work teaches them to be independent and think for themselves, brings them together and gives them good experience in organization and executive work.

Evening Classes.

When the boys have served their time, the company still makes it interesting to them to continue their educational work and evening classes are held from October to April inclusive. These classes are for those that have served their time and

INSTRUCTIONS :- Make sketches from pattern similar to above view and then proceed to show a plan view. Take your own dimensions from pattern and insert on sketches.

Fig. 31.—Mechanical Drawing Lesson Sheet.

any other employees who want to attend. These classes are under the management of Mr. Martin Gower and usually consist of blackboard lectures and individual instruction on one or other of the following subjects:—

(1) Geometry and workshop drawing for locomotive machinists. (2) Arithmetic and mensuration for all grades. (3) Forge shop work for blacksmiths. (4) Carpentry and joinery drawing for carmen. (5) Lectures on locomotive boilers, engines and air brakes. (6) Electrical course for electricians. (7) Shop mechanics for all grades.

Those attending these classes are encouraged to ask questions and promote discussion on the subject of the evening, and that they are popular is shown by the attendance last winter when there were 260 enrolled. Examinations are held at the end of the session and prizes awarded.

The syllabus for the season of 1909-1910 is as follows:—

Locomotive Shop Practice.—Instructor, Mr. A. H. Kendall, foreman, locomotive erecting shop.

Electrical Engineering. — Instructor, Mr. Guy McDermot, construction foreman, electrical department.

Mechanical Drawing.—Instructor, Mr. D. L. Davies, electrical and motive power draftsman.

Car Drawing.—Instructor, Mr. M. H. Vezina, carshops apprentice instructor.

Mathematics. — Instructor, Mr. H. Maxwell, educational instructor.

Iron and Steel.—Instructor, Mr. E. B. Tilt, assistant engineer of tests.

The upkeep of these classes is divided between the company and the Educational Department of the Province of Quebec. The latter allots an appropriation every year, covering the salaries of the instructors.

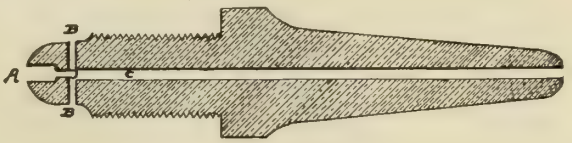
As the classes take place immediately after work, the company supplies a good substantial meal to those men who take the classes. This meal is free and there is no charge made for the building, light or heat. The company also furnishes absolutely everything connected with the classes, such as pencils, drawing instruments, paper and other materials. This is in contrast to other systems in vogue on other railroad systems, but the C.P.R. thinks that the man who has a large family perhaps, or other cares that give him no excess money for outside things should have the same chance for advancement as the more fortunate man who has less calls on his pay envelope. This education then does not cost the men one single cent.

Photographs were taken by the Canadian Photographic Co., Montreal.

Davis-Bournonville Process of Welding and Cutting

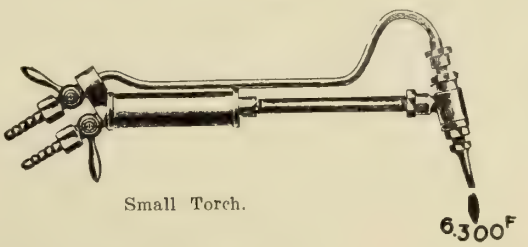
Autogenous Welding with Oxy-Acetylene, Torches, Generation of Oxygen and Acetylene—Use of the Process for Iron, Aluminum, Brass, etc.

The Expanded Metal & Fireproofing Co., Toronto, have erected a special building for oxy-acetylene welding, a process by which castings usually thrown away, are repaired. A Davis-Bournonville apparatus has been installed, daily demonstrations being given by J. Edward Fennell, who has charge of the oxy-acetylene welding department. A broken gasolene engine cylinder was repaired with the greatest ease. In repairing the broken cylinder it was first heated to red heat in a preheater so that the casting would not crack when repaired.



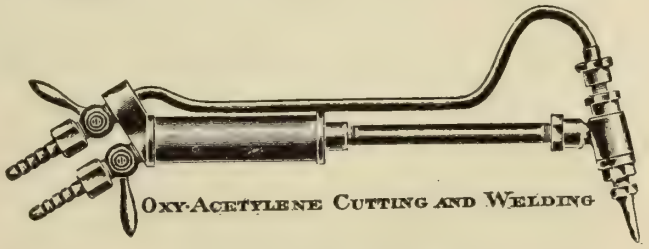
Oxy-Acetylene Interchangeable Nozzle Tip.

The following is a partial list of the applications of the process of oxy-acetylene welding and cutting:



Small Torch.

1. Reclaiming light and heavy castings coming from the sand with blow holes, sand holes, cold shuts, lugs off, etc. 2. Reclaiming light or heavy cracked or broken castings, whether of cast iron, cast steel, brass or aluminum. 3. Adding metal to parts subjected to friction, making such part as serviceable as orginally. 4. Repairing small or large boilers in place, welding in new parts or filling in cracks edge to edge. 5. Split piping of all kinds can be quickly welded when in place usually without breaking connections. 6. Welding flanges on pipes. 7. Pipe manifolds or connections or intricate forms can be made. 8. Rivet heads quickly cut off and shanks driven out. 9. Holes in metal parts (when connected up) can frequently be enlarged by heating with the torch only and using punch. 10. Tool steel can be added to common steel. 11. Dies can be cut out, also repaired. 12. Cast iron heads can be united to valve stems. 13. Castings impossible or difficult to mould can be made in parts and united. 14. Many joints which never need be broken can be welded instead of bolted, and compactness, lightness and greater strength secured. 15. Imperfect steel castings of all kinds can be reclaimed. The percentage of imperfections in these is greater than in any other class of castings. 16. Shafting, etc., cut too short can be extended. 17. Bridges, boilers, arches, steamships, can be wrecked by the cutting process. 18. Wearing qualities may require steel in certain places while wrought or cast iron will afford the requisite strength for the bulk of the supporting body. 19. Bolt and other holes worn beyond use can be restored to former size, etc. 20. Holes drilled in error can be filled in, dressed down and not discernable. 21. Small metal parts broken off or missing can be added. 22. The shape of patterns can sometimes be modified, also metal added. 23. Main frames can frequently be welded in place without stripping. 24. Steel rails can be bond-



Larger Oxy-Acetylene Torch.

ed with copper, also welded end to end. 25. Teeth broken from gear wheels can be renewed. 26. Steel or wrought iron to the thickness of 5 or 6 inches can be cut, the kerf about $\frac{1}{8}$ to $\frac{1}{4}$ inches in width. 27. All kinds of metal fluid and liquid containers can be made without joints and less liable to leak when bruised or dented, also defective parts can be cut out and replaced with a perfect sheet, the same shape and welded into position edge to edge. 28. Joining of steel parts for reinforcing concrete.

Heavy Casting Welded; Note Added Metal.

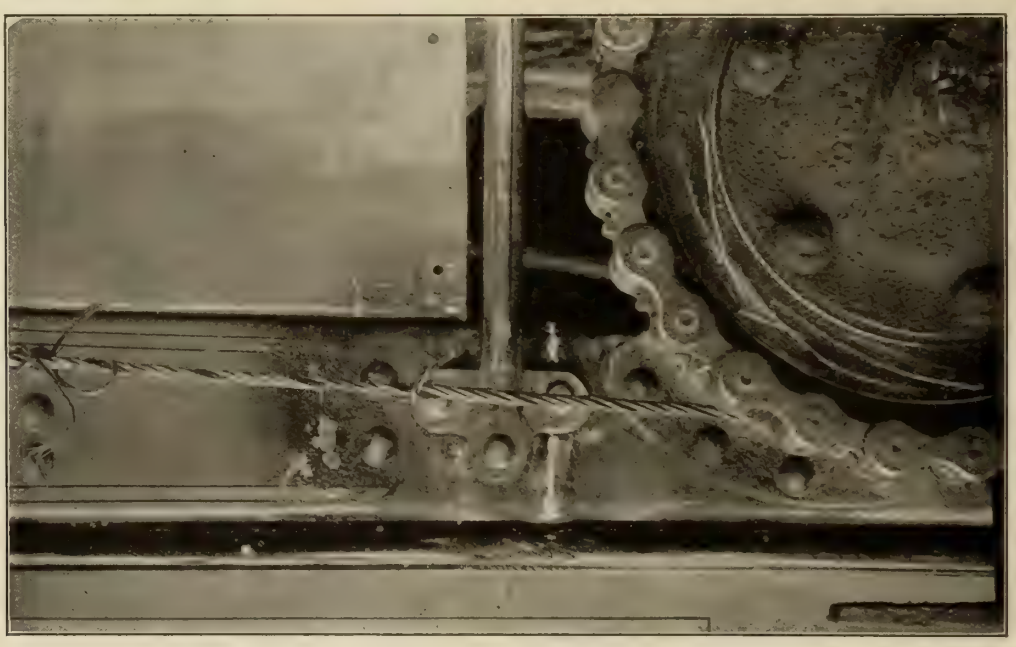
Welding Apparatus.

The "torch" consists of an upper tube carrying oxygen at a pressure varying from 5 to 25 pounds as required, leading into a mixing chamber into which is introduced a lower pipe carrying acetylene at a pressure of one pound. Into the mixing chamber may be screwed a variety of different nozzles having a lengthwise hole, in its passage through which the jet of high-pressure oxygen draws in the acetylene through radial holes around the sides of the nozzle. The proportion of the area of the holes in the nozzle sufficiently regulates the proportionate mixture of the gases, but the latter may be further controlled by cocks upon either pipe. The acetylene pipe is also provided with an enlarged chamber filled with porous material which prevents any danger of flash-back of the flame into the acetylene supply pipe, and also serves as a handle for the torch.

The acetylene being under pressure, however, the flame is not dependent upon injection for its acetylene supply, and the torch as above described is all that is required for welding. The two pieces of metal to be welded, with no flux or special preparation whatsoever, are simply laid with the edges to be welded together, the jet of flame from the torch is passed along the joint, and the intensely high local temperature generated causes the metals to flow together, and the weld is complete. In most cases it is advisable to add a little of the same metal from a wire or stick carried in the other hand, and introduced momentarily into the flame, as required when it drips off, just as one drops sealing wax onto an envelope.

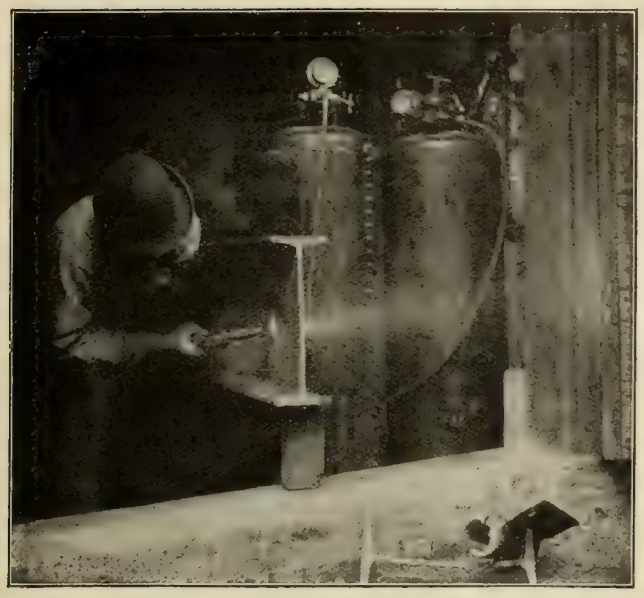
Gas Generation.

Acetylene is generated in a Davis pressure generator, which is a "carbide feed." Lumps of carbide are dropped into a large volume of water, a gallon of water being used to every pound of carbide. A "carbide feed" generator prevents excessive heat.



Auto Truck Frame Welded Without Stripping.

Oxygen is generated in the Davis-Bournonville process by chlorate of potash and manganese-dioxide, and is passed through caustic soda to cleanse it.



Cutting 15" I-Beam in Less than Three Minutes.

It is then pumped from the receiver into pressure cylinders.

Welding.

Reference has been made to the many applications of oxy-acetylene welding. The welding is done without materially changing the composition. Cast iron, brass, aluminum, steel, etc., are easily welded. In fact welding cast iron is really the most satisfactory, as the metal becomes sufficiently fluid to leave a smooth surface.

Possibly the most radical development which this process has produced is the satisfactory welding of aluminum. This has long defied all attempts to unite it in a manner that would withstand a strain anything like the metal itself. It is due to the reducing nature of the flame, which is not sufficient to cause the metal to flow together. The actual uniting is produced by puddling the molten metal with a steel rod, which effectually breaks up any coating of oxide.

Cutting With Oxy-acetylene.

Steel and iron can be cut with great facility. The operation is performed by heating the metal at the first point of contact to the red, by the ordinary welding flame, and with this flame continued a jet of pure oxygen is turned on which unites with the carbon of the metal and disintegrates it with surprising rapidity. The cut is narrow and smooth, with no material injury by oxidation. The cut can be made in any shape, and the process will be found very useful in cutting irregular forms, and will be valuable especially in making many kinds of dies and in fitting steel plates. It is especially effective for cutting steel beams in structural work, steel arches, large steel beams, steel boilers, steel piling, shaped deck plates for steamships, and will cut the hardest steel for vaults and other purposes.

NATIONAL MACHINE TOOL BUILDERS' CONVENTION.

The eighth annual convention of the National Machine Tool Builders' Association was held at Hotel Astor, New York City, October 12 and 13. One of the matters of greatest importance was the presentation of electric motors as applied to machine tools.

The first question asked was: If all the manufacturers of motors were to make their base dimensions and other important dimensions alike for a given horse power, would it not be beneficial to all? The question brought the unanimous answer of "Yes."

No definite action was taken except that the committee will work along this line. The motor manufacturers of the United States will meet in November, when it is hoped that some definite action will be taken. As it is at present there is a diversity of opinion on some points, as, for instance, the maximum speed of motors, both constant and variable. The majority favored 1,200 r.p.m., at least on small motors up to 5 horse power. There was a difference ranging from 900 to 1,800 r.p.m. Where rawhide pinion is used it was found that the maximum speed was somewhat higher, but that still 1,200 r.p.m. was most commonly used. With metal pinion this was somewhat lower.

Another subject discussed was the creation of machinists, from the standpoints of education and payment. Best results were obtained in one shop by advancing the wages from 15 to 17½, 20 22½ and 25 cents, as the young men became more acquainted with the work. They were taught by a first-class machinist, and by exercising great care, machinists were created in a short period of time. There must be mutual care, however, both by the company and the young man who wishes to advance. Other methods were also discussed.

A. S. M. E. MEETINGS.

On November 9, papers on Reinforced Concrete Beams and Stresses in Curved Machine Members will be read before the American Society of Mechanical Engineers, 29 West 39th Street, New York. The annual meeting will be held December 7 to 10. The secretary is Calvin W. Rice, United Engineering Bldg., New York City.

STEEL CORPORATION AT COAST.

It is beginning to look as if British Columbia is to have a steel industry. G. M. Gibbs and G. S. Faulkner, of Vancouver, have had a conference with Jas. A. Moore, who is head of the Irondale Steel Co., Irondale, Wash., and H. E Law, of San Francisco, who is also largely interested. The result is the formation of the Western Steel Corporation, with a capital of $20,000,000, and headquarters at Seattle. The new company will take over the Irondale works and intend to start operations shortly in British Columbia. In that province there are known deposits of iron, assaying 66 per cent., and within easy reach of tide-water one large deposit being right on the sea.

QUEBEC BRIDGE PLANS READY.

Tenders for two types of bridge, cantilever and suspension, will be called for shortly by the Quebec Bridge Commission. The plans of the new bridge call for a structure 150 feet above high tide for at least 600 feet of its mid-river length. It will also be 24 feet wider than the old structure, the total width called for being 85 feet. A new pier is to be built 100 feet further from the north shore than the present pier, thus reducing the length of the centre span to 1,715 feet. Work will in all likelihood be commenced next spring. The plans are now ready.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

TOOL HOLDER.

By MacK.

Our keyseater, a nearly new machine of a standard make, would never take a big enough chip to suit the boss. The cutters are inserted in the bar and are expensive to buy and drill easily. Figs. 1 and 2 show the cutter. They were held by a set screw in the centre of the lower bar shown in Fig. 3.

The cutter used now and giving better satisfaction is a piece of high speed steel, ground to micrometer and fitted tight in the squared opening in the lower bar Fig. 4, and having a taper pin, 5 inches, flattened in one side, drawn across the top of the cutter, and

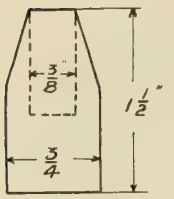


Fig. 1.

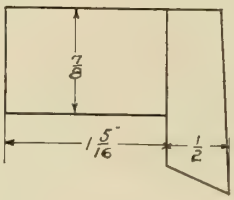

Fig. 2

including $\frac{5}{8}$ inch in size. The new cutters can be made by the dozen for the price of one of the old style. They cut faster, do not dig in, and wear longer. After a trial of the cutter, three sizes were put in each bar. Above $\frac{5}{8}$ in size we upset square steel in a die and grind to size.

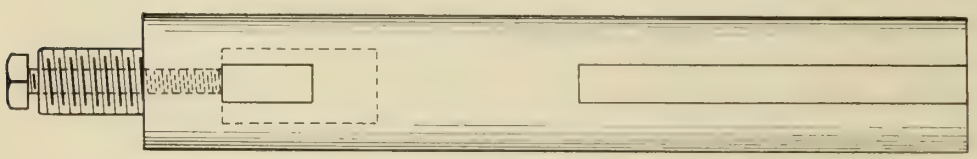

Fig. 3.—Tool Holder.

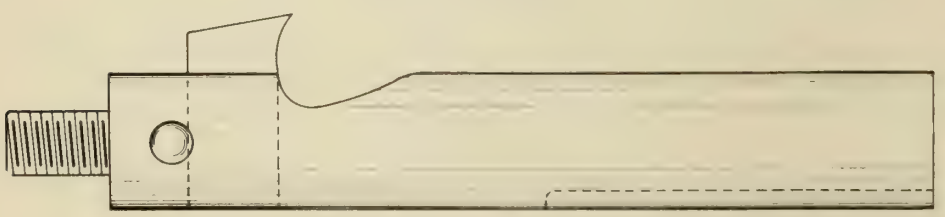

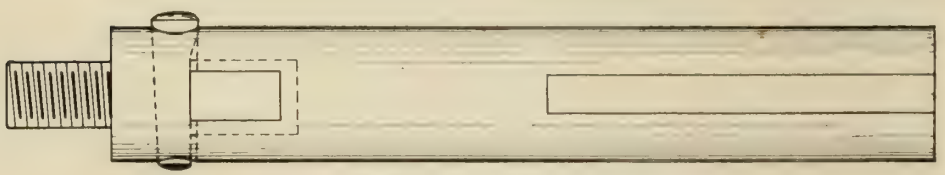

Fig. 4.—Tool Holder.

DESIGNING CHEAP HANGERS.

By Arthur Jacques.

Some time ago the writer had occasion to design a cheap overhead motion for a certain machine, of which large quantities were being made. This overhead

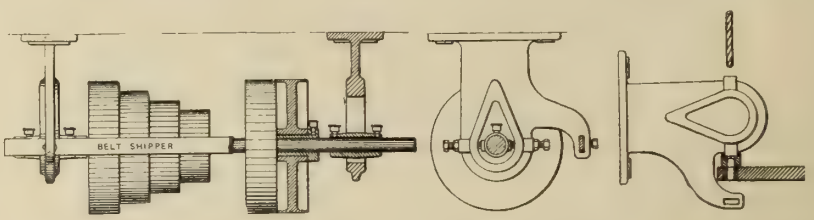

Fig. 1.—Designing Cheap Hangers.—Fig. 2.

motion is also suitable for any other class of machinery, such as lathes, drilling machines, milling machines, etc.

The ordinary type of hanger with a brass step at the bottom, about $1\frac{1}{2}$ diameters long, being too expensive to make, we decided to have our hangers made with a long solid cast-iron bearing four diameters long, each bearing ta be greased with Stauffer lubricators, and to be held in position by the ends of screws so as to allow the bearings to swivel. Fig. 1 shows the hanger as adopted. These hangers we now make in three sizes to fit $1\frac{1}{4}$, $1\frac{1}{2}$, and $1\frac{3}{4}$in. shafting, each size having a different depth.

The only machine work on each hanger is drilling the holes for the $\frac{5}{8}$in. screws which hold the bearing in position. These holes are drilled and tapped in an ordinary drill press, with a reverse drive. The bottom boss is put in a cone or female centre, and is held there by the operator, as shown in Fig. 2, while both holes are drilled and tapped. We have broken no taps yet, though we use ordinary pulley taps fitted in a "Little Giant" drill chuck. The drill press is reversed by a treadle connected to the shipper.

The shaft for an overhead motion is generally forged with a collar at the end. This requires turning up, and as this was out of the question, we decided to use a solid-drawn steel shaft with a steel collar driven on and pinned in position. These collars are easily made in a turret lathe, and are drilled with a D size drill, $\frac{1}{4}$in. wire being a nice driving fit into the hole; the end of the pin is filed level.

The ordinary collars are also made in a turret lathe from bright steel, and are drilled and tapped in a drill press, being driven on a stick and put on a V-centre. The cone pulley and fast and loose pulleys are made in the usual way, but the loose pulley revolves on a sleeve fastened with a grub screw to the shaft, the sleeve being greased by a Stauffer lubri-

cator. This we find a great improvement upon the usual method of having the loose pulley revolving on the shaft and oiled by an oilhole. This oilhole is hardly ever at the top when the pulley is oiled; consequently, only the ends are oiled, and when the machinery starts, all the oil is thrown either on the machine or operator.

The sleeves are made from cast iron, are bored to fit on the shaft and then turned for the pulley, and drilled and tapped for the lubricator. The bearings for the shaft are bored in a boring lathe, then reamered out, and the ends faced up.

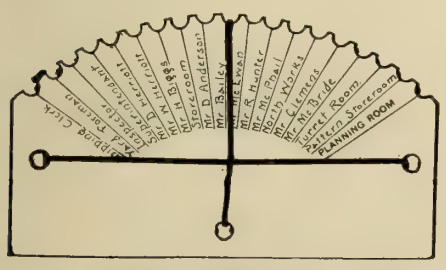
The holes where the screws fit, which hold the bearings in the hangers, are drilled about ¼in. deep, and ⅝in. diameter. The casting has a boss on each side, and if the holes are drilled in the centre of these bosses they are true enough. We have tried jigging them, but it was too much trouble.

The bearing is then slotted with a round slot for the grease, and drilled and tapped for lubricators, one on each side. The writer has personally fitted up several dozens of these overhead motions, and no trouble has been experienced as regards either the bearings heating or wearing out of parallel. They are fitted up in half the time taken with the old-fashioned brass bearing hanger.—Mechanical World.

INTER-FACTORY MAIL DELIVERY.

By G. Campbell.

The accompanying illustration shows a very convenient device used in the works of Goldie & McCulloch, Galt, for the transmission of mail or parcels among the various departments. The device consists of a cardboard, one side colored red and the other green. The green side is here shown and on that side is printed the names of the various



Card to Facilitate Delivery of Mail Among Various Departments.

departments of the works. On the red side is printed the names of the men in the office.

Two elastic bands, as shown, are used on each card. The mail is placed in the horizontal band while the vertical band indicates the department or official to whom the mail is to be delivered. In the illustration the elastic is at the name of Mr. Bailey showing that mail is to be delivered to him.

A delivery boy makes regular rounds leaving the mail with proper persons. In order that his work may be facilitated, and to prevent mistakes, two baskets are used, one marked "In" and one "Out." When delivering mail the boy places it in the "In" basket removing that from the "Out" basket, to be delivered to the proper person or department on his next round. The device is found to work very satisfactorily.

MAKING A BLANKING DIE FOR PAIL SECTIONS.

By J. H. R., Hamilton.

The accompanying drawings show the method of developing the template and making the die for a half-section of a five-quart pail body. In Fig. 1 a b c d show the elevation of the pail. Diameter at top=8 ins. Diameter at bottom=6 ins.

To find the volume of the frustum of a core on pyramid:

Rule.—Add the areas of the top and bottom, and the square root of the product of both the areas, and multiply by one-third the altitude.

Or in the form of a formula:

$$\text{Volume} = (a^t + a^b + \sqrt{a^t \times a^b}) \tfrac{1}{3} \text{ alt.}$$

One U. S. gallon contains 231 cu. in., 5 qts.=1.25 gallons.

1.25 gallons contains 231×1.25=288.75 cu. in.

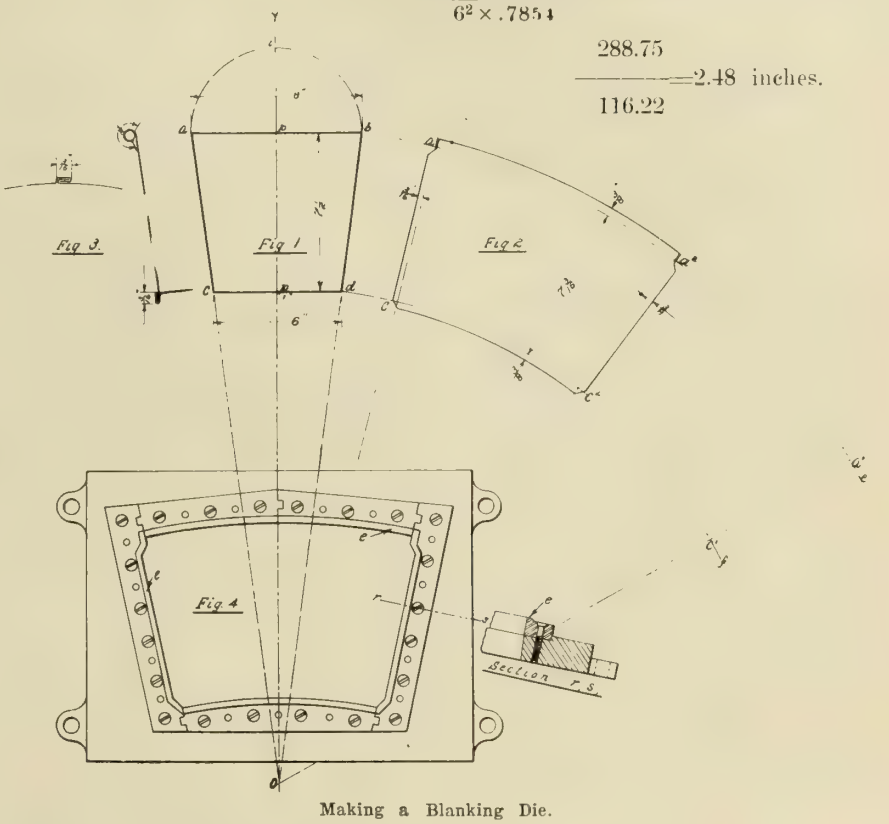
Then by the formula:

$$\text{Volume} = (a^t + a^b + \sqrt{a^t \times a^b}) \tfrac{1}{3} \text{ alt.}$$

or

$$\tfrac{1}{3} \text{ alt.} = \frac{\text{Volume}}{a^t + a^b + \sqrt{a^t \times a^b}} = \frac{288.75}{(8^2 \times .7854) + (6^2 \times .7854) + \sqrt{8^2 \times .7854 \times 6^2 \times .7854}} =$$

$$\frac{288.75}{116.22} = 2.48 \text{ inches.}$$



Making a Blanking Die.

Therefore altitude = 2.48 × 3 = 7.44 inches, or 7½ inches.

To develop the pattern of the section shown in Fig. 2. Draw the vertical line OY Fig. 1. Through a point p draw the horizontal line a b, having the points a and b 4 inches on each side of the vertical line OY.

From point p lay off the point p, a distance equal to the altitude, or 7.5 inches. Through p, draw a horizontal line, and lay off the points c d, 3 inches on each side of the vertical line OY.

Draw lines from a to c and b to d and produce until they intersect the vertical line at o. With o as a centre and od and ob as radii, describe arcs df and bc. On the arc bc lay off the distance of a a^1 equal to the circumference of the top of the pail=8×3.1416=25.133 inches.

Through a and o a^1 draw the radial lines ao and o a^1 cutting the arc df at c and c^1. Then a a^1 c c^1 is the development of the conical section of the pail. As the bodies of pails are usually made of two or more sections, this development must be divided into two or more sections of equal area and shape, in this case two as shown at a a^2 c c^2.

Fig. 3 shows the allowance made for wiring the top and double seaming the

bottoms, also the side seam. This makes the total depth of pattern=7.5625 nearly +.375+.375=8.3125'' or 8 5-16'' nearly. For side seaming 3-16'' must be added to one edge, and $\frac{3}{8}$'' to the other edge or 9-32'' to each edge. The comers are then notched as shown, so that when the pail is made up, the wiring and seaming leaves a smooth, neat appearance.

Fig. 4 shows the method of building up the blanking die for the above pattern. The steel used is $1\frac{3}{4}$'' wide by $\frac{3}{4}$'' thick. By placing the blank or pattern on a flat surface the various sections of the die can be determined to the best advantage. The several pieces are fitted as shown, with tongue and groove, thus locking them firmly together. The blank is then placed on and the shape marked on the steel, which is then shaped and fitted to size; the surface of the steel is cut away on the outside, leaving a raised edge for grinding as shown at c in the sectional cut, and in Fig. 4.

After drilling for screws and dowls, the pieces are hardened and re-fitted. The bolster plate is then recessed out to a depth of about $\frac{1}{4}$'', so that the pieces fit closely together, and when screwed and dowled make a good serviceable die. The punch is built up after the same manner as the die.

LINING, SETTING AND ADJUSTING PLANERS.

By S. J. Kelley.

The first step in erecting a planer is the foundation, which should be 3 or 4 feet deep, according to the weight of the machine, and of brick or stone masonry or concrete. A template should be made to fit the bottom of the planer bed, and with holes for the bolts, which are to hold the planer. The bolts are set at least 24 inches in the foundation, with iron plates 6 inches square below them. Pipe, 2 inches in diameter, fits over the bolts, giving them a little play in order that the planer bed may be set on and the nuts tightened without bending them.

Set the plates, bolts and pipe in position and tighten the nuts so as to hold the template in position, being sure that the planer bed will be in line with the line shaft from which power is to be taken. Put in the foundation and allow it to set for at least 36 hours before placing the planer on the bed. The bed should have wedges about 3 feet apart between it and the foundation when first placed thereon.

Level the bed both across each end, lengthwise and across the corners. When this is done and the machine is in the position desired build a trench entirely around the machine and ½-in. higher than the bottom. Pour into this trench sufficient fluid concrete or cement and work it well under the sides of the machine. Allow it to set for about thirty-six hours and then tighten the bolts, after which the truth of the bed should be tested again.

The cross-rail is now tested to see if it is true with the ways. Run the rail down to within a foot of the ways and take two turns back in order to eliminate all lost motion. Place a piece of shafting in each of the ways, clamp a tool with a micrometer bar attached in the head and run the bar down so that a piece of tissue paper between it and the shafting will pull. Move the head directly across to the other way without moving the cross rail. If the same conditions hold true the cross rail lines with the ways. If it is not true face off the collar of the screw a little and test again.

If the planer has been used for some time the platen will, no doubt, be peened out of shape. This has a tendency to throw both ends down and the centre up, and makes it impossible to plane a long piece true or straight. Plane off the platen, taking a cut deep enough to remove metal all the way across. The bed will then be found to be low in the centre and high at the ends, having gone back to its natural position. A light cut and then a scrape will correct this trouble and produce a true, level bed.—Southern Machinery.

LARGEST GAS ENGINE IN CANADA.

Technical Education Dept , Halifax, N.S.
Mr. G. C. Keith, B.Sc.,

Man. Editor Canadian Machinery

Dear Sir,—The September number of Canadian Machinery has just come to hand. I wish to call your attention to what I believe to be an error in your article on the Shops of the People's Railway at Moncton, N.B., in which it is stated that they have the largest gas engine in Canada. The writer designed a gas engine plant at Edmonton, Alta., and installed the first unit of 1,000 H.P. twin tandem, Allis Gas Engine. The cylinders are 24'' in diameter and 36'' stroke, so that you see it is rather under rated. The capacity is more than twice that at the Moncton shops. Credit is due to Alberta, and to myself for the largest installation up to the present time, so far as I know.

Yours very truly,
P. R. KEELY,
Professor of Electrical Engineering.

TORONTO BRANCH A. I. E. E.

The annual meeting of the Toronto branch of the American Institute of Electrical Engineers was held in the rooms of the Engineers' Club of Toronto, on Friday evening, October 15th, when A. J. Soper, of Smith, Kerry & Chace, read a paper on "Transmission Line Calculations." The election of officers for the current year resulted as follows: Chairman, H. W. Price, School of Practical Science; vice-chairman, E. Richards; executive committee, A. L. Mudge, R. J. Clark, H. A. Moore, and F. A. Gaby. W. H. Eisenbeis, of the Canadian Westinghouse Co., 1207 Traders Bank Bldg., is secretary.

PRESIDENT OF SOO INDUSTRY.

T. J. Drummond, Montreal, has been elected president of the Lake Superior Corporation in succession to Charles D. Warren, who has been president for

T. J. DRUMMOND.

the past five years. The Lake Superior Corporation, is now free of debt and during the coming season the works at the Soo will see the extension of the steel producing plant, blast furnace capacity doubled, erection of structural steel mill, establishment of electric smelting plant, etc.

THE DOG BIT HIM.

G. D. Clewes, who sells pipe for the Montreal Rolling Mills, is a great lover of dogs, but it got him into trouble the other day at the dog show at the Toronto Exhibition, where he spent the past fortnight in charge of the M.R.M. exhibit.

Showing his affection for the dogs by patting them one by one, he had nearly made the rounds when one hungry pup took a notion to have a meal and closed his jaws on a couple of Clewes' fingers, necessitating a vitist to the exhibition hospital to get the wound cauterized. G. D. says he won't bother going to the Pasteur Institute—says he knew a man who went to the Keeley Institute and then went right back and got bitten again.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

GARDINER'S AUTOMATIC SAFETY LEVER.

The device shown in the accompanying cuts is the invention of C. M. Gardiner, Montreal, and is designed for use on power presses and similar machines. The fundamental use is in preventing the accidental starting of a power press, while being set up. Another aim has been to overcome the more or less convulsive movement, when such a machine is started.

The device is manufactured in Canada exclusively by the Crescent Machine Co., Ltd., 15 Dalhousie Street, Montreal.

FIG. 1

Fig. 1.—Lever in Safety Position. To Start a Machine the Slide A, to which is Attached the Pedal C, is Pushed Forward Releasing it From the Locking Device B, the Lever D can then be Pushed Downward. When the Foot is Removed from the Pedal the Lever is Brought Back by the Spring E, and the Slide A is pushed Into the Safety Position by Spring G.

The lever requires a double movement—thought and actions combined—to begin operation. This is accomplished by no loss of time.

Fig. 1 shows the lever in the safety position. To start a machine the slide A, to which is attached the pedal C, is pushed forward, releasing it from the locking device B, the lever D can then be pushed downward. When the foot is removed from the pedal the lever is brought back to the spring E, and the slide A is pushed into the safety position by spring G.

In Fig. 2 the lever is in the down position and shows the lock clearly. In some factories the foot lever has been done away with to some extent and hand levers are used, the device being applicable to this method of starting and stopping also. The lever is so constructed that is is adaptable to use in shifting belts or clutches, etc.

SPEED INDICATOR.

The B. & S. Speed Indicator registers on either side, a distinct feature. One side is used for ascertaining the velocity of shafts and spindles running in one direction; the other side for determining the speed of shafts and spindles running in the opposite direction. Confusion and errors that arise where all readings are taken from one dial are thus avoided.

FIG. 2

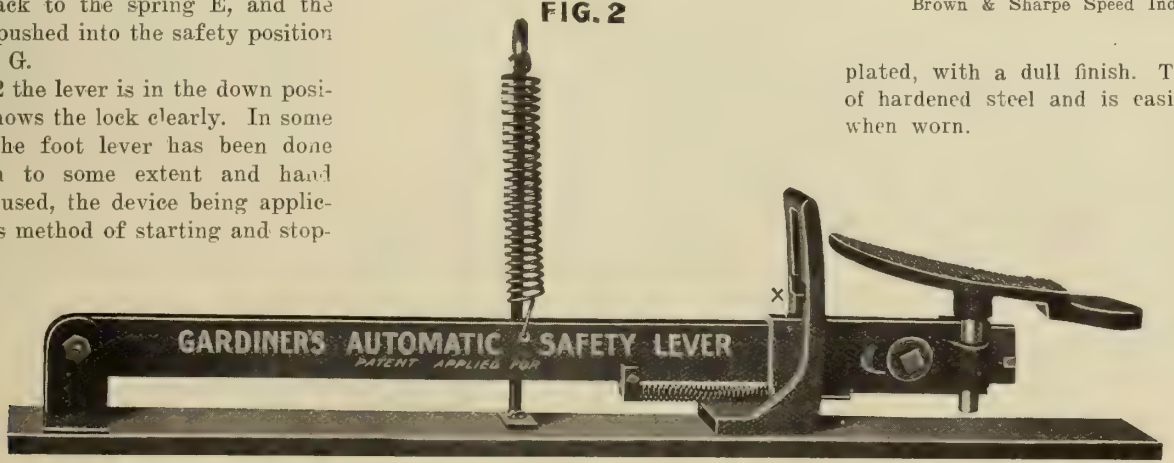


Fig 2.—Lever in Down Position and Showing the Lock Clearly. In Some Factories the Foot Lever has been Done Away with to Some extent and Hand Levers are Used, the Device is Applicable to this Method of Starting and Stopping Also. In Fact this Device can be Used to Shift Belts, Clutches or Anything Similar.

The indicator registers revolutions in units, tens and hundreds.

A small knurled wheel on the side of the case provides for quickly readjusting the tools after a reading has been taken. This wheel when turned reverts the disk that indexes 100 back to the starting point, a most desirable feature where a series of readings is to be taken.

The indicator is small, light and convenient to handle. The working mechanism is encased, and protected from dirt and injury. The case is heavily nickel-

Brown & Sharpe Speed Indicator.

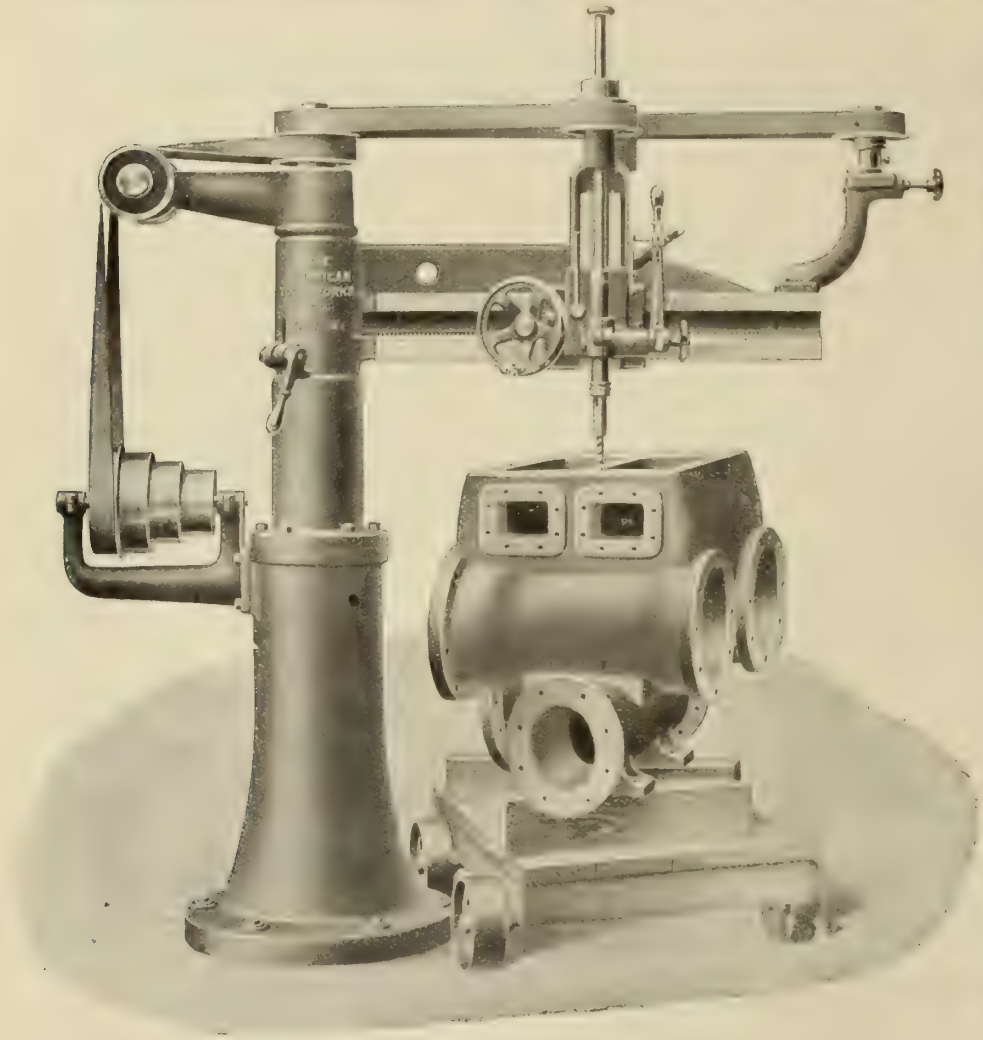
plated, with a dull finish. The point is of hardened steel and is easily removed when worn.

Each indicator is provided with a polished wooden handle. It is made by Brown & Sharpe, Providence, R. I.

HIGH SPEED SENSITIVE DRILL

The accompanying illustration shows a further development of the drill described in April and October issues of Canadian Machinery. The one shown in this (November) issue shows the 3-ft size mounted on a "pedestal base," which is not equipped with a box table. This type of machine, is particularly convenient in the drilling of a multiplicity of holes in work, which can be conveniently moved on a truck or otherwise beneath the spindle of the machine. This does away with considerable handling of the work and permits of it being moved from the drilling department along to the next department with the least possible delay.

This machine is adapted to the work in automobile and gas engine manufacturing plants, and it is due to their request that this particular type of machine was designed. The arm is easily swung to the position desired, and the head readily set at any point along the arm to locate the hole desired. Where drilling with a jig is practiced, the work is accomplished very rapidly. A spindle speed of 900 r.p.m. is available, although this may be increased or diminished to suit special requirements. As all the bearings are of the "ball bearing" type, the drill will stand up to a speed of 2,000 r.p.m. without sign of distress, but of course no twist drill will hold an edge at such a speed.



High Speed Sensitive Drill.

This drill is manufactured by the American Tool Works Co., Cincinnati.

A NEW BALANCING TOOL.

The Rockford Tool Co., Rockford, Ill., have recently put on the market a new tool for use in balancing pulleys, cones, armatures, etc. As will be seen from the accompanying illustration the tool is simply and substantially constructed. The rotating discs are hardened and ground and run in ball bearings, which makes the tool very sensitive.

The Twentieth Century Balancing Tool.

It is made in two sizes. Size 1 is intended to set on the bench and will balance a pulley up to 22 inches in diameter. Size 2 is for use on the floor and will balance any work up to 46 inches in diameter. Williams & Wilson, Montreal are Eastern Canadian agents for this tool.

A GRAVITY VISE FOR DRILL PRESS WORK.

This vise works on a principle which is as old or older than the history of machinery. It is the application of this principle to a work holder which is the new feature claimed.

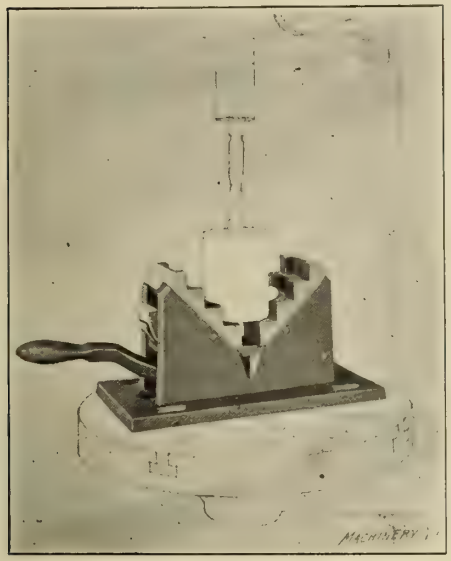
As seen in the accompanying illustration the base of the vise is essentially two planes inclined at 45 degrees to the horizontal, making 90 degrees between them. On these planes slide the two jaws which are raised by means of the handle, but which take their holding position and maintain their grip on the work by virtue of gravity augmented by the pressure of the drill. In this respect the vise is automatic.

When the pressure on the drill is decreased at the end of a hole the vise is held against turning by a slight pressure on the handle. Slots are provided for bolts, but except in extreme cases they are not necessary. In many cases it is claimed that this vise will replace a jig since special shapes are held as firmly as those of regular dimensions.

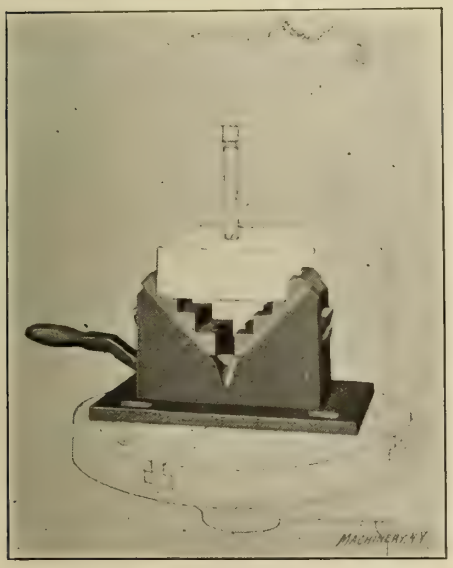
There are no springs about the mechanical details of the vise and but

five different parts make up the whole. It is very compact, measuring 7½x14 inches, and has a capacity of from ½ inch or less to 8 inches, rounds being held securely by means of the depression in the centre of each size of jaw.

The vise is made by the Mitchell-Parks Manufacturing Co., St. Louis, Mo., and is handled in Canada exclusively by Alexander Gibb, 13 St. John St., Montreal.



Gravity Vice Gripping Round Work.



Gravity Vice Gripping Square Work.

NEW HYDRO-CARBON BURNER.

Wherever Pintsch Gas is manufactured for railroads, there is a great quantity of refuse which is commercially called Hydro-Carbon. The accompanying r productions illustrate a burner in actual operation with Hydro-Carbon. Fig. 1 a locomotive boiler heating corners, Fig. 2 heating a locomotive frame for straightening. This burner obtains a very clear flame.

The construction of this machine is very simple and absolutely reliable, and can be handled safely by any workman. An important feature of this burner is, that it can be changed with a slight alteration so that any liquid fuel can be successfully used with same.

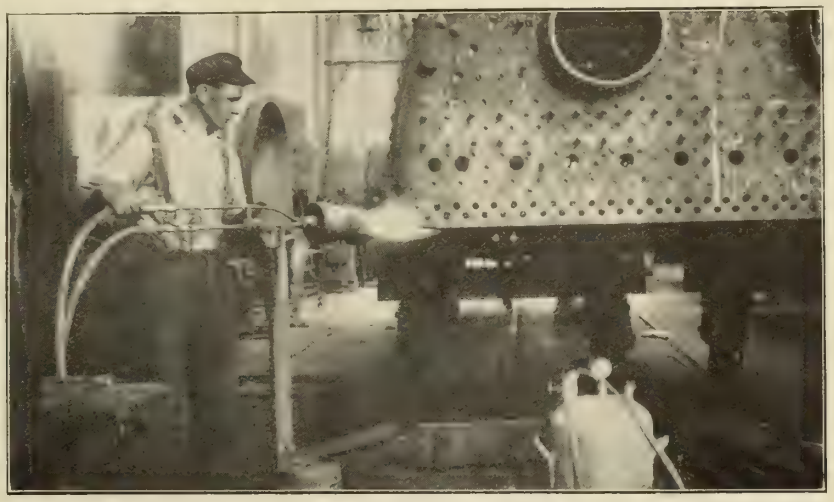


Fig. 1.—Hauck Patent Burner Used for Boiler Work.

This machine is adapted for constructing and repairing steel cars, straightening and welding engine frames. It can be successfully used for pre-heating in connection with thermit welding, constructing and repairing boilers, brazing and various other heating operations.

The manufacturers are the Hauck Manufacturing Co., of 140 Cedar St., New York City.

HARDENING STEEL.

The following is a description of a comparative test made under normal conditions in the shops of the Chicago & Alton R.R., Bloomington, Ill. Two pieces of steel were cut from the same bar 9 x 1 1¾ srock. They were forged to shape and ground by the same blacksmith, who also hardened one of these tools knowing that it was to be intended for a test. The other tool was hardened by the demonstrator in a bath prepared with "Kalux." This one was heated to the same heat as the other, but only the cutting point being hardened and that left entirely hard without drawing to color, the remainder of the tool being simply cooled off to permit of handling, there not being sufficient heat left to harden it. A drill arbor which it was desired to reduce in diameter was then placed in a lathe and the squaring off and starting cut made with another tool, thus permitting of the two test tools being used under absolutely uniform conditions as to speed, feed and class of work done. At the conclusion of the tests it was shown that the tool hardened in the hardening bath prepared with "Kalux" had done 200 p.c. more work than the other hardened by the ordinary method, and after being ground three times it still showed the same proportionate gain in efficiency, thus clearly showing that "Kalux" does not simply case harden.

Fig. 2.—Hauck Patent Burner Heating Locomotive Frames.

It is expected that tests with high speed steels will be carried on at Toronto University at an early date, to test the qualities of "Kalux" hardening solution.

Vol. V. November, 1909 No. 11

TECHNICAL EDUCATION.

In this issue we publish a description of the apprenticeship system in use in the Angus shops, Montreal Perhaps the most complete systems in use in Canada are those of the C.P.R. and G.T.R., the educational systems including all the railroad shops of these two companies. While some manufacturers have been slow to recognize the value of time spent in educating their apprentices and the wheels of the Provincial Governments have been slow to revolve in the carrying out of efficient industrial educational systems, these two great railroads have developed and applied their educational scheme all over their systems, wherever their shops are erected. Not only has the apprentice been taught along mechanical lines but railroad Y. M. C. A.'s have been built where young men might attend to their physical needs and feel the elevating influence of that branch of a man's education taken up by the Y.M.C.A.

It would be well for some of our Provincial Governments to take a lesson from the railroads. Nova Scotia is carrying out a policy and Quebec has a scheme under way, but there has been no united definite educational system evolved which will place our industrial life on a level with that of Germany and some other countries, where the artisan is carefully trained for his life's work.

Several systems for industrial education have been reviewed in Canadian Machinery. We have recognized the rapid development of manufacturing interests in our country and the problem of securing an adequate supply of skilled labor. The United States has had a remarkable record of industrial enterprise on account of its advantages as to the cost of raw material, but Germany has to a large extent offset those advantages by training the workmen.

In Canada we have the resources and we can have well trained mechanics if the governments will only take hold of the problem as they should. Then, with both these advantages, Canada will become an industrially greater nation than those countries to which we have referred. We need more intelligent artisans, and industrial education is the key to the situation.

IMPORTANCE OF SIGNS.

"Keep your name before the public" is a motto which should be hung up in the mind of every business man.

A trip through the country impresses one with the absence of signs used by manufacturers—a condition of affairs which can and should be rectified without delay.

A large number of manufacturing plants are observed with not a sign to show the name of the company or the products turned out. Signs can be procured at little expense, and every manufacturer should have one showing the name of the company in the most conspicuous place possible. They are clearly a good advertisement, and their importance must not be overlooked.

SECRET COMMISSIONS ACT.

There seems to be doubts in the minds of some as to the application of the Secret Commissions Act. It was thought that this act referred only to the civil service. While it is a copy of the English act and was introduced on account of the secret rebates exposed in the investigation of the marine department of the civil service in one of the provinces, for the purpose of preventing such occurrences in future, we understand it was first passed in England to prevent buyers going to London and getting a secret commission from the houses they bought from while in the employ of the houses for whom they bought.

Manufacturers will be interested in knowing that the Secret Commissions Act refers to ordinary business transactions as well as to the civil service.

The following letter from the Clerk of the Parliaments, Ottawa, gives a brief history of the bill:

"It was introduced into the Commons on 1st February, 1909. Passed by House of Commons, 23rd February; received by the Senate on 2nd March; amended by

Senate on 24th March ; returned to Senate with amendments agreed to 21st April ; assented to 19th May."

The amendment referred to is the principal feature of the bill which makes it general in its application. It reads :

> Every person who is a party or knowingly privy to any offence under this act shall be guilty of such offence and shall be liable upon conviction to punishment hereinbefore provided for by this section.

This, according to the best of authorities makes the traveler or wholesale house guilty of a breach of the act.

TRAVEL ON YOUR OWN POWER.

The force that is going to carry you to your goal is coiled up inside you—in your energy, your pluck, your grit, your determination, your originality, your character, says Dr. Marden, in an article to young men on "The Precedent Breaker." Further, he says :

"The sooner you become disillusioned as to getting any great assistance outside of yourself, and fall back upon your own inherent force, the better.

"It is a pitiable thing to go through the world borrowing other people's ideas, plans, methods ; other people's judgment—running to this one and that for advice—never developing your own power, independence, self-reliance.

"Originality is force, life ; imitation is weakness, death. There is nothing else which will kill the creative faculty and paralyze growth more quickly than imitating others, following precedent in everything, and doing everything in the same old way."

UPWARD MARCH OF CANADA'S TRADE.

The total trade of Canada for the first half of the current fiscal year has been $304,390,088, an increase of $43,221,436, or about seventeen per cent., as compared with the corresponding six months of 1908, Imports, exclusive of coin and bullion, have totalled $172,373,148, an increase of $35,727,931, or over twenty per cent. The increase in customs revenue has been $5,827,658.

The total of exports of domestic products for the half year has been $120,484,255, an increase of $10,375,204. Exports of foreign produce have totalled $9,187,371, an increase of $1,683,464.

Last year during the six months from April to September inclusive Canada imported coin and bullion to the value of $5,816,437. This year for the same period the amount was only $827,284.

For September the imports totalled $30,339,930, an increase of $6,161,155 over September of last year. Exports of domestic products for the month totalled $23,548,330, an increase of $3,554,960. The total trade for the month was $56,601,753, an increase of $7,091,184, or over fourteen per cent. The trade of the Dominion now is equal to the record figures of 1907.

The financial statement of the Dominion for the first half of the present fiscal year ending Sept. 30, shows an increase of $6,526,297 in revenue as compared with the first six months of 1908-09. On the other hand, the expenditure on consolidated fund account decreased by $1,098,335, and on capital account by $802,582. For September alone the increase in revenue was $1,570,709, while the total expenditure decreased, as compared with September of last year, by $2,584,275. Judging by the figures of revenue and expenditure for the first half of the year, the surplus of receipts over ordinary expenditure at the close of the year should be the largest on record.

The main figures for the month and for the six months are as follows :—Revenue—September, $8,853,659; six months, $47,353,819. Expenditure on consolidated fund account—September, $5,210,213 ; six months, $31,563,393. Expenditure on capital account—September, $3,967,321 ; six months, $13,213,063. The net debt of the Dominion on September 30th, was $320,698,464.

Canal traffic returns since the opening of the season show an increase of eleven million tons over the same period last year. The Soo Canal alone shows an increase of ten and a half millions. The Trent Canal alone shows a decrease in traffic.

AN EXPORT BUREAU.

An export bureau is being established by the Trade and Commerce Department at Ottawa, for the purpose of encouraging and facilitating export trade. It is proposed to establish a list of Canadian manufacturers and others who desire to extend their trade to Great Britain and foreign markets. Circulars are being sent throughout Canada inviting such firms to send in their names and lists of articles they are in a position to sell abroad. With this information the Department of Trade and Commerce will be in a position to supply it to its agents, of which it has six in Great Britain, one in France, two in South Africa, one in Mexico, one in the West Indies, two in Australia, one in China, one in Japan, one in Holland, and one in Newfoundland.

Nothing of this kind has ever before been attempted in Canada, and it will entail great labor in the department in indexing the information to make it readily available when required. But it is to be hoped that it can be made the basis of a permanent list which will be immediately available at all times in the advancement of the foreign trade and commerce of Canada. The department desires the name of every exporter from the Atlantic to the Pacific, with a detailed list of the goods they are in a position to sell abroad.

BOILERS REQUIRE CARE.

"We find that John Pickering came to his death by being scalded by water escaping from a boiler not properly blown off, and the D. B. Martin Co. be censured. It is our opinion that the engineer should have seen that the water was all out of the boiler."

The foregoing verdict was brought in at the Morgue, Toronto, Sept. 29, 1090, by a jury under Coroner Hopkins, touching the death of John Pickering, an employe of the D. B. Martin Abattoir, who died in the Western hospital from injuries received by the blowing out of a hot water pipe. Boilers are not play toys. They require careful handling. You cannot play with a match in a powder magazine. The result will be disastrous.

Canadian Machinery has, on many occasions, drawn the attention of its readers to the danger of unprotected machinery and belting. A fatal accident is reported from Berlin where a young man in the prime of life was drawn into the shafting by a belt making two hundred revolutions per minute. Proprietors, superintendents, foremen and workmen should unite in protecting all dangerous belting and machinery.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

NEW ADDRESS OF A.B.F.A. SECRETARY.

W. M. Corse, secretary and treasurer of the American Brass Founders' Association, has accepted the position of works manager of the Lumen Bearing Co., Buffalo, manufacturer of Lumen bronze, manganese bronze, aluminum castings, etc. In future all communications from members of the American Brass Founders' Association should be addressed to Mr. Corse in care of the Lumen Bearing Co.

PRODUCTION OF PATTERNS FOR LIGHT CASTINGS.*

By W. H. Sherburn.

The general term "light castings" covers a very wide range, and, therefore, we shall confine our consideration of this

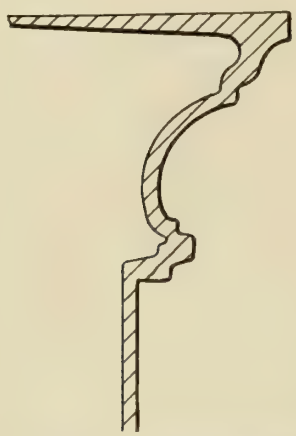

Fig. 1.—Section of Cast Iron Frieze, Showing Inequalities of Metal Thickness.

subject to one metal and to one branch, which I will term the domestic branch. This deals largely with the fireplace and its furnishings. The range of patterns is wide and varies from the simplest flat plate, which a shop boy can make, to the most elaborately modeled design. Just as the artistic finish of the pattern has so wide a range, so do the materials and methods by which they are produced. Wood, for all the plainer patterns, is generally the material used, but for the patterns to which I refer, wood takes a secondary position, except as a backing and boarding for the patterns made in other materials.

* From a paper presented at the Birmingham Convention of the British Foundrymen's Association.

In producing this work we must have not only co-operation, but sympathy between the designer, patternmaker and molder. The molder should have a wide

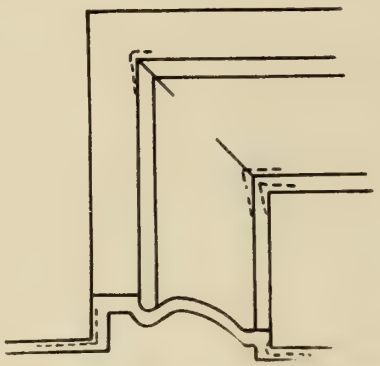

Fig. 2.—Corner of Cast Iron Panel Molding Showing the Effect of Repeated Casting. Three Shrinkages—Original Pattern, Pattern Plate and Casting.

knowledge of molding methods and should know something about patternmaking. The patternmaker should have a knowledge of molding methods and the action of metals in cooling. He should also know something about design and ornamentation. I am giving the patternmaker rather a high mark to aim at, but he should attempt it. The designer must keep in view the essential purpose of the pattern he is designing. He should know the best form in which it can be made without destroying its usefulness in any way. He must know all about designing, a great deal about patternmaking, and should have some knowledge about molding.

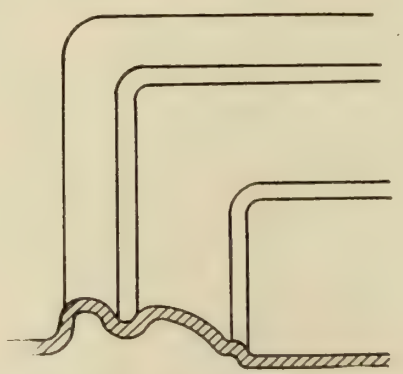

Fig. 3.—Corner of Panel Properly Designed.

Unfortunately, this is not frequently obtained in the light castings trade. Very often the designs have been purchased from an artist who has known practically nothing of the technicality of cast iron. The designer naturally objects to the patternmaker taking liberties with his work, but, unfortunately, they must frequently be changed before they can be reproduced.

Occasionally, a frieze, shown in Fig. 1, will be received from the designer. This is an extremely difficult section to cast straight and the designer, without a knowledge of practical work, will occasionally provide for right-angle edges and deep sections. Unless modified by the patternmaker trouble will follow in the foundry. The outer edge will cool rapidly, while the heavy section will retain its heat and strains will result.

In constructing a panel, the designer will occasionally furnish a section similar to the one shown in Fig. 2. Such a pattern will have to be cast three times

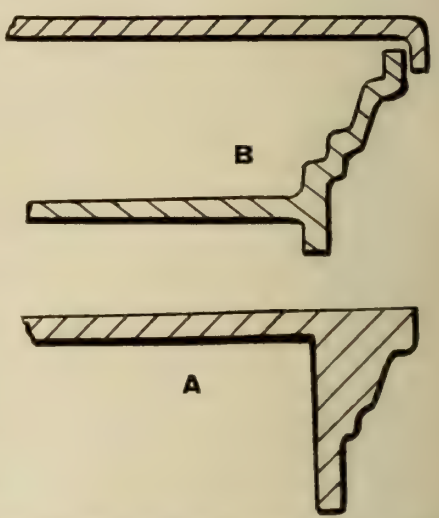

Fig. 4.—Cast Iron Model Shelves—Good and Bad Design.

to secure the master pattern, a working pattern or plate, and ultimately the casting. Plate molding exaggerates all the difficulties in regard to bends, twists, and shrinkage. A square mitre or a right-angle in casting iron, is a point of weakness. The design begins to loose its form at the mitres in the direction shown in Fig. 2, and when ultimately the casting is obtained from the plate, the mitres sink and lose their shape. The designer should have filed the inner angles of his panel without necessarily loosing any of the artistic effects. This suggested change in position is shown in Fig. 3.

A mantel shelf edge is shown in Fig. 4, and to make this casting in one piece it would be necessary to have a heavy

edge on a light plate, as shown at A, and what would transpire if it were made in this way would not be difficult to imagine. A more satisfactory method of constructing this pattern would necessitate the production of two castings, instead of one, the top plate forming part of the edge, and the bottom plate the other half.

If the pattern is highly ornamented, the designer makes his model in clay, and from this he casts a mold in plaster and usually overlays the plaster mold with a thickness of clay equal to the thickness of the finished casting. The back mold is then cast in plaster and when set the molds are separated, the clay removed and the intervening space is filled with wax. From this wax model a casting can be made in soft metal, which is then cleaned and chased, which is used as a master pattern.

Methods differ greatly in different districts. There used to be a Scotch method and an English method of patternmaking, each of them, of course, being the best. The English method is what we may call "the more artistic" method. The Scotch we may call the "scientific" method. Scottish patternmakers always paid great attention to their lines and the uniformity of their thicknesses. The English patternmakers look more to the artistic and were very proud of their work from an artistic standpoint. Both of these methods are correct to an extent, and during the last fifteen years there has been a blending of these two, to the advantage of both.

ECONOMICAL METHOD OF HEATING STEEL USING STOKERS.

By W. Almond Hare, B.A., Sc.

The selection of the most economical means for heating steel in a manufacturer's plant, presents a problem that to the uninitiated is one of considerable obscurity. Unfortunately the art has been shrouded in a certain amount of mystery and with the various claims put forth by manufacturers of different systems it is not easy for those without a practical experience in this work to select the most economical system.

When the problem of this kind presents itself, the main feature which the purchaser must keep steadily before him is the cost of operation. In material of this kind the depreciation of the metal parts is not excessive and that of the brickwork does not differ materially whatever system is selected, so that the first cost within reason does not exert a very great influence on the problem.

The selection of the system is really a selection of the kind of fuel. In this we have the following principal fuels to choose from :

Large Work— Continuous or intermittent. (Billets, skelp, slabs, large plates).	Natural gas Producer gas, regenerative type Lump Coal, reverbatory type. (hand fired.) Slack Coal, reverbatory type (stoker fired.)
Medium Work— Locomotive and other forgings, bolts, nuts, rivets, plates, spikes, axles, rods, small billets, springs, etc., etc.	Natural gas Producer gas Reverbatory. Anthracite coal " Lump coal, hand fired " Slack coal, stoker fired " Crude or fuel oil.
Small Work— Rivet heating for steel workers, tool making, small forging or welding, etc.	Natural gas Producer gas Anthracite coal Crude or fuel oil Slack coal, stoker fired.

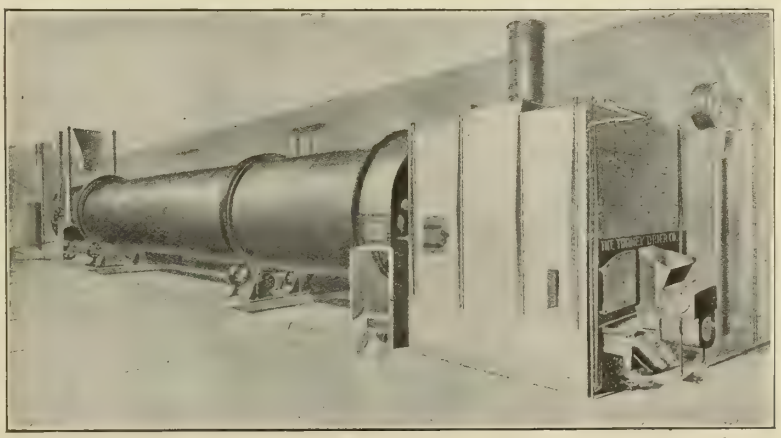
Natural Gas.

The factor of location governs the selection of this fuel, as the cost of piping the gas to any great distance precludes its adoption. It is perhaps the cleanest and handiest of all fuel, but after all the main fact of the matter, from the manufacturer's standpoint, is that of operating cost, and therefore one is not justified in using natural gas unless by doing so the cost of heating the steel can be reduced below that of some other method. In some industries, it is important that no dust or dirt be allowed in the air, owing to possible injury to delicate machinery, and in these instances, which are, however, rare, it is best to burn such fuels as gas or oil as depreciation is of great account, Where, however, there are no such restrictions as these, as would be the case in almost all of the manufacturing industries, natural gas will be found expensive unless it can be obtained at a very low figure.

In ordinary types of furnaces for medium work the allowable rate to pay for natural gas per 1,000 cu. feet can be found by the formula :

$$r = .035\ c.$$

Where r equals rate per 1,000 ft. for gas and c equals cost per ton of a good gas slack coal delivered in the works. Where good slack coal can be obtained of a quality known as "Pittsburg gas slack," with a calorific value of 13,800 B.t.u. per pound for a price in the neighborhood of $3 per ton, natural gas at 10 cents per 1,000 cu. ft. offers no inducement in preference, provided, of course, that furnaces adaptable in each case are installed, and where the work is moderately large. Gas furnaces for very small work can be made more economical than coal furnaces, and this is true even if the price of gas exceeds the figure calculated by the above formula by reason of the fact that the flame can be a little better localized and less heat is dissipated in radiation, etc. In larger furnaces, heating say more than 1,000 lbs. of steel per day, coal furnaces burning soft slack coal and fired automatically by mechanical stokers will show a higher economy in operation.



Rotary Dryer, Using Stokers and Burning Soft Slack Coal.

A recent test conducted by a large rolling mill in Pennsylvania showed a

very considerable saving for the stoker fired furnace over natural gas at 10 cents per 1,000 cubic feet.

This furnace was designed and built for gas and was altered partially for the application of the stokers. If the furnace had been designed originally to accommodate the stokers the coal consumption would no doubt have been considerably below 635 lbs. per ton, as the economy depends to a great extent on the design of the furnace. Even with the very poor quality of coal burned, the price per ton of the coal could have been as high as $2.50 before the cost of heating one ton of steel would have been as high as with gas at 10 cents per thousand feet.

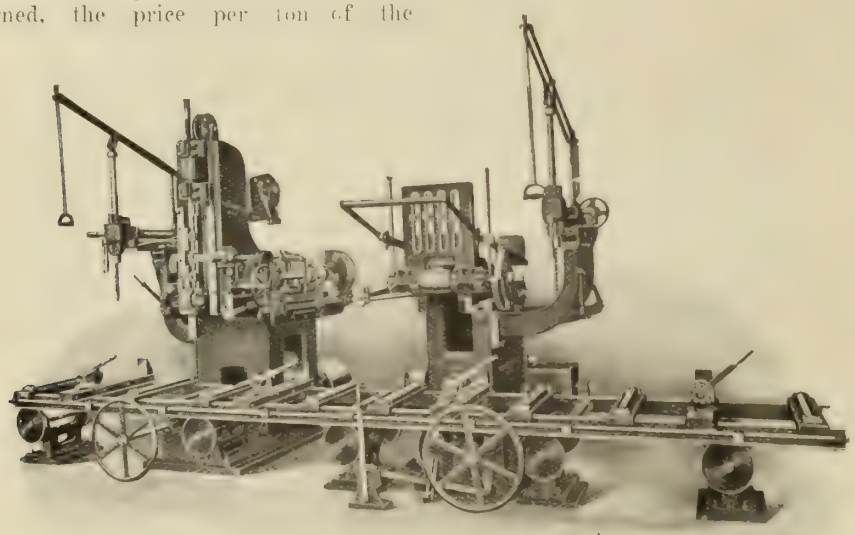
In the December issue further figures will be given and the whole subject of heating steel will be entered into. As this is of vital interest to practically every manufacturer of steel products, it should be followed with great interest.

Test of Slack Coal Using Stokers and Natural Gas.

Date of test—Week ending Feb. 1, 1908.	Coal.	Gas.
Total steel heated	200.8 tons.	
Total coal burned	127,640 lbs.	
Total gas burned		16,064,000 cu. ft.
Coal burned per ton of steel	635.65 lbs.	
Gas burned per ton of steel		8,000 cu. ft.
Cost of coal per ton	$1.35	
Cost of gas per M. cu. ft.		$0.10
Cost of coal per ton of steel	$0.43	
Cost of gas per ton of steel		$0.80
Saving of coal over gas	37 per cent.	
Weekly cost using gas		$160.64
Weekly cost using coal	$86.17	
Weekly saving in favor of coal	$74.47	
Additional weekly charges, interest depreciation, etc.	$3.87	
Net weekly saving	$70.60	
Net yearly saving (50 weeks)	$3,570.00	

TOOL FOR CAR AND BRIDGE CONSTRUCTION.

There has been a long felt need among car and bridge constructors for a machine that would mortise and gain heavy material without moving it from one machine to another—thereby saving a considerable amount of time and labor. The J. A. Fay & Egan Co., 362-382 W. Front St., Cincinnati, O., introduced a machine of this kind to the market.



Combination No. 214 Vert. Hollow Chisel Mortiser and No. 150 Aut. Car Gainer.

The manufacturers have constructed this machine by placing their No. 214 vertical hollow chisel mortiser and No. 150 automatic car gainer side by side with a single traveling table. This combination machine has capacity for timbers up to 20 inches thick and 24 inches wide.

The company have just issued a circular showing a large half-tone photograph of this machine together with detailed description which they are mailing to those sending a postal for it.

RECORD ENGINE REPAIR WORK.

The other day some ambitious C. P. R. machinists at Winnipeg, showed anxiety to test their abilities as skilled workmen against the workmen on United States railways. It took the shape of the rapidity in which was what is known as "Number One Repairs" could be completed. The record for the American repair shops was seven days on a first-class engine. Satisfied that they could leave their cousins in the shade, they proceeded on a recent Monday, at 6 a.m., on one of the big freight engines. From the very start there was no doubt as to the result, and in two and a half days the full repairs were completed and the engine sent off to Brandon. This record smashes any record extant by four days and a half, putting the American record, not only in the shade, but in vertiable darkness. Two gangs were kept at work, one during the day and the other at night. The men were particularly jubilant.

MARK TWAIN ON THE VALUE OF ADVERTISING.

"It pays to advertise," said Mark Twain at an advertisement writers' banquet. "When I was editing the "Virginia City Enterprise," writing copy one day and mining the next, I tried to force this truth in many ways.

"A superstitious subscriber once wrote and said he had found a spider on his paper. Was this good or bad luck? I wrote to him in our 'Answers to Correspondents' column as follows:

" 'Old Subscriber—The finding of a spider in your copy was neither good luck nor bad. The spider was merely looking over our pages to find out what merchant was not advertising, so that it could spin its web across his door and lead a free and undisturbed existence forever after.' "

A. B. Walker, formerly of Canadian Fairbanks, Toronto, has accepted a position in the machine tool department of H. W. Petrie, Toronto.

H. A. Harrison, formerly of the Milroy-Harrison Co., has taken a position as machinery salesman with the Canadian Fairbanks Co., Toronto.

The man who thinks that his goods will sell themselves, like the girl who expects a sweetheart to look her up, usually has a lot to say about unjust competition.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

The M.C.R. anticipate a busy winter in their St. Thomas shops.

Work has been started on the new I.C.R. repair shops at St. John.

The Cockshutt Plow Co., Brantford, are making additions to their plant.

The Northern Engineering Co., Fort William, will build a second additional warehouse.

The General Shoe and Machinery Co., Quebec, propose erecting a branch factory at Hull.

The B. C. Electric Co. will erect a second car shop at New Westminster for the repair of cars.

The Dominion Wrought Iron Wheel Works, Orillia, is erecting a new building for warehouse purposes.

The Burton Saw Works have secured a site of ten acres at Burnaby, and will move their plant there from Vancouver.

The Moose Jaw Stove Co. is a new concern, which will make a straw-burning stove. A plant will be built at Moose Jaw.

The Atikokan Iron Co., Port Arthur, will operate their plant all winter, having made arrangements to sell their output in the east.

The furnaces at the Granby smelter are being further enlarged to smelt about 4,500 tons of ore per day and manufacture 40,000,000 pounds of copper per annum.

Spencer & Halsey, makers of gasoline engines Montreal, have dissolved partnership; and a new company has been formed under the title Harry W. Spencer & Co.

The Irondale Steel Co., of Irondale, Wash., intend to locate a plant, similar to the one at Irondale, somewhere in the Province of British Columbia, on a site to be selected.

The Vancouver Engineering Works has installed a new complete plant for the production of steel castings, having adopted the surface blown bessemer process for making the steel.

The Corrugated Pipe Co., an American concern, manufacturing corrugated steel pipes for culverts and drainage purposes, is seeking a site in Ontario, and may locate at Lindsay.

D. D. Mann is authority for the statement that the Canadian Northern Railway will erect its general repair and construction shops in Toronto, and that they will employ between 2,500 and 4,000.

A new building going up at Bridgeburg will house the Ferro Steel Co., of Cleveland, Ohio, and the Tuttle & Bailey Mfg. Co., of New York. The latter company will manufacture steel registers.

Negotiations are in progress whereby it is expected that the Canadian Gas Power & Launches of Toronto and Chatham, will dispose of their Chatham plant, formerly the Defiance Iron Works, to a new firm.

The Canadian Graving Dock and Shipbuilding Co. intend to erect a shipbuilding plant in Canada and are asking information about Sydney, C.B., and what inducements would be offered the company to locate there.

John McKechnie has purchased the machine shop of W. A. Spence, rear of 18 Millstone Lane, Toronto, where he will make special machinery, dies, models, tools, etc., in addition to doing general repair work.

The new tube works of the Page-Hersey Iron and Tube Co., Welland, are now in the process of erection. An inch mill in addition to the buildings now in course of construction, will also be built. About 500 hands will be employed.

Frederick E. Seedering, of New York, who represents a well-known eastern American gasoline engine manufactory and yacht building concern, is interested in a new boat-building and marine engine industry which proposes to locate at Vancouver.

Work is now being rushed on the new boiler and structural steel works which the Doty Engine Works is erecting at Goderich. It is intended that the boiler works will be completed by December, and that when equipped fifty hands will be employed.

A machine and locomotive works to cost $300,000 will be running in Vancouver within six months, according to the plans of the Sumner Iron Works Co., of Everett, Wash., whose officials have closed a deal whereby they have acquired 30 acres of land in Burnaby.

The Vancouver Docks, Ltd., at a recent meeting of the Point Grey council guaranteed the expenditure of $1,500,000 in seven years upon the receiving of the charter to build a breakwater and dock in English Bay. The breakwater will be about two miles long.

The Automatic Tool Co., Toronto, has made an assignment for the benefit of the creditors. The assets of the concern are about $1,600, and the liabilities about $600. The company had been in business only a few months and prospects seemed bright, when the financial pinch came.

A great structural steel works and shipbuilding yard and drydocks in which will be built 600-foot steel leviathans for the traffic of the great lakes are two industrial plants proposed to be built in Toronto within the next year of two, by the men who now constitute the Polson Iron Works.

H. S. Holt, president of the Montreal Light, Heat and Power Co., and F. W. Thompson, of Montreal, vice-president and general manager of the Ogilvie Flour Mills Co., are interested in a wire and iron rolling mill proposed to be built at Fort William and on which $500,000 is expected to bt spent.

The C.P.R. has closed its shops at Farnham, Que. About 400 men were employed there and $20,000 at least is paid in monthly wages. It is understood that the employes will all be taken on in the Angus shops, Montreal. At C.P.R. headquarters it was explained that the change was in the interest of economy and efficiency.

The Vulcan Boiler Works, until lately located at New Westminstr, will be moved to a new site on the North Arm of the Fraser river and the plant and buildings will be greatly enlarged to meet the increased business. The present site of the Vulcan Boiler Works has been purchased by the B. C. Electric Railway Co. with the intention of erecting new freight sheds thereon.

The Vancouver Engineering Works has installed a plant that will enable the company to give better satisfaction to those who use mining, sawmilling and manufacturing machinery, and who desire something stronger than cast iron for certain uses. Special attention will be given to logging machinery, and a fully equipped chemical laboratory will be maintained.

It is estimated that the proposed dry-dock for Owen Sound will cost $225,000 and that the town council, will vote substantial financial aid to the scheme. Plans will be sent to Ottawa with a view of having the undertaking subsidized by the Dominion Government. The Polsons of Toronto, who formerly operated the steel ship-building plant there, have offered to enter into a working arrangement with the new concern.

McDougall & Jenkins, engineers, are making progress with the work of establishing their works on their new property at North Vancouver. The machine and boiler shop will be the first to be erected. The machinery will consist of the entire plant which which has been in use by McDougall & Jenkins, at Victoria, together with $10,000 worth of new machinery, recently ordered from Chicago. It is expected that the works will be in operation in three months.

The Valleyfield Iron Works, Valleyfield, P. Q., have added a new department to their manufacturing. They have only recently commenced the making of aluminum castings under the supervision of Mr. A. Moore, who has had many years' experience in his branch of foundry work. The company has installed the very latest equipment for this sort of work and are prepared to give very prompt delivery on aluminum castings. The head office is at 324 W. Craig St., Montreal, in charge of Mr. Siegfried Schopftocher.

Without a dissenting vote, the rate payers of Chippewa recently passed a by-law granting exemption for ten years and a fixed assessment of $25,000 for a further ten years to the Electrical Furnace Products Co., of Pittsburg. The company has purchased nineteen acres of land and have already begun the erection of a $50,000 steel plant to manufacture structural steel. The plant will be in operation before spring. The company will employ about sixty men to commence with.

Municipal Undertakings.

A $17,000 waterworks system is suggested for Carlyle, Sask.

Excavation work has been commenced on Cobalt's waterworks system.

Armstrong, B. C., ratepayers favor spending $10,000 on improving the water and light services.

Portage la Prairie ratepayers will shortly vote on a by-law to raise $17,500 for waterworks.

Fort William has accepted Engineer Galt's plans for the new waterworks intake pipe to cost $30,000.

New Westminster's waterworks intake pipe will be enlarged to supply Coquitlam and Port Moody with water.

A by-law has been passed at Brockville to issue $4,050 debentures for the purchase of road-making machinery.

The contract for excavation for water mains in St. John, N.B., was awarded to Robert Short and Peter Arsenault.

Summerland, B.C., council proposes to buy the domestic and irrigation water systems of the Summerland Development Co.

The by-law authorizing the installation of a $25,000 municipal water system has been passed by the Trail, B.C. ratepayers.

Wells & Emmerson received the contract for 3,500 feet of 20-inch spiral rivetted pipe for Port Arthur's waterworks intake pipe.

The proposed water systems, to embrace the municipalities of Burnaby, South Vancouver and Point Grey, are estimated to cost $500,000.

The Perth, Ont., town council has awarded the contract for sewer work to Mr. Haggarty, of Brockville, Ont., for the sum of $3,400.

The municipality of St. Pierre, Montreal, has

awarded the contract for the laying of sewers for the amount of $61,000 to J. Henault.

At a recent meeting of the St. Catharines city council the necessity of another waterworks main from the reservoir to the city was discussed.

The Ottawa city council almost unanimously passed a by-law sanctioning the purchase of a site for a civic incinerator plant at a cost of $10,000.

A by-law to provide $4,000 for the purchase of an additional pump at the pumping station has received the sanction of the ratepayers of Red Deer, Alta.

A new rand compressor, capable of pumping over one million gallons of water, will be purchased by the London water commissioners for the Horton Street wells, at a cost of $1,400.

City Engineer Ker recommends to the Ottawa Water Committee the establishment of a reservoir with a capacity of 30,000,000 gallons. The cost of the work is estimated at $150,000.

It is expected that tenders for the proposed new septic tank and filter for the Coldwater disposal plant will be called for shortly, though work on these will not start until next spring.

At a recent meeting of the Montreal Road Committee, tenders were opened for the construction of a sewer on Eighth Avenue, Rosemount. The contract was awarded to Mr. Lewis at $9,982.

The Toronto Board of Control recently awarded contracts as follows: Sewers—Emerson Avenue, McKnight Co., $1,940; Davenport Road, Godson Co., $44,380; Humberside Avenue, Maguire Co., $41; Keele St., Excelsior Co., $700.

At a recent meeting of Coldwater ratepayers it was resolved that the council be asked to have a by-law submitted to the people to decide whether the village will instal a system of fire protection alone, at an approximate cost of $10,000, or a complete waterworks system at an approximate cost of $29,000.

Over ten miles of steel pipe, costing over a million dollars has been ordered by the Esquimalt Waterworks Co. from the Vulcan Works, Motherwell, Scotland, to bring the Goldstream water to the City of Victoria. Delivery is to begin on March 1, and 55,000 feet of steel pipe is to be landed before June 30 next.

Tenders will be received by registered post only addressed to the chairman of the Board of Control, city hall, Toronto, up to noon on Tuesday, November 16th, 1909, for the supply of three thousand feet of rivetted steel pipe 60 inches in diameter, and five hundred feet of rivetted tapered steel pipe, also one thousand seven hundred and eighty-two lineal feet of 60-inch reinforced concrete pipe for the outfall sewer.

Railway Development.

The Canadian Northern's new road from Toronto to Ottawa will cost in the neighborhood of $10,000,000.

A party of G.T.P. engineers is in the district about Duck Lake locating a line from Watrous to Prince Albert.

The construction of the National Transcontinental railway north of Lake Nepigon is being rushed to a finish.

Twenty miles of the Great Waterways Railway will be built this year between Edmonton and Fort McMurray.

B. Corey has applied for a franchise to operate an electric railway on the streets of Welland. It is expected to run from Port Colborne to Niagara Falls.

A company is being organized to build and operate a street railway in Lethbridge and connect it with Royal View and other towns in the near vicinity.

The steel of the B.C. electric railway company has been laid from New Westminster to Cloverdale, a distance of 12 miles, comprising the first section of the Chilliwack extension of this company's line.

The N., St. C. & T. Railway will at once start extending the line from Welland to Port Colborne, and it is expected to be in running operation this fall. The survey has been completed and a lot of the material ordered.

The ratepayers of Guelph will at the January municipal elections vote on an extension of the Guelph Radial Railway system, not only to Puslinch Lake, but also to Hespeler, to connect with the extensive system running into that town.

The contract for the construction of the uncompleted portion of the Alberni branch of the Esquimalt & Nanaimo railway, a section about 27 miles, at the western end of the road, has been awarded to the Calgary contractors, Janse, McDonell & Timothy.

Surveys are being made for a Great Northern line to run from Brandon to Regina, connecting the Great Northern line known as the Brandon, Saskatchewan and Hudson Bay, and the line chartered to run from Minot, N.D., to Regina. Construction will be started before the end of the year.

The contract for extending the railway right of way along the front of the town site at Prince Rupert, has been awarded to Foley, Welch & Stewart. The contract calls for the expenditure of over $500,000. Sub-contracts have been awarded to Angus Stewart and V. W. Smith & Co.

Laying steel on the line of the Canadian Pacific between Saskatoon and Wetaskiwin has been completed. This line will constitute the main line of the Canadian Pacific between Winnipeg and Edmonton, and much traffic which now goes by way of Calgary will be diverted to it as soon as possible.

A syndicate of Oshawa manufacturers will build an electric road from Cobourg to Toronto. Application will be made to the Dominion parliament at the approaching session for a charter for the "Toronto and Eastern," as it will be known. Mr. Fowke, M.P., will take charge of the bill.

S. Anderson, who is now operating 40 miles of electric railway, is looking into the possibility of a street railway extension from Fenelon Falls to Bobcaygeon passing through Sturgeon Point, and it has been suggested that a large hotel and pavilion may be erected on the beach at the east end during the coming winter.

The tri-weekly passenger trains over the Grand Trunk Pacific Railway, which have hitherto run only to Scott, Sask., will go through to Wainwright, Alta., 100 miles farther west. The regular passenger service is now within 115 miles of Edmonton, and it is stated that through trains from Winnipeg to the Alberta capital will be in operation this month.

William R. Clarke, financial manager of the Alberta & Great Waterways Railway, which holds a charter to build from Edmonton to Fort McMurray, and holds also a Provincial Government guarantee of bonds for the line, announces that he is prepared to commence immediate construction upon the road. The capitalization of the company includes English, French and American money.

Structural Steel.

The Consumers Gas Co., Toronto, will erect a new gasometer to cost $250,000.

E. Millet has the contract for building a new bridge over Baynes river, at Comox, B.C.

Pease Bros. were awarded the contract to build a bridge over the First river, at Port Arthur.

The contract for the Castor river bridge, near Ottawa, has been given to Helmer Bros., Newington.

The tender of the Jenks Dresser Co. for the steel work of the new Parkdale school, Toronto, $2,800, was accepted.

The Selkirk, Man., council are proposing a joint bridge over the red river with the municipality of St. Andrews.

It is announced that the Pennsylvania Steel Co., Pa., are to tender for work in connection with the Quebec bridge.

It is now practically decided that the new bridge across the Coaticook river at Coaticook, Que., will be built next spring.

The contract for the steel work in the Consecon bridge at Picton, Ont., has been awarded to the Hamilton Bridge Works, at $984.

The Montreal Shiplining Company's tender of $1,124 was accepted for the work on the overhead bridge at St. Helen's Island ferry wharf.

The Dominion Bridge Co., Montreal, will supply the steel to be used in the construction of the new Trust & Loan building at that place.

Plans for the Queen Street high level bridge, at the Don river, Toronto, have been prepared by the city engineer for the Railway Commissioners.

The contract for the sub-structure of the C.P.R. bridge over the Richelieu river, between St. Johns and Iberville, has been awarded to Quinlan & Robertson, Montreal.

City Engineer Speakman, of Brandon, has been instructed to prepare plans and estimates for a subway or bridge at a crossing of the Great Northern and C.P.R. tracks on 18th Street.

Ald. McBride is interested in a movement at Vancouver to secure the construction of a bridge across the intervening territory abutting on False Creek, from Keefer street or Westminster avenue.

The Dickson Bridge Co., of Campbellford, were awarded the tender for the steel superstructure of the Wilton avenue bridge, Toronto. Their price is $35,809, or 4 9-10 cents per pound, for a 438-ton superstructure.

Contracts for the reconstruction of the burned wing of the Parliament buildings were let recently. The steel for the building will be supplied by the Dominion Bridge Company, and must be delivered by November 15.

The following bridge contracts were awarded by the N. B. Public Works Department recently: Hatfield bridge, Simonds, N.B., W. R. Fawcett, Temperance Vale, $900; Dingey bridge, Simonds, Aaron Shaw, Peel, Carleton county, $600; Ellis and Maugren bridges, Brighton, N.B., W. R. Fawcett, $3,300.

Electrical Notes.

J. Collins, Montreal, has secured the contract for the new power house at Verdun, Que.

Kamloops council intends installing a modern fire alarm system.

The Cornwall Board of Trade has endorsed the Long Sault power scheme.

The B. & H. radial railway intend erecting a power house at Brantford.

The demands on the Revelstoke, B.C., power plant exceed the present capacity.

The Waterloo Board of Trade is discussing the establishment of an independent telephone system.

The Canadian Niagara Power Co. are seeking a franchise for the supply of power in Bridgeburg.

The British Columbia Telephone Co. will shortly establish a telephone system in Prince Rupert.

The Cranbrook, B.C., Electric Light Co., have made arrangements to erect a $7,000 power house.

A private company is said to be preparing to develop power at Burleigh Falls, near Peterborough.

Tenders are asked for the construction of the transmission line to supply Port Arthur with power from Dog Lake.

Montreal has been authorized by the Quebec Legislature to borrow money for the purchase of the Montreal Water & Power Co.

The Otonabee Power Co., who have asked Peterborough for a twenty-year franchise, propose to spend $250,000 in uniting their two dams.

The contract for the conduit electric wiring of

"B" Postal Station, Point St. Charles, has been awarded to the Empire Electric Co., of Ottawa.

The Georgian Bay Power Co. has offered to sell 1,500 h.p. to Owen Sound at $20 per h.p. at Eugenia Falls, or $24 per h.p. delivered at Owen Sound.

John B. McRae, consulting engineer, has been engaged by Renfrew, Ont., to report on the advisability of installing a municipal electric power plant.

It is learned that the promoters of the Sherbrooke Street Railway extension are seriously considering the proposal to purchase and develop the Westbury power.

A by-law will be submitted to the electors of Norwich, Ont., for making a contract with the Hydro-Electric Power Commission for 150 horsepower of electric energy.

A special meeting of the Board of Trade held to discuss the question of electric light and power for the town of Yorkton passed a motion favoring instalation.

The Camrose, Alta., Tannery Co., have decided to instal an electric lighting plant of their own. A dynamo with a capacity of about 150 lights will be installed.

The Dominion Iron & Steel Co. have decided to operate their pumping station at the Sydney River dam by electric power transmitted direct from the steel plant.

The National Carbon Co., Cleveland, Ohio, makers of electrical batteries, carbons and supplies, will locate a Canadian factory at Toronto to employ over 200 hands.

Plans are being made by the Niagara, St. Catharines and Toronto Railway Co., to construct a rotary transformer station at St. Catharines with an output of 500 k.w.

A contract was awarded to the Canadian General Electric Co., to supply electrical and power machinery and line material to the Nanton, Alta., electric power plant for $9,965.

Waterloo, Ont., council has purchased for $15,500 the outside plant of the Electric Power Co. there, preparatory to making a contract with the Hydro-Electric Commission.

The officials of the Saraguay Electric Light and Power Co. have renewed their offer to the Montreal Council to light St. Andrew's, St. Joseph's and St. George's wards for $70 per lamp.

A $3,000 fire at Deschenes power house occurred on Oct. 19 which for a couple of hours tied up the Hull street cars, as well as a number of factories in Hull. The plant is running again.

The action brought by R. S. Morris, Hamilton, to restrain that city from entering into a contract with the Hydro-Electric Power Commission for one thousand horse-power, was dismissed.

The Shuswap Power Co. has submitted three alternative proposals to the Kamloops city council which are largely based on the figures suggested by the city's consulting engineer, H. K. Dutcher.

The management of the British Columbia Electric Railway Co. has given the contract for the erection of five substations along its extension from New Westminster to Chilliwack to T. R. Nickson & Co.

Twenty-five cycle power has been agreed on for all purposes as the standard for Niagara hydro-electric power. Rotating machinery will be dispensed with as far as possible, and static transformers will be used.

The Nova Scotia Construction Co., of Montreal, has been awarded a sub-contract, amounting to approximately $200,000, in connection with the Canadian Light & Power Co. development work at St. Timothee, Que.

At a combined meeting of the Board of Trade and the town council a proposal to enter into negotiations with the Hydro-Electric Power Commission for a supply of power was unanimously endorsed at Paris, Ont.

H. S. Acres, engineer of the Ontario hydro-electric commission is arranging for the building of a sub-station at Port Arthur through which the commission will supply power from the Kam Company to Port Arthur.

The parish of Pointe aux Trembles, Que., have awarded to the Saraguay Electric & Water Co., an exclusive franchise for 25 square miles on the Island of Montreal, stretching from Boute de Isle to Longue Pointe.

On June 1 next Hamilton will commence to purchase electrical energy from the Hydro-Electric Power Commission. In accordance with the decision of the ratepayers the city will enter into a contract for 1,000 horse-power.

Fifty men left Victoria recently to join those employed in the preliminary work of the installation of a 10,000 horse power electric generation plant at Jordan river for the British Columbia Electric Railway Company.

Fort Frances will get power at $12 per h.p. from the hydro-electric plant at International Falls. The instalation of the street lighting system is now going on and by December the entire lighting system will be in working order.

Hamilton will have to pay $12,000 more than it figured on for the electric meters at the Beach pumping station and the $30,000 voted by the ratepayers will not cover the cost. This extra expenditure is due to the high voltage of the Dundas line.

The debris of the old Badaur power house at Perth, Ont., has been cleared away, and stonemasons are now engaged in putting up a new building. The work is being rushed. Manager Smith hopes to have the new power house ready by December 1.

The Creston, B.C., Power, Light & Telephone Co. is putting the finishing touches to its new telephone system. Altogether there are about fifteen miles of line hung. The electricians have installed the new switchboard and distributor in the company's new head office.

The Northumberland-Durham Power Co., lessees of the Healey Falls power, will transmit power to Belleville and the cement mills, Deseronto, Napanee and Kingston; also to Port Hope and Cobourg and north to Hamlet, Norwood and the Blairton iron mining district.

As a result of an unexplained explosion of the boiler in the Aylmer Electric Light & Waterworks, on October 12, Harry Fisher, the engineer, is dead, and the plant itself is a mass of wreck and ruin. The loss is estimated at $35,000, on which there is an insurance of $18,000.

Drayton electric light plant has gone under new management, the village, through the municipal council, having leased the entire plant. The present proprietor, R. O. Hube has been engaged to run the machines and do all the work in connection with installing new lights.

In accordance with the recommendation of Prof. Herdt, of McGill University, the Winnipeg Street Railway has opened the first of three sub-power stations. It is hoped by these and by bonding the rails, to reduce the danger to water mains and gas pipes from electrolysis.

The Toronto Board of Control has decided on the recommendation of Electrical Engineer Aitken and City Engineer Rust, to arrange with the Hydro-Electric Power Commission for the installation at the city's distributing station of sixteen feeder switches at a cost of $2,000 each.

"We expect to have hydro-electric power in Toronto, Preston, Hespeler, Galt and Berlin in March next," said P. W. Sothman, chief engineer, of the hydro-electric commission, the other day. "The construction work is going ahead fast." Woodstock will have the power by May.

E. I. Sifton, electrical engineer, is preparing plans for an underground system at London for the transmission lines of the Hydro-Electric Commission. The cost of the underground system is estimated at approximately $70,000. The poles of the London Electric Co. are said to be useless for hydro-electric purposes.

The Kaministiquia Power Co., which is controlled by Holt & Co., is increasing its power at Fort William so that in the future it will be in a position to dispose of 21,000 horse power instead of 14,000 as at present. This is accomplished by adding one more Penstock at the power house at Kakabeka falls.

The Power, Light and Heat Committee, of Regina, have decided to recommend the city council to adopt a reduced scale of charges for electric power. The electrical engineer in his report stated that the greater the output the less would be the cost per k.w. hour. Last year the plant was run at a 10 per cent. loss.

Tenders have been called for the construction of five sub-stations along the line of the British Columbia Electric Railway from New Westminster to Chilliwack. The buildings are to be of concrete construction, and will be used for the distribution of light and power to the surrounding districts as well as in connection with the operation of the tram system.

The Burrard Power Co. has received from the Dominion Government a grant of 25,000 miners' inches of water on Lillooet river. Under the terms of the grant the harnessing of the waters of the Lillooet will be commenced at no distant date, and as the power plant will be only 23 miles from Vancouver, it is declared that it will not be long before some sections of industrial Vancouver will be drawing power from the source.

When Port Arthur officially approves the contract submitted by the Kam Power Co., through the Hydro-Electric Commission it is probable that the contract between the company and Fort William will be revised downward. The contract provides that Port Arthur shall pay a maximum rate of $17 per h.p. and that the minimum shall be $14, which shall be the price charged after 5,000 h.p. shall be used daily. Fort William is at present paying $25 per horse power delivered at the city substation.

Planing Mill News.

The Peterborough Lumber Co., opened their new mill last week.

A large planing mill will be erected at Montreal by Friedman Bros.

A new sash and door factory is to be built at Victoria, B.C., by Burdick Bros.

A large planing mill is being erected at Hamilton by the Burton-Baldwin Mfg. Co.

The Beaver Lumber Co. have purchased a site at Portage la Prairie for the extension of their plant.

P. J. Noel, Merrill, Wis., proposes establishing a large factory for woodenware at Fort Frances.

The Robinson & McKenzie Lumber Co. will erect a mill at Kamloops, B.C., if a site can be secured.

Donaldson's sash and door factory at Almonte, Ont., was destroyed by fire last week. Loss about $6,000.

Stephen Bros.' sawmill, at Windsor Junction, N.S., with all its machinery was recently destroyed by fire. Loss, $8,000.

Work will be commenced almost immediately on the rebuilding of the Niagara Falls planing mill, Niagara Falls, recently destroyed by fire.

Work nas been started on the foundation of the new Camrose, Alta., planing mill. The building will be rushed to completion as speedily as possible.

The B. F. Graham Lumber Co. has announced its intention of constructing at Victoria, B.C., in the near future, a sawmill with a daily capacity of 100,000 feet.

The American Finance and Securities Co., New York, have purchased C.P.R. timber lands on Cowichan Lake, B.C., and will erect a large mill, spending $1,000,000 on development.

If a site can be secured, the Cranbrook mill people will erect a plant costing over $100,000 at Kamloops, B.C. In addition, they will also put in a sash and door factory and a casket factory.

The new shinglemill being built on Lulu Island for the Westminster Shingle Company will commence operations shortly. The mill will be one of the most modern of the kind in British Columbia.

William Currie & Co. have sold their mill property and timber limits at Charlo, N.B., to the Credit Foncier Canadien, of Providence, R.I. The business will be run as formerly and a large mill will be erected to manufacture spruce.

J. C. Campbell, of Vancouver, and J. C. Laidlaw, of New Westminster, have purchased the sawmill of R. McAllister & Sons, six miles south of New Westminster, for $15,000. The sawmill has a capacity of 20,000 feet of lumber daily.

The interests controlling the Berlin Mills property in New Hampshire are planning to instal a print paper mill plant at La Tuque, Que. It is also reported that the International Paper Co. has prepared plans for numerous mills in Canada.

It is estimated that the mills in the Georgian Bay district will cut 550,000,000 feet the present season. The Spanish Boom & Slide Co. will handle a total of about 150,000,000 feet of logs. The season has been favorable for log rafting, as there was a good stage of water for driving purposes in the spring.

The new sash and door factory of the Robt. Bisset Co., at Strathcona, Alta., has been put in operation and the machinery is now running under a full head of steam. The new factory is situated on the site where stood the previous buildings which suffered total destruction by the several unfortunate fires of the last few years.

The Nepisiquit Lumber Co., composed of some of the wealthiest lumbermen of the United States, closed a deal last week, whereby they take over the control of the extensive properties of the Adams, Burns Co., of Bathurst, N.B. The purchase includes all the lumber, crown lands and milling properties, as well as the wharves and stores at Bathurst village. The price paid is said to have been several hundred thousand dollars. A large and modern lumber mill is to be erected in place of the present buildings and it is also possible that a pulp mill may be established.

Trade Notes.

The Dominion Foundry Supply Co., Montreal, have secured the exclusive Canadian agency for the Peerless brand portable electric tools manufactured by the Cincinnati Electric Tool Co., Cincinnati,, O.

Chas. S. Ferry, formerly chief engineer Windsor Hotel, Montreal, and Sam. McCrudden, of the Peck Rolling Mills, have formed a partnership under the name of Ferry & McCrudden Co., 204 St. James St., Montreal. They have been appointed eastern agents for the Standard Engineering Co., Toronto, and will handle Standard Crown values, Cyclone grates, etc.

Kilmer, Pullen & Burnham, Toronto, have received an order from Calgary for 4—750 k.v.a. water cooled step-down transformers for the Calgary Power & Transmission Co. They have also received from Toronto an order for one 650 k.w., 120 r.p.m. engine type alternator, together with switchboard, steam driven exciter and motor generator set. Kilmer, Pullen & Burnham are Canadian representatives of the General Electric Mfg. of Sweden.

A recent Montreal business amalgamation was that of the Canadian Appraisal & Audit Co., with the Canadian branch of the American Appraisal Co. The name of the new company will be the Canadian-American Appraisal Co., Ltd. This combination of these two companies ensures to the public the highest possible service at a minimum cost, on account of the joining together of the forces of experts which made up the two separate companies. The new Board of Directors consists of John L. Moon, president; F. W. Cooper, vice-president; F. M. Lloyd, general manager; Hon. Lionel Guest; and L. W. Just, secretary-treasurer. The head office of the company will be in Montreal, at 4 Hospital Street, the old home of the Canadian Co. Mr. H. S. Snead will be the manager of the Montreal office.

Gas Items.

A company of Lethbridge men will bore for gas in the vicinity of that city.

English prospectors have struck natural gas at a depth of one thousand feet in Albert county, N.B.

The Barrie Water and Light Commission have awarded to the Crossley Bros., of Manchester, England, at $4,332, f.o.b. Liverpool, the contract for a gas-producing plant for the water and light station.

Representatives of the Maritime Oilfields Co. discussed with the Moncton, N. B., civic authorities the question of natural gas supply for that city. There are indications of gas in large quantities about that place.

The Montreal Light, Heat and Power Co. have taken out a building permit for the construction of a new office and valve house at the gas works to cost $8,500; and also an alteration permit for adding a storey to another building there, to cost $3,000.

The Sterling Gas Company have paid over the money in the purchase of the plant and franchise of the Mutual Natural Gas Company, at Port Colborne, and are now in full possession. Manager C. E. Steele states that they will have some forty wells in all and will be able to give a good service.

Wm. Mackenzie said that if Port Arthur and Fort William would lay the mains and enter into a contract with him he would instal ovens at the Atikoken furnaces and supply gas. He could not say at what price gas could be supplied until the matter had been investigated, but was sure it could be furnished at a price much below that which a regular gas company would have to charge.

The installing of a gas plant at Regina city was one of the questions briefly discussed by the Power, Light and Heat Committee recently. The committee were agreed in the opinion that the city should retain ownership of the plant, as it was an asset that would pay from the start and the chairman thought the city should not grant a franchise to any company, but should advertise for tenders to instal the plant and run it themselves.

Eugene Coste, mining engineer, Toronto, who is consulting engineer for the C.P.R., in the drilling operations being conducted for gas and oil along its lines in Southern Alberta, discussed with the Red Deer Board of Trade the likelihood of getting natural gas at Red Deer. Mr. Coste did not doubt but that natural gas could be got at Red Deer if they went down far enough, but he believed they would have to go down 3,500 or 4,000 feet, at least, to strike a permanent and adequate supply and the cost would be prohibitive; it would be very difficult to give any estimate of the cost, but it would go, probably $100,000 or more, as he could not be sure they would reach it at 4,000 feet. He doubted whether any large seams of coal could be found in the tetiary rock underlying Red Deer.

General Manufacturing Notes.

The Sydenham glass factory at Wallaceburg is in full operation again.

The Northern Pyrites Co. will likely build a large ore dock at Fort William.

A branch factory of the Steel Shoe Co., of Racine, Wis., will be established at Toronto shortly.

The Crawford Handle Factory at Tilbury, is running night and day in the effort to keep pace with orders.

The Hamilton Sewer Pipe Co. are looking over Medicine Hat, preparatory to locating a factory in the west.

R. Smith & Company's candy plant, at Victoria, was completely destroyed by fire last month at a loss of $20,000.

Another story will be added to the Ogilvie flour mills at Fort William, and the Kaministiquia Power Co.'s plant at the same place will be doubled.

The David Craig Co., Boston, Mass., capitalized at $1,500,000, and manufacturing concrete-block houses, will establish a branch plant at St. John, N.B.

A gang of workmen are busy making alterations at the factory of the Dominion Mfg. Co., Galt, which, when completed, will double the size of the present premises.

A company subsidary to the Sydney Cement Co. has already commenced construction upon a plant for the manufacture of brick from Dominion Iron & Steel blast furnace slag cement.

The Dominion Tar and Chemical Co. are increasing their plant to the extent of nearly double their present capacity, with a view to taking care of the increased output of crude by-products, the result of the expansion at the steel plant at Sydney.

A company has been formed, financed by Victoria and British capitalists, and with half a million dollars subscribed for the purpose of establishing works for the manufacture of Portland cement at the property known as the Rosebank lime quarries, Esquimalt harbor.

W. J. Lindsay, the man who is interested in the locating of a wagon and carriage manufacturing plant at Port Arthur, says his plant will be established shortly. "There is sufficient business contracted for to give employment to' says Mr. Lindsay, "from 125 to 150 men all the year round."

Application for incorporation has been made to the N. B. Provincial Government by William McAllister, of Moncton, and others, as the Empire Steel Ladder Co. Mr. McAllister secured a patent on this ladder in May, 1908, and it is the intention of the company to manufacture and sell the ladder, and also other minor flexible steel articles, and to carry on a business as founders, with a capital stock of $24,000.

F. C. Durant, who is looking over possible sites for the establishment of a sugar refinery is very favorably impressed with St. John as a location on account of its being on the sea coast and also having excellent rail facilities. He says his company would operate under a Dominion charter, and would be capitalized at $2,500,000. The plant to be erected would cost in the vicinity of $2,000,000. About 300 hands would be employed.

The Westmoreland copper mine, at Dorchester, N.B., one of the richest in the province, was sold by the Maritime Exploration Co., to L. Vogelstein & Co., of New York, one of the largest copper concerns in the world. The new owners announce their intention of beginning work at once on a large scale, for the development of the mine, and expect in the near future, should results prove satisfactory, to erect a concentration mill with a capacity of 1,000 tons of ore daily. This industry would afford work for about 500 men.

Building Operations.

The Hamilton Cotton Co. will rebuild its dye house.

The Witness Publishing Co., Montreal, will rebuilt at once.

W. E. Sanford Mfg. Co., Hamilton, will build a model factory.

The Cudahy Packing Co. will build a $17,000 factory at Toronto.

The Walters Axe Co. are building an addition to their plant at Hull.

The Tuckett Tobacco Co. will build an auxiliary factory at Hamilton.

The Western Soap Co., Vancouver, will erect a new and modern factory.

The C.P.R. contemplate erecting a 250,000 bushel elevator at Vancouver.

The F. W. Bird Co. contemplates making an addition to its Hamilton plant.

The addition to the Meriden-Britannia Co.'s Hamilton works is being pushed.

The Toronto Board of Education will erect a $40,000 school on Avenue Road, that city.

Plans have been approved for the $1,500,000 extension to the C.P.R. Windsor station at Montreal.

J. B. Lusby, Amherst, N.B., has the contract for building a new factory at Sackville, for the A. E. Wry Co.

Land has been purchased in Hastings townsite, Vancouver, with a view to the erection of an isolation hospital.

G. F. & J. Galt have been granted a permit for a warehouse, six storeys high at Winnipeg. The cost is $65,000.

A by-law to raise $25,000 for the erection of a new school building will be submitted to the Meaford ratepayers.

The Thompson-Macdonald Co., Cobourg, will erect a new building of three storeys next to their present premises.

V. Williamson has been given the contract to build a laboratory building at Walkerville for the Geo. H. Rundle Co.

The contract for the construction of the Masonic Temple at Prince Albert has been let to A. Anderson, at $60,000.

The contract for the erection of the Tobin Arms Company's new plant at Woodstock, was awarded to W. J. Taylor.

A site has been purchased at Regina by Whitmore Brothers, upon which they will at once proceed to erect a theatre.

The Imperial Auto Co., have purchased a site at Toronto on which they intend to erect a large building immediately.

A permit has been granted to the Rookery Building Co. to erect at Winnipeg a three storey block to cost $155,000.

A by-law granting J. W. Ford $10,000 to erect a flour mill and elevator at Swift Current, was carried by the ratepayers.

The Grand Trunk will shortly commence work on a considerable enlargement of their freight sheds at Turcot, west of Montreal.

It is learned that work on the new $100,000 hospital to be erected by the Grey Nuns at Regina, will be commenced as soon as the trunk sewer is down.

The Lyall, Mitchell Co. have been awarded the contract for the new warehouse and office building of the Gutta-Percha Rubber Co., to be erected at Winnipeg.

The new plant of the Tudhope Carriage Co., at Orillia, which is to replace the one destroyed by fire late in August, is more than two-thirds built. The cost will be $120,000.

A syndicate of British and Toronto capitalists have purchased 350 acres just outside the latter city. The intention is to lay the property out in avenues and squares for high class residences.

The Alberta Pacific Elevator Co. propose erecting four elevators at Vancouver, each capable of holding 250,000 bushels of grain. This company already owns 90 elevators and warehouses in Western Canada.

It is proposed to have a new and modern market on a new site at Brantford and to have new Government and city buildings combined on the present market square. The latter is estimated to cost $250,000.

The Board of Trustees of the General and Marine Hospital, Owen Sound have decided to build an addition to their institution. The annex will cost between $12,000 and $15,000, and will double the present accommodation.

The congregation of Bonar Presbyterian Church, Toronto, authorized an architect to draw up plans for a church to cost $40,000, with a seating capacity of 1,000. Work upon the new edifice is expected to commence early next spring and the building to be completed in a year's time.

The Toronto Board of Control having approved of the site purchased by the Board of Education for the new Northwest High School, the work of building will go on at once. Excavations will be begun this fall, and by the opening of the fall term next year, the new $150,000 High School building will be ready for occupancy.

Work has been started on the excavations for the foundation of the first permanent building for the new asylum to be built in Coquitlam, B.C., near Westminster Junction. The building will be an exceptionally large one, and will cost nearly $400,000, and will accommodate 600 patients. Five other buildings in all will be added later, but they may not be completed for some years.

New Companies.

Star Shoe, Ltd., Montreal; capital, $20,000; to manufacture boots and shoes. Incorportors, J. B. Hurteau, V. Labonte and Z. Lacasse, Montreal.

Carriage Factories, Ltd., Montreal, capital, $4,000,000; to make vehicles of all kinds. Incorporators, G. P. Grant, A. J. Brown and F. G. Bush, Montreal.

Natural Enamelware, Toronto; capital, $1,000,000, to manufacture enamel wares. Incorporators, J. H. Carter, H. C. Secord and R. B. Young, Toronto.

Eastern Construction Co., Toronto; capital, $40,000; to carry on contracting and building business. Incorporators, A. Mullin, G. Service and J. L. Wood, Toronto.

The Peerless Heater Co., Toronto; capital, $40,000; to manufacture and sell boilers and hot water heaters. Incorporators, A. Dods, G. Grant and R. P. Stockton, Toronto.

Buckingham Graphite Co., Toronto; capital, $150,000; to develop and treat ores, minerals and metals. Incorporators, W. W. Dunlop, R. H. Cuthbert and S. Linn, Toronto.

Jacobs Asbestos Mining Co., Montreal capital, $3,000,000; to mine and work asbestos and other minerals. Incorporators, F. Lewis, A. McReaper and A. Charters, Montreal.

British Canadian Lumber Co., Montreal; capital, $2,000,000, to engage in sawmilling and lumbering. Incorporators, E. F. Surveyer, G. V. Cousins and C. A. Hale, Montreal.

The Western Sugar Refining Co., Toronto, capital, $1,500,000, to manufacture and refine sugar. Incorporators, J. R. L. Starr, M. C. Cameron, and A. S. Grant, Toronto.

Tobin Arms Mfg. Co., Woodstock; capital, $100,000; to manufacture firearms and metal specialties. Incorporators, K. Harvey, H. A. Little and A. J. McIntosh, Woodstock.

Vogel Co. of Canada, Montreal, capital, $20,000; to manufacture automatic sprinklers and fire extinguishers. Incorporators, J. J. Keys, Jno. Ogilvy, Montreal, and A. H. Chave, Westmount.

The Sterling Electric Supply Co., Toronto; capital, $25,000; to manufacture electric supplies, fittings and machinery. Incorporators, A. G. Manly, R. W. Strickland and P. W. Greene, Toronto.

Montreal Safety Gas Machine Co.; capital, $100,000; to manufacture gas-producers, machinery, ranges, heaters, burners, etc. Incorporators A. J. Brown, R. O. McMurtry and G. P. Drennan, Montreal.

The Bow Centre Collieries, Ottawa, capital, $3,000,000; to carry on mining, milling, reduction and development business. Incorporators, W. P. McAllister, A. W. Fraser, and W. C. Perkins, Ottawa.

The Woltz Moulding Mfg. Co., Toronto; capital, $20,000; to manufacture picture frames, art furniture, room mouldings and artists' supplies. Incorporators, Geo. Woltz, Alf. Jones and G. E. Alexander, Toronto.

Canada Pottery Co., Iberville, Que.; capital, $90,000; to manufacture sanitary porcelain baths, lavatories and all kinds of pottery. Incorporators Alb. Clayton, O. Couturier and Arthur Clayton, Iberville.

Windsor Superior Mfg. Co., Windsor; capital, $40,000; to manufacture and deal in wares of every description composed of wood and metal. Incorporators, W. Bong, Jno. Atchison Smith, Windsor, and S. T. Allen, Detroit.

Tuttle & Bailey Mfg. Co., Bridgeburg, Ont., capital, $40,000, to manufacture and deal in heating and ventilating supplies. Incorporators, C. H. Tuttle, Englewood, N.J., J. H. Bailey, Brooklyn, and Robt. Kelting, Chicago.

A. Matthews, Ltd., has been incorporated at Toronto, with a capital of $30,000 to take over the manufacturing of roofing and sheet metal material business carried on by Asa Matthews. The incorporators are Asa Matthews, John O'Donnell, Israel Morin and W. N. Downs.

At Hartland, N. B., a company has been organized and will apply for incorporation as the Hartland Concrete Block Co., for the purpose of manufacturing concrete goods of every description, especially concrete blocks for building purposes. The officers of the company are Dr. W. DeC. McIntosh, president; A. G. Baker, vice-president; Arthur Dickinson, managing director, and J. B. Daggett, secretary-treasurer.

The Windsor Superior Mfg. Co. is the name of a new concern formed at Windsor, Ont., for the purpose of manufacturing a patent can opener, which has been on the American market for some six or seven months. S. G. Allen, of Detroit, is patentee, and the new company possesses the sole Canadian rights. The American branch is in Detroit. The Canadian company is capitalized at $40,000, Walter Boug being president.

Addition to Dunlop Rubber Works.

An addition to the rubber works of the Dunlop Tire and Rubber Goods Co. has been commenced. The addition will be erected to the north of the present factory on Booth Avenue. The new building will be completed, and plant installed, by December next. It will be devoted to the production of automobile tires and mechanical rubber goods.

Extension of Dominion Iron and Steel Co..

The Dominion Iron & Steel Co., of Sydney, N. S., has closed a contract with the Canada Foundry Co., Toronto, for the construction of an additional blast furnace, an extension to the Bessemer plant, and two 50-ton open-hearth furnaces of the new type, and for the carrying out of the new process in making open-hearth steel. The amount involved is upwards of $500,000. The steel company will also build an additional rod mill, two merchant mills and another mill for the production of finished material.

National Iron Works, Toronto.

The National Iron Works Co., which has just purchased from Toronto a site on Ashbridge's marsh, was awarded a large contract for cast-iron pipe by the Board of Control of that city. The company's tender was an unexpected one, as it was not supposed that it would take contracts until its big foundry in the marsh is built. "The day after the city conveyed the property to the National Iron Works Co. men were set to work upon the building of the foundry," said Cawthra Mulock, president of the company. The contracts, he said, all call for the completion of the works by February 16 with heavy penalties for failure to finish the work in time. The work will be pushed even in the cold weather. The work called for in the contract of yesterday will be done at the National Iron

Works. The tender calls for the supply of 1,080 lengths of pipe for the water services to the new districts, at $27.45 per length of pipe.

Standard Sanitary Co.

The Standard Sanitary Mfg. Co., Pittsburg, have concluded a deal for the purchase of a site for their new factory at Toronto. The property comprises 7¾ acres, and embraces the block of land from Lansdowne Avenue to the G.T.R. tracks and from Royce Avenue to Lappin Avenue.

The land was purchased from the Canada Foundry Company for $5,000 an acre, making about $40,000 in all. The location is immediately south of the Canada Foundry Co., and a short distance west of the Dominion Radiator Co.'s works. It is also about half a mile immediately north of the King Radiator, Somerville Brass and General Brass factories.

"We will be enameling bath tubs in six months and making a full line of our goods inside a year," said W. A. Porter, manager of the Standard Sanitary Co.'s jobbing business at Toronto. "Our people have built a number of plants in the United States and we are in a position to build and instal the necessary machinery quickly."

James Riordan, it is expected will be manager of the new plant.

Car Shop Merger.

N. Curry, president of the new Canadian car merger, which will be officially known as the Canadian Car & Foundry Co., in an official statement regarding the completion of the consolidation makes the following announcement :—"The new company's capital will be as follows : $3,500,000 of six per cent. bonds ; $5,000,000 of seven per cent. preferred stock ; $3,000,000 of common stock.

"The companies being secured with their capital are as follows :—Rhodes-Curry, $1,850,000 preferred stock, $1,000,000 common stock ; Canada Car Co., $1,000,000 preferred stock, $2,000,000 common stock ; Dominion Car & Foundry Co., $3,510,900 common stock. The officials of the new company will be ; N. Curry, pres. ; W. W. Butler, 1st vice-pres. ; N. S. Reeder, 2nd vice-pres. The first board of directors will include James Redmond, director of the Royal Bank ; T. Jl Drummond, pres. of the Lake Superior Corporation ; Wm. Aitken, pres. of the Royal Securities Co. ; Mr. Z. A. Lash, K. C., of Toronto, director of the Canadian Bank of Commerce. The head office will be in Montreal. The purchasing agent will be A. H. Chabe, and J. A. Skelton will be secretary-treasurer.

NEW CATALOGUES.

CUTTING MACHINES.—The George Gorton Machine Co., Racine, Wis., are distributing a 16-page, 8½ x 11½ inch catalogue, descriptive of their new heavy duty cutting off machines, illustrated in November Canadian Machinery. A two-page insert gives very complete records of tests made on these machines by disinterested parties and users.

GRINDING WHEELS.—The Norton Co., Worcester, Mass., manufacturer of Alundum grinding machinery, etc., is sending to the trade a booklet entitled "Facts Worth Knowing About Grinding Wheels." Their method of manufacture is briefly referred to, and rules are included for obtaining surface speeds, calculating speeds and diameters of pulleys, etc.

BRASS FOUNDRY ALLOYS.—The United States Alloys Co., Baltimore, Md., manufacturer of metals, alloys and fluxes, is sending to the trade a 6-page folder describing fluxes for brass foundry use. Flux No. 1 cleans the metal bath and converts the impurities into a fusible slag which rises to the surface and can easily be skimmed off. No. 2 flux has essentially the same action as No. 1, but is somewhat milder, and is preferred by some brass founders as it can be used in somewhat larger quantities, approximately one half pound per 100 pounds of metal. No. 1 flux is neutral in its action, whereas No. 2 is slightly acid. This concern also manufactures manganese-copper, silicon-copper, manganese silicon-copper, ferro-silicon, ferro-manganese, as well as other deoxidizers and alloys for saw, giving particulars regarding speed, etc.

CUT-OFF SAW.—A pamphlet from Kellogg & Co., 196 King St. West, Toronto, describes the John H. Hall & Sons No. 1 cold saw, which Kellogg had on exhibition at the Canadian National Exhibition. The circular describes the saw giving particulars regarding speed, etc.

CRUCIBLE FURNACES.—Natural draft crucible furnaces, built by the J. D. Smith Foundry Supply Co., Cleveland, O., are described in a 14-page catalogue recently issued by this concern. Numerous views are included showing various installations and a list of users is also given. In a 4-page pamphlet published by this concern, the Cleveland squeezer is described, while another pamphlet is devoted to the Cleveland Jr. core oven, which is semi-portable, and is provided with rolling drawers. It can be heated by either coke, coal, oil or gas.

B.C. ELECTRIC RY. LOCOMOTIVES.

The electric locomotives have been built by Dick, Kerr & Co., for the B.C. Electric Railway Company.

The locomotives are of the articulated truck four-axle type, with one motor mounted upon each axle. The maximum rated tractive effort is 16,000 lb. drawbar pull, and the maximum instantaneous effort is 25,000 lb. A feature of special interest in the truck arrangement is that the body of the locomotive rests upon two four-wheeled trucks coupled together by a massive hinge having lateral flexibility but vertical rigidity, thereby enabling the rear trucks to resist any tendency to tilt under the action of the forward truck, and vice versa. The centre pins and cab platform framing are not subjected to any longitudinal stress, except that due to its own inertia when starting and stopping, the whole pull of the motors being transmitted direct from the motors through the trucks.

The motor equipment consists of four Dick-Kerr 12a motors. When operating on a 600 volt circuit each motor will give a tractive effort of 1,010 lb. on the periphery of the 42 in. wheels, and a speed of 15 miles per hour at the one-hour rating. Each motor is fitted with reduction gear having a ratio of 3.54 to 1. The armature bearings of the motor are lubricated by oil rings, which are specially designed to prevent flooding when running at high speeds. The axle bearings are lubricated by a system of wicks which are immersed in oil wells.

The motors are designed and arranged for forced ventilation, the air being blown into the motor shell at the end farther from the commutator, and passing out at suitable openings provided at the commutator end.

In addition to the blower for the motors, there is an electrically driven air compressor with suitable air reservoirs for the air brake equipment, the locomotive being fitted with combined straight and automatic air brake. The compressor for the brake equipment is mounted above the motor driven blower in the cab. Two current collectors are provided, these being of the straight under running trolley type, the current being collected from an overhead trolley line. The trolleys are equipped with retrievers.

Chapman & Walker, corner Victoria and Lombard Sts., Toronto, are Canadian agents for Dick, Kerr & Co.

AGENT WANTED.

LEADING English gas engine and producer maker desires first-class buying agent for Canada. Liberal discounts to substantial firm who can finance business. Replies to "Gas Power," care CANADIAN MACHINERY AND MANUFACTURING NEWS, 88 Fleet Street, London, England. (12)

MANAGER WANTED.

WANTED—Manager to look after the manufacture of high class mechanics' and precision tools. One accustomed to the assembling of small pieces. Age, experience, wages and references required. Address. P.O. Box 325, Montreal. (11)

POSITION VACANT.

YOUNG machinist or technical graduate wanted to travel. Must be good talker and resourceful. No previous traveling experience necessary. Splendid opportunity for ambitious man to work into a good position. Apply Box 101, CANADIAN MACHINERY, Toronto. (11)

PATENT FOR SALE

The Proprietors of Canadian Patent No 108836, 1907, for Combined Electric Cable Connectors and Plugs for Permanent and Portable Electric Light and Power installations, are desirous of entering into arrangements for its sale outright on reasonable terms

Good business being done in Great Britain with H.M. War Office, Indian War Office, Railway Companies, Dock Yards, Mines, &c

Apply SIMMONDS BROS., LTD., Newton Street, Holborn, London, Eng., or to their agent, where the goods may be procured J. C. SIMMONDS, Big Cove, Sutherlands River, Pictou County, Nova Scotia.

"MORSE" DRILLS

ARE A SAFE INVESTMENT

When you buy a stock of a broker you expect to get good returns from it. You are often disappointed, but you have no recourse.

When you buy **"MORSE" DRILLS** you get a selected stock, and if the returns are not satisfactory, from any defect in stock or workmanship, such defects are made good.

"MORSE" DRILLS are made of carbon or high-speed steel, in many styles and sizes.

Makers of Drills, Reamers, Cutters, Chucks, Taps, Dies, Arbors, Counterbores, Countersinks, Gauges, Machines, Mandrels, Mills, Screw Plates, Sleeves, Sockets, Taper Pins and Wrenches.

We have an illustrated catalog of our entire line. If you are in need of **"MORSE" TOOLS**, it will pay you to look it over. It costs you nothing, not even postage. We await your address.

A COMBINATION HARD TO BEAT

THE "PARAGON" DRILL
Twisted High Speed Steel with a Flat Taper Shank

THE "PARAGON" DRIVE
A simple, inexpensive sleeve with a Flat Taper hole : :

FOLDER "C" gives details.

The CLEVELAND Twist Drill Co.

CLEVELAND, OHIO, U.S.A.

It is not possible for you to get a better quality of **High-Speed Steel** or **High-Speed Drill** than

BEARDSHAW'S "CONQUEROR" BRAND

And don't forget **our prices are in your favor.**

Alexander Gibb, - 13 St. John St., Montreal

GENERAL SALES AGENT.

BROWN & SHARPE MFG. CO.

PROVIDENCE, R.I., U.S.A.

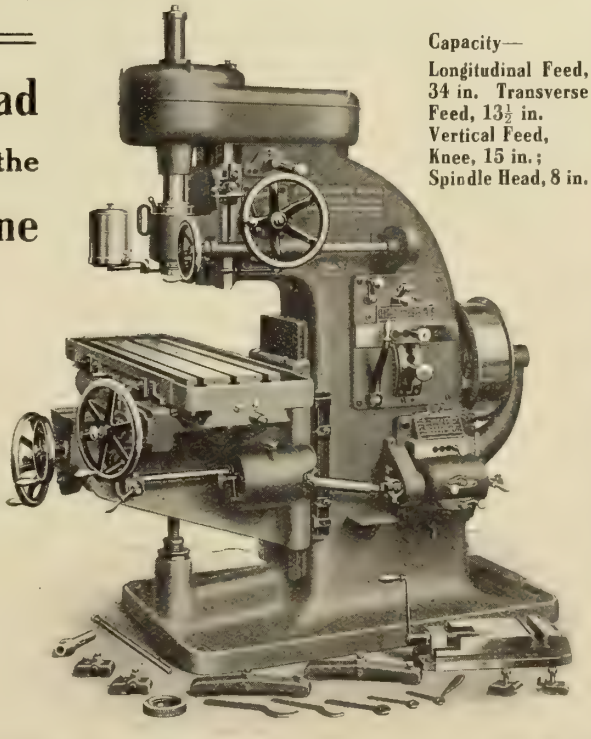
An Automatic Feed for Spindle Head

is a new feature embodied in the construction of the

No. 3 Vertical Spindle Milling Machine

¶ By its employment a large variety of **drilling and boring can be economically done** on this machine in addition to all classes of ordinary vertical milling. An adjustable dog on the spindle-head slide can be set to trip the feed at any point, and a micrometer stop is provided to facilitate fine adjustment after the automatic feed has been thrown out of action; thus accurate duplicate pieces of work are insured.

¶ This is only one of the numerous advantages offered by this machine. Others are fully explained in an attractive circular, a copy of which will be sent free to any address.



Capacity—
Longitudinal Feed, 34 in. Transverse Feed, 13½ in. Vertical Feed, Knee, 15 in.; Spindle Head, 8 in.

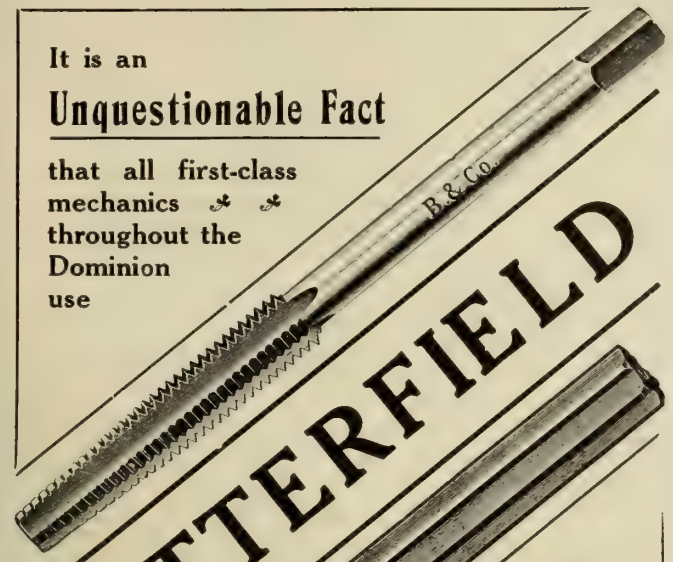
It is an
Unquestionable Fact
that all first-class mechanics throughout the Dominion use



BUTTERFIELD

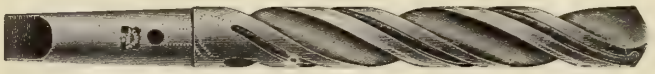
TAPS, DIES and REAMERS

because they realize they are tested tools, accurately finished and made to wear. You can turn out first-class work with these tools. Send for catalogue.

Butterfield & Co., Rock Island, Que.

THE STANDARD TOOL CO'S

Oil Tube Twist Drills



Made with either Taper or Straight Shanks for drilling holes rapidly and accurately.
Brass tubes are fitted to connect with a hole in the shank. Oil is forced through them, giving a constant supply at the cutting point, keeping it cool and forcing out the chips.

TRY THEM.

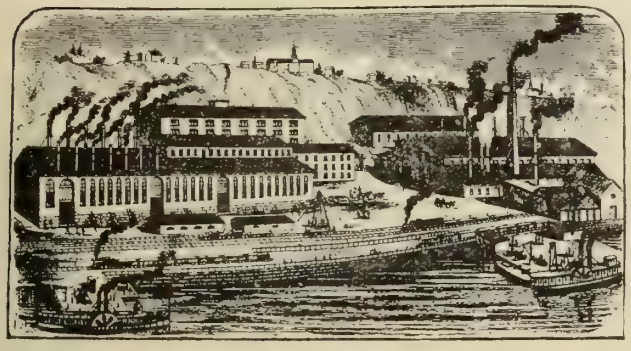
The Canadian General & Shoe Machinery Company

Limited

ERNEST CARON, Managing Director

LEVIS, Quebec



¶ Mechanical Engineers and General Contractors. ¶ Brass and Iron Founders and Boiler Makers. ¶ Marine, Pump and General Repairs.

¶ Manufacturers of Heavy and Light Castings of every description.

Shoe Machinery Engineers

¶ Manufacturers of NON-ROYALTY Machines. ¶ Metallic and Goodyear Systems.

¶ "Fortuna" Skivers and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines, etc., etc.

¶ WIRE of every description for Slugger and Standard Screw Machines. ¶ Brass and Steel Nails for "Loose Nailer." ¶ Inks, Stains and Polishes.

ABOUT six months ago we booked an order for shipping tags (the cheapest kind we make) for a Company shipping castings and machine parts.

The other day they wanted another lot of tags and we suggested using a tougher tag. It didn't take much to persuade them, as the cheaper tag was not sufficiently strong to carry their heavy merchandise. We are now running their order on a four grade better tag.

Let us check up your tag situation.
Samples of all kinds on request.

What is "KALUX"?
REG 48,758
SIMPLY THIS—
THE FINEST, MOST EFFICIENT AND RELIABLE, STEEL HARDENING SOLUTION EVER PLACED ON THE MARKET. Its use means a new money-making era in your shop, longer life to your tools, and an efficiency gain of from 50 to 150 per cent. Just add KALUX to plain water and proceed as usual, keeping the quenching heat low. Sample free.

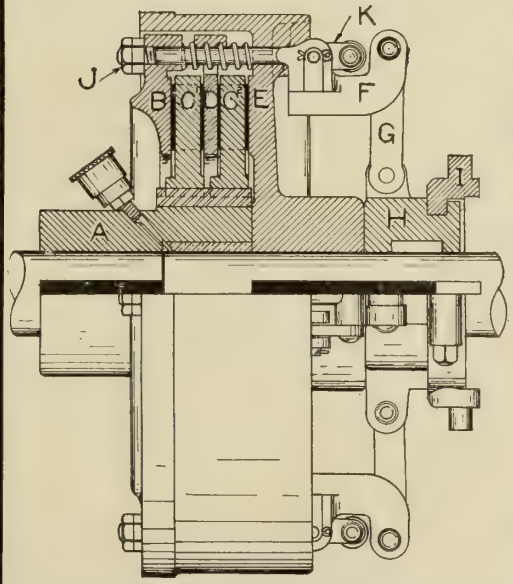
THE IDEAL CLUTCH



IS THE CLUTCH THAT GRIPS

Because it has Large Friction Surfaces and Powerful Lever Movements for size of clutch. Our Friction Clutch is made solid and split. It is also perfectly safe when out of gear, as it cannot start unexpectedly.

We make also a Hub Clutch especially for Counter Shafts or Gas Engines.

Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

PATENTS.

THE PROPRIETOR of the Canadian Patent No. 83902 "Improvements in camdises for operating the exhaust valve in four-stroke combustion engines," is desirous of entering into arrangements, by way of license or otherwise, for practically working the patent. For particulars apply to "Reversator," care of S. Gumaelii, Annoncebureau, Stockholm, Sweden. (10)

POSITION WANTED.

YOUNG (Scotch) Engineer seeks position in drafting or commercial office of engineering firm. Mechanical and electrical experience. Apply Box 90, CANADIAN MACHINERY, Toronto. (9)

SUPERINTENDENT WANTED.

A PRACTICAL SUPERINTENDENT, experienced in the manufacture of Traction Engines and Threshing Machines, to take charge of plant. Apply, stating experience, Box 91, CANADIAN MACHINERY, Toronto. (9)

FIRE PROOF SAFES, VAULTS, ETC.

IF YOU are in the market for a Safe or Vault Door let us send you our illustrated catalogue "S." Our Safes are made to suit all requirements, from the smallest household Safe to the largest bankers' Safe made. The material and workmanship used in the construction of our Safes are the best obtainable. They are made to stand any fire through which they may be called upon to pass. Write to-day for book showing Safes which have passed through Canada's most severe fires. Address all inquiries to Dept. "S," The Goldie & McCulloch Co., Ltd., Galt, Ontario, Canada. (tf)

MISCELLANEOUS.

WHEN buying bookcases insist on having the best in the market—"Macey Sectional Bookcases." Carried in stock by all up-to-date furniture dealers. Illustrated booklet sent free on request. Canada Furniture Manufacturers, Limited. General offices, Woodstock, Ont. (tf)

725,000 LIVE MERCHANTS use National Cash Registers. We couldn't sell them unless they saved people money. The National will guard your money too. Write us for proof. National Cash Register Co., 285 Yonge St., Toronto.

YOUR personal reputation and dignity should be reflected by your office appearance. Our office fittings are artistic in design, thorough in workmanship and pleasing in finish. Our illustrated catalogue contains much of interest to every business man. Send for it to-day, Dept. E, Dominion Office and Store Fittings Co., Ltd., London, Ont. (tf)

AN EXTRA 1 PER CENT. PROFIT.—A National Cash Register will earn at least an extra one per cent. profit for any retail merchant. The National Cash Register Co., F. E. Mutton, Canadian Manager, cor. Yonge St. and Wilton Ave., Toronto, Ont

WE HAVE eight rebuilt Visible Oliver Typewriters for sale. The price is $30.00 each, and at that figure they are a bargain and should not be on the market long. Monthly payments can be arranged if desired. The Monarch Typewriter Company, Limited 98 King W., Toronto.

THE "Kalamazoo" Loose Leaf Binder is the only binder with a flexible back. There are no exposed metal parts to injure the desk. It is a book, not a box; and will hold firmly ten sheets or a thousand sheets—just as many as you actually require and no more. The book is stronger than any other, the alignment perfect, the sheets lie close to the desk and the writing surface is flat. Booklet on request. Warwick Bros. & Rutter, Ltd., King and Spadina, Toronto. (tf)

THOUSANDS OF DOLLARS go astray in the mails every year. YOU should therefore insure against a possible loss by sending YOUR remittances by Dominion Express Company Money Orders and Foreign Drafts. If delayed, lost or stolen, a refund will be promptly arranged or a new Money Order issued without further charge. The Dominion Express Company also transfers money by telegraph and cable and buys and sells foreign money. If you want to send money to any part of the world the Dominion Express Company will be pleased to accommodate you. Hundreds of agencies throughout Canada.

SIR GILBERT PARKER is to the fore again with his latest book entitled "Northern Lights." It pictures the life of that portion of our country upon which all eyes are now turned. The stories portray conditions in the Great West before and after the effects of modern civilization, and treat the subject with a master-hand. For sale at all bookstores. Cloth bound, illustrated, $1.50. The Copp, Clark Co., Limited, Publishers, Toronto. (tf)

JUST NOW we are holding a special sale of second-hand typewriters. All makes are represented—Underwood, Remingtons, Olivers, Empires, Smith Premiers, etc. They have been carefully rebuilt and are in good workable, wearable condition. The Monarch Typewriter Company, Limited, 98 King St. W., Toronto, Ont.

"SYSTEMS" stand for all that is best in loose-leaf binders and supplies, letter-heads, statements and in fact your office stationery of every description. Send us samples of what you are using—we will send you prices that will interest you. Business Systems, Limited, Manufacturing Stationers, Toronto. (tf)

MISCELLANEOUS.

YOUR CHEQUE CAN'T BE RAISED to any amount above that which you intend it to cover if you use the PROTECTOGRAPH. This device stamps a line such as "Not over ten dollars, $10," with acid proof, indelible ink, which penetrates right through the fibre of the paper. This device is being used by 90% of the Banks of Canada and the United States, as well as the treasuries of both countries. Write for full particulars and price. W. E. Parker & Co., Sole Canadian Agents, 37 Yonge Arcade, Toronto, Ontario.

PEERLESS CARBON PAPERS and TYPEWRITER RIBBONS are unequalled in writing, manifolding and wearing qualities. Our "Klear Kopy" Carbon was awarded a contract over 43 competing lines by one of the world's largest governments. All up-to-date dealers in stationery, typewriters and office supplies handle our goods. Ask them or write us direct for prices and samples. Peerless Carbon & Ribbon Manufacturing Co., Toronto, Canada.

TAYLOR-FORBES COMPANY, LIMITED. Head Office, Works and Foundries, Guelph. Largest manufacturers of hardware in Canada. (tf)

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling, and greatly facilitates the loading of cars, drays, etc., and for handling goods in and about the warehouse and factory reduces the cost of labor because far less warehouse help is required. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley St., Toronto. (tf)

ACCURATE COST KEEPING IS EASY if you have a Dey Cost Keeper. It automatically records actual time spent on each operation down to the decimal fraction of an hour. Several operations of jobs can be recorded on one card. For small firms we recommend this as an excellent combination—employe a time register and cost keeper. Whether you employ a few or hundreds of hands, we can supply you with a machine suited to your requirements. Write for catalog. International Time Recording Company of Canada, Limited. Office and factory, 27 Alice Street, Toronto. (tf)

ELLIOTT-FISHER STANDARD Writing-Adding Machines make toil easier. Elliott-Fisher Limited, 513, No. 83, Craig Street W., Montreal, and 129 Bay Street, Toronto.

THOUSANDS OF DOLLARS go astray in the mails every year. YOU should therefore insure against possible loss by sending YOUR remittances by Dominion Express Company money orders and Foreign Drafts. If delayed, lost or stolen, a refund will be promptly arranged or a new money order issued without further charge. The Dominion Express Company also transfers money by telegraph and cable, and buys and sells foreign money. If you want to send money to any part of the world the Dominion Express Company will be pleased to accommodate you. Hundreds of agencies throughout Canada.

WANTED—A splendid opportunity for dealers to handle the best combination Duplicating, Addressing and Office Printing Machine on the market. Exclusive territory. Send name and address, giving occupation and references, to the Canadian Writerpress Company, Ltd., 33 John St., Hamilton, Ont. (tf)

PROBABLY the most talked about machine in Canada is the Hamer Book-keeping Machine. Everybody helps to sell it who has seen it or it will sell itself when exhibited. It combines in one machine the cash and credit register, time recorder and account register. We want representatives everywhere—men alert, intelligent, not afraid to hustle. Write for our proposition. Book-keeping Machines Limited, Head offices and show rooms, 424 Spadina Ave., Toronto. Branches, Vancouver, Winnipeg, Montreal. (tf)

THE ability of your hand-writing as well as the ease and speed with which you execute it are matters of great importance. They are also matters of pen point. Use "Crucible" Steel Pens and settle the matter. 15 different styles. Ask your dealer for free samples and pick out the pen you want. If he cannot supply you ask us and we will send samples by return mail. The Copp, Clark Co., Ltd., 64-66 Front St. W., Toronto.

INSTAL an Otis-Fensom Hand-Power Elevator. Costs only $70. Merchants and other business men can turn a second story lumber room into a properly equipped warehouse, leaving ground floor unhampered by reserve stock, packing cases, etc. When power is available we suggest a belt-driven elevator operated by motor or line shaft. Write for catalogue containing illustrations of the different kinds of elevators we handle. Otis-Fensom Co., 1401 Traders Bank Building, Toronto. (tf)

OIL—An Ideal Fuel

The use of oil as a fuel has long since passed the experimental stage, and the advantages gained by its use are so great that manufacturers are at last realizing that it is an ideal fuel—especially for shop purposes.

of superiority of OIL as a fuel may be noticed.

1.—CLEANLINESS. Oil is a clean fuel to use, it produces no ashes, and every portion of it can be converted into heat.

2.—SAVING of TIME. There is no loss of time fixing fires, and the uniform heat increases the output 50 to 100%.

3.—NON-INJURIOUS Its chemical properties are not injurious, and will not attack the metal.

4.—UNIFORMITY of HEAT. Each piece is treated in a perfect manner and there is no waste of material through faulty treatment.

5.—RAPIDITY of OPERATION which makes for economy.

The "KING" Oil Furnaces are perfect in every detail and utilize this valuable fuel to the very best advantage.

Send to

FRANCIS HYDE & COMPANY, MONTREAL for full details.

Low Pressure Burner

Style No. B. 6
High Pressure
Burner

Style No. B. 7
High Pressure
Burner

THE

JACOBS BURNER

is that part of the famous King Oil Fuel Furnace which is of the most vital importance.

We claim that it is the most economical burner on the market, because:—

1. It does not require either compressed air or steam with fan blast for proper atomisation and combustion.
2. It can be operated by fan blast, compressed air or steam.
3. It has few parts, is easily adjusted and cannot get out of order.

The simple and effective manner of controlling the supply of oil and air ensures a perfect admixture of the same.

Send for our illustrated catalogue.

"If a man can write a better book, preach a better sermon, or make a better mouse trap than his neighbor, though he build his house in the woods, the world will make a beaten path to his door."

—EMERSON.

THERE IS A BEATEN PATH TO THE DOOR OF THE

JONATHAN BARTLEY CRUCIBLE CO.

TRENTON, N. J., U. S. A.

There is a reason.

NO FOUNDRY CAN MAKE GOOD
WITH POOR CASTINGS.

The advantages in the use of STEVENS' GENUINE EAST INDIA PLUMBAGO are all the possible advantages that come from the use of the very best facing known to Foundry Practice.

The price is never above the quality, and quality means saving all around—in time in finishing and dressing the mold—the casting coming out so clean that the cost of chipping and cleaning is saved, and so it goes right on towards pocket-book popularity.

The element of quality permeates everything I manufacture, and I manufacture FOUNDRY FACINGS and SUPPLIES, POLISHERS' COMPOSITIONS and PLATERS' SUPPLIES.

FREDERIC B. STEVENS

Everything for the Foundry from a Dust Bag to a Cupola

That's a large order to be sure—**but we can fill it all the same.** Our range includes every appliance used in modern foundry practice. We can fully equip a foundry from top to bottom, inside and out. We are the **only** manufacturers in Canada of

Foundry Facings

We import the genuine Ceylon Plumbago in large quantities, refine and grade it by our own specially designed machinery. We are so confident of the superior quality of our facings that we **guarantee** them to give **entire satisfaction** or they may be returned at our expense—**we paying the freight both ways.** No guarantee could be stronger than this!

We are now manufacturing the unbeatable

"Climax" Core Oil

in our Hamilton factory. It is quick drying; relieves freely from the casting; makes no smell; will not draw moisture; will mix from 40 to 75 parts of sand to one of oil according to sand used and strength required. Cores made with "Climax" oil will not break or blow.

WRITE FOR OUR NEW CATALOG

LOCATE AT

St. Catharines

Ontario - Canada

Power House at Decew Falls of Dominion Power and Transmission Co., Ltd., and Lincoln E. L. and P. Co., Ltd.
2½ miles from St. Catharines, 100,000 H.P.

WHY? BECAUSE—

1. TWENTY-EIGHT PLANTS have located here for good reasons—most of them Metal-working Industries.
2. ELECTRIC POWER is cheaper here—right where it is made—than elsewhere. Less than one-third the cost of steam.
3. WATER SUPPLY is from Lake Erie, with a head of about 200 feet.
4. FREIGHTS are as cheap here as if we had 100 railroads. BESIDES, you can use our port for water shipment to all great lake points and to salt water.
5. LABOR – Good supply of skilled mechanics and laborers. Most workmen own their own homes. They come to stay.
6. SITES are available for YOU to choose from, all good ones, and to be got at figures and terms which are big inducements.
7. INCIDENTALLY—We are one hour (by electric and steam railways) from Niagara Falls and Hamilton.

ALSO—St. Catharines is the market and shipping point for Canada's Greatest Fruit District——

Pattern Making

By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

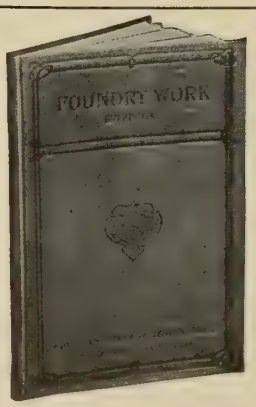
Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

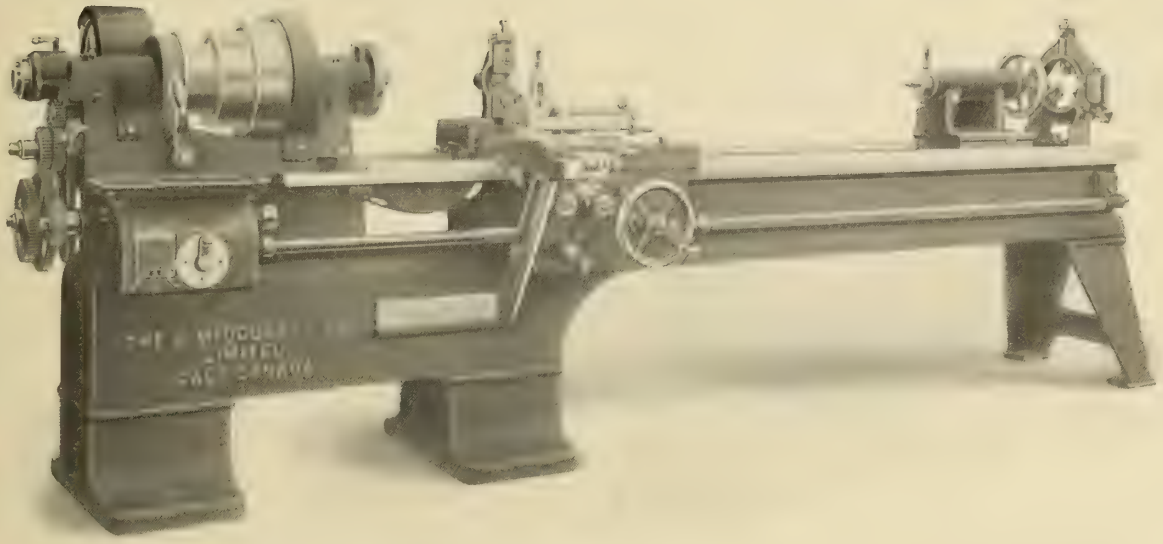
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

"BLISS" ARCH POWER PRESSES

"BLISS" ARCH POWER PRESS, No. 30.

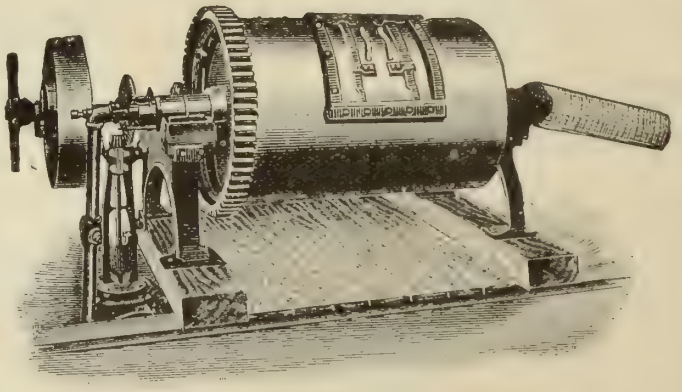
Nos. 30 to 34 are used where the product is varied and especially where want of room excludes a large number of presses. These presses are exceptionally handy and convenient. All parts are well proportioned and the shape of the frame gives great rigidity between punch and die—thus saving dies. The No. 30 shown is regularly made with solid front to bed, and is designed for heavy work, such as stamping petroleum can sides, cutting spoon and frying pan blanks, cutting and stamping coal hod bottoms, fire shovels, metallic shingles, and other work of a similar nature. It may also be used for operating large lettering dies. It is very often built with removable front piece as pictured here, making it suitable for operating horns and forces and wiring dies.

E. W. BLISS COMPANY, 20 Adams Street, Brooklyn, N.Y., U.S.A.

LONDON OFFICE : 114 Victoria Street, London, E.C., England.

A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

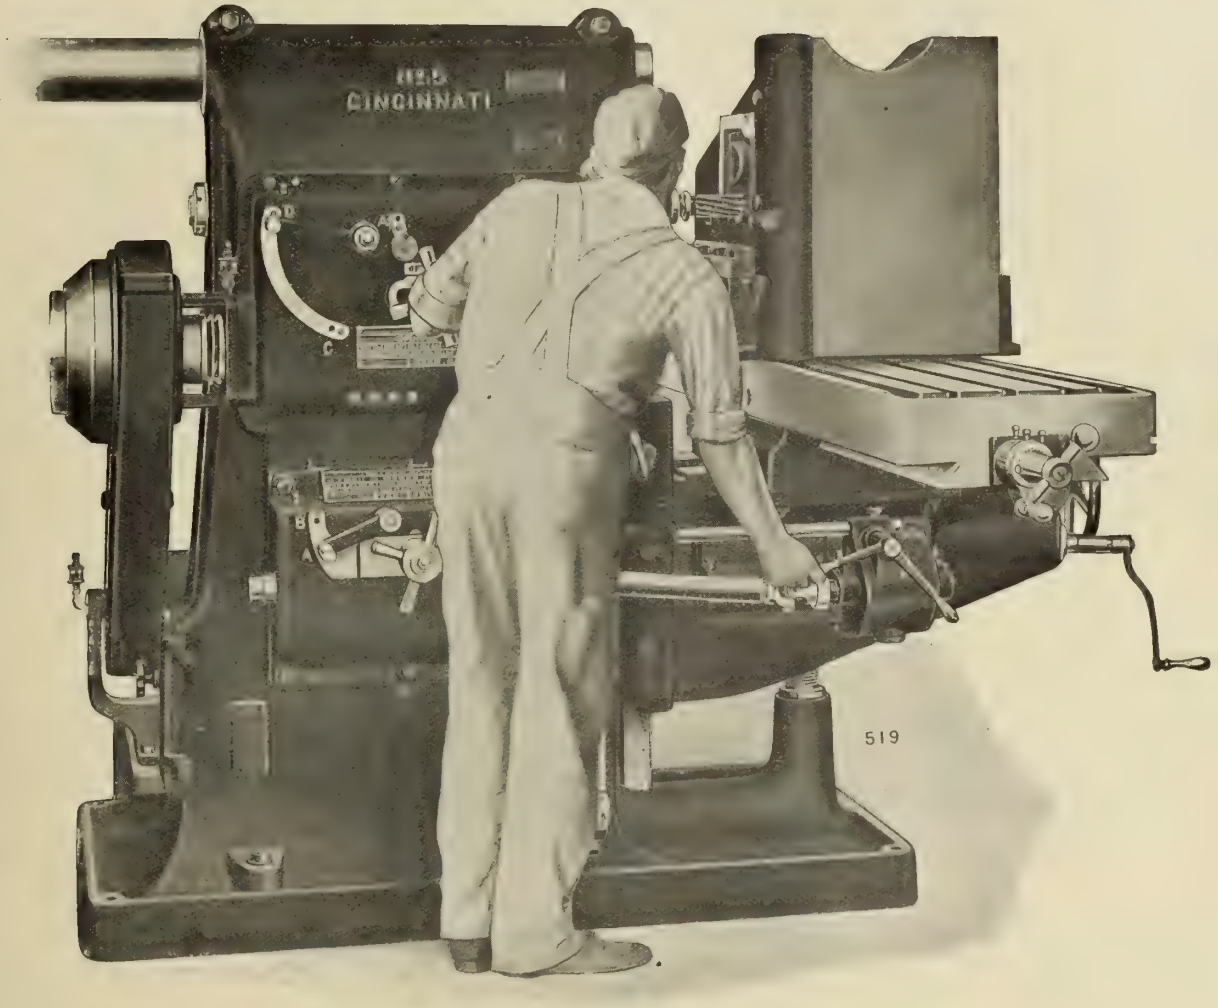
Cincinnati Handiness



WHEN you have a job of end or face milling to do on a Horizontal Miller, don't you find it hard to operate the feed lever and at the same time keep your eye on the cutter?

That's because the machines you are using can be operated from only one place. Our new High Power Machines have an additional feed lever at the side of the knee.

The operator can stand close up to his work, with the cutter in full view, and control the machine from this position.

With this one lever he can operate and reverse table, cross or vertical feeds.

The main starting lever is immediately in front of him and the speed and feed changers are at his elbow, so that the entire machine is under complete control from here.

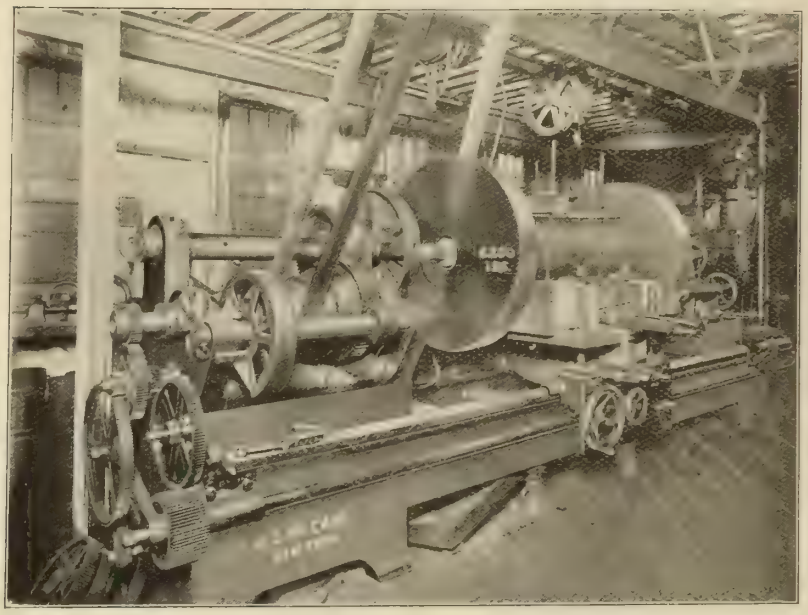
Ask for the Catalog.

The Cincinnati Milling Machine Company

CINCINNATI, OHIO, U. S. A.

CANADIAN AGENT—H. W. Petrie Limited, Toronto, Montreal and Vancouver.

It's as "Straightout" a 48" Lathe—



as any 48-inch Lathe built -but McCabe's Lathe "improves it."

With Internal Geared Face-plate, it is geared up 72 to 1 against 50 to 1 of the "ordinary style."

We don't know of a Lathe job it cannot do—Driving Wheels to turn —Engine-cylinders to bore out— or the smallest piston rings to face off —everything you'd do on a 48-inch Triple-geared or a 26-inch Back-geared Lathe—and "double" the range of work you'd do on any ordinary Lathe.

The 26-inch Swing is responsible for the greatness of McCabe's Lathe —and half the big price is responsible for its great demand with Machine and Repair Shops.

McCabe's **"2-in-1"** Double-Spindle Lathe 26-48-in. Swing.

J. J. McCabe "The Double-Spindle Lathe Man" **30 Church St., New York**

STAMPINGS Special Manufacturing to Order

No matter how hard a stamping problem you put up to us, the chances are we can satisfy you. Many people use stampings in place of castings and find them more satisfactory and often cheaper. Send blue prints and samples and let us quote you.

The Silent Partner is an interesting little magazine. We send it free when there's a reason

THE GLOBE MACHINE & STAMPING CO.
899 Hamilton Street, Cleveland, O.

DON'T relegate those apparently unmachinable castings to the scrap heap.

NOVO SUPERIOR
HIGH-SPEED STEEL

has already saved hundreds of castings from this fate.

Will readily cut castings which could not be touched with the best standard high-speed steels.

One customer writes: "We have been using a NOVO SUPERIOR tool continually for the last four weeks on cast iron fly wheels running at a speed of from 15 to 25% higher than we had been able to run with ——— High-speed Steel. During this time we have used up but one inch of the tool. . . . . We have not yet hardened the tool the second time" etc.

Have you any NOVO SUPERIOR in your shop? If not, send us a trial order and convince yourself of its remarkable qualities.

WRITE FOR FURTHER PARTICULARS.

HERMANN BOKER & CO., 332 St. James St. MONTREAL

NEW HIGH-SPEED STEEL

Engineers now have the opportunity of using a much more durable Steel than the best High-Speed Steel hitherto used, and this they will find in our

Allen's IMPERIAL Special (The new improved) High-Speed Steel

which may be either air-hardened, oil-hardened or water-hardened.

This ***Imperial*** Special Steel will cut much harder materials than can be cut with Tools made of ordinary best High-Speed Steel, and heavier cuts may be taken, or Machines may be driven at accelerated speeds when (in either case) it is found economical to do so. ***Imperial*** Special will also wear much longer than ordinary best High-Speed Steel before requiring to be re-ground.

IF YOU WANT A BETTER QUALITY OF STEEL than that you now use, we shall be glad to receive your orders for our

THE CHUCK THAT GRIPS AND WILL NOT SLIP!

THE

RUSSELL ANTI-FRICTION DRILL CHUCK

is remarkable for the ease with which it can be attached and released. It is self-tightening and entirely automatic in its action. Ball-bearings eliminate all friction, and it has interchangeable jaws, perfectly accurate. It is the only chuck that will hold straight shank drills without slipping!

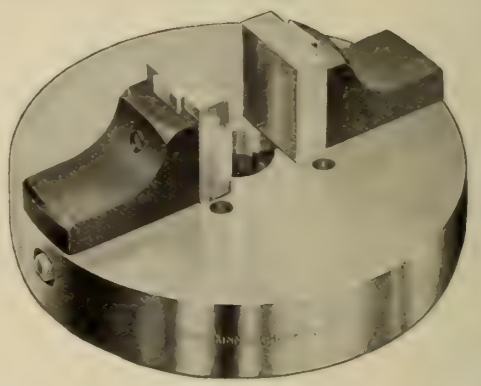
Made in five sizes

The Russell Anti-Friction Drill Chuck Co., Elmira, N.Y.

Sole Distributing Agents for Canada

THE GENERAL SUPPLY CO. OF CANADA

Ottawa - - - - - - - - Canada



This is the Chuck we recommend

for holding odd shaped pieces. By machining the steel slip jaws, a firm bearing can be obtained all around. Additional slips for additional pieces, and only one chuck, as the slips are interchangeable. Brass workers use this chuck for holding delicate pieces which would be crushed if gripped at points.

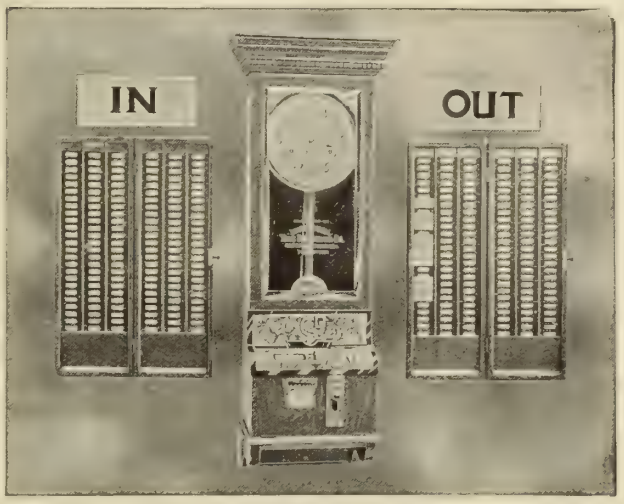
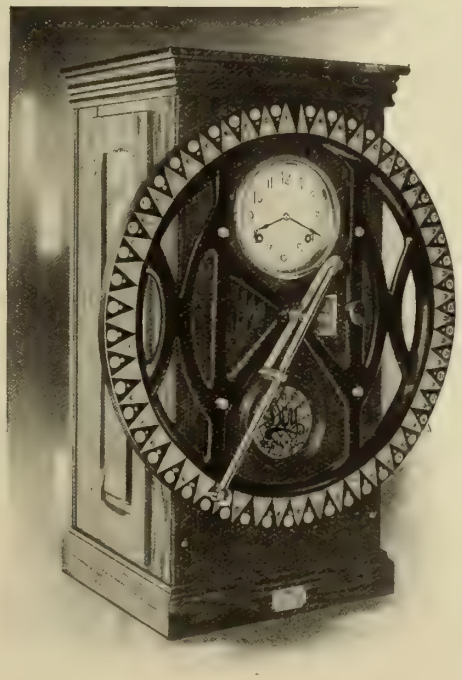
LABOR TIME RECORDING

The chief item in the expense account of the average business concern is the cost of labor. Labor cost represents Time for which the employer pays Money. It naturally follows that ar efficient system of checking the time given by employees in exchange for their employers' money is essential to the proper conduct of business. No system that is in the least dependent for its operation upon the honesty or energy of a clerk will give very satisfactory results. A clerk is only human. He has his likes and dislikes; his fits of laziness; of indisposition; of carelessness. The perfect system is the



International Rochester Card Time Recorder



This system is entirely automatic and is the very acme of simplicity. It consists of a clock with a special mechanism, two card racks and sufficient cards of a simple ruling, as shown in the above illustration. When ringing "in" the employee takes his card (designated by name and number) from the "out" rack, stamps it on the clock, and places it in a corresponding pocket on the "in" rack. On his card the exact time of his arrival—day, hour and minute—has been recorded. He repeats the operation whenever going in or out. At the end of the week your card racks contain an absolutely accurate record of the time worked by every employee. This system cannot err or be manipulated. Its records are absolutely indisputable. Could anything be more satisfactory ? We are also manufacturers of the well-known

Dey Dial

another entirely automatic time-recording system, manufactured in eighty-eight different styles.

No matter what the nature of your business may be, or how large or small its size, we can supply you with a time-recording system at a fraction of the cost of a human time-keeper and with infinitely better results.

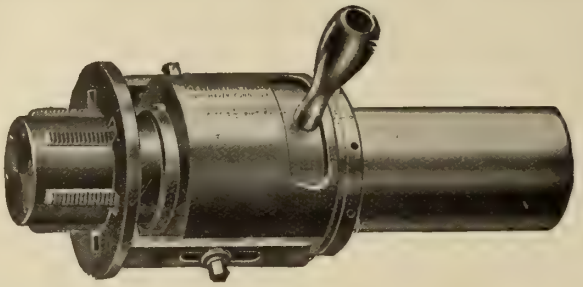
SOMETHING ENTIRELY NEW.

THE WORTMAN & WARD CO. LIMITED

LONDON, ONTARIO, CANADA

The user of solid taps is wasting valuable time, which also means a waste of money.



The only way to overcome this is to instal an equipment of the

GEOMETRIC ADJUSTABLE COLLAPSING TAPS

These instantly collapse when the desired depth is reached, and can then be withdrawn without the chasers touching the work, which cuts the time down one-half. This does away with the damage to the threads and breaking of taps so objectionable in backing out solid taps.

The chasers can also be adjusted to tap slightly larger or smaller than the size for which the tap is made.

If you want a saving in your tapping cost, write us for particulars.

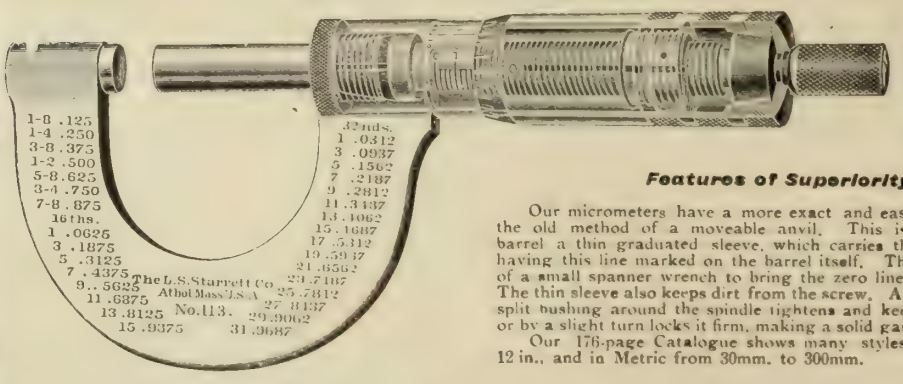
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



Starrett Micrometers

Features of Superiority Patented

Our micrometers have a more exact and easier way of adjustment than by the old method of a moveable anvil. This is obtained by placing over the barrel a thin graduated sleeve, which carries the base or zero line, instead of having this line marked on the barrel itself. This sleeve may be turned by means of a small spanner wrench to bring the zero line correct to compensate for wear. The thin sleeve also keeps dirt from the screw. A knurled locking nut contracting a split bushing around the spindle tightens and keeps the spindle central and true, or by a slight turn locks it firm, making a solid gauge when desired.

Our 176-page Catalogue shows many styles of Micrometers from ⅓ in. to 12 in., and in Metric from 30mm. to 300mm.

FACTORY HEATING AND VENTILATION

BY

The Simplest and Most Economical System Known

The SHELDON FAN SYSTEM

CONSISTING OF

A Pipe Coil Heater, using exhaust or live steam, or both, which can be arranged for gravity return to a boiler located on the same floor.

A Blower, fitted with Sheldon Multivane Runner, which can be operated by any convenient power, most economically by a Direct Connected Engine, the actual operating cost of which amounts to only a small percentage of the heat in the steam passing through the fan engine, the remainder being utilized in the heater, into which the engine exhausts.

Fan, Heater and Engine are centralized in one compact apparatus.

The Fan can be so arranged to take all or any part of its air supply from outside or inside the building, as desired.

The warm air is conveyed through ducts or flues and distributed throughout the entire building.

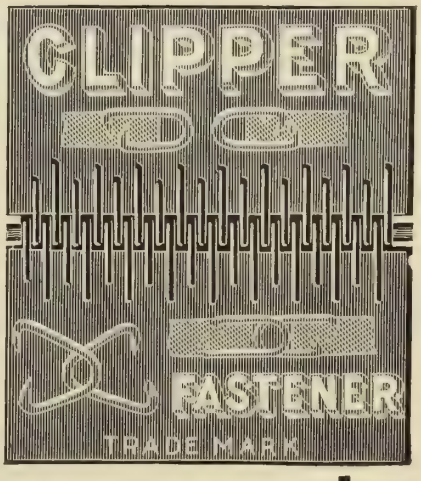
Let us tell you more about it.

SHELDONS LIMITED, :: Galt, Canada

THE

"CLIPPER" BELT LACER

is the simplest belt-lacing outfit, because—



It is not necessary to remove belt from shaft.

Tool holds hooks perfectly while inserting it.

It laces both sides alike.

The hooks are made of special wire, and there is no cutting of the belt half in two as with other makes. The same tool laces any width or thickness equally well.

We invite your investigation of the many special and exclusive features of the CLIPPER BELT LACER. Write for details and prices.

TALK 5

BELTING
vs.
INDIVIDUAL ELECTRIC DRIVES

Since there are so many objections to "Individual Direct Connected Motor Drive," there must be some very plausible argument in its favor. This argument is "variable speed." This element is desirable in a machine tool, especially in lathes and boring mills, but the importance of great range has been very much exaggerated.

Cones are used to obtain this variable speed where belts are employed, and modern practice cuts down the number of cones needed.

High-speed tools work very rapidly, and hence the cutting time is becoming a smaller percentage of the whole time. In the days of carbon steel, when it took several hours to make a finishing cut on a small diameter shaft, doubling the speed was important. Not to-day, however, when a finishing cut is taken with a half-inch edge, the time saved by a 20% increase in speed is negligible in the whole time.

For the speed variations that occur on the same piece of work, as turning the hub and rim of a fly wheel on a boring mill, few variations are required, or two heads rather than a great number of small steps.

Usually, therefore, an individual drive is a luxury, NOT a necessity.

NEXT MONTH—An interesting concrete comparison of costs in motor and belt driven shops. Watch for this. It will, perhaps, open your eyes to losses in your own shop.

THE HAMILTON TECHNICAL SCHOOL

The opening of Hamilton's new technical school marks an advance in technical education in Ontario and in the industrial centre in which it is situated. The staff is well selected and the equipment is excellent. In Hamilton are large steel works, electrical plants and manufacturing industries of various kinds. It is expected that these concerns will draw their apprentices from the technical school. The technical school will not make skilled workmen, but it will supply boys who are familiar with tools, who have some manual facility, and who have learned the necessity of observation and accuracy. The courses will include classes in English, arithmetic, algebra, physics, drawing, woodworking, electricity, forging and machine shop practice.

The school is situated on Stinson St., and will be directly under the control of the Board of Education. The course of study in the classes mentioned have been arranged for the first year and will also be arranged for second and third year students.

Evening Classes.

The evening classes are intended primarily to meet the requirements of apprentices, journeymen and others who are engaged in industrial or commercial pursuits during the daytime by providing mathematical and scientific training and supplementary shop practice. The practical breakdown of many of the apprentice systems has been one of the principal reasons for the establishment of industrial and technical schools. The session began early in October and will end in May. Instructions are given on Monday, Wednesday and Friday evenings.

Evening Courses are given in the following subjects:—

Carpentry and Building Construction.
Pattern making.
Algebra.
Plane Trigonometry.
Industrial Chemistry.
Industrial Design.
Graphic Statics.
Architectural Drawing.
Freehand Drawing, Mechanical Drawing.
Printing.
Plumbing.
House and Sign Painting.
Textile Design and Manufacture.
Domestic Science.
Dressmaking.
Millinery.

Fees.

For day classes the fees are $1.00 a month for residents of Hamilton and $3 per month for non-residents.

For evening classes the fees are $1 per month for residents and $5 per month for non-residents. Fees are payable in advance. The above fees admit pupils to all classes.

Pupils are required to provide themselves with drawing instruments, paper and a few tools, and with overalls for use in the shops. Drawing boards and T squares are provided by the school.

The Building.

The Technical School is a brick building, with brown stone trimmings. It is a two-story structure, with basement and attic. In the basement, which is high and well-lighted, are located the forge department, the electrical laboratory, the painting and plumbing departments, fan room, store rooms and lavatories. On the first floor are to be found the office, the woodshop, the machine shop and class-rooms; on the second floor, the domestic science department, the drafting room and class rooms. The building is heated by steam. A complete ventilating system has been installed.

Entrance Requirements.

Those elegible for admission are:—

(A) As regular students—(1) pupils who have passed the entrance examination; (2) those whose standing is equivalent to High School Entrance, on the joint approval of the Inspector of Public Schools and the Principal of the Technical School.

(B) As special students—others whose qualifications are satisfactory to the Inspector of Public Schools and the Principal of the Technical School.

A three years' course is offered. In the first year the student's time is divided about equally between the academic and the technical work; in the succeeding years increased attention will be given to the technical work.

Forging.

The forge shop is a room 84 feet by 28 feet, located in the east side of the basement. Besides benches fitted with blacksmiths' vises, it contains 16 Sheldon forges with blast and exhaust system and a full complement of Peter Wright anvils and small tools, including flat and round jawed tongs, swages, fullers, hardies, sledges, hot and cold sets, flatters, hammers, dividers, calipers and wrenches. An additional line of tools is provided for special work.

Course 1—5 months—Instruction in the making and managing of the fire; fuel; tools used in hand forging; iron and iron

working; welding; explanation of the different heats; tempering. Practical instruction in drawing down, bending and welding. Simple exercises, including the making of hooks, staples, rings, bolts, chisels, lathe tools, etc. Working drawings are used throughout the course.

Machine Shop Practice.

The equipment of the machine shop, which is a well-lighted room, 84 feet by 28 feet, consists of eleven benches furnished with Holland's vises and individual sets of tools, 1 high speed and 6 engine lathes of from 11 inches to 16 inches swing, a 24-inch by 24-inch by 6-foot planer, a 16-inch, London Machine Tool Co., Hamilton, back geared shaper, a 20-inch drill press with hand and power feed, a Robertson Drill & Tool Co., Buffalo, power hack saw, a Canadian Hart Wheel Co., Hamilton, grinder and a Fox, Grand Rapids, milling machine, besides a tool room stocked with a line of special tools.

Course 1—5 months—An elementary course. Frequent talks on shop methods and the use of the various tools and machines with which the shop is equipped. The bench work includes the operation of chipping, filing, polishing, scraping, tapping and threading. After this a number of exercises are undertaken, which involve the use of the machines enumerated above. Working drawings are used throughout the course.

Electricity.

In the course in electricity emphasis will be put on the laboratory practice, but the theory and mathematics of the subject will not be overlooked. The laboratory is a room 78 feet by 28 feet, situated on the west side of the basement. It is equipped with sets of magnets, galvanoscopes, resistance boxes, D'Arsonval galvanometers, Wheatstone's bridges, batteries of various types, and other apparatus for individual experiments in elementary magnetism and electricity; doorbells, annunciators, switches, sockets, receptacles, incandescent lamps of carbon, tungsten and tantalum types, and arc lamps, for practice in wiring and testing; and for testing generators and motors a full line of ammeters, voltmeters and wattmeters, and generators and motors of various types.

Course 1—An elementary class-room and laboratory course in magnetism and electricity, covering magnetic lines of force, simple voltaic cell; electrochemical series; two-fluid cells of various types; Ampere's law; Ohm's law; measurement of resistance by various methods; law of divided circuits; battery resistances; heating effect of current; induced currents; construction and operation of simple dynamo; electric bells; electroplating; electrostatics series.

Woodworking.

The wood shop is a large well-lighted room 98 feet by 28 feet, equipped for bench and machine work. There are twenty-four benches furnished with vises, saws, chisels, gauges, planes, mallets, dividers, ratchet braces and bits, rules, etc., for the commoner operations in carpentry cabinet making and pattern making. The list of machines includes 2 wood turning lathes of 12-inch swing and 5-foot bed, four 14-inch swing and 6-foot bed, with a full complement of wood turning tools, including gauges, chise's, scrapers, inside and outside calipers, etc.; rip and cross-cut power saw with tilting table and bevelling attachment; a 30-inch band saw with tilting table; buzz planer, with adjustable table; and power grindstone.

Course 1—5 months — Instruction in the growth of trees and the preparation of lumber, the properties of the commoner woods, and the uses and care of wood working tools. The shop excerises will afford practice in planing, sawing, etc., the making of joints used in carpentry and cabinet work, and wood turning. The course will aim to develop the individuality of the student and, by practice, to familiarize him with the correct and accurate use of wood-working tools.

In the second and third years, courses in pattern-making and carpentry will be offered.

Both ordinary and Chapman double ball bearings are in use. Experiments will be made by the students with the two types.

The Teachers.

The principal is J. G. Witton, B.A., S. B., who will have charge of Mechanical Drawing; H. Nold, a mechanical and electrical engineer, will be instructor in electricity; William Bailey, in wood working; Frank E. Brancht, in machine shop practice, and Julian H. Thomas in forging. Other teachers have been appointed to take charge of art, domestic science, etc.

The Technical School has taken over the equipment of the Hamilton Art and Technical School, and this department will be under the supervision of J. S. Gordon.

THE TENSILE STRENGTH OF NICKEL STEEL.

Tests performed at the Institute for Testing Materials at the Darmstadt Technical High School have shown, according to Preuss (Stahl and Eisen), that the tensile strength of nickel-steel rivets is two to two and a half times as great as that of ordinary rivets, whilst the resistance to slip is not inferior to that of the latter. At high temperatures the breaking-strength of nickel steel is higher than that of welded iron; and this applies in a still greater degree to the elastic limit. Hence during the cooling of nickel-steel rivets after being hammered up, the pasty condition of the metal ceases at a higher temperature than in the case of welded iron, so that elastic stresses are set up at an earlier stage. Superheating, followed by slow cooling, lessens the capacity of nickel steel to withstand repeated bending at right angles and re-straightening; but even after exposure to white heat the flexion value was $1\frac{3}{4}$, which may be considered satisfactory for boiler-plate steel. Still higher temperatures cause the flexion value to rise again.

It is essential that the difference of potential between nickel-steel rivets and the plates they are intended to hold together should not be too great. In order to study the influence of electrolytic decomposition a number of nickel-steel rivets and welded-iron rivets were driven through separate plates of mild steel and immersed for two months in a brine corresponding to sea water. The loss of weight sustained by the nickel-steel rivets was in the proportion of 11 to 6 as compared with the loss sustained by rivets of iron, and further experiments showed that the difference of potential between nickel steel and mild steel is greater in brine and tap water than that between welded iron and mild steel.

TARIFF CHANGES BY ORDER-IN-COUNCIL.

An order-in-council from Ottawa has been made transferring to the free list the following:

Metallic elements and tungstic acid when imported by manufacturers for use only in their own factories in the manufacture of metal filaments for electric lamps.

Steel imported by manufacturers for use in their own factories in manufacturing rough unfinished parts of rifles, when such parts are to be used in rifles to be made for the Government of Canada.

Gun barrels in single tubes, forges roughbored.

Hyposulphite of Soda when imported by tanners for use in their own factories in the tanning of leather.

Rolled iron and steel rods, not over half an inch in diameter or in width, to be manufactured into horse shoe nails, when imported by manufacturers for such nails.

Laboratories, etc., in the Hamilton Technical School, Hamilton.

Costs that Wore Masks; Story of a Factory System

Richard Bracefield, in System, Relates this Story of a Factory System in which Expenses Masqueraded with Bankruptcy.

"Mr. Newhall wants you."

Crosby was under a lathe when he got the peremptory summons. Delving in grease and steel dust, he was attempting to coax a worn-out machine to do the impossible. In no amiable mood he crawled forth.

"All right," he answered sharply. "Guess he can wait until I clean up."

He crossed to a faucet but, changing his mind, followed the messenger. "The old man may as well know that this is no collar-and-cuffs job," he muttered, surveying his begrimed hands. "If things go wrong, it's not because I supervise at long range."

Entering the president's office, he was conscious of a new, a sharper antagonism. For weeks—virtually for half his short service with the company—his relations with his chief had been growing colder, more formal. In the brusque greeting now, the invitation to be seated, he recognized the heralds of a crisis.

"When you came to us, Mr. Crosby," the elder man began, "it was with the idea that you would cut our making costs in your two departments, wasn't it? You were also to perfect our Model 7 and get out the machine tools for it. But the main reason you were hired was to reduce our production expense in your two shops. Your own estimate, you'll recall, was that it ran twenty-five to thirty per cent. too high."

The supervisor inclined his head. The other's trend was unmistakable; it remained only to hear the specific charge.

"Very well." Mr. Newhall chose a typewritten statement from the little pile before him and handed it to the younger man. "There's a tabulation of manufacturing accounts F and G for the three months you've been in charge and the three months preceding. How do you account for the extraordinary increases?"

Crosby compared the figures. On their face they were inexplicable. Yet he knew that, despite his inheritance of careless workmen and ill-kept machines, he had not done badly during his three months.

"Now then"—the president broke harshly in upon his swift analysis—"on top of this disappointing showing comes a requisition signed by you"—he waved it at the superintendent—"for the purchase of three expansion reamers to be bought outside.

"If that's your idea of cutting costs"—his voice rose in his excitement—"it's time we came to an understanding. You propose here to pay eighteen dollars apiece for these reamers when our books show that we've made them for eleven."

Crosby took counsel with himself. He had ordered the reamers because they were badly needed and the price seemed low. He had been in the plant long enough to discover that its accounting system held inscrutable mysteries. The exigencies of shops full of poor equipment had left him no time to master the riddle of his predecessor's cost system. The sheet in his hands—account F representing drills, taps, files, toolsteel and the like, the other jigs, templates, reamers and so on—showed an excess in costs during his incumbency of nearly one hundred per cent. without a corresponding increase in equipment. The figures did not reflect the facts; but he saw no way of demonstrating their falsity. Swiftly he framed his answer.

"I've given all my time to production, Mr. Newhall,"—he met his senior's eyes frankly—"you know our machines were in deplorable condition when I took hold, and discipline so lax nobody did good work. Those were concrete evils no one could mistake: I tackled them first and in a measure I've corrected them. But I don't understand why your figures here should indicate what I know isn't true.

"Give me a week to dig into the thing. If I can't satisfy you then that I'm getting out more work and getting it out cheaper than Fox did, I'll quit."

Mr. Newhall swung back to his desk and picked up the offending requisition.

"Have it your way." he said. "Meanwhile, you had better start to make these reamers."

II

Crosby hurried back to his office with a well-defined sense of his crisis. He had pledged himself to prove that departments R and X under his management had increased output and lowered costs. Failure meant a serious check, perhaps the end of his career as an executive.

He cast back over his three months' experience, recalling each change and correction he had made. He had been conservative in his betterments. Every machine tool that could possibly be used or repaired he had retained: he had limited repairs and new construction to imperative necessities, replacing no gauge or jig whose faults could be overcome by adjustment or extra vigilance on the part of the workman handling it.

In this he had gone even further than his own ideas of quality in product dictated because Mr. Newhall had vetoed nearly every suggestion involving outlay on new tools or machines. Admitting that the stock room was burdened with imperfect parts, the president had insisted that incompetent workmen and careless supervision were to blame—not the shop equipment. It was Crosby's job to correct these evils, he pointed out.

Reorganization of the force and restoration of equipment had been strenuous tasks. For keeping time and stock satisfactory systems were in use; but the methods of computing costs offered endless opportunity for error. Pay-rolls, drawings, patterns, machine tools and materials were charged to their proper accounts, it is true; the trouble lay in the overhead expense.

Both of Crosby's departments were distinct in output and radically different in the demands they made on power and non-productive labor from other departments of the business. Yet their share of the charge for interest, taxes, small tools, power, light, heat, insurance and repairs on buildings, clerical expenses and the like, was based on the general approximation used for all other departments. All these items were lumped in one account nominated shop expense and distributed by the easy but inaccurate method of charging against every job a fixed ratio of sixty-five per cent.

The new supervisor had questioned this procedure, since three other departments patently required more non-productive labor and tools than did either R or X. Newhall pooh-poohed his objection.

"What's the use fussing over red tape or chasing every penny to its rat hole?" he demanded. "Don't you lend and borrow men and tools from the other shops? To keep track of every transfer would mean big expense. It's all in the family, any way. You'll find plenty to occupy you in the making end. Leave the costs to us."

The sixty-five per cent. the president admitted, was no more than an approximation. "A little high, maybe," he said, "but good enough for all practical purposes."

Reviewing these circumstances now, Crosby remembered his distrust of such guesswork as against the cost systems he had been accustomed to, which reduced every item to tangible figures. Allowing for errors, he could not account for the extraordinarily low costs his predecessor had made in manufacturing accounts F and G. It was all the more mystifying in view of the many spoiled and unfinished gauges and jigs he had uncovered in the shops.

From verification of his own figures, he turned to analysis of the other man's. The accounting department was willing to help, but could throw no light on the matter

"You see," the head explained. "Fox took his costs from time cards turned in under order numbers, just as you do now. As fast as his clerk extended the

costs the cards were destroyed. Fox couldn't see any reason for keeping them and Mr. Newhall didn't care. Until you came, no one considered preliminary records important.

The "shake up" in R and X had included both foreman and time clerks. In his quest for information, Crosby was compelled to throw himself on Fox's generosity.

In vain. The former supervisor, now a job foreman in a neighboring factory, laughed at his successor's predicament.

"Up against it, eh?" he smiled in mockery. "Well, you were going to cut my making costs 25 or 30 per cent: go ahead and do it. If you're not smart enough to hold your own in that easy-going old asylum, you'd better go somewhere and take lessons. But not from me. I could put you wise, all right, but I'm not doing it."

The boast stirred anew the suspicion which had recurred again and again to Crosby. But he tried diplomacy. He urged that he had played no part in Fox's discharge: that they had a common interest in proving Mr. Newhall's cost system unfair and inaccurate; in bringing the autocratic president to confession of his errors. The foreman grinned and shook his head.

"Better hunt up Jim Williams," he suggested. "He was foreman and could tell you how we cut costs. He hasn't a job yet, but he'll be glad to see you. He had an idea that he lost his place through you."

III.

Find Williams; there was no other way. The foreman's threats had given Crosby little concern before this: now they loomed up as barriers to an understanding with the man. And an understanding was necessary; he had made search for Fox's clerks and the other foreman before appealing to his predecessor. Williams offered the last chance of clearing up the riddle within the week Newhall had granted; four days had already been consumed in fruitless investigations.

For the twentieth time, Crosby rebelled against circumstances. He was competent, faithful, skilled. He had proved his methods in other factories; he knew he had made the most of his materials, machines, men; that the tools he had made could not be duplcated with the same equipment for less cost. Fox had juggled his figures: Williams should explain how and why.

Telephoning to his wife and bolting a hasty lunch, he took a car to Williams' house. The foreman, sitting on the steps of his cottage, scowled as the supervisor turned in through the gate. Crosby lifted his hat to Mrs. Williams—a courtsey that saved him, perhaps, from instant attack.

"Go inside," the foreman commanded harshly. Without acknowledging the visitor's greeting, he sprang to his feet.

"You've got your nerve," he challenged, facing Crosby with clenched fists.

"Why?" the latter demanded boldly. In the car he had determined his course. "I've done you no harm. You can help me; I may be able to help you. I will, if I can."

"Help me!" the other sneered. "Yes, you will. You helped me out of my last job. And you'll settle for that right now."

"Go ahead," Crosby answered steadily. "If you've got any real grievance against me, here I am. But you know"—he sudenly took the offensive, hazarded all on the suspicion which had grown to conviction in the last hour—"that Fox got you in bad and that you signed your own pay-off when you helped him juggle his costs."

The thrust went home. Williams flushed.

"I didn't help him," he denied. "He was boss and could do what he pleased."

Masking his exultation, the supervisor pressed his advantage.

"But Newhall paid you for a square deal," he urged. "You couldn't expect to stick when they got next to Fox's little game."

"Say," the foreman blustered, "they'll need a new supervisor, if you don't mend your talk."

Crosby ignored the threat. His end was within reach if he could only win this man.

"Look here, Williams," he said, earnestly, "I'll give you a chance. Fox worked you for a catspaw, but I believe you've learned your lesson. You know your trade. You'd be a good foreman if you figured loyalty as the first thing you owe the house.

"I'll get you a bench job with my old company," he proposed. "I'll put you in right with the front office and after you've proved you're on the level, they'll start you up the lader again. How does that strike you?"

The foreman's eyes clouded. He was in straits, his savings exhausted, his rent overdue and no opening in prospect. Yet distrust died hard. "It strikes me," he declared roughly, "that you and old Newhall want something out of me pretty bad."

"I do," Crosby acknowledged promptly. "But Newhall would probably have a fit if he knew I was talking to you now. What you can tell me—what you can prove, doesn't matter the snap of your finger to him. This shop is on a sound basis now; any decent man can keep it there indefinitely. But I'm down and out"—his voice sagged—"unless you decide to help me."

For a full minute Williams debated. He was readjusting his attitude towards Fox, towards Newhall, towards this newcomer he had so cordially hated. The chance of a fresh start lured him.

"Sit down," he said; "what do you want?"

IV.

Crosby's buoyant air the next afternoon nettled the president. He had expected the supervisor to avoid his office, to ask an extension. Instead the latter's manner bespoke confidence, an easy mind.

"How are those reamers coming on?" he asked, choosing the topic he fancied would dash the other's spirits.

"The new design is in the pattern shop," Crosby answered. "We've machined down three of Fox's imperfect tools and are using them till the others come through. They figure in your statement"—he produced the tabulation which had initiated the dispute—"as costing eleven dollars. With your over head, correcting them cost four-fifty each."

"What was the matter with them?"

"They were from sixteen to twenty-one thousandths of an inch off scale. Three one-thousandths is the limit.

"Here's a suggestion of what Fox's tools have cost you," he declared. "I had one section of our finished stock overhauled this morning. Of one hundred and twelve items inspected, more than forty per cent. of each must go into second-hand stock. Here's one bunch where three in every four must be thrown out even though we stretch our limit to five-thousandths."

The president waved the sheet aside.

"I knew Fox's tools weren't perfect," he said shortly. "That's why we hired you. But you're dodging the real issue. Let's settle that: then we'll talk about the efficiency of Fox's tools."

Crosby's eyes gleamed.

"I spoke of efficiency first," he said, "because inefficiency is cost multiplied as often as you use the poor tool. If you insist that I ought to make a perfect reamer for what Fox turned out a worthless one, I tell you that you never knew what Fox's tools cost. He might have put them down as costing five dollars or twenty-five: you'd never know the difference."

Touched in his pride, the president swung round sharply. Crosby was framing up an excuse, he decided.

"That's a large statement," he said crisply. "Prove it—here—now."

The supervisor rose.

"There's a man outside," he began.

"Bring him in," Newhall ordered curtly. As Williams entered, however, he rose.

"That'll do" he said coldly. "I gave you a table of figures to explain, Crosby. You'll answer with figures, or not at all. I'll not listen to a discharged employe."

The supervisor met him squarely.

"You gave me a table of gusses," he countered. "I'll meet them with facts if you'll let Williams talk. I've found where your profits are going. I'd like to tell you—after you've accepted my resignation."

Newhall studied him gravely.

"I accept it," he announced, "go ahead."

Turning to Williams, the supervisor put question after question, the answers indicating intimate knowledge of Fox's methods of time and cost keeping.

"What did the time cards show?"

The foreman shifted uncomfortably.

"Well," he said, "they showed the man's name and number, the order number, the time and the date. Sometimes" --he hesitated—"the order number was left off."

"You mean they didn't always state the job on which the time was spent."

Williams nodded.

"Those were Fox's orders," he defended. "He told us the front office was nutty about three or four accounts and that the easiest way to get along was to make a fine showing there and cover up somewhere else."

Abruptly the president intervened.

"What accounts were those?" he asked.

"D was one,"," the foreman faltered, mopping his flushed face, "F and G were were the ones Fox doctored most."

"How did he cover up, as you say?" Newhall's voice was level, but Crosby sensed the pain and wrath behind.

"Charged the time to general shop expense or transferred it to jobs that borrowed men had worked on. He said the office soaked us sixty-five per cent for overhead and that we might as well even up."

"Did Fox juggle any other accounts but these three?" The president was relentless. He saw his factory system tumbling; but like an honest surgeon he proposed to cut out the cancer, root and branch.

Williams grinned sheepishly.

"Whenever we spoiled castings or ran up the time on regular orders," he replied.

The president's eyes traveled back to Crosby's statement of imperfect parts now in finished stock. For a little space he was silent; then he turned to the supervisor.

"You make your point," he declared. "I wish you'd recall your resignation."

"Certainly." Crosby's face was aglow. Better than the vindication was the discovery that his chief was big enough to admit an error so flagrant.

"I didn't bring Williams here just to square myself," he continued. "I wanted to prove to you that your system of approximation is dangerous. You've seen how your departments can make products at a loss without you knowing it—how costs can wear masks and losses masquerade as profits. Come down into the shops and I'll show you where thousands of dollars of your legitimate profits disappeared: where inefficient tools and machines even now are cutting your margin down hundreds of dollars each month."

"You've got to quit guessing, Mr. Newhall,"—his voice rang with earnestness—"You sell everything you make for a fixed price, but you don't know what job makes or loses money. Knowing exact costs, you could cut out the unprofitable orders, reduce your selling price on others. You need accurate costs to help you sell. Without them, I can't get returns from my men. Now, then, do we get them?"

In his eagerness, he had risen. The president smiled up at him.

"We do," he declared, "line up your work so you can give me all your time for a month. I think"—his manner was judicial—" that I've tried to run this factory long enough without a superintendent."

ANNUAL MEETING OF AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

The thirtieth annual meeting of the society will be held in the Engineering Societies Building, 29 West 39th St., New York, December 7 to 10.

The entire social entertainment will be in charge of the members resident in and about New York, under the immediate direction of a local committee appointed by them, of which Mr. William D. Hoxie, is chairman. For Wednesday afternoon, December 8, an excursion is planned which members and guests will be asked to attend in a body, and during the balance of the time there will be opportunities for smaller parties to visit places of interest. In the evening, there will be a lecture for members and guests upon the subject of Agricultural Machinery.

The professional papers assigned to the meeting are as fallows : Tests on a Venturi Meter for Boiler Feed, Chas. M. Allen ; The Pitot Tube as a Steam Meter, Geo. F. Gebhardt ; Efficiency Tests of Steam Nozzles, F. H. Sibley and T. S. Kemble ; An Electric Gas Meter, C. C. Thomas ; Tan Bark as a Boiler Fuel, David M. Myers ; Cooling Towers for Steam and Gas Power Plants, J. R. Bibbins ; Some Studies in Rolling Mill Engines, W. P. Caine ; An Experience with Leaky Vertical Fire Tube Boilers and the Best Form of Longitudinal Joint for Boilers, F. W. Dean ; Testing Suction Gas Producers with a Koerting Ejector, C. M. Garland and A. P. Kratz; Bituminous Gas Producer, J. R. Bibbins ; The Bucyrus Locomotive Pile Driver, Walter Ferris ; Lineshaft Efficiency, Mechanical and Economic, Henry Hess ; Pump Valves and Valve Areas and a Report on Cast-Iron Test Bars, A. F. Nagle.

In addition to the above papers there will be several valuable reports submitted by committees of the Gas Power Section.

PERSONAL NOTES.

F. P. Jones, general manager of the Dominion Iron & Steel Co., Ltd., has resigned to become general manager of the Canada Cement Co.

L. A. Crandall, manager of sales in the middle west, for the J. W. Paxson Co., Philadelphia, died at his home in Toledo, Ohio, October 17. Mr. Crandall had been connected with foundry supply houses for 25 years, and was one of the best known salesmen in that trade in the United States and Canada. For a number of years his headquarters were at Detroit.

The officers and shareholders at Aikenhead Hardware, Ltd., Toronto, recently waited upon their president, Thomas Edward Aikenhead, and his wife at their home in Markham Street, the occasion being their silver wedding, and presented them with a handsome silver tea service. The address and presentation were made by S. T. Shepard, the secretary of the company. Mr. and Mrs. Aikenhead were taken completely by surprise. Mr. Aikenhead expressed in fitting terms his appreciation of the gift.

AN ALUMINUM FLUX.

Chloride of zinc is now extensively used as a flux in melting aluminum. It is thrown on the surface of the melted metal in the crucible, before pouring. The quantity to be used depends upon the amount of dross on the surface of the metal, which should be vigorously stirred throughout the reaction. If the surface of the metal has not been cleaned by the first lump of chloride of zinc, another small piece should be used.

A good dip for pickling brass castings that are to be tinned, consists of oil of vitriol 1 gallon, aqua-fortis 1 gallon and common salt, 1 ounce.

CHATS FOR MACHINE-TOOL OPERATORS.

In connection with a paper on the "Application of Electricity to Railroad Shops," read before the Association of Car Lighting Engineers by J. H. Klink, the author, discussing the matter of power requirements, distributed three charts, reproduced herewith, which serve as a ready means for determining data relative to cuts by machine tools, where, with certain factors known, it is desired to find the remaining one. The explanation given on the charts will serve to indicate their use. There is no curve giving the horse-power consumed at various cuts, as this would depend on several conditions, such as condition of the tool, etc. Where automatic tool grinders are used, the tools will generally be found in such condition that the minimum power is required. From the curves showing cubic inches of metal removed for given sizes of cuts, the horse-power may be obtained approximately by the use of certain constants. For cast iron this constant would be from 0.3 to 0.5—for example, where the constant is 0.35, 10 cub. in. of metal removed per minute would mean 3.5 h.p. For brass the constant is from 0.2 to 0.3, for wrought iron 0.6, for tyre steel from 1 to 1.25. This applies only to tools in a horizontal position, where the metal removed will fall away; vertical drills and milling machines where the metal stays in and clogs the cut more or less, may require as much as fifty per cent. more power.

The Prevention of Accidents in Manufacturing Plants*

In View of the Many Serious Accidents in Industrial Plants, the Methods Here Given for their Prevention Should Prove Very Valuable.

Machinery should never be cleaned while in motion if it can possibly be avoided. The soft materials used in cleaning, such as waste and the like,

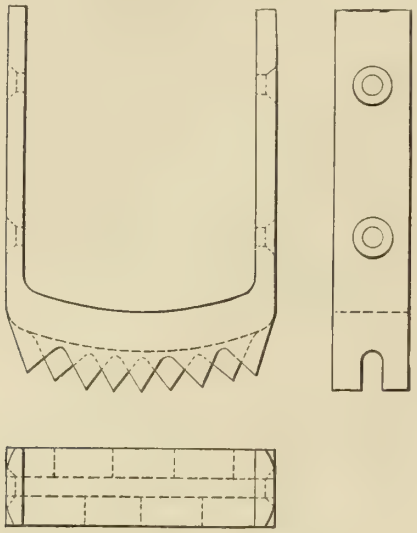

Fig. 1.—Ladder Foot Safety-Device.

catch easily in the gears, or other moving parts, and the workman's fingers, hands, or arms, are drawn in and broken and crushed.

All shafting and pulleys less than 7 ft. above the floor should be securely fenced. Housings of sheet-metal, iron grille-work, wire netting, or wood, or railings of pipe or wood may be used for this purpose. If it is impractical to fence certain pulleys, their arms should be covered with a disk of sheet metal or wood fastened thereto, with screws or wire. The use of inverted U or V-shaped metal-sheet shields, extending for a length of 15 ins. on each side of shaft bearings requiring attention when

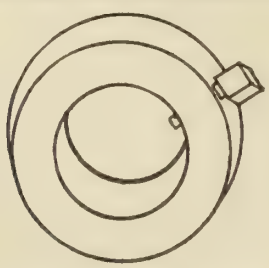

Fig. 2.—Projecting Set-Screw.

the shafting is in motion, is recommended. Even perfectly smooth shafting is highly dangerous when in motion, and no one should be ever allowed to come into contact with it when it is in motion.

Painting Moving Part of Machinery Red.

All moving parts of machinery and other moving parts wherever practical should be painted bright red. Although this method of warning has thus far been confined almost entirely to high-tension electrical apparatus, it has been extensively applied to machinery in general in European countries, and has proved a most efficient aid in the prevention of accidents.

Oiling Shafting.

The oiling of shafting should be done whenever possible while the machinery is at rest. Better still, the bearings may be fitted with automatic lubricators which need be refilled only when the shafting is not in motion. But sometimes the shafting requires attention while in motion, and safe means of access should be provided for this purpose. The following means are the safest. (1) A service platform suspended by metal straps from the ceiling, or carried on brackets, attached to a wall or to columns. Such a platform should be provided with a hand-rail three feet high and a skirting-board about six inches in depth, the latter to stop the foot in case of slipping. (2) A ladder provided with hooks or hangers to fit over the shaft at the upper end, and with some material to prevent slipping at the lower end. (A ladder should never be permitted to lean against shafting in motion, if it is possible to avoid so doing). For wood or cement floors, iron straps pointed at the end and screwed to the sides of the ladder, so as to project some two inches below the bottom are considered best. Fig. 1 presents an elaboration of this device, which has been very successful. These "feet" are made of malleable iron and are fastened to the ladder with ordinary wood screws. The "foot" illustrated in the sketch is for a ladder 3 inches wide at the foot and has ten staggered teeth on the bottom at about ¾-inch centres.

Rubber is also used to some extent for this purpose, but is liable to slip on a wet or greasy floor.

In no case where a line of shafting is close to a wall should an attendant be allowed to fix a ladder against the wall, and thus place himself between the shafting and the wall. Working in a cramped place like this, close to a rapidly revolving shaft is dangerous. (3). The use of a car hung from a rail or L-beam along the shafting, the rail or beam being suspended from the ceiling. The oil cans used in oiling shafting and heavy machinery should have necks at least 9 inches long.

Whenever the shafting or machinery thus requires oiling or other attention when in motion, the work should be done preferably by one man, who should

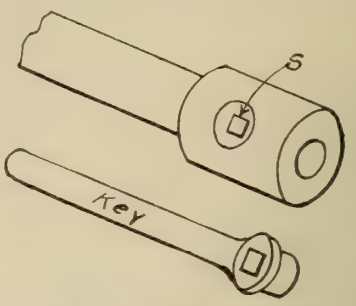

Fig. 3.—Countersunk Set-Screw.

be required to wear exceptionally tight fitting clothing, to lessen the chances of his being caught in the machinery.

Projecting Set Screws.

Projecting set screws when on line shafting and revolving parts of machines are a constant menace to life and limb. The ordinary clothes-catching-set-screw in a collar is shown in Fig. 2.

This hazard may be overcome at a trifling cost in any of the following ways. (1) By countersinking, as in Fig. 3. The set screw may be adjusted by a box-key shown therewith. Of course this method required either a shorter screw or a thicker collar.

(2). By using a flat-head set-screw slotted to take a screw-driver as in Fig. 4.

3). By the use of hollow-set screws. These are made to take a hexagonal key or socket-wrench, as shown in Fig. 5. Either of the two latter obviate the

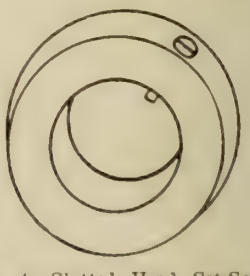

Fig. 4.—Slotted Head Set-Screw.

necessity of countersinking, and may be used instead of the old square-head screws. As it does not matter whether they come flush with the surface of the collar or pulley-hub or set below it, only one length of each size of screw is

* Copyrighted by the Fidelity and Casualty Co., 92 Liberty St., New York, and reprinted by their permission.

required for any depth of hole. These screws may be protected against rust by filling the hole above the screw with wax. If the hole is quite deep and it is desired to lock the screws, one screw may be put down on top of the other.

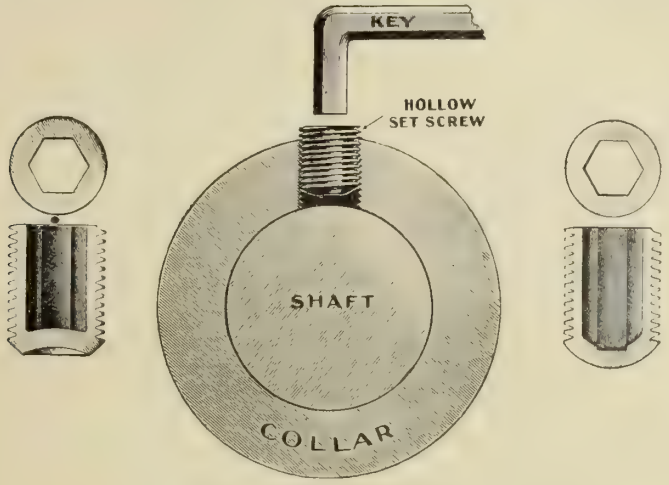

Fig. 5.—Hollow Set-Screws.

The hollow type is to be preferred to the slotted-head screw because there is not the danger of twisting the head off as in the case of the latter.

In a case where for any reason it is imperative that the old square-head set-screws be retained, it is strongly recommended that one of the following guards be applied. (1). A sheet metal plate curved to fit snugly over the screw and to spring on around the shaft. This serves both to keep the head from catching in clothing, and incidentally to retain the screw should it loosen. (2). A piece of leather belting laced about the screw. (3). Wooden guard rings. These are made in halves with a recess bored for the screw-head to fit in, and screw together thus forming a perfectly smooth ring which may be easily removed and replaced. (4). When set-screws or keys project at the end of a shaft they may be covered by a sheet-metal cap fitting over the shaft.

Shaft Couplings.

Fig. 6 shows the ordinary flange shaft-coupling with its array of clothes-

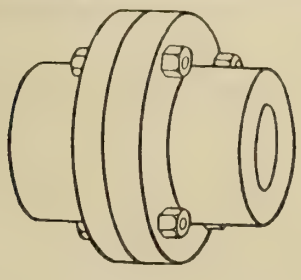

Fig. 6.—Projecting Bolt Coupling.

catching bolt-heads and screws. These are a menace equally with projecting set-screws. Figs. 7 and 8 illustrate two forms of safety coupling. In the former there is used the thickened flange coupling and recessed bolt-heads and nuts, and in the latter the rim-flange coupling beyond which the bolt heads and nuts do not project. In either case it is next to impossible for them to catch the clothing. The safety feature should never be lost sight of when purchasing a coupling.

Guarding Belts.

Main belts which run through the floor should be boxed or fenced in to a distance of 6 ft. above the floor. Small belts, if running close to or through the floor, should be guarded sufficiently to prevent contact with a workman's clothing. If a man gets caught, cut a belt, if this is quicker than stopping the machinery. Where belt connections

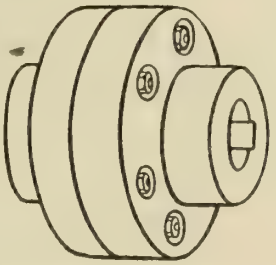

Fig. 7.—Thickened Flange Safety Coupling.

are made with motors or exhausters, the belts usually run at a very high speed, and it is well to fence off the whole apparatus. Pulleys should not be nearer a shaft-hanger or other obstruction than the width of the belt. This precaution will prevent the belt becoming wedged if it slips off the pulley, with the attendant danger of pulling the shaft down onto a workman. Spaces are allowed so that if the belts slip off, they cannot wedge and pull the countershaft down onto a workman. If sufficient space is not allowed for the belts, should they slip off, they will endanger a workman as the countershaft may be pulled down into him.

A belt should not be allowed to rest on a moving shaft. Something may catch and cause it to be wound around the shaft. In every place where it is desired at times to unship a belt, a belt-perch or hook on which to rest the belt should be provided, so as to prevent the belt from coming into contact with the revolving shaft. In case where a pulley is situated very near a journal, a guide bar should be placed close to the pulley, on the side opposite to a belt-perch or hook, at the point where the belt runs onto the pulley. This will prevent the belt falling between the bearing and the pulley and causing damage.

Belt Lacings.

The tearing and flying off of high speed belts is largely due to improper lacing. The lacing should be smooth and flat in order that the shock caused in passing over the pulleys should be the least possible. It will be readily recognized that if an excessive shock is caused in passing over the pulleys, the parts of the belt adjacent to the lacing will be subjected to heavy stresses, which will in time tear the belt. When this occurs the belt is liable to fly off and cause series injury to anyone standing by.

Belt lacings should be tucked well and the excess length cut off close to the belt so that it cannot catch in anything. Should a lacing catch, it may result in the unshipping of the belt. Belt cords on automatic machinery running at high speeds should be sufficeiently guarded to prevent flying in case the cord breaks.

Belt Shifters.

Often a belt is too large to be handled by a belt pole, and it becomes necessary for a workman to use a ladder in replacing it. In this case the ladder should be placed on the side of the pulley opposite the belt, as this position facilitates the operation, and lessons the danger of the workman becoming caught and drawn over the shaft. This is a dangerous operation at best, and should be avoided wherever possible, especially on high-speed shafts.

Loose pulleys and belt shifters or

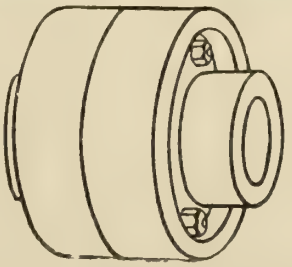

Fig. 8.—Rim Flange Safety Coupling.

clutches should be used wherever possible for throwing machines out of motion when not in use. No employe should be allowed to shift a belt with his hands or a stick whilst the ma-

chinery is in motion. The practice of shifting belts by hands is dangerous, even though they travel comparatively slowly. In cases where belt shifters are not provided, or where it is necessary to shift or repair belts on single pulleys while the machinery is in motion, these operations should be performed by one man detailed for all such work, who should be provided with suitable appliances for the purpose.

Care should be taken to make the belt shifter action used for removing a belt to the loose pulley, of a positive character either by employing one of the many forms of locking gear or a balance-weight. Many accidents have arisen through the lack of this precaution, the belt creeping back onto the tight pulley, and the machine just starting unexpectedly. This applies particularly to wood-working and other

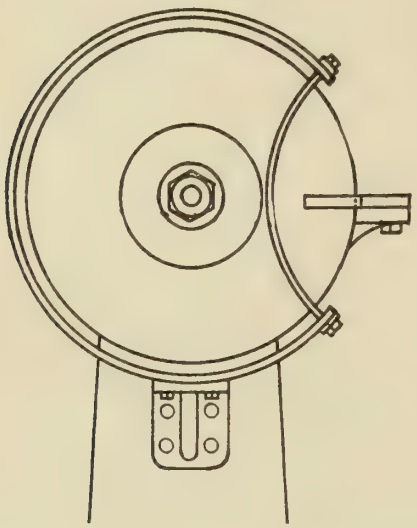

Fig. 9. Emery Wheel Guard.

high speed machinery. Machinery of this class is also set in motion without warning, sometimes, by the loose pulley seizing upon the shaft or by the side friction of the adjacent rims of the pulleys. This danger may be avoided by the mounting of the loose pulley on a well lubricated idle stud, co-axial with the machine-spindle, and using a collar which prevents any end motion in the direction of the tight pulley. The same object may be attained with existing troublesome loose pulleys by encasing the necessary bearing length of the shaft in a collared sleeve which does not revolve with it and on which the loose pulley runs.

Guarding of Gearing.

All gearing, sprockets, and chains with which a workman may come in contact, should be completely covered, so as to leave no point of danger between the guard and the gearing. Small and moderate-sized gears may usually be well guarded by a strip of sheet metal screwed on to some adjacent stationary part and bent to conform to the contour of the gears. Very large gears may often be fenced to advantage. A train of small gears is best guarded by a wooden or metal casing, so con-

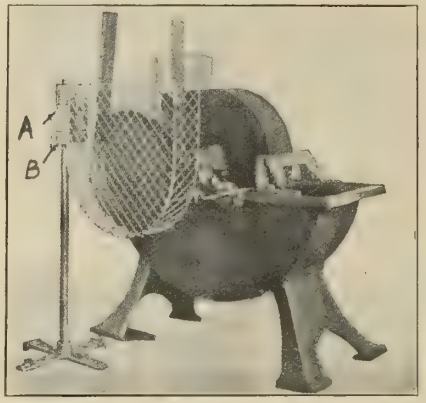

Fig. 10. Grindstone Belt Fixed Guard Closed.

structed that it may easily be removed for repairs or oiling.

Pulleys.

Frequent inspections of the numerous small pulleys in use in every plant should be made. The arms of cast iron pulleys are very liable to crack. When this occurs a piece of the rim may be thrown out by centrifugal force and may cause serious if not fatal injury to any workman near by. The wheels should be hammer-tested frequently, to detect cracks.

Cranes, Winches, Etc.

These should be carefully inspected at intervals for such dangerous defects as worn chains, ropes, sheaves or pins, broken split-pins, etc. All platforms should be provided with skirting boards to prevent the accidental rolling-off of spanners or necessary tools in use. All winches should be provided with efficient brakes. The crank-handle of a hand

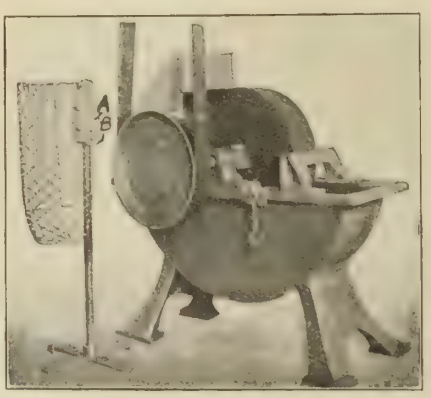

Fig. 11. Grindstone Belt Fixed Guard Open.

switch should not be permitted to attain a very high velocity in running down. Fatilities have occurred from the handle flying off, due to centrifugal force.

All overhead cranes should be provided with a railed walk the entire length of the bridge. It seems strange that manufacturers would build cranes without these walks, but they do. These cranes should also be equipped with foot-gongs, for the use of the operator, with a box on the bridge in which to keep tools and oilcans, and with limit-switches to prevent running the hoist blocks into the drums and probably breaking the cables, allowing the burden to fall onto workmen below.

Each crane should have a switch instaled at some point on the bridge which will cut off all power, making it impossible to start the crane from the cab. Many men have been injured while working on the top of a crane by a thoughtless craneman forgetting for the moment that they are there and starting the machinery.

Each man working on a crane should be provided with a warning sign bearing his name, which he should attach

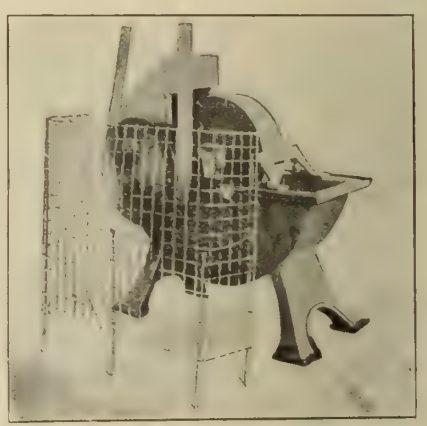

Fig. 12. Grindstone Belt Movable Guard.

to the safety switch, warning all not to throw in that switch, as he is working on the machinery. All overhead cranes should be equipped with sweep-brushes, extending out from the truck wheels, sweeping the rails, the purpose being to warn a person resting his hand on the rail of the approach of the crane. The number of arms and hands lost by persons working on scaffolds along crane runaways, who thoughtlessly rest against the runaway and fail to notice the approach of the crane, is appalling. Four instances have come to my personal knowledge within the past year were these brushes have prevented such accidents. No man should ever be allowed to go on to an overhead crane runway without permission from his foreman, and then, not until the cranemen have been notified and steps taken to protect him from the cranes while he is on the runway.

Chains.

Hoisting and other chains under heavy stress from time to time grow weaker

continuously by reason of crystallizing of the metal. The action of crystallization will continue to a point where rupture will occur under a comparatively light load, unless checked by annealing the entire chain at least once every six months. The effects seem to be more marked in metal which undergoes the interchange of heat and cold very often, and to these especially should this treatment be applied. Chains should be carefully examined for any weakness, at regular intervals.

Position of Machinery.

Under no circumstances should machinery be crowded, so that those using the passages are placed in danger. Any passage towards which a planer-platen, lithographic printing-table, self-acting mule or other carriage runs, should have 18 ins. space in the clear, between the carriage or any fixed structure, when the carriage is fully out. Occasionally a shaft or belt running across or projecting to a stairway is met with. Such shaft or belt should invariably be boxed in, and a warning sign hung from a guard box if it encroaches on the headroom.

Guarding Fans and Blowers.

Revolving fans and intakes of blowers within reach of persons standing on the floor or on adjacent platforms should be guarded by wire screens of not greater than one-half inch mesh.

Emery Wheels and Grindstones.

Emery wheels and fast-running grindstones should be enclosed by a substantial guard, fastened to the wheel-base and of sufficient size and strength to withstand the shock of the flying parts of the bursting wheel. The fact should be recognized of course, that an emery wheel may be broken or caused to burst from improper use, as for instance excessive pressure or blows when grinding a tool as well as from excessive speed.

Fig. 9 shows what is considered to be the best guard of this kind. The wheel is entirely surrounded except for a small open space at the front of the wheel above the rest. This is ample space to work conveniently and yet the wheel is well protected, and the workman protected. Another good safety device is so designed that the wheel plays a part. The sides instead of being parallel, are divergent, so that the thickest part of the wheel is at the centre. A number of sets of steel safety collars are furnished, varying in size, so as to allow for wear of the wheel, which fit the wheel tightly to a distance of two inches from the grinding surface. In case the wheel ruptures the tapered sides cramp between the collars, and so do not allow the pieces to fly. A number of manufacturers of emery wheels loan safety collars free of charge to the users of the wheels. Advantage should always be taken of this offer.

The following suggestions as to the use of emery wheels should be carefully observed. Do not have the rest so far away from the wheel that the work may become cramped. The use of a releasing-rest may be the means of saving crushed fingers. This applies also to grindstones. Keep the boxes well oiled so that the arbor will not become heated, and by causing expansion rupture the wheel.

Never crowd an emery wheel upon an arbor. Have the wheel slip easily on the mandrel, and screw them only tight enough to prevent slipping. Wheels should be mounted so as to run true and steady.

Do not allow the wheel to vibrate when running at normal speed. If there is vibration, either true up the wheel or re-babbitt the boxes after trueing up the journals or both.

Never mount wheels without flanges. Do not use too small or too light flanges and have them properly concaved. They should be at least one-third the diameter of the wheel. The makers in general recommend one-half as still better practice, always concave, never straight or convex.

Never screw a nut directly against the emery wheel. It will "creep" and rupture the wheel from excessive side pressure at the bushing. Never run a wheel above its indicated speed.

A workman on an emery wheel should keep his eyes and body out of the plane of rotation of the wheel, chips from the wheel will be less likely to strike him if this suggestion is heeded. The grinder will find that large glasses made of plain glass, or indeed his own spectacles, should he wear them, will afford great protection from flying particles ; or he may use other protectors with glass in front and gauze surrounding the glass.

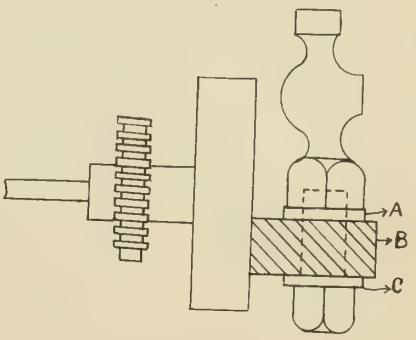
Great care should be taken in storing emery wheels and grindstones to keep them free from dampness. They should not be stored with the stone standing upon the ground, as it will absorb moisture. Likewise the idle mounted stone used in wet grinding should not be left over night, or for any long period, with a portion immersed in water. Particular care should be paid to the guarding of grindstone belts and pulleys. Although these usually run at comparatively low speed they offer much opportunity for injury to a man stooping to pick up a tool he has dropped (quite a common occurrence) in the process of grinding. Figs. 10 and 11 show an excellent form of guard of stout wire for this purpose. The guard is fixed to the collar A which moves freely about the pipe standard. The lower face of this collar is furnished with a V-shaped projection which engages with either of the V-shaped slots in the upper face of the collar B, according as the guard is open or shut. The collar B. is firmly fixed to the standard with a set-screw.

The objection to a movable guard for this purpose of the type shown in Fig. 12 is that a man may have to remove the guard, and will thereby run the risk of being hurt by the unfenced belt or pulley when he stoops to pick up a fallen tool. Another objection to a guard of this kind is that a careless workman may remove it and fail to replace it.

HANDY TOOL FOR CHUCKING.

By J. B. Kennedy.

The accompanying illustration shows a very handy tool for chucking work, especially in brass shops. There is practically no trueing up after the first one is machined. Most shops have an old 4-jaw chuck plate (although a special plate for the purpose is better), for which 2 new jaws and screws may easily be made on the premises. In the sketch the lug B is shown off the centre, which



Handy Tool for Chucking.

allows for work with extra long centres. The other jaw has the lug in the centre for ordinary work. The jaw not in use can be adjusted to balance the chuck when running.

The sketch shows the manner of holding the work, by the mandrel or screwed chuck C, coming up through the lug of jaw. A is a washer. The work is then placed over it and screwed down. Flanged work which would require an L-plate can be held fast, between the jaws and trued much easier and more quickly than could be done on an L-plate.

Misfortune always keeps her appointments with those who expect her.

The minute a man begins to consider himself indispensable he ceases to be.

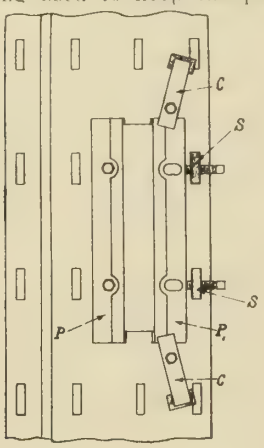
PLANER FIXTURES.

By J. H. R., Hamilton.

Fig. 1 shows a very useful vise for use on a planer for a variety of work. The piece P having a tongue planed on the bottom to fit the tee slots of the table, is bolted to the table and planed on the faces. The piece P_1 is similar to piece P only flat on the bottom, to pass freely over the table. The work is placed between the two pieces (light pieces being placed on the small shoulder as shown) and securely fastened by means of the stops S S, the clamps C being used to keep the piece P_1 flat on the table. The screw e passes through the stop S making an angle with the table of about 10 deg.



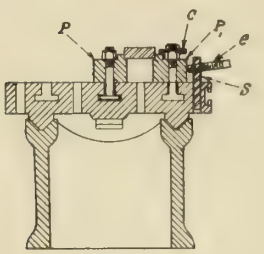


Fig. 1.

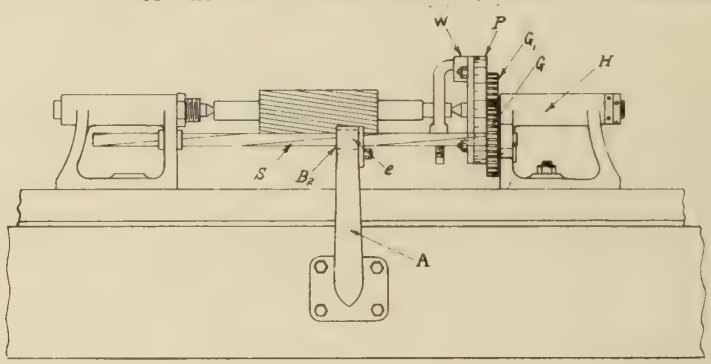
Fig. 2 is a sketch of an attachment placed on a planer for cutting spiral grooves or flutes in cutters, corrugating rolls, etc. The centre heads are similar to the ordinary ones used, with a few additions. As shown, one head has two special bearings, B and B_1. B is to carry one end of the shaft S and a similar bearing in the other centre head carries the other end of the shaft.

Fastened to one end of shaft S is a gear G which meshes with another gear G_1, secured to the centre shaft of head H. Secured to gear G_1 and likewise to the centre shaft is the face plate P which is graduated on the edge.

A wing plate W is free to revolve on the hub of the face plat P and secured in position by the two bolts shown by means of a tee slot in plate P. The wing plate W has a slotted fork on its face which drives the dog that is fastened to the work. A set screw in one side of the fork avoids any back lash to the tail of the dog.

The arm A is secured on the bed of the planer in a suitable position, the bearing B_2 being in line with the bearing B and the bearing in the other centre head.

The small bush e is fitted in the bearing B_2 and grooved out on the inside to fit the twisted shaft S, which is twisted to suit the work to be done.



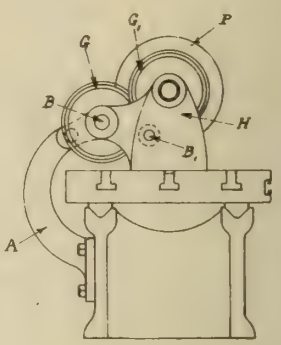


Fig. 2.

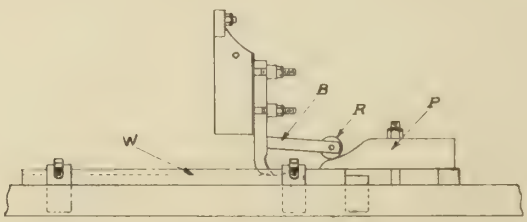

Fig. 3.

Some Planer Fixtures.

The bush e being stationary, as the table moves, the shaft S is caused to revolve and likewise gear G which turns gear G_1, which revolves the work as the tool is cutting the groove. By loosening the two bolts in the wing plate W the work can be revolved to the next position.

By using a pair of smaller gears and an intermediate one in bearing B_1, the work will be turned in the opposite direction. By the use of change gears several different spirals can be obtained from the one shaft S.

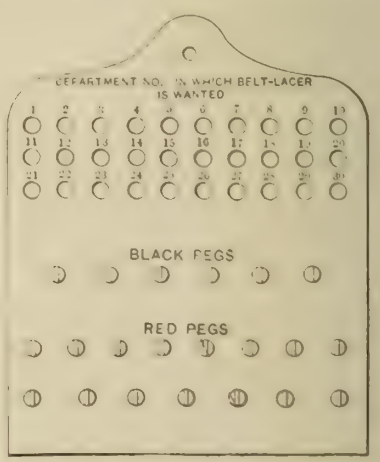
Fig. 3 shows an arrangement used when cutting key-ways or slots, when it is advisable to run out instead of cutting into a drilled hole or slot. The bar B is fastened along with the tool in the desired position, the outer end carring the roller R which comes in contact with inclined face of piece P, which gradually removes the tool from the work.

KEEPING TRACK OF BELT LACER.

By K. Campbell.

The accompanying drawing shows a recording board, used in our shops in West Toronto, which gives the number of the department in which the belt lacer is at work and also indicates where he is wanted. Before this simple device was used, there was a lot of waste time looking for the man who looked after the lacing of belts.

The board has thirty holes at the top, each having a number corresponding to a department. At the bottom of the board are additional holes, containing six black pegs and fifteen red pegs. These latter are numbered from 1 to 15.



Recording Board.

When belt lacer is wanted one of the numbered red pegs is put in the hole at the top to show the department where a belt requires attention.

When the belt lacer returns he sees at a glance where he is wanted. Before leaving he replaces the red peg with a black one. The first one uses red peg 1, the second one requiring his services uses 2, etc., so that the belt lacer can tell where to go first. By using the black peg the belt lacer can be easily reached in an emergency.

TURNING CRANK SHAFT.

By Nemo.

Having a three-throw crank shaft to turn up, it being a forging, all in one piece, the pins and bearings to finish to 10'' diameter, and not having a lathe heavy enough to swing and balance it while turning the pins; the question of balancing seemed to be a formidable one.

The face plate of the lathe was far too small to think of bolting any weights to it, which would overcome the weight of the shaft whilst turning pins, and it was equally impossible to clamp anything like a proportionate weight on opposite side of shaft.

The best plan I could think of at the time, was as follows:—I got two pieces of 1'' x 4'' steel bent U-shaped with holes in each end to take the cable ends; then I drilled holes in the bottom of the U, and made a bearing of babbitt metal about ½'' thick. I then carried wire cables from the ends of these pieces through sheaves attached to the beams above the lathe, and to the other ends of these cables, attached weights enough to maintain the shaft in any position. The weights agregated about three tons. This plan worked admirably, the lathe turning easily, the weights moving up and down freely as the shaft turned, and enabling us to turn the pins round and true, and at a minimum cost.

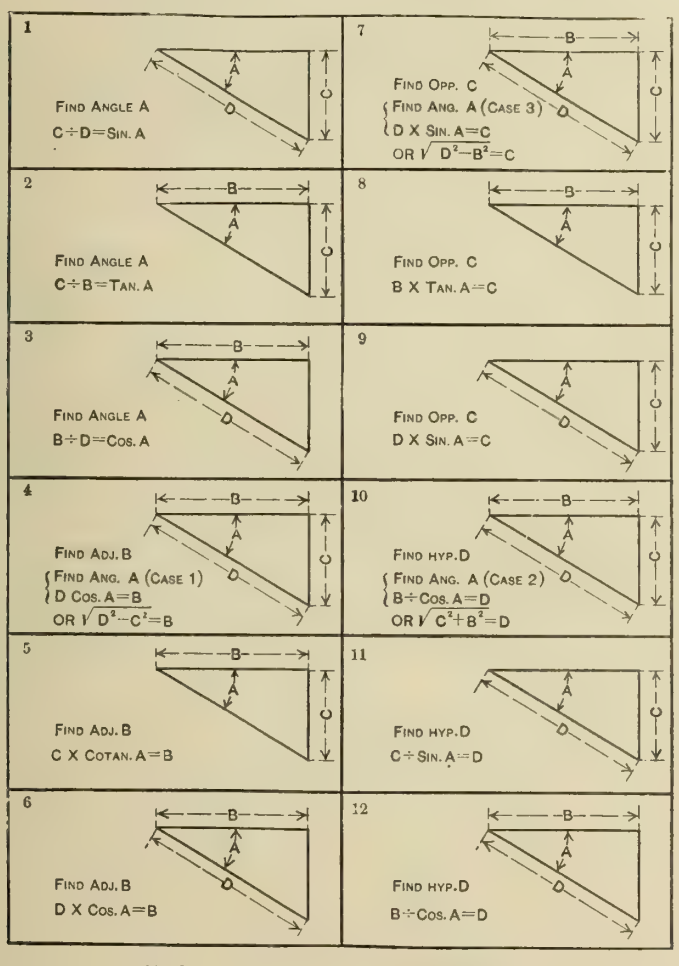


Table for Solution of Right Angles.

HANDY TABLE FOR THE SOLUTION OF RIGHT-ANGLE TRIANGLES.

By F. J. Bouve.

The table above gives in a convenient form the rules necessary for solving right-angle triangles. To the toolmaker or apprentice who has not had the privilege of becoming familiar with trigonometry, it is put up in a very handy form for reference. There are a great many who do not understand the meaning of "square" and "square root" and who will find it easier to first find the angle when two sides are given, and then find the required measurement of the third side from the angle by the rules as stated. It will be noted, however, that the formulas giving the length of the third side when two sides are given in the form of a square root is also included.—Machinery.

LOCATING ANGLE BELT DRIVES.

The accompanying illustration reproduced from Machinery is a date sheet of angular belt drives. The diagrams show all the different positions of the pulleys for different directions of rotation of the shafts, and are also applicable to shafts in any position, vertical or horizontal.

PULLEYS A A1 DRIVING IN THE SAME DIRECTION BUT ON OPPOSITE SIDES OF THE DRIVEN PULLEYS. THE DRIVEN PULLEYS B B1 ARE IN REVERSED POSITION IN CONSEQUENCE.
PULLEYS DRIVING A A1 IN OPPOSITE DIRECTION TO ABOVE.
NOTE:-
THE DRIVEN PULLEY MUST ALWAYS BE LINED UP FROM THE CENTER OF THAT FACE OF THE DRIVING PULLEY FROM WHICH THE BELT LEAVES IT, AS AT A. AFTER SETTING UP AS ABOVE THE BELT WILL RUN IN ONLY ONE DIRECTION FOR EACH DIAGRAM.
THE DRIVEN PULLEY CAN BE SET AT ANY ANGLE IN RELATION TO THE DRIVING PULLEY AS LONG AS IT IS TURNED ABOUT THE POINT A AS SHOWN BY DOTTED LINES.

Locating Angle Belt Drive.

CORE DRILLING TOOLS.

By W. Petersen.

The illustrations herewith show some designs of tools for core drilling used on various jobs in railroad shop work. These tools have been in use for several years, and during that time have proved to be very effective. The principle is not new but the details of them were arranged with the view of getting a tool that was cheap to maintain, capable of standing up under heavy cuts

without springing, and to produce holes of an exact size.

Tool number 1 is used for rod work. The cutter head is made from a steel casting, and blades are of high speed steel. A tongue on the back of the blades fits into grooves on the head. The strain is thus taken off the binding screws. The cutters are ground with a side clearance in opposite directions to each other. This is very important as it unsures that the cuttings are broken up in the centre, leaving them only half the width of the groove. Failure to follow this principle will invariably cause trouble in deep holes as the cuttings will choke up the groove and break both the cutter and the head. A tempered steel bush has been fitted to end of pilot in order to maintain the size.

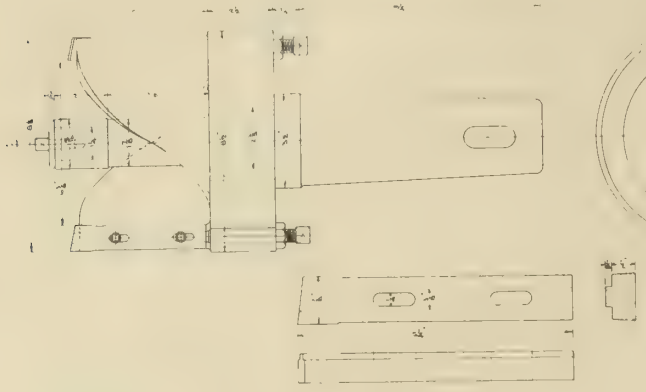

Fig. 1.—Core Drilling Tool.

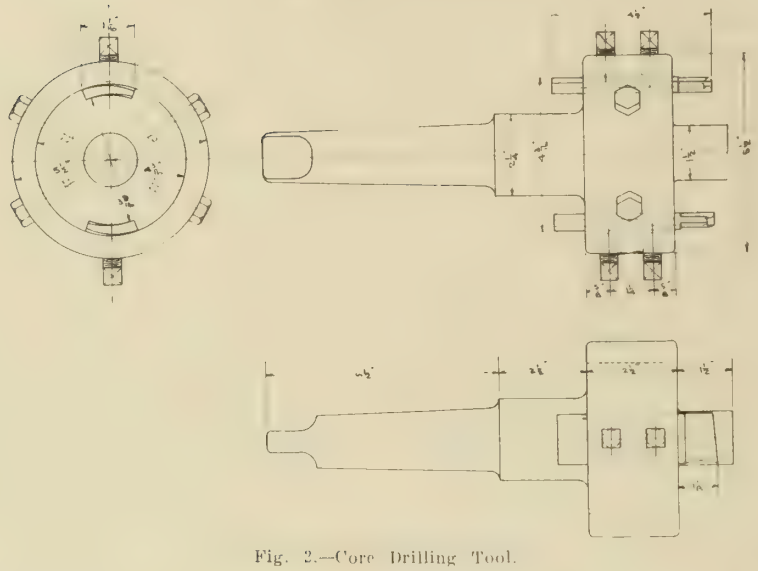

Fig. 2.—Core Drilling Tool.

Tool number 2 was designed for plate work. The first consideration to be given was to produce a hole of exact size and perfectly round, as it had to be tapped. The body is made of machinery steel. The seats for tools carefully machined. A collar is then shrunk on, and high speed steel cutters fitted into the grooves. These cutters are only ground on the ends and can be removed for grinding, or can be replaced any number of times without in any way altering the sizes of holes.

Tool No. 3 is an adjustable tool for the same class of work as No. 2, and for holes of varying diameters. The sizes are quickly determined by inserting standard blocks of various sizes behind the cutters. This tool comes in very handy where there is comparatively few holes to drill of any one size, but for standard sizes, however, where a large number of holes are required, it has been the writer's experience that it pays to make non-adjustable tools, for the reason that no time is lost at the machines in setting and sizing these tools. They can also be made much more substantial and rigid, and thus allow a much heavier cut to be taken with them than would be possible were they adjustable.

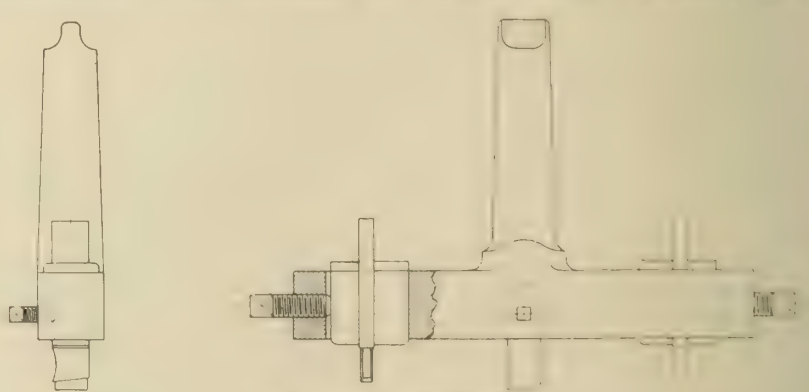

Fig. 3. Core Drilling Tool.

BORING ELLIPTICAL HOLES.

A lathe atachment for boring elliptical holes has been patented by James Shaw, Dauphin, Man. Fig. 1 shows the lathe with attachment in place. A and B are movable supports. C is a boring bar with eccentric end bearings.

Fig. 2 is a longitudinal section through the bearing brackets showing boring bar C. The ends D and E are eccentric to C and are in alignment longitudinally the one with the other. D and E are carried by bearings which can be raised vertically in guideways at the rear face of the supports, while at the other face the main shaft has bearings with horizontal guideways. When the device is in operation the sliding bearings are free to move in their respective ways. In the main shaft is a hole for the cutting tool, shown in Fig. 2, and in Fig. 1, the tool is shown in position boring an elliptical hole in the work on the lathe carriage.

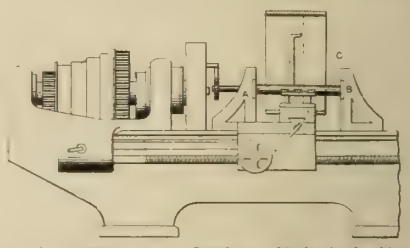

Fig. 1.—Lathe for Boring Elliptical Holes Showing Device in Place.

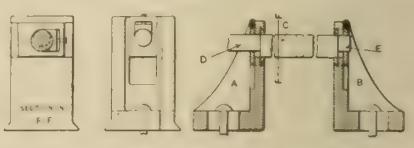

Fig. 2.—End and Sectional Views of Elliptical Boring Device.

MANUFACTURE OF SHAPERS.

The accompanying photos illustrate two of the most important shop operations in the manufacture of shapers in the shop of the Queen City Machine Tool

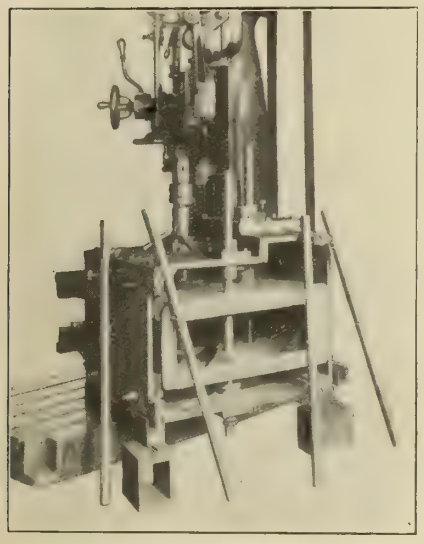

Fig. 1.—Box Pattern Jig.

Co., Cincinnati. They show how the bind and buckle is eliminated from the working parts and how friction is reduced.

Fig. 1 shows the boring of columns. Note that all holes are bored and cast

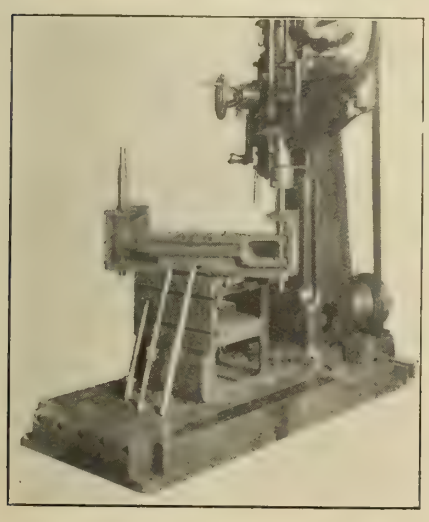

Fig. 2.—Boring Shaper Rocker Arm.

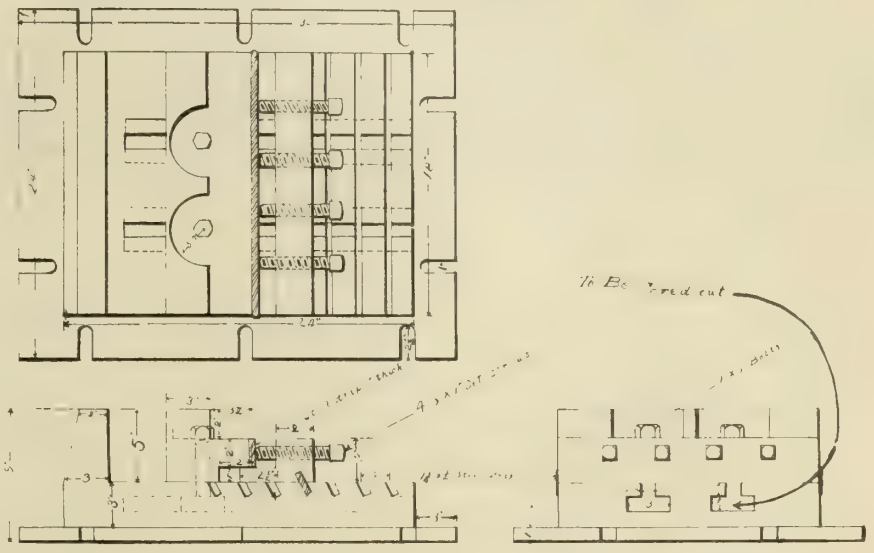
iron bushed, providing for the maintenance of original centres, and this jig insures practically perfection of original centres, and interchangeability. It is of true box pattern, both ends of the large boring bars being supported, and provided with knuckle joints; the holes are roughed out so that only a light skim is removed with the special finishing cutter. This insures the proper distancing and alignment of shafts, and as all gears are turned to gauge and cut with special cutters, the result is as near to perfection as is possible. The connecting work between bull wheel and rocker arm is also carefully jigged, to make good results certain.

The top and bottom holes in the rocker arm must also be carefully bored at exact right angles to the planing of sliding block bearing, as the slightest twist here is fatal to good results. Fig. 2 shows the jig in working position. All shafts are accurately ground, insuring smooth running and long life.

PLANER CHUCK.

By W. B. Miller.

The accompanying illustration shows a planer chuck we have used on a London 36" x 36" x 11 feet planer for over a year. The chuck will stand more than the belts will pull for I take off some big chips with this machine.



Planer Chuck.

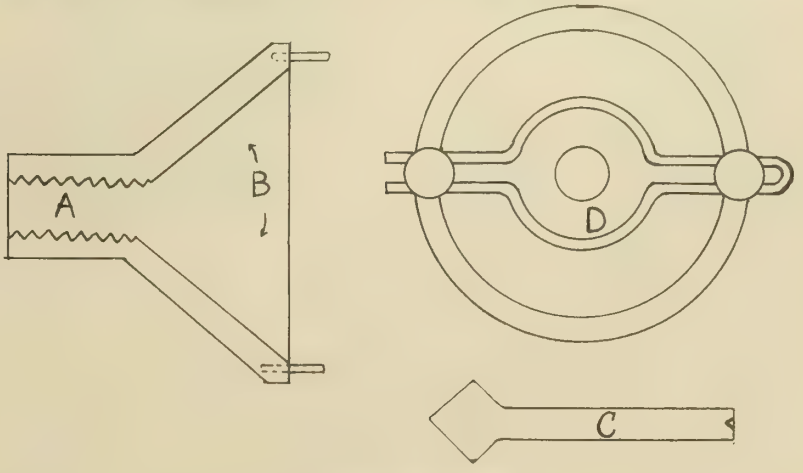
It will be noted that the slots A are slanting about eight degrees, which is an advantage. Block B does not raise up and tighten the set screws for this trouble is overcome in the slanting slots. Another advantage is the wide base C to all the chuck to be fastened on to the platen. Lugs might be used to fasten chuck to platen if desired. The jaws are made heavy so that a light cut may be taken off when necessary to keep them true.

JIG TO HOLD MITRE GEARS.

By F. A. Rodgers.

We use a jig to hold mitre gears when boring and facing them. I work in a shop in Victoria, B.C., where I have 200 steel mitre gears to bore and face. I devised the device shown in the sketch, and with it I turn out 25 in nine minutes.

The jig is made of cast iron. A is threaded to fit spindle of lathe, and B is bored on a bevel, which should correspond to that of the mitre gear, C is a spear, centred at one end, which holds the gear against the jig until it is "turned up." Then clamp D is used. It is fastened on the jig by two studs tapped in same. The job can be very quickly "trued up" by tapping with a hammer on high spots shown by chalking, each time following up with spear by use of tail stock centre.



Jig to Hold Mitre Gears.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

KEARNEY & TRECKER UNIVERSAL MILLING ATTACHMENT

Five illustrations show the construction and application of the new universal milling attachment recently placed on the market in connection with their

Fig. 1. Attachment in Position for Vertical Milling.

milling machine, by Kearney & Trecker Co., Milwaukee, Wis. Fig. 1 shows the attachment in position for vertical milling. Fig. 2 shows the use of the attachment for horizontal milling, but in a position at a slight angle with the axis of the main spindle. Fig. 3 shows the attachment set for angular milling. In Fig. 4 the attachment is shown applied to the machine, with its spindle at right angles to the axis of the regular milling machine spindle, but parallel with the table. It is here shown operating in connection with the spiral head.

Fig. 5 shows a section of the device. It will be seen that the gear A is attached to the regular horizontal spindle of the milling machine, and drives gear B keyed to a horizontal driving shaft on the end of which is cut a bevel pinion

Fig. 2.—Attachment Used for Horizontal Milling but at a Slight Angle With Axis of Main Spindle.

C; this pinion drives the bevel gear D, which latter is made in one piece with the bevel gear D_1. This arrangement permits the pinion E to revolve to any position without interfering with the driving pinion C. The bevel pinion E is cut on a steel sleeve on which also are cut spur gear teeth of wide face meshing, with a similar gear provided on the cutter spindle of the attachment. All of the gears, as well as the cutter

Fig. 3.—Attachment in Position for Angular Milling.

spindle, are made from hardened steel, the spindle being ground on the outside as well as in the tapered hole.

The wear on the bronze boxes is taken up by an adjustment nut or collar at F. The bushing G rotates with the spindle, it being keyed to the latter. Thus when the nut F is tightened, this bushing slides forward, and the spindle is at the same time drawn back into the taper box at the front bearing. The end of the spindle is provided with a slot or keyway for driving arbors carrying face mills and large milling cutters in general. The attachment is heavily built, and can be used for any work. It will fit all sizes of their milling machines.

This device in connection with the regular horizontal milling machine makes

Fig. 4. Attachment Used in Connection With Spiral Head.

it possible to do all classes of milling on this type of machine, and due to the fact that the attachment has been built along heavy lines, it is possible to perform vertical and angular milling practically to the full capacity of the main spindle of the machine. It has a capacity for face milling with cutters up to 6 inches in diameter. The attachment is made in three different sizes, all being provided with No. 10 Brown & Sharpe taper hole in the spindle. The distance

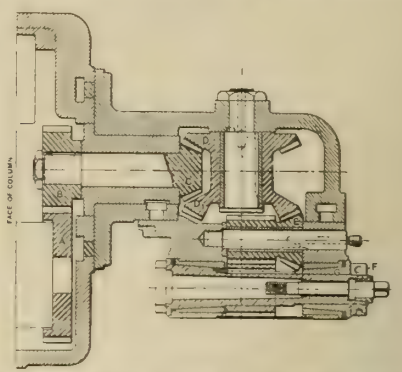


Fig. 5.—Section Through Universal Milling Machine Made by Kearney & Trecker Co.

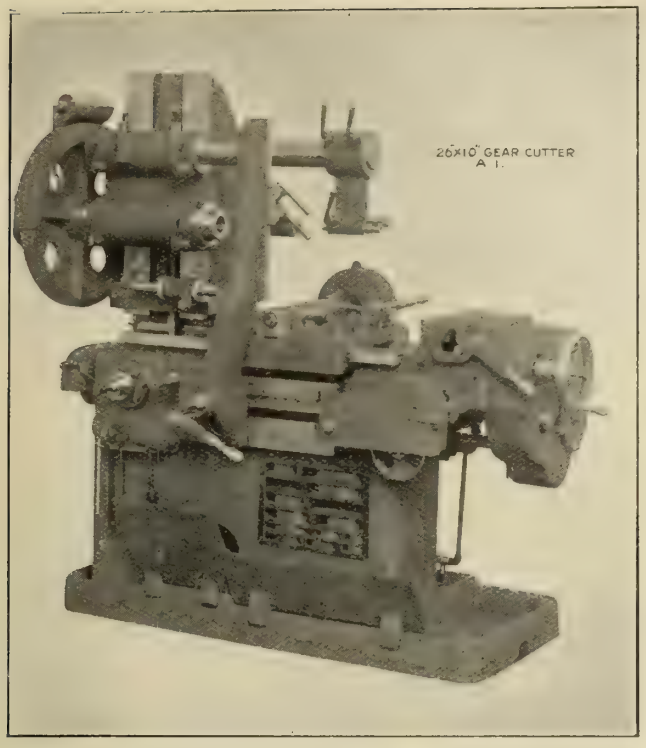
from the centre of the spindle to the bottom of the attachment does not exceed 19-16 inch, and the distances from the centre of the spindle to the face of the column when used for vertical milling is $10\frac{3}{8}$, $11\frac{1}{4}$ and $11\frac{1}{2}$ inches, respectively, for the three different sizes.

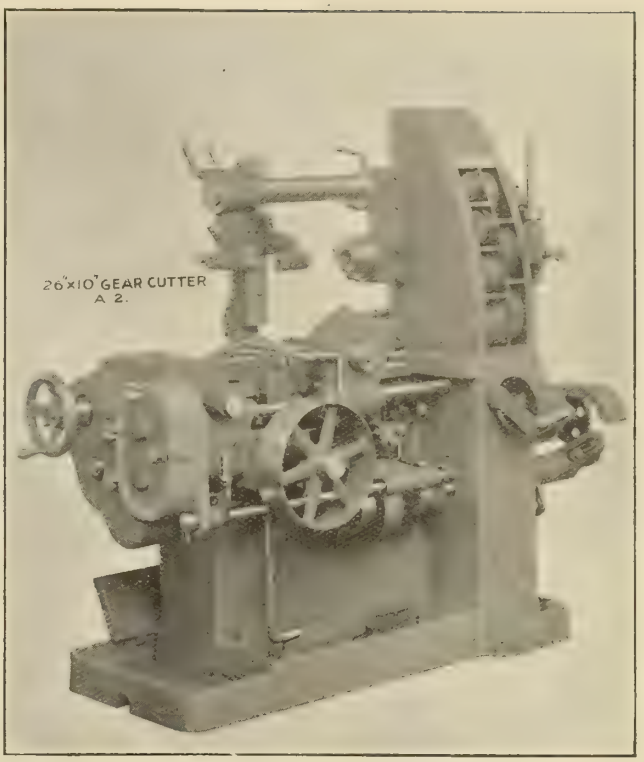
"CINCINNATI" AUTOMATIC GEAR CUTTING MACHINES.

These machines, to cut spur gears 26" x 10" and 36" x 10" respectively, have been designed with a view to securing rigidity, large wearing surfaces, and simplicity of parts. The power is transmitted through one pulley, running at a constant speed, and the various speeds and feeds are obtained by transposing gears, conveniently located. All gibs are of the taper type, adjustable from the ends. All shafts and spindles are accurately ground, and are journalled in bronze bushes. The movements are all automatic, each being dependent on the preceding one, and cannot take place until it has been completed. The work saddle is so gibbed to the housing that the work arbor and blank do not drop out of parallelism when the clamps are loosened for adjusting the work for tooth depth. The screw is operated from the front of machine, and has micrometer collar graduated to .001 of an inch. The work spindle, of steel, is accurately ground and journalled in bronze bushes, and has provision for taking up wear. The arbor is drawn in and forced out by a threaded shaft and hand wheel.

The cutter slide has rectangular guiding surfaces with long taper gibs, for

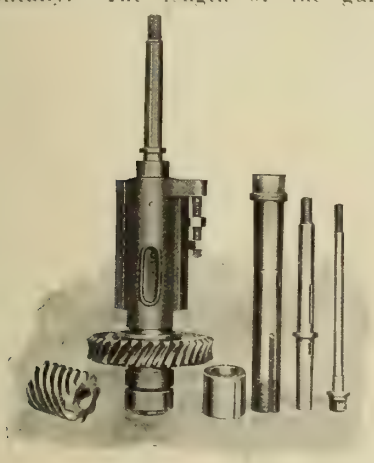


A 1.—26" x 10" Gear Cutter.



A 2.—26" x 10" Gear Cutter.

taking up wear, both vertically and horizontally. The length of the guiding

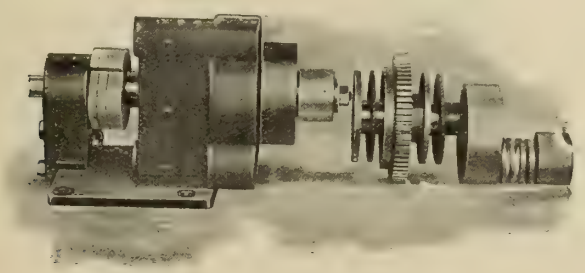


A 10.—Cutter, Bearing and Spindle Assembled and in Detail.

surface is over 4 4-7 times its width, thus reducing any binding action. The slide is fed forward and retracted by a screw. The dogs, for adjusting the justable dogs, is provided so that the slide can be run to the extreme back position for removing blanks without disturbing the setting of the dogs. An automatic disengaging crank wheel is provided to move the slide by hand. The cutter slide returns at a constant speed, regardless of rate of feed. There are 12 changes of feed.

The cutter spindle, of large diameter, is accurately ground and has easily accessible means for taking up wear. The spindle has both a taper and a straight bearing, and is journalled in a bronze bearing, that is adjustable endwise for centreing the cutter. The drive is through a worm wheel, with means for taking up end thrust wear of worm. The cutter end of spindle is provided with a taper hole for receiving the cutter arbor; this arbor is keyed in the spindle, and is drawn in and forced out by a threaded bolt. A removable bearing is provided for supporting the outer end of cutter arbor. Six changes of speed are provided for wheel quickly and brought back into the exact meshing depth, or the worm can be disengaged from the index gears and rotated any desired amount for resetting work, and again secured to the index gears.

The indexing mechanism is so interlocked with the cutter slide feed that it is impossible for the cutter to advance until the work is properly indexed, or when the cutter is feeding to index, thus making it impossible to spoil work. The work spindle can be made to space once or revolve continuously by a hand movement, under control of the operator. The friction operating the disc stop is simple and accessible, as it is not necessary to dismantle any part of machine to adjust it; a minute's use of a pin spanner wrench does it. Index gears are furnished to cut all teeth from 12 to 100 and, with the exception of prime numbers and their multiples, from 100 to 450. Special change gears can be furnished to cut other numbers of teeth.



A 11.—Friction Assembled and in Detail.

A. 12.—Inverted View of the Cutter Saddle, Showing the Method of Taper Gibbing both Vertically and Horizontally.

length of feed of cutter slide, are operated by a crank wrench from the front of bed. A retractable tappet, for adthe cutter spindle. The indexing mechanism is of simple construction. The index worm can be disengaged from the Both over head and outer supports for the work arbor, and rim support for gear blanks, are furnished. The machine

is regularly equipped with a countershaft, though if desired, will be furnished with T. & L. pulleys mounted on the initial shaft, and also arranged for motor drive, if desired.

The machines are built by the Cincinnati Gear Cutting Machine Co., Cincinnati.

"LAFFITTE" WELDING PLATES.

Fig. 1 is a section of Laffitte plates made in one size 4 x 8 ins., and is

Fig. 1.—A Section of Laffitte Plate Reduced.

chequered so that a piece of any size can be broken off by hand without loss or waste. It is made in two weights—the heavy for all ordinary work, and the

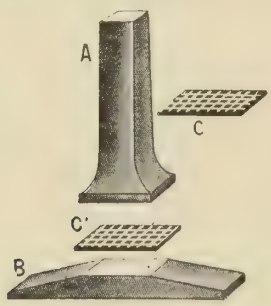


Fig. 2.—Application of Plate for Welding.

light for spring steel, small angles, etc. One plate is sufficient to make from half a dozen to one hundred welds. The chemical action of the plate increases

Fig. 3.—File Welded with a Plate and Hole Punched While Hot.

instead of decreases the strength of the weld.

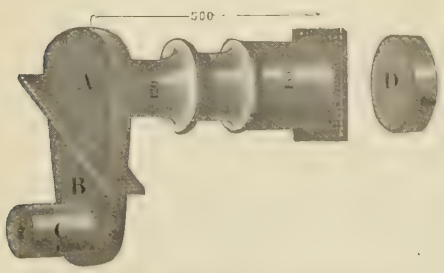

Fig. 4.—Butt Welding a Crank Shaft.

The plates are used in a simple manner, as the two parts to be welded are heated to a cherry red if steel, or a white heat if iron. A piece of plate of sufficient size is then placed between the two parts, as shown in Fig. 2. Then press together until the plate fuses, hammer lightly and complete by hammering the usual way. The piece may then be reheated to any desired heat without endangering the weld.

A feature of the plate weld, is the fact that a homogeneous joint is secured. It becomes one solid mass, with the strength of the original. In many cases the strength is materially increased, as in the case of steel castings.

The plates are used to weld iron to iron, iron to steel, steel to steel, ma-

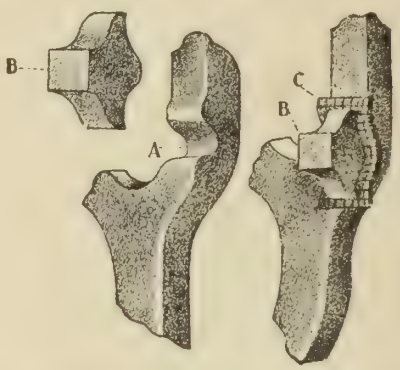

Fig. 5.—Method of Repairing Steel Castings.

chinery steel, tool steel, steel castings, copper to steel and copper to copper. Blacksmith's find the plate method of welding economical.

Laffitte plates here described are manufactured by the Phillps-Laffitte Co., Philadelphia, Pa.

GORTON CUTTING-OFF MACHINE.

Essentially the cutting apparatus in this machine is a second-order lever which, by providing the maximum of support, makes possible the application

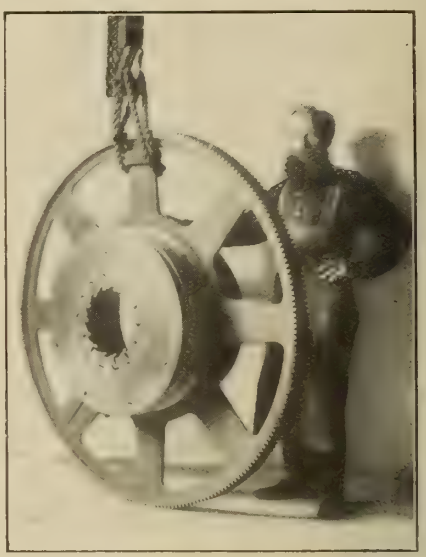

Fig. 2.—Main Driving Gear With Cutter Drum and Blade Complete.

of great power without distortion and consequent vibration. Applied to the cutting off of bar material by a rotary cutter this involves passing the work through the cutter, which takes the form of a disc of relatively large diameter with a central opening about which the cutting teeth or tools are either formed or secured and the provision of means

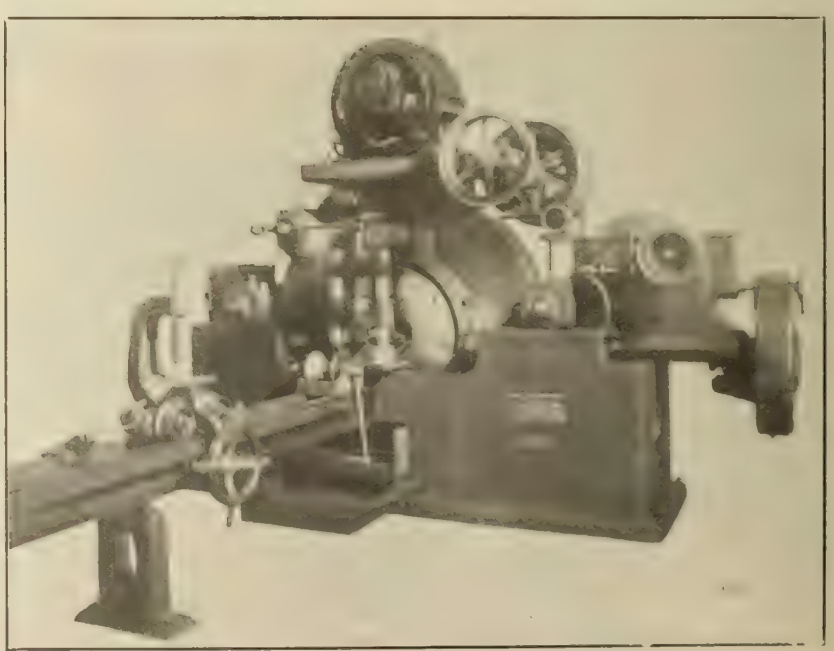

Fig. 1.—Front View No. 2—B Gorton Cutting-off Machine.

for either feeding the work across the disc or vice versa.

A gear of large diameter, with an elongated hub running in suitable bearings and with an internal diameter sufficient to take the stock and allow of a transverse feed at least equal to the greatest diameter of work fulfills these conditions and constitutes the central feature about which the machine shown in Fig. 1 is built. In this design the work is clamped rigidly upon a stationary bed and the entire head carrying the gear, with drive, is fed across the bed.

Fig. 2 shows the drum gear dismounted and shows clearly the construction of the cutter disc and method of securing to hub, by means of dowels and screws.

This machine has a capacity for bars up to 6 inches, which it will cut off in less than one minute, though the makers say that no tool steels yet available will maintain this rate; the machine, therefore, is somewhat in advance of steel development. The speeds are calculated for 76 feet per minute at the cutter teeth and the feeds have seven changes for 13 inches to 6 inches per minute. A geared pump delivers lubricant to the cutter teeth. The machine is designed upon absolutely sound principles and should be capable of rendering the constant hard service for which its makers say it was designed.

BORING, DRILLING AND MILLING MACHINE.

The horizontal boring, drilling and milling machine illustrated herewith is built by the Fosdik Machine Tool Co., Cincinnati, O., and represents their latest design. This machine is built in two sizes, Nos. 1 and 2, and is capable of performing all the operations of drilling, milling, tapping, boring, facing, etc., on light and heavy work in the most efficient and accurate manner.

The column carrying the spindle head has horizontal movement on the bed by hand or power in both directions; also a quick forward and return motion by power, operated by a lever conveniently located on the front of bed.

The head which is counterbalanced and provided with a safety chain, has vertical movement on the column by hand or power in both directions. For quick adjustment the pilot wheel on the front of the spindle head is used.

The spindle sleeve runs in adjustable bronze bearings and has a thread cut on its front end to hold chucks, large milling cutters and facing heads for heavy work. The spindle bar which passes through the sleeve is driven by two keys, and is fitted with a No. 5 or 6 Morse taper, and provided with a cotter key to be used when driving large boring bars. It has a power and hand feed in both directions.

The spindle driving gears are located on the spindle sleeve close to the work. This construction reduces the torsional stresses in the spindle to a minimum, and is especially advantageous when using large milling cutters, as it practically eliminates all chattering. The back gears are of the tumbler type, and can be engaged while the machine is in motion by means of a lever conveniently located on the head.

The outer support for boring bars has horizontal and vertical movement by hand and is provided with scales, same as are fitted to the main column and bed.

The table in which the T-slots are planed, is stationary and securely bolted to the base and bed, insuring perfect alignment with the spindle at all times.

There are eight changes of feed, ranging from 7-1000" to $\frac{1}{4}$" per revolution of spindle. Sixteen changes of spindle speeds, ranging from 4 to 260 r.p.m., are secured either through the cone pulley or speed box, by using a double speed countershaft.

For a constant speed motor drive a $7\frac{1}{2}$ h.p. motor, 825 r.p.m., is mounted on the rear of the machine and connects through gearing to the speed box. For a variable speed motor drive a $7\frac{1}{2}$ h.p. motor, 400 to 1600 r.p.m. is used and is mounted on the rear of the machine and connects through gearing direct to the driving shaft. The controller is mounted within easy reach of the operator.

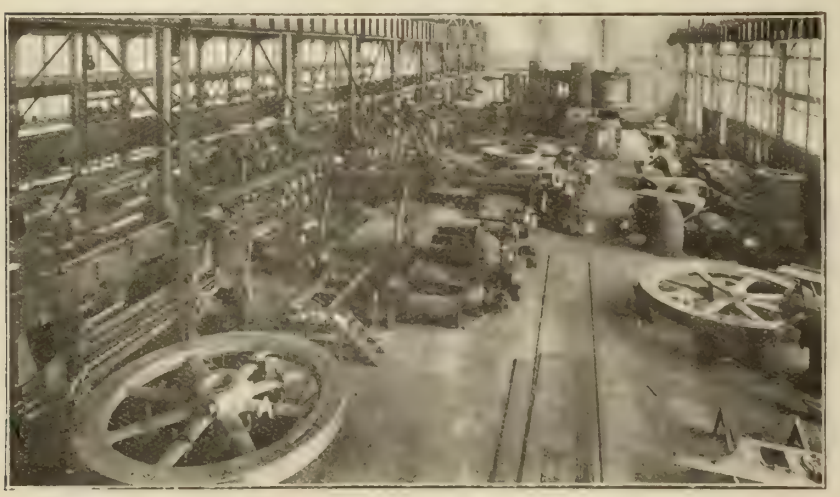

Fig. 7.—Machine Shop of John Inglis & Sons, Toronto.

SOME LARGE POWER MACHINERY IN COURSE OF CONSTRUCTION.

The growth of Toronto has necessitated the addition of some large pumps and engines to the pumping stations. The one illustrated in Fig. 1 is under construction at John Inglis & Sons, Toronto, and will be erected in the main pumping station, John Street. The contract for the pump was awarded in February, 1908, and it is expected that by February, 1910, the erection of the pump in the John Street station will be completed.

Fig. 1 shows the cylinders and bases of the engine and pump, with the base of the low-pressure cylinder removed in order to show the valve mechanism of the pump. When in place, the pump will be 52 feet in height, and have a

Fig. 3. Low Pressure Cyl., Inglis 15,000,000 Pump and Engine.

capacity of 15,000,000 gallons every 24 hours. It is a direct-flow type, that is, the water always flows in one direction. The cylinders are 32, 60 and 90-in. in diameter, with a 60-in. stroke. The floor space covered is 16 feet by 32 feet.

The pump cylinders were cast in the foundry of John Bertram & Sons, Dundas. The low-pressure cylinder weighs twenty tons, and the others 22,810 lbs. and 19,320 lbs. The steel for the engine, including the crank shaft, was furnished by the Nova Scotia Steel & Coal Co.

The pump valve cages are shown in Fig. 2, and are 42 in number, each containing 28 brass pump valves, 3§ ins. in

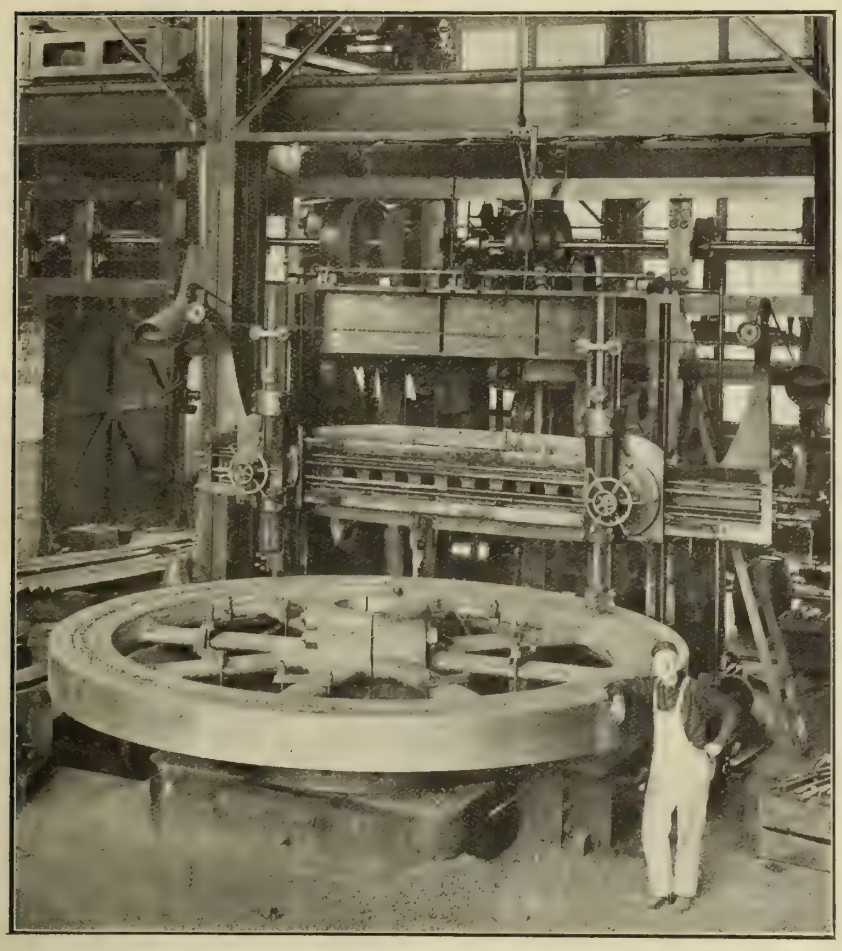

Fig.4.—Turning One of Large Flywheels for 15,000,000 Gallon Engine and Pump.

diameter. The cages are made secure to separate, vertical cast steel valve decks.

The crank shaft in its finished condition weights 15 tons. It is 23 feet between the pins, is 17 inches in diameter at the bearings, and 19½ inches where the fly-wheels go on. The cranks are in two pieces, and pressed on at 200 lbs. pressure. The high and low crank pins are 8 inches diameter by 8 inches long, while the intermediate is 12 inches diameter, by 8 inches long.

Fig. 3 shows the low-pressure cylinder, which is 90 inches in diameter. The large castings for the pump were made in the foundry of the Berg Machinery Co., Toronto. All the large pump connections were made under the direction of David Reid, superintendent of the Berg Machinery Co.

Fig. 4 shows one of the large flywheels, 15 feet in diameter, being turned. Fig. 5 shows the manner of connecting the flywheels, which are made in halves. The steel rods are heated, and when in position are allowed to cool, shrinking 1-16 inch, thus holding them closely together. The wheels are 19½-inch bore and 14-in. face.

Fig. 6 is a Corliss engine for Kew Beach Sewage System, Toronto. It is a compound engine with the high and low-pressure pistons on one piston rod. The cylinders are 12-in. and 24-in. by 30-in. stroke. A receiver connects the two cylinders.

Fig 7 is the main bay of Inglis machine shop, A and B are flywheels for the 15,000,000 gallon pumping engine, C is engine shown in Fig. 6, D is large pipe connection, E is large pipe connection F is base of low-pressure cylinder, G is a collection of 42 valve cages shown in Fig. 2, H is the large 15,000,000 pumping engine in course of erection. A large electric crane is used in this bay to move the large castings to place desired.

DEATH OF ROBERT McKECHNIE.

Robert McKechnie, who died at Dundas, Ont., Oct. 16, was partially responsible for the early development of machine tool building in Canada. He learnt pattern making in the old Gartshore foundry and then later started manufacturing. John Bertram became a partner and their company, the Canada Tool Works, became well known. In 1886 he retired, leaving John Bertram to continue the business.

Vol. V. December, 1909 No. 12

TECHNICAL EDUCATION.

Slowly but surely the question of technical education for mechanics and apprentices is receiving attention. The Provincial Government of Nova Scotia has taken up the question with the result that a comprehensive system of technical education has been developed, which is an example for the other provinces. This system was described in February, 1909, issue of Canadian Machinery. The department of technical education has been established in Nova Scotia for two years and schools have been established in twenty-one industrial communities, with an attendance of over 1,400 students in the different courses during the year.

In Quebec there are 11 schools of arts and manufactures. Among the subjects treated are drawing, woodwork, metal work, etc. Montreal is a leader in technical education in Quebec Province. Early in October the corner stone of a large provincial technical school, which will be complete in all its branches, was laid in Montreal. There will also be a provincial institution in Quebec.

Prince Edward Island, New Brunswick, British Columbia, Alberta, Saskatchewan and Ontario Governments have done practically nothing for technical education. It is a tribute to the progressiveness of those cities that have investigated the needs of a growing industrial nation and have endeavored, at least, in a measure, to meet the demands for artisans by developing young men along practical lines. Many Ontario towns and cities have begun courses in manual training, which will develop into more complete courses.

Hamilton, one of Ontario's busy industrial centres, has dealt with the question in a gratifying manner. A well equipped technical school has been erected, where courses will be given in practical work, including forging, woodworking, metal working, work in electrical laboratory, etc. In all cases practical work will be accompanied by instruction.

The railroads have their own systems, and they are excellent, but in many growing industrial centres there is nothing of this nature for a young man. He enters a shop as an apprentice and picks up knowledge the best way he can. In Nova Scotia the question has been properly dealt with and Quebec is beginning its scheme. The other provinces, especially Ontario, which is the manufacturing province, should adopt an organized scheme for technical education. The scheme will cost money, but it will be worth it, and it will be supported by both the manufacturer and the public generally.

CAMPAIGN FOR UNIFORM BOILER LAWS.

For several years Canadian Machinery has followed closely the campaign to secure uniform boiler legislation in the various provinces of Canada. The manufacturers and engineers of Canada have recognized fully the importance of building boilers acceptable in any province in the Dominion. Now the realization of the hopes of both the manufacturer and consumer is in sight. For several months J. W. Harkom has interviewed the men in charge of boiler inspection, construction and stationary engineering departments, with the result that British Columbia, Alberta, Saskatchewan, Manitoba, Ontario and Quebec will be represented in a conference at Regina December 1, 1909. The representatives will attend with instructions to consider the act prepared by the Boiler and Engine, and Boiler and Thresher sections of the Canadian Manufacturers' Association, and bring to the Provincial Governments recommendations which can be adopted by them and stimulate, instead of retarding, the trade between provinces.

As the laws stand at present, a boiler built to the specifications of one province will not be acceptable in another province, and the effect has been to stop, or at least curtail, business carried on between provinces. This appears to us to be striking a blow at the British North America Act of 1867. One of the important features of the act was to remove the barriers preventing provinces trading with each other.

The benefits of a uniform law are threefold: (1) The manufacturer will be able to build a number of boilers on the same pattern, allowing him to build a better boiler at less cost, because the numerous patterns, templets, etc., are done away with, and workmen can become more efficient; (2) The consumer will know that he is getting a good boiler that can be used in any province; (3) any engineer securing a certificate in one province and moving to another will not have to pass examinations in all the provinces in which he may reside.

The act and regulations that have been prepared cover the ground very thoroughly. The differences in opinion manifested by the legislation in the various provinces should be easily reconciled. The time has arrived when greater protection is necessary, to which recent explosions testify. A strict, uniform law will carry out the spirit of the British North America Act, and will protect to a greater extent, life and property, and guarantee to the user that all precautions have been exercised in the manufacture to secure for the user a well-constructed boiler.

INSURANCE AGAINST UNEMPLOYMENT.

A question which is exciting a great deal of attention in England at this time is, that of insurance against unemployment and an experimental plan to be presented to the British Parliament.

Whether or not the effort to make such insurance compulsory by parliamentary enactment as to certain industries will be successful can not now be foretold, but it is evident that an earnest effort will be made to secure the passage of such a law. The proposed legislation, as recently outlined by the president of the British Board of Trade, will embody these three cardinal features—it will be compulsory, contributory, and specialized as to different groups of trades.

It is claimed that the futility of voluntary schemes of insurance against unemployment have been caused by the fact that the majority of those interested in such schemes have been themselves out of employment, and consequently unable to make the necessary payments. Contributions from employer and employee are regarded as essential in order to secure stability and permanence to the undertaking, and it is believed that the wage-earner, with the assurance that he will be provided for in a time of misfortune and distress, will be less inclined to engage in strikes, and that a larger measure of peace will be thereby obtained for the industrial world.

The division into trades, it is urged, will solidify the interests of employers and employees, and if there should be a depression in one trade the scale of contributions or allowances could be changed without affecting other industries.

The trades of building, shipbuilding, engineering, construction work generally, and vehicle making have been subject in the past to the most serious fluctuations, and it is in these trades that the insurance against unemployment will be first made applicable. One-third of all the employes in the United Kingdom in what may be called purely industrial occupations are engaged in the said trades.

It is intended, if the law is enacted and proves effective, to enlarge its scope from time to time so as to include other trades, giving the preference to those trades in which it may be inferred from past experience that frequent, violent, and sustained depressions are most apt to occur. It is expected that the contributions required from the State, the employer, and the worker will be about 5 cents a week each. The amount paid by the wage-earner will be stamped weekly upon his insurance card. This card will also show the weekly contribution by the employer.

The labor exchanges and the insurance against unemployment will be closely associated, and through this co-operation it is anticipated that the disturbances which now agitate the labor market through a superabundance of workers in certain trades or in certain localities and a scarcity in others will be largely avoided.

The wage-earner when out of employment must report to the nearest labor exchange, and through it an effort will be made to find work for him. He will be paid nothing out of the insurance fund during the first week that he is unemployed, upon the assumption that he has probably saved enough to tide him over that short interval. If work is secured for him he must accept the employment unless he can furnish a satisfactory reason for not doing so to a committee composed of employers and employes, which will be constituted to decide the contention. If he is willing to work and employment for him can not be found, then he is to receive ordinarily $1.92 per week for fifteen weeks if employment is not secured during that period, or for a longer period (but in no event to exceed twenty weeks) if he receives a smaller weekly benefit.

If he makes an application a second time he must contribute to the insurance fund for a longer period than the first time. The original period during which he must contribute to the fund before he can receive insurance benefits would probably be eight months, and the second or third periods, if he should make three applications in all for employment, would be progressively longer. The insurance scheme, it will be thus seen, is not intended for the benefit of men habitually or chronically out of work, but for the steady and industrious wage-earner who temporarily has no employment.

It is estimated that the contribution to the insurance fund by an employer of 500 men would not exceed $1,200 or $1,450 a year. Arrangements, it is suggested, should be made to enable individuals or associations of workmen who are not employed in the insured trades to insure against unemployment through the Government voluntarily, but in such cases the terms of the insurance would not be as favorable to the employe as if he were engaged in one of the compulsory trades.

The proposed legislation has met with a varying reception from the large employers of labor and from the trade unions, some approving and others condemning it; but it can not be said as yet that there are any indications of organized and general opposition to the proposal of assurance against unemployed from either of these sources.

PRODUCTION OF PIG IRON AND STEEL IN CANADA.

The detailed figures of the pig iron and steel production of Canada for the half-year ending June, disclose a very gratifying state of progression. Not only was there significant increases in the totals over those for the half-year ending Dec. 31, 1908, of 96,524 tons in iron, and 84,333 tons in steel, but every individual line showed an advance. It can thus be seen that the general increase was not due to any unusual inflation of a particular line, but to an improvement in every branch—a sign of a stimulated demand from a predominating number of most important industries.

As iron and steel closely indicate the prosperity of a country, Canadians can appreciate how prosperous trading conditions must have been during the first half of the year, and what gratifying totals are promised us at the end of the year. The steel details are particularly interesting. Rails, for instance, show an increase of 34,364 tons; structural materials, etc., of 14,077 tons, and plate, axles, spikes and other sundries of 1,292 tons over six months ending Dec., 1908. These figures indicate how railroad purchasing improved, and how the construction shops, the contractors, and other industrial corporations developed in their production.

As can be imagined, no plants have been dismantled, while, on the other hand, the different iron and steel corporations have been making extensive additions to their furnaces, mills, etc., to cope with the demand. Ten furnaces were in blast during the half-year.

The Dominion Iron & Steel have put into construction or are projecting, 120 improved Otto Hoffman by-product coke ovens and accessory plant and equipment; an additional fifth blast furnace with stoves, etc.; two 400 to 500-ton open hearth steel furnaces; an additional, third,

Bessemer converter, and a turbo-generator plant for utilization of waste steam and generation of electric energy—to replace present direct steam generation system and afford sufficient additional current to electrify the company's pumping station. There will probably be some additions to present mill equipment to take care of the increased tonnage of steel that will be produced by the enlargements previously noted.

The Atikokan Iron Co. blast furnace was blown in during the second half of the year. The Hamilton Steel & Iron Co. are building a new Gayley dry air blast equipment. It is also announced that a new bolt and bar mill will be built, and that the company will do business on a much larger scale, entailing an expenditure for new works of over a million dollars.

Lake Superior Corporation are erecting one new blast furnace with a capacity of 400 tons per day, and one 12 and one 18 merchant mill with a capacity of about 400 tons per day. An enlargement of the rail mill is contemplated. Four thousand men are now being employed on full time.

SECRET COMMISSIONS ACT.

The following letter from a prominent Toronto business man illustrates the importance of the act :

> Editor of Canadian Machinery,—In the October issue of your journal you reprint and call attention to the Secret Commissions Act, which was passed at Ottawa last session. This piece of legislation has not received the attention that it deserves, and, in fact, is almost yet unknown, as a law, to the great majority of citizens of the Dominion. You are undoubtedly doing a great public service in bringing this act before your readers, and it is to be hoped that other publications will follow your good example. All papers should freely comment upon it. It is a case where the necessity of such a law being properly observed should be "pounded in" everywhere.
>
> Too much publicity cannot be given to the fact that our corrupt business methods have forced such legislation, and in response the act has been brought into existence and stands upon the statute book, with the severe penalties therein prescribed for infraction of same.
>
> Attention should be called to the alarming increase in the petty bribe and graft custom in our business life in Canada ; in this particular we seem to be following closely the regrettable usuages of our neighbors south of the line, although the Old Country is not a stranger to it.
>
> This matter is more important and far-reaching than is generally supposed ; in some lines of business it amounts almost to blackmail. Some Government and municipal employes look for a commission, and trade is only secured through this channel ; purchasing agents in large concerns have to face it, and in some cases suggest it ; many engineers are "fixed" to report on oils, etc., and qualities and quantities used, as well as prices made, are in accordance with the "fixing" regulations ; printing inks and various other supplies are thus often bargained for. In fact, this dishonest and debasing process runs through so many avenues and lines that it is impossible to enumerate them. It destroys all fair competition and is utterly demoralizing to the individual and the nation.
>
> In the interests of common honesty, business integrity and good citizenship, this abuse should be stamped out. It curses "him that gives and him that takes."
>
> TORONTO BUSINESS MAN.

In New York manufacturers are having trouble with secret rebates and the practice is strongly condemned by the New York Journal of Commerce. An act such as the Canadian Secret Commissions Act, would evidently be very acceptable to those who have to put up with the unfairness caused by giving secret rebates.

The Journal of Commerce says under the heading "Rebating is Dangerous" :

> One of the propositions which causes the wholesaler about as much trouble as any other is that of the practice on the part of the traveling salesman of giving rebates from his pocket. It is a two-edged sword, which hits both at the house and at the salesman. Besides the direct money involved it often places the employer in a position where the employe does something that causes much embarrassment in more ways than one.
>
> Too often the salesman is anxious to make a record of selling a large amount of goods and sends in his orders at regular prices, but digs down in his pocket and hands back to the buyer enough to make up the difference in the figures between what he should get and what the buyer is willing to pay.

We believe this act to be to the interests of business men, and it is hoped everyone will assist in its enforcement. Canadian Machinery intends giving publicity to everything which will place the mechanical men and the manufacturer on a higher plane. We believe the enforcement of this act will do this and assist in the building up of honest men who can be trusted to do the right things wherever they are employed.

"Take some serum from a cost system and inject it into your backbone" — F. I. Ellich.

CANADA'S GROWING TRADE.

During the decade from 1898 to 1908 Canada led the world, with the exception of Argentina, in comparative increase in trade. During the preceding decade, from 1897 to 1907, Canada ranked third in respect to trade growth, Argentina first and Japan second. Japan now ranks third. This is the most interesting fact brought out in the annual report of the Trade and Commerce Department recently issued.

Statistics of canal traffic for the six months ending September 30th show a marked increase totalling about eleven million tons. The increase at the Sault canals was 10,500,000 tons, Welland 119,516, St. Lawrence 263,234, Chambly 163,079, Ottawa river 47,463, Rideau 650. The Trent canal alone shows a small decrease.

The customs collections for October show another gain of nearly $1,000,000, as compared with the corresponding month of last year. The total customs receipts for the month just ended were $5,236,737, an increase of $920,263. For the seven months of the fiscal year the total customs revenue has been $34,017,806, an increase of $6,838,614, or nearly $1,000,000 a month as compared with the corresponding period of last year. The rising tide of imports consequent upon the recovery from the trade depression of last year shows no sign of ebbing, and indications point to an increase of about $12,000,000 in customs revenue alone for the present fiscal year.

Canada's trade for October was $62,417,614, an increase of $5,189,061 compared with October of last year. Imports for the month totaled $31,473,960, an increase of $3,814,600. Exports of domestic products totalled $27,250,759, an increase of nearly one million.

For the first seven months of the fiscal year the total trade has been $366,807,482, an increase of $48,400,497, as compared with the corresponding period of last year. Imports totalled $202,787,905, an increase of forty millions. Exports of domestic products totalled $147,735,014, an increase of a little over eleven millions.

The total customs revenue for the seven months was $33,797,520, an increase of $6,787,452, or nearly one million a month.

The financial statement for the Dominion for the month of October, and for seven months of the current fiscal year, according to the returns of the Finance Department up to the end of October has been issued. The revenue for October was $8,553,766, an increase of $1,034,050, of which $897,696 was in customs revenue. For seven months the total revenue was $55,907,586, an increase of $7,660,348, or over one million a month, as compared with the corresponding period of last year. For the month of October, the expenditure was $6,710,684, a decrease of $1,106,938. For seven months the consolidated fund expenditure was $37,137,139, or $2,205,237 less than for the corresponding period of 1908. The surplus of revenue over ordinary expenditure is therefore nearly nineteen millions. Expenditure on capital account was $17,196,084, a decrease of $808,298, as compared with last year. The total expenditure on both capital and consoildated fund account for the seven months was $54,363,223, or $1,544,363 less than the total revenue, notwithstanding an expenditure of over ten millions on the National Transcontinental Railway.

The total net debt of the Dominion on October 31 was $321,727,816, an increase during the month of $1,029,352.

According to figures furnished by the Department of Land and Commerce, the Dominion Government since 1896 has paid out in bounties $16,507,205 of all kinds.

During the fiscal year which closed March 31, 1908, the total amount paid was $1,864,614, and for iron and steel as follows: Algoma Steel Co., Soo, $304,789; Dominion Iron and Steel Co., Sydney, $1,067,528; Nova Scotia Steel Co., $130,374; Hamilton Steel Co., $252,311; Canada Iron Furnace Co., Midland, $39,968; Canada Iron Co., Radnor Forges, $3,742; John McDougall and Co., Drummondville, $3,394; Lake Superior Co., Soo, $45,890; Ontario Iron Co., Welland, $6,887; Can. Iron Corporation, Midland, $9,295; and the same company for its Drummondville forges, $431.

TAKE TIME TO READ.

"I have no time to read." This is an expression sometimes heard by technical paper canvassers, and if it were as well understood by those who make use of it, as it is by canvassers it would not so frequently be expressed. Instead of being an excuse for not subscribing for a paper that will benefit the foreman, superintendent or proprietor, it is an admission of neglect to do what every progressive mechanical man is expected to do.

Technical papers are busily engaged in searching for new and progressive ideas, and are bringing the best that can be found to the attention of their readers who are continually making use of them.

A young man recently engaged in a business of which he has little knowledge. He has not the least inclination to read and therefore has little chance to learn. He is consequently not making headway and cannot understand what is the matter.

Another young man started under similar conditions, but he caught on to the idea that knowledge is the source of success. He devoted certain hours every week to the reading of technical literature, and he claims that his success, to a large extent, is due to the valuable information he obtains in that way. If a man has no taste for reading he should cultivate it; in fact should make himself read, and he will soon acquire a habit that will be beneficial to him. The man who does not read must not forget that others read him, and they soon find out that he is narrow in his views and selfish in his dealings.

It is even time well spent for mechanical men to take a look at other shops in order to get improved ideas, but what is that compared with the knowledge he can gather from his technical paper, which is on the lookout for the best systems and methods all over the world, and which are gathered up and brought right to his office or shop every month for his own benefit and at his leisure.

No time to read! One might as well say that he had no time to eat.

CAR SHORTAGE IN CANADA.

There is such a shortage of cars on the Canadian railroads that manufacturers and shippers find it difficult to make deliveries. It has been reported to Canadian Machinery that orders placed early this year have not been delivered through lack of rolling stock.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

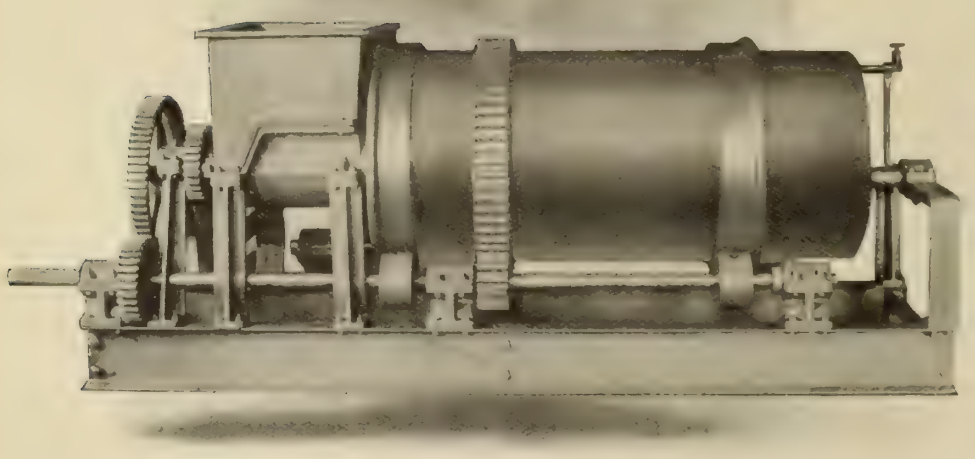
DETROIT CONVENTION OF THE AMERICAN FOUNDRYMEN'S ASSOCIATION, 1910.

The committee appointed on behalf of Detroit foundry and foundry supply interests to arrange for the convention of the American Foundrymen's Association in Detroit in 1910, had a meeting on October 12, at Detroit, with the officers of the Foundry and Manufacturers' Supply Association. The Detroit committee offered as a meeting place the fair grounds, located on Woodward Avenue. The time most suitable to the local committee, it was stated, is the week opening May 30, but the dates have not yet been definitely determined. The representatives of the foundry supply interests expressed approval of the site. The completion of the arrangements was left in the hands of President F. N. Perkins of the Foundry and Manufacturers' Supply Association, to co-operate with the Detroit committee.

A number of entertainment features are proposed, including a boat ride on the Detroit river for all attendants at the convention, a smoker for the men, a drive about the city and a theater party for the ladies. Frank T. F. Stephenson is chairman of the Detroit general committee and his associates are the following chairmen of sub-committees: Frederic B. Stevens, finance committee; Joseph J. Wilson, plant visitation committee; James S. Keightley, reception committee; W. P. Putnam, convention sessions committee; Melvin Henry, ladies theater party and sight seeing committee; E. J. Woodison, smoker and get-together entertainment committee, and Oliver Phelps, boat ride committee. The Detroit Foundrymen's Association, has as its president, Arthur T. Waterfall, who is also president of the American Foundrymen's Association for the present year.

McCORMICK CONTINUOUS SAND MIXER.

The sand mixer shown in the accompanying illustration, is so constructed that wear on the operating parts, as a result of the abrasive action of the sand, is reduced to the minimum. Sand is fed into a hopper containing two feed worms or screw conveyors, which deliver the material to a revolving drum, inside of which is a rotating reel operating in the same direction as the drum. This reel is so constructed that it thoroughly mixes and cuts the sand before it is discharged from the machine.



McCormick Continuous Sand Mixer.

At the discharge end of the drum is a device for tempering the material as it is being turned over. The machine can also be arranged as a proportion mixer by placing a partition in the hopper and operating the feed worm at different speeds by the use of sprocket wheels. In this way facing and core sand can be accurately mixed. The machine is built in sizes having capacities from 10 to 15 tons per hour, by the J. S. McCormick Co., Pittsburg.

WRINKLES FROM A PATTERN SHOP.

By P. Maker.

The writer has worked at wood patternmaking the past 25 years. The greater part of this time was spent in shops in large cities. Six months ago I thought I would try a shop in a small or medium-sized town. About seventy-five machinists and three patternmakers are employed with three machinist apprentices and one patternmaker apprentice. Practically all of the small tools were made by these apprentices in a workmanlike manner.

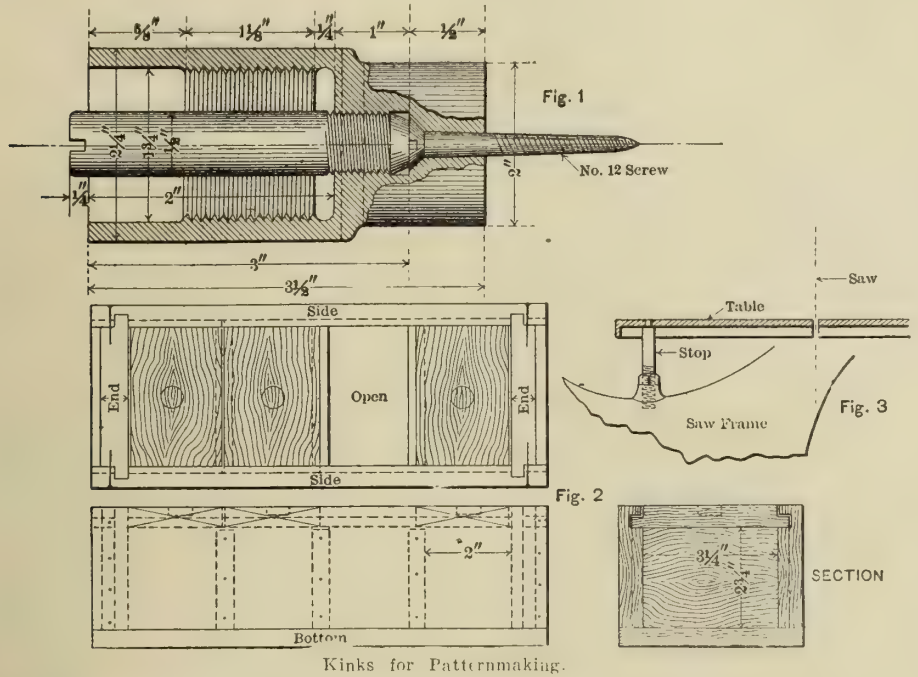
Fig. 1 shows a screw chuck made of cast iron; it is without a doubt the best chuck that I ever used or saw. It is made long enough so that a firm grip can be taken to remove it from the lathe. The threads are cut away to insure a straight start on the spindle. It is drilled and countersunk for a No. 12 screw which is secured in place by a ½-inch setscrew which is nothing more than a common ½-inch bolt with the head cut off and a saw-slot cut in as shown. The screw can be removed and another put in in less time than it takes to think about turning a thin disk to place back of the work. The small face-plates are fitted with this screw.

The large wood face-plates vary in size from 2 to 6 feet in diameter. Each of these is fitted with an iron face-plate which is never removed until the wood plate is out of use.

Fig. 3 presents a band-saw table stop which was designed and made in this shop. The old stop was a simple setscrew and locknut which was removed and in its place was put a stud with a shoulder pin. The table rests on the shoulder, the pin passing through a hole in the table and finished flush with the top. With this device a workman can

detect at a glance if the table is in a correct position or not.

Fig. 2 is a simple shop requirement, one that is in constant use but given little attention. It is for brads, screws, etc. Three of these are made for each bench. One is for very fine brads, one for heavy brads and one for screws. It is made up of several compartments each about 2 by $2\frac{3}{4}$ by $3\frac{1}{4}$ inches. It has individual covers over each pocket, excepting one as shown. Only the one is open which contains the nails or screws required. The contents of box are never mixed up, it is always clean, and the contents of one can be removed without disturbing the other castings.



Kinks for Patternmaking.

HOW THE "OLD MAN" WAS WON OVER.

"Along early in the winter," said the foundry foreman, "they called me over to headquarters, up to the drawing room. The old man was there, studying blue prints for some new cylinders he had been working out with the chief draftsman. They must have stayed up nights on the job, for the drawings were fancier than anything they'd ever sent to the foundry. The old man went over them with me.

" 'Can you get 'em out?' he asked.

" 'I can try,' I told him.

" 'You can try?' " said the chief draftsman. 'Is that all you can do? Anybody can do that much, and we're giving you credit for being a first-class foundryman.'

" 'Now look here,' I said to him, 'I might tell the president I could get out that casting, and probably I could. But I'd only be guessing about it. I don't know sure. Now, why isn't it a blame sight better for me not to be too everlastingly positive till I'm certain I know what I'm talking about?'

"Then I asked the president to let me tackle the hardest proposition of the lot, and he said to go ahead. Well, the casting turned out bully, smooth and true and without the sign of a flaw. They were as tickled as could be up at the office, particularly the old man, who called me up to talk it over.

" 'I guess there isn't much doubt now that you can turn out that cylinder according to the design,' he said.

" 'You're satisfied with the casting?' I asked him.

" 'Why, yes,' he said. 'Certainly I'm satisfied.'

" 'Well then, I'm not,' I told him. 'That's only a trial casting and you're not counting on using it. Now I want it cut up so that we can see what the cylinder looks like inside. Judging from outward appearances, it's all right, but maybe there's something out of the way that we can't see. It might be a good while before we would discover anything wrong. A lot of these cylinders might have gone out onto the market, and they wouldn't be doing our reputation any good. I want this one cut up so that we will know it's in first-class shape inside and out. Then we can go on with the others.'

"The old man thought this was a good idea, and we tried it. We didn't find anything wrong inside the cylinder, but I've noticed that lately they've been calling me up to the office more and more, and from the way the old man talks, I believe he's coming around to the place where he sets some store on what I've got to say about any troublesome little job that turns up."—Foundry.

PLUMBAGO.

The United States imported in the fiscal year 1908, 13,398 tons of plumbago, orth $1,206,016, nearly all from the British East Indies. Canada supplied only $14,054 worth, but this total is likely to be given a boost. According to the U S. representative at Kingston, the shipment of plumbago has largely increased from that consular district of Ontario Province during the past six months, due to the discovery of an extra quality of the material and the increased demand in the United States. It is mostly mined at Calabogie, some 90 miles north of Kingston. H. D. Van Sant further reports that the prospects are for largely increased shipments during the coming year, and more machinery is now being installed at this mine. American capital is backing the enterprise.

IMPROVING ALLOYS WITH MANGANESE.

Boileme (La Fonderie Moderne) prepares high-grade copper-manganese by placing 75½ lbs. of broken or powdered manganese (98 per cent. pure, and free from iron and carbon) in a graphite crucible and covering it with about 1 lb. of borax, the crucible being then filled up with 154 lbs. of copper, which is also covered with borax. The charge is heated for about two hours in a coke furnace, and when all the floating fragments of manganese have disappeared the product is cast into ingots, which are hammered to expel the scoria. Manganese-zinc and manganese-tin are prepared in the same way, except that the manganese is not added until the other metal has melted.

The addition of manganese (maximum 6 to 7 per cent.) to bronze gives a softer and more homogeneous metal by increasing the malleability and ductility of the alloy. The manganese is added in the form of copper-manganese or zinc-manganese. It must not, however, be added to bronzes containing over 2 to 3 per cent. of tin, as decomposition is produced and the quality of the alloy is impaired. About ¼ to ½ per cent. of Mn in white metal gives the product a silvery appearance, increases density, and facilitates working.

Added to nickel, 2 per cent. of manganese prevents the formation of bubbles in the castings and increases the fineness of the grain. Copper-manganese containing 30 per cent. of Mn (free from iron) may be used with advantage to replace zinc and nickel in aluminium alloys. From 4 to 6 per cent. of pure manganese forms a useful addition to the copper stays of locomotive fireboxes —the presence of iron would considerably lessen the resistance of the metal to fire-heat.

Manufacture of Cast Iron Pipe: Anthes Core Machine

Process of Manufacture Used in the Anthes Foundry, Toronto—Machines do a Large Part of the Work—Well Lighted and Modernly Equipped Plant

Back in 1894 H. W. Anthes and E. W. B. Snider established a soil pipe plant on Niagara Street, Toronto, under the name of the Toronto Foundry Co. In 1900 a charter was secured as an incorporated company with Mr. Snider as president and his two sons, W. W. and C. W. as vice-presidents, Mr. Anthes continuing in charge of the industry as general manager, while his son, L. L. Anthes, was appointed superintendent. Two years later, in 1902, the industry was moved to Atlantic Avenue, near the Exhibition grounds, and a thoroughly modern foundry building constructed. And now another change is being made, the old name being discarded owing to its similarity to many others, the distinctive name of Anthes Foundry, Limited, being substituted. Mr. Snider and his sons, will still maintain their financial interest in the company, devoting their time to the Waterloo Mfg. Co., Waterloo, Ont., and the active management of the foundry will continue, as before under the direction of H. W. and L. L. Anthes.

Fig. 1.—General View of Anthes, Limited, Pipe Foundry.

On approaching the plant one is naturally struck with its architectural features first. In the design and construction of the buildings care and consideration have been given to each detail which would tend to cut down unnecessary labor, and at the same time give a plant that was adequately protected from fire, well lighted, properly heated, and in every respect satisfactory.

The offices, pattern and machine shops occupy a rectangular building, 50 x 75 feet, at one corner of the plant. Beneath the offices there is a fire-proof pattern vault with concrete ceiling and self-closing fire doors. Under this part of the building are also the wash-rooms and the warehouse for snap-flasks, follow-boards, and similar equipment.

The foundry proper is divided into two parts, the entire foundry being 75 by 200 feet. Two-thirds of the floor is devoted to the manufacture of soil pipe, and one-third to the manufacture of fittings. For lighting the building side windows and a double monitor roof are used, the latter extending lengthwise over the foundry. Between the two monitor roofs there is a sunken gutter, which is very plainly shown in Fig. 1. Beneath this sunken gutter are supported the trolley tracks for carrying the iron in ladles to the fittings floor. The cupola is located midway of one end of the soil pipe shop and the overhead trolley system passes in front of it. The finished pipe is taken out on an industrial railway system.

The soil pipe manufactured varies from the heaviest to the lightest and from two to eight inches in diameter. Green-sand cores are employed in all of the work, both for fittings and for pipe. The flasks are all ground on the joint to insure accurate fitting. By traversing the flask back and forth under a revolving wheel, the joint is very quickly ground true and straight.

The molds are made on specially constructed molding machines. Patterns are arranged to strip down through the plate far enough to thoroughly release them from the mold. The cope and drag portions of the mold are exactly like each other except for the gates. The heavier sections are gated on each

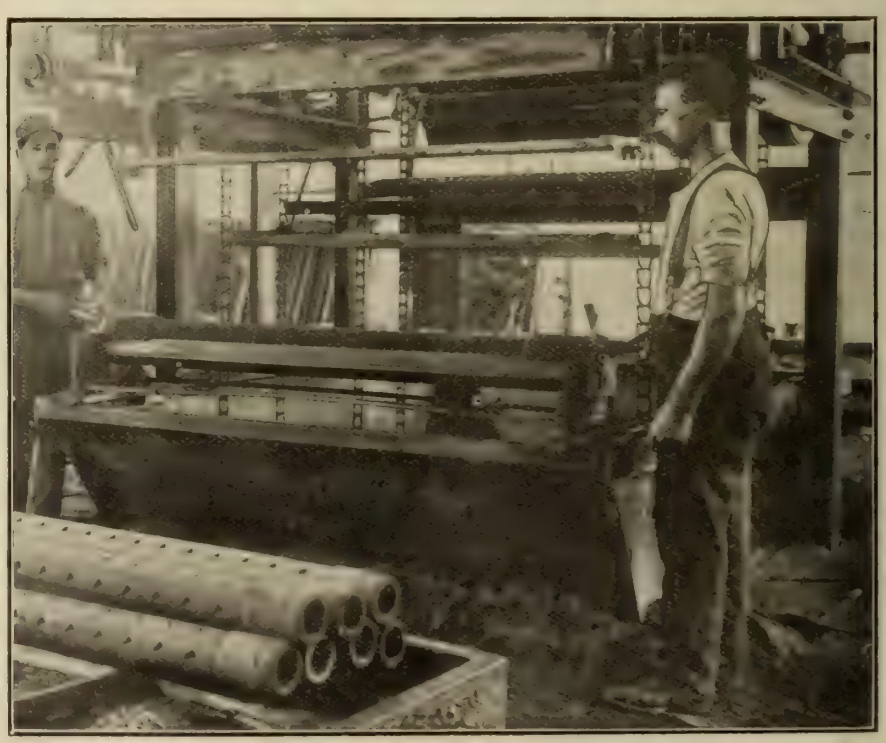


Fig. 2.—Side View of Green Sand Core-Making Machine.

end, while the lighter pipe is cast two pieces in a flask and gated on the sides.

Special Core Making Machine.

For making the cores for the pipe a special machine has been designed by L. L. Anthes and it turns out green-sand cores with remarkable accuracy and rapidity. One of the working sides of this machine is shown in Fig. 2. The machine is constructed double so that cores may be made on each side. The sand is elevated from the boot to sand hoppers above by long elevator buckets. In the bottom of the hopper there is arranged a bar, carrying teeth, which can be reciprocated by the eccentric shown just above the workman's head. When the mechanism is started, this bar with the teeth projecting from it causes the sand to flow in a steady shower and fall upon the cast-iron arbor. These arbors are first wetted and then rotated by a suitable crank, the arbor being supported in chilled bearings and the sand struck off to form the core by a straight-edge as shown. The sand in falling packs sufficiently so that the cores are made very quickly. As soon as the cores are made they are lifted out and placed on horses ready to be set in the molds as they are required. With the foundry running to its full capacity in turning out a carload of soil pipe a day it is necessary to operate both sides of the core machine, which keeps four men busy.

The core sand is kept separate when the castings are shaken out and by mixing a little new sand with the old it is again used, the only sand ordinarily discarded being that which passes out with the work as it goes to the tumbling barrels.

Fig. 3.—Molding Machine for Pipe, with Flask and Sand Hopper in Place.

Molding Machines.

The molding sand is used over and over, new sand being added to keep the pile up to strength. The molding machines are arranged to slide along the floor upon railroad iron guides which are permanently set into the floor each side of the sand heap, so that the workman is always near his work.

Fig. 3 shows one of the molding machines at the end of a row of completed molds. In the illustration a machine is shown with a cope flask in place and the sand hopper on top of it. A little facing sand is first riddled on top of the pattern and the hopper then shoveled full of heap sand. The molder first peens one side and then the other of the mold, after which he removes

Fig. 4.—Pattern for Pipe Fitting.

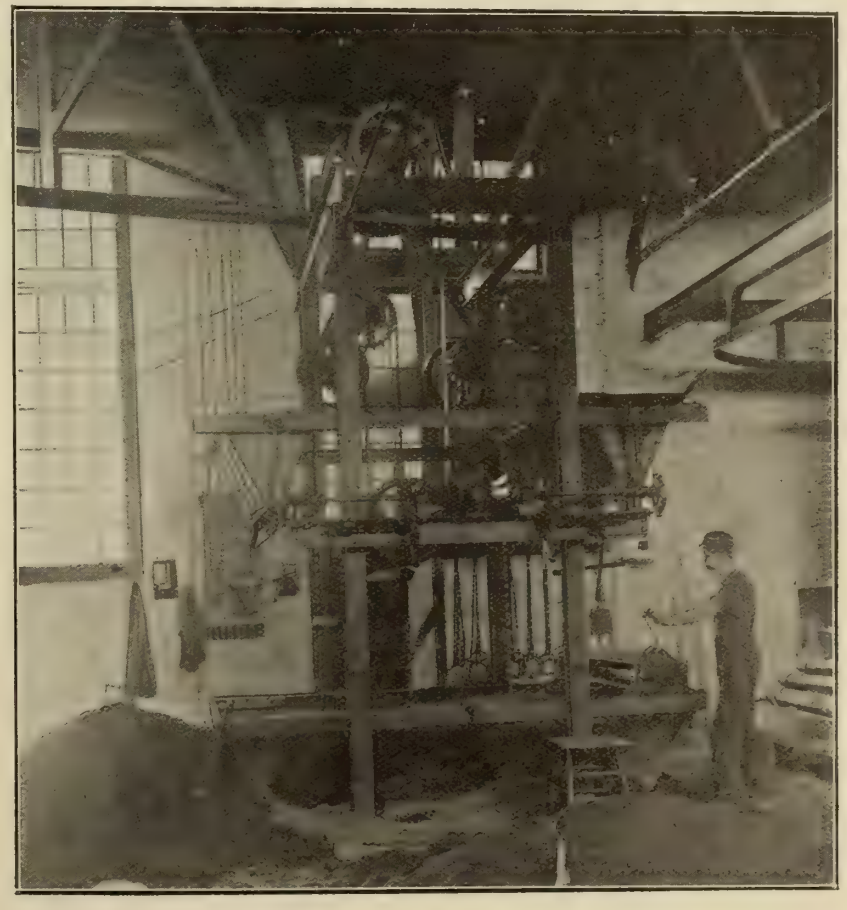

Fig. 5.—End View of Core Machine.

the hopper and buttrams the heap of sand left in the centre.

Making Fittings.

The fittings are all made with split shell patterns so arranged as to leave their own green-sand cores, as shown in Fig. 4. The patterns are in halves so as to form the green-sand core on the inside of the pattern and the mold on the outside. In the centre of the illustration referred to is seen a follow-board with the pattern and sprue in place. The cope and drag portions of the flask are held together by small wedge clamps slipped over chucks as shown. In the making of a 4-inch offset the drag half of the pattern is laid in the follow-board and the core arbor

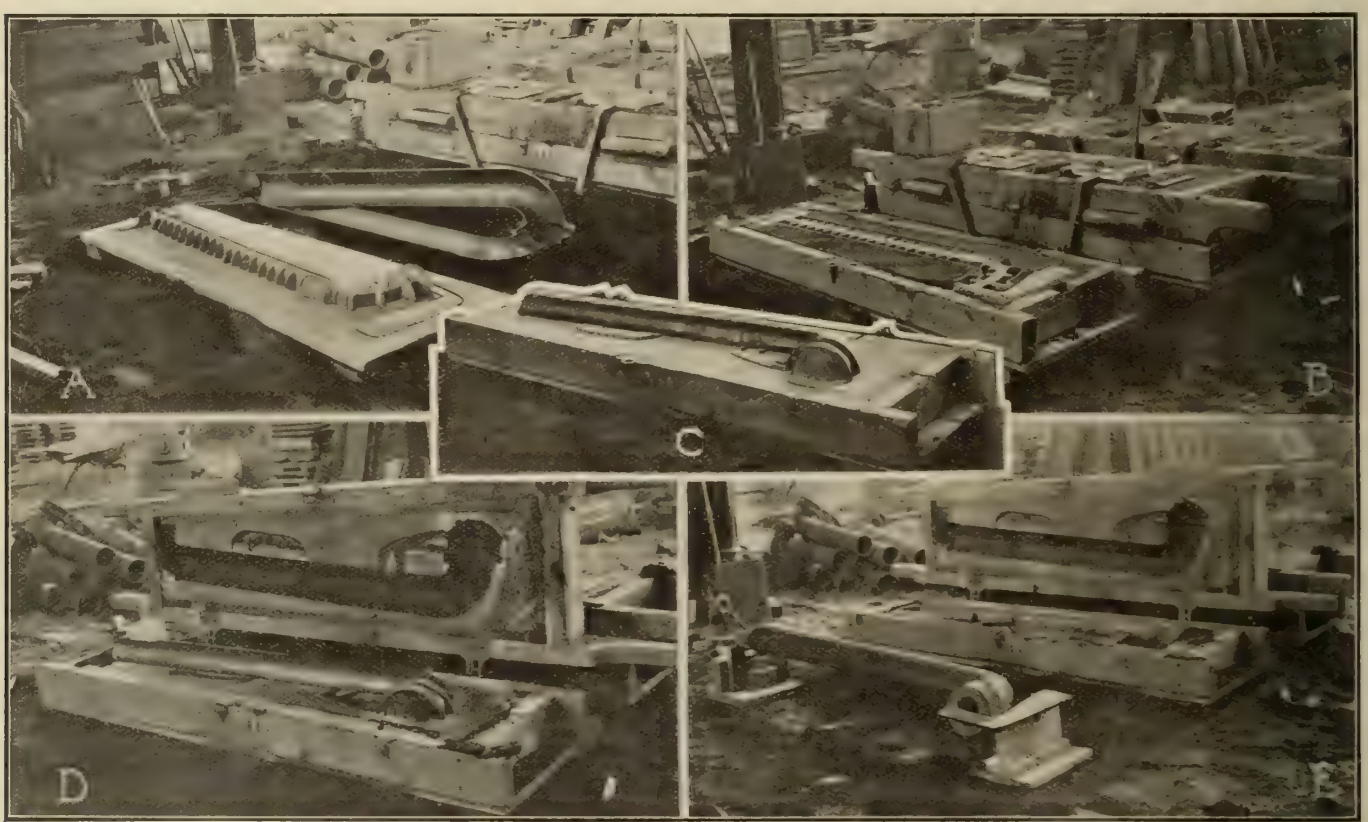

Fig. 6 A.—Core Arbor on Bottom board and Patt ern for a Quarter Bend 36 Inches Long Behind the Bottom board. B. Drab Rammed Up and Arbor in Place in Pattern Ready to Form Drag Half of Core. C.—Core Finished and Pattern in Place Ready to Ram Cope. D.—Mold Finished and Cope Rolled Back. E.—Core Lifted Out to be Finished and Mold Open.

or anchor placed in position as shown. These arbors are made in two or more pieces to suit the irregular form of the cores. The joints are dovetailed together, the parts being formed in chills so that they always fit accurately.

For all but the largest sizes of work, the foundry is equipped with carefully made iron flasks for use in connection with the manufacture of both pipe and fittings. The hinges used on all these flasks are so constructed that the cope may be rolled back and blocked in a vertical position. Some of the advantages of iron flasks are that they take up less space on the floor than wooden flasks and are less cumbersome. They are more durable, as they do no burn as do wooden ones, nor do they wear as rapidly. The iron flasks roll over better than wooden ones. They also take up less space in the flask storage, and the fire risk is eliminated.

For the medium-weight pipe two beads are used on the bell in place of one. The use of an extra bead around the base of the bell stiffens it and makes it better able to resist calking. The heavy fittings are made without the extra bead, as is the case with most fittings turned out in the United States.

Cleaning the Pipe.

The castings are tumbled in ordinary stave mills. Up to this point the practice does not differ greatly from that found in many foundries in the United States, but the finishing of the pipes for the market is radically different. In the United States some of the pipe is dipped in a tar kettle, and in other cases it is marketed without any finish whatever; the reason for the latter practice being that the laws in many of the States demand that the pipe be left unpainted until after it has been installed, so that it may be thoroughly inspected. Where the pipes are left without tarring or coating they rust rapidly. The Canadian laws provide for the use of a coating of linseed oil. The linseed oil is thinned with benzine and the pipe and fittings are then dipped in this mixture and set up to drain. Within a few hours the linseed oil has dried down to form a hard but thin coating which is transparent, so that the pipe may be inspected just as well as though not coated. At the same time this coating prevents rust and also forms an excellent base for the application of paint.

Every foundry has to adapt its practice to existing conditions. In Canada the market is limited, hence there is not so great a demand for each separate size and weight of pipe and fittings as in the United States. For this reason it would not pay to fit up for the immense tonnage that could be disposed of in the latter country. The heavy duty on soil pipe in each direction prevents the sale of Canadian pipe in the United States and of American pipe in Canada. However, Anthes Foundry, have a wide connection and some of the pipe is being shipped to the Pacific Coast.

The system of molding fittings used is especially adapted to the class of work being manufactured, and also to the relative number of pieces of each size which must be turned out. The entire work of the plant is on a piecework basis and the greatest possible harmony exists throughout the entire organization.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

An $11,000 Brick machine shop will be erected by the Ottawa Car Co.

The Pacific Creosoting Co., Seattle, will erect a plant on Burrard Inlet.

The Calgary warehouse of the Cockshutt Plow Company will be enlarged.

The Belleville G.T.R. shops were partly destroyed by fire last month.

The Robert Bell Engine & Thresher Co. will erect a warehouse at Moose Jaw.

P. Delorme's machine shop, at Sherbrooke, was badly damaged by fire on Nov. 7.

Concessions of land have been granted at Regina to the Regina Machine & Iron Works.

The Paymaster mine at Gold Rock, near Keewatin, Ont., are erecting a stamp mill.

It is probable that a fire clay plant will be established at Matsqui, B.C., in the near future.

The Bitulithic Contracting Co. have applied for a new site for their plant at St. Boniface.

Harvey Motors, Ltd., intend erecting a marine and stationary engine plant at Dundas, Ont.

Brantford has 5,000 men employed for the most part in implement factories and iron foundries.

Confirmation has been given to the report that the C.N.R. will erect new shops at Port Arthur.

A site has been secured at North Sydney for the smelter to be erected by J. H. Brown and his associates.

The National Iron Works, Toronto, are asking for a railway spur to their property in Ashbridge's marsh.

The Canadian Corrugated Pipe Co. has purchased several lots at Portage la Prairie and will erect a plant there.

The contract has been let to Wm. Kribs for the extension to the premises of the Hespeler Machinery Co., at Hespeler.

Clare Bros. & Co., Preston, have let the contract for an additional storey to be put on the present building used as the stove-mounting shop.

The Dominion Bridge Co., Lachine, have purchased property in Clarkstown, a suburb of Ottawa, for a storehouse for material and working plants.

The Stinson-Reeb Builders' Supply Co., Montreal, which deals in bricks, lime, etc., are said to contemplate manufacturing along this line at St. John.

The Allan Hills Edge Tool Co. have opened up operations at the old axe works in Galt, which had been closed for a year. In a short time 100 men will be employed.

The Malleable Iron Works at Amherst are again in operation, and are giving employment to forty men. It is possible that the staff may be increased in the near future.

A new steel manufacturing plant is to be established in Longue Pointe by the Montreal Steel Works, the property for the new establishment having been purchased in November.

The Maple Leaf Harvest Tool Co., Tillsonburg, Ont., have been making extensive additions and alterations to their plant and have succeeded in getting the new works in operation for the coming season's trade.

The Provincial Steel Plant at Cobourg has been rolling on an order for the Intercolonial Railway and as the order is a very large one it will keep the mill running several months.

The B.C. Electric railway has let the contract for the erection of its new car-barns and repair shops at New Westminster to W. W. Forrester. Work will be commenced immediately.

The Rock Island Tool Co. has been taken over by the Rock Island Mfg. Co. The business has been reorganized, and Harry Roper, of Montreal, has been appointed agent for the new company.

The Standard Foundry Co., Longueuil, Que., has been reorganized as the Standard Foundry & Machinery Co. E. Prevost is president of the new company, and S. Whiteside, is secretary-treasurer.

A syndicate of Watertown, N. Y., men have taken hold of the business of grinding the mica waste, or broken mica of the Canadian mines and have established a factory at Cape Vincent, N. Y.

The Canadian Bronze Powder Co.'s works at Valleyfield, Que., have an equipment for the manufacture of bronze and aluminum castings. The factory also affords accommodation for a jobbing iron foundry.

The Canadian Iron Furnace Co.'s works on the Ste. Maurice, at Three Rivers, have been partially burned out, the loss being about $50,000. The fire will probably throw some 200 men out of employment for some time.

A representative of the John Deere Mfg. Co., Illinois, manufacturers of agricultural implements and engines, was in Brantford recently, looking for a site for the establishment of a Canadian branch of the firm.

S. G. Kitchen, president of the Jackson Wagon Works, St. George, Ont., and president of the Brantford Cordage Co., Brantford, contemplates the establishment at Dort Arthur of a large wagon manufactory.

Fire completely gutted the large foundry owned by H. F. McCrae, at Tillsonburg, on Nov. 7. The loss will be $1,500, mostly on the machinery. Two valuable patterns were destroyed, but two large engines were taken out intact.

The International Gully Co., Montreal, has been changed to the Standard Foundry & Machine Co. to continue making on a larger scale the Colas gully. Alfred Colas, son of the inventor is vice president of the new company.

The Dominion Wire Mfg. Co., Montreal, propose to establish at once a factory and warehouse at Vancouver, which will be ready in two months. For the immediate present, the operations of the company will be confined to wire nails.

Douglas Bros., Winnipeg, sheet metal workers, have purchased a location in Vancouver. This concern has been doing business in Winnipeg since 1872. An expenditure of $100,000 is contemplated, with employment of 100 hands at the outset.

Tenders were approved of for the erection of shops in the new corporation yard, Montreal. H. Lalonde, house and sheds, $9,300; Montreal Ship Lining Co., store and office, $24,400; and the Montreal Ship Lining Co., $28,780, for the shops.

Owen Sound parties who are forwarding the 500-foot dry dock scheme, have received assurance from Ottawa that there is a good chance for the usual 3 per cent. yearly bonus being granted by the government in favor of the enterprise.

Motors Ltd., is the name of a new company that will erect a large garage in Toronto where they will manufacture automobiles and cater to the Canadian trade. George Frost formerly of Smith's Falls will assist in the management of the new company.

An endeavor is being made to interest the Belfast shipping firm of Harland & Wolff in the recently established shipyard at North Vancouver, of McDougall, Jenkins, Ltd., since the Old Country firm has announced its intention of starting in Canada.

The Valleyfield Mfg Co. have erected a large concrete building alongside the G.T.R. track, at Valleyfield, Que., and are now manufacturing stoves and ranges, and intend to manufacture iron beds. Mr. Howard, formerly of Morrisburg, is the manager.

Edward Gurney, president, and E. Holt Gurney, sales manager of the Gurney Foundry Co., Toronto, made a trip to the Pacific coast, to look over the western field with a view to the establishment of a branch foundry at Vancouver or New Westminster.

The Collins Mfg. Co., Toronto, have erected a new factory. New machinery has been installed and several new hardware specialties will be put on the market soon, at present their energies being directed chiefly to sprayers, gas stoves, steam cookers, asbestos thimbles, etc.

A wire factory will probably be established in New Westminster in the near future, by Thomas F. Black, of the Black Hardware Co., Winnipeg, who has been conferring with the city council and board of trade there on the matter of securing a suitable site for the proposed plant.

The Smith's Falls Malleable Castings Co. have reopened the new shops in the north end of Smith's Falls and both plants will be kept busy supplying malleable castings. E. J. Curran, Chicago, has been engaged as superintendent of the new shops and J. T. Cauley, Marion, Ind., assistant-supt.

The resumption of mining in Eastern Ontario, may mean a smelter in Kingston, a new industry, if the city council and citizens will encourage it, but unless encouragement is given in the way of municipal site and exemption, it is within reason that the smelter will be put up at the mines.

A company capitalized at $250,000 has been formed, under the name of the St. Lawrence Car Works Co., to carry on a railway car building industry at Levis. The new company proposes to establish works capable of turning out 600 cars a year on the average, representing a value of $600,000 at least, and to spend over $60,000 a year in salaries.

Robert J. Riddell, Chatham, who has since the death, some years ago, of his father, the late Robert Riddell, carried on the business of machinists under the firm name of R. Riddell & Son, has made an assignment. December 6 has been fixed as the date after which a distribution of the assets will take place. The firm has done a considerable business in fire escapes, also handling bicycle repairs.

The Western Steel Corporation, recently incorporated with a capitalization of $20,000,000, has opened offices at Vancouver. In this company are interested a number of large and successful business men on the coast, and the scheme is

to have a manufacturing site somewhere in British Columbia. An announcement is made that they are the buyers of a Fraser river waterfront, valued at $300,000.

The James Stewart Mfg. Co., Woodstock, were unfortunate enough to lose their warehouse and entire stock in Winnipeg by fire on Saturday, Oct. 30, but fortunately their insurance will fully cover the loss. Cars which they had on the way at the time of the fire have since arrived and further ones are now on the way. Temporary quarters have been secured, and they are conducting business as usual.

At a recent meeting held in Wingham, Ont., directors of the Western Foundry Co. were elected as follows: T. A. Mills, J. J. Cunningham, R. Vanstone, J. A. McLean and W. D. Varey. Mr. Mills was elected as president and the stock held by Dr. Allen, of Toronto, was transferred to Mr. Mills and other Winghamites. The Western Foundry Co. is considering the enlargement of the plant.

The Regal Automobile Co., of Detroit, proposes to establish its Canadian branch at Windsor, and a new company is being organized, including E. N. Richards, of Windsor, who is to be manager. To supply the Canadian trade the company proposes to establish a $100,000 plant, with a capacity of five cars a day. Negotiations for a suitable site are being made and it is expected building will begin shortly.

The Ross Sleeping Car Co. are looking about Vancouver with a view to the establishment of a large car building plant there. The concern has recently been organized with large capital to put put on the market a sleeping car of steel construction, which has many improvements over the cars now ordinarily used, these being covered by patents in the United States and Canada. The company expects to employ 500 men.

T. McAvity & Sons, who have been in business in St. John, N.B., for a century associated with the McLean, Holt Co., intend establishing a foundry in Fort William, providing satisfactory terms can be arranged with the city. J. L. McAvity, who is interested in both concerns visited Fort William spending several days in conference with Herbert W. Baker, Industrial Commissioner, Mayor Peltier and other civic officials.

A syndicate of Canadian business men, headed by a group of prominent Halifax gentlemen, and backed by the big shipbuilding firm of Swan, Hunter & Wigham Richardson, Wallsend-on-Tyne, England, will apply for a charter of incorporation for a company, to be capitalized at $10,000,000, for the purpose of erecting large shipbuilding docks at Halifax and Dartmouth, and is said to have purchased land for that purpose.

The Hamilton Steel and Iron Co. state that Montreal and Toronto capitalists have bought large blocks of stock, and that E. B. Osler and W. D. Matthews have been added to the board of directors. The rumor that the C.P.R. has control of the stock is denied absolutely. A new bolt and bar mill will be built, and the company will do business on a much larger scale, entailing an expenditure for new works of over a million dollars.

It is stated on reliable authority that among those interested in the new lease of the government dry dock at Kingston, is the Collingwood Shipbuilding Co., and that when the lease is finally accepted by the government, as there seems to be no doubt it will be, it will mean the establishment of a very large repair plant in connection with the dry dock. The drydock was leased by W. J. Fair, who is interested in the erection of a modern repair plant.

The Frost & Wood Co., Smith's Falls, and Cockshutt Plow Co., Brantford, have cemented their interests in the west and in future the latter company will handle the output of the Frost & Wood Co. in Western Canada. The Cockshutt Plow Co. are making an addition 100 x 50 ft. to their plant. Frost & Wood Co. have over 500 men at work. H. Cockshutt has been elected vice-president of the Frost & Wood Co. to fill the place of the late C. B. Frost. Hon. Francis T. Frost is president.

Work on the construction of the new plant of the Standard Sanitary Mfg. Co., on Royce Avenue, Toronto, has been begun. The foundations of four buildings have been excavated and the work of erection will continue all winter, all the buildings being steel frame with reinforced concrete fireproof construction. There are to be six buildings in all, an enameling building, 60 x 150 feet; a 3-storey mill building, 65 x 50 feet, for making enamel; a 6-storey warehouse, 65 x 200 feet; a 4-storey pattern building, 65 x 130 feet, and a foundry and a cleaning house for castings, the dimensions of which have not been decided. Frank Painter, superintendent of the plant, has removed from Pittsburg to Toronto and will supervise the work of construction and instalation of machinery.

Negotiations have been concluded for the location at Welland of a large steel plant, where smelting will be done by electricity. This company will be known as the Electric Steel Co., of Canada, with head office in Toronto and branch office in Buffalo. The men behind the industry have large interests in steel and iron in the Pittsburg section. They are: President, Tyson S. Dynes, St. Louis, Mo.; vice-president, George G. Goodrich, Saratoga, N.Y.; secretary, A. S. Ramage. Work on the initial building, the billet mill, will begin in a few days. One thousand horse-power for the operation of the mill have been contracted for with the Falls Power Co. The daily output will be 1,000 tons, which will require 2,000 tons of ore daily or a shipload a day. Five vessels are already under contract to deliver ores before the close of navigation, for it is anticipated that the mill will be ready for testing before the opening of navigation next season. It is intended to erect next year other mills for the making of finished products in iron and steel.

The shipbuilding yards and boiler-making works now in course of construction by McDougall & Jenkins, Vancouver, are being rushed. This company has acquired 200 feet of water-frontage on Burrard inlet with a depth of 300 feet and a ground area of 60,000 square feet. Work is now proceeding on the erection of buildings and the preparation of the ground and some of the plant has already arrived, including an electric crane with a lifting capacity of 40,000 pounds. The boiler shop, machine shop, foundry and blacksmith shop will all be equipped with modern plant and this branch of the business occupies a prominent place in the plans of the company. The shipbuilding department is something in which great interest is being shown for developments are expected which will mean great things to the port of Vancouver. The yards will go in for steel shipbuilding, and already plans are out for two steel freight steamers to be constructed there.

Municipal Enterprises.

Penticton, B.C., proposes to establish a waterworks system next summer.

Plans are being prepared for the Montreal high pressure water system.

The waterworks by-law for $400,000 has been passed by Vancouver ratepayers.

Coldwater, Ont., is considering the advisability of installing a system of waterworks.

Victoria council will be in the market shortly for an up-to-date street flushing machine.

The contract for Elizabeth Street sewer, at Barrie, was let to T. E. McMurray, for $2,125.

The Portage la Prairie, Man., waterworks by-law has been passed. Estimated expenditure, $20,000.

The installation of New Liskeard's waterworks connections is held up by the lack of the necessary fittings.

Wingham ratepayers will in January vote on a by-law to construct a waterworks system and a main sewer.

Victoria is making surveys relative to undertaking the construction of a waterworks system from Sooke Lake.

Waterworks and electric light extensions, estimated cost $2,600, have been sanctioned by the Port Colborne council.

Tenders are being called for waterworks construction, including piping and valves for wood pipe for South Vancouver.

A by-law will be submitted to the Havelock ratepayers in January next to raise $4,000 for a permanent drainage system.

Cleveland & Ducher, engineers, have prepared plans for supplying several adjoining Vancouver municipalities with water. Initial cost, $500,000.

A by-law has been adopted by Longue Pointe to borrow $150,000 to construct a water system, the water to be supplied by the Montreal Water & Power Co.

Lachine P. Q., has closed a contract with John McDougall & Co., Caledonian Iron Works, Montreal, for the purchase of a new pump for the aqueduct.

The Victoria city council is calling for tenders for ornamental steel pillars for carrying arc lights. The lights are to go along the causeway in front of the Empress Hotel.

The Ontario Railway and Municipal Board have approved by-laws under which Cobalt township is to spend $75,000, and the town of Cobalt $25,000 upon a water works system.

By installing a gravity system, which will do away entirely with maintenance and operating expenses, Hamilton hopes to save about $25,000 a year on the new west end sewage disposal plant, which will be built next year. The system will be the first of its kind in this country, although there is one in use in Germany.

Weston town council awarded contracts last month for the new waterworks system. The successful tenderers are: Contract "C 1," steel water tower, Toronto Iron Works, $5,040; Contract "D," all cast iron water pipes and special castings, Canada Foundry Co.; Contract "E," fire hydrants, sprinkling cranes, gate valves, and valve boxes, The London Foundry Co. The total cost of the work will not be less than $55,000.

Railway Construction.

The C.N.R. and Hill lines are building roads to Lethbridge.

The proposed underground railway at Toronto is estimated to cost $1,000,000 a mile.

J. Stewart Clark is promoting an electric railway between Port Dover and Berlin.

It is rumored that the Grand Valley Railway Co., will extend their system to London next year.

It has been definitely announced that the C. N.R. will enter Hamilton. A route has been decided on.

A party of engineers has started from Pas Mission to locate the Hudson's Bay line from there to the bay.

The Calgary street railway management find it necessary to extend the present system, and will spend $40,000.

The C.N.R. will be into Kamloops within two years' time and will go down the Thompson and Fraser rivers to the coast.

Mackenzie & Mann interests have acquired railway construction near Portland Canal, B.C., and will build 20 miles of road there next year.

It is expected that track-laying on the Ontario West Shore Electric Railway, between Goderich and Kincardine, will commence in a few days.

The Chicoutimi Pulp Co. has awarded contracts for the construction of an electric railway from its mills to the limits in the Riviere du Moulin district.

The G.T.P. has awarded to Foley, Welch & Stewart, the contract for constructing a 140 mile section of main line from Kitsilas Canyon to Aldermere, B.C.

The Winnipeg Street Ry. has been notified by the city council that, owing to the increase of the population in the northwestern part of the city, it must extend its system.

The Public Works Department, pending the completion of the Quebec bridge, have in view the construction of railway terminals for the Delaware & Hudson Railway at Levis.

The contract for the building of the spur line on the T. & N. O. Railway, connecting with the main line at New Liskeard, has been awarded to Canadian Contracts, Ltd., Toronto. The work will be proceeded with at once.

The purchasers of the London and Port Stanley electric railway propose extending the line east through Ingersoll, Woodstock and Paris, to Brantford; west from London to Strathroy and Glencoe, and from St. Thomas to Aylmer.

The plans of the Montreal and Southern Counties Electric Railway comprise, besides the St. Lambert line, three extensions, viz., from St. Lambert to Chambly, a second to Longueuil, and a third to Laprairie and the up-river parishes.

Progress is being made by the survey party making preliminary locations for the line for the Victoria and Barclay Sound Ry. The party has reached Boulder Point, 40 miles from Victoria, and are rapidly approaching San Juan, the objective point for this season's operations.

The contract for the construction of the uncompleted portion of the Alberni branch of the Esquimalt & Nanaimo railway, a section of about 27 miles, at the western end of the road, has been awarded to Janse, McDonell & Timothy, Calgary. Construction will commence immediately.

A sub-contract has been let by the C.N.R. to Dibona & Orlando Bros. for the construction of the section between Trenton and Brighton, and they have brought their plant from Quebec to start work at once. They will begin at the Trenton end. A steel bridge with a swing span will be erected across the Trent river.

Under the name of the Pine Pass Railway, a company is seeking incorporation to build a railway from Edmonton through the northern wilds to Fort McGeorge, a Hudson's Bay post. The company is reported to have strong backing, financially, and as soon as the charter has been obtained construction will be commenced.

Shut out of the Fraser river canyon owing to the prior location of the C.N.R., it is stated that the Grand Trunk Pacific has decided to seek another route for that portion of its proposed branch line between Kamloops and Vancouver. Its engineers have completed the survey of the line all the way from Yellowhead Pass via Cranberry lake and thence down the North Thompson to Kamloops.

Structural Steel.

The Department of Public Works, Ottawa, has called for tenders for the removal of the wreckage of the Quebec bridge.

The Hamilton Bridge Co. was awarded the contract for the erection of a new steel bridge at Kelvin, near Brantford.

The Langevin bridge by-law, for a 30-foot bridge over the Bow river at Calgary, has been sanctioned by the ratepayers.

A by-law will be voted on at Toronto next January to raise $769,000 to build a viaduct across the Don valley at Bloor street.

Tenders will be asked for early next spring, for the erection of a new steel bridge on Market Street, Brantford, over the canal.

Brandon's city engineer, R. E. Speakman has submitted estimates of the cost of a subway under the G.N. and C.P. Railway tracks, also of a bridge over the same. Estimated cost of former $120,000, and of latter $105,000.

At a recent meeting of the Sherbrooke city council, the road department recommended that the tender of Mackinnon & Holmes, for the construction of the new bridge over the Magog river be accepted, it being the lowest tender.

The B.C. provincial government will immediately commence the construction of a bridge over the Slocan river at Slocan Junction. The bridge will be 213 feet in length and will cost $10,000. The contracts for the iron works has been let to the Nelson iron works.

The Municipal Council of the Township of East Farnham, Que., has decided to build a new iron bridge across the river at Brigham. They have received aid from the government for the construction of this bridge. Tenders have been called for and the plans and specifications are ready.

Electrical Notes.

Stratford has purchased the electric light plant from the Stratford Gas Co.

An option has been secured on a water power north of the town by the Lindsay council.

The B. C. Electric Railway Co. has completed the lighting and power services at Port Moody.

Saskatoon ratepayers endorsed a plan to purchase the Saskatchewan Power Co.'s charter for $1,000.

The Shediac river is being dammed to generate power for electricity to light the town of Shediac, N.B.

Machinery is being installed for the electric lighting service at Carmangay, a three months old town in Alberta.

A by-law to appropriate $16,000 for the construction of an electric light plant has been passed at Nanton, Alta.

The General Electric Co., Schenectady, N.Y., has reopened its mica works at Carleton Place and will employ 150 hands.

The controllers decided to buy a site at the corner of Duncan and Nelson Streets, Toronto, for an electrical substation.

The C.P.R. management is investigating the feasibility of electrifying its branch line between Phoenix and Granby smelter.

F. P. Charlebois, Toronto, having secured the water rights in Silver Creek, has made an offer of cheap electric power to Collingwood.

The contract for the installation of government telephone exchanges at Hanley and Melville, has been awarded to Simpson & Craig, Virden, Man.

The corporation of Ingersoll will not enter into arbitration proceedings with the Ingersoll Electric Light and Power Co. for the purchase of their plant.

The Raymond Mfg. Co., Guelph, a large concern in the manufacture of sewing machines, etc., have added a new department for the making of electrical supplies.

The contract for about 8,000 pounds of wire for the balance of this year's electric light work at Calgary, has been awarded to the Canadian General Electric Co.

The Kamanistiquia Power Co., of which Sir Edward Clouston, H. S. Holt, C. R. Hosmer, F. W. Thompson, and J. E. Aldred, of Montreal, are directors, has just been granted a ten year franchise by Port Arthur.

The document approving of the undertaking of the Vancouver Island Power Co., at Jordan River by which power will be supplied to the B.C. Electric Co., has been published.

Three car-loads of electrical machinery arrived for the Fort Frances Canadian power house from Hamilton, and is now being transferred to the power house to be placed in position.

Eastview, Ont., village council has received an offer of electricity at $15 per horse power for lighting its streets and houses. The village will probably establish a municipal plant.

At a meeting of the Montreal Fire and Light Committee a resolution calling for the immediate purchase of some 200 electric lamps of the style at present in use in the city streets was adopted.

At a general meeting of the Berlin Board of Trade the railway committee was instructed to enter into negotiations with the G.T.R. regarding the electrifying of the Galt and Elmira branches.

The St. John Railway Co. is remodelling its office building on Union Street and will convert the entire ground floor into a showroom for electric light and gas fixtures and gas stoves and accessories.

Cornwall is to have a big power company, if Parliament, at its next session, incorporates the St. Lawrence Power Transmission Co., with a capital stock of $250,000, which is applying for a Dominion charter.

Brockville's civic light and power department closed a successful year on September 30. The plant was purchased nine years ago, and since then gas and electric light have been reduced from $2 to $1.12½ net per 1,000.

The M.C.R. is arranging to substitute electricity for steam on its St. Thomas yard engines. Electric locomotives for switching purposes will be one of the improvements to come with the opening of the tunnel at the Detroit river.

W. Hibbard, representing Montreal capitalists is trying to secure the Sherbrooke Street Railway, with a view to securing a water power which that city now controls. If power can be had the system will be extended in the city by about eight miles.

The Ontario Power Co. is negotiating with the Central Methodist Church, at Welland, for the privilege of erecting a transformer station on the rear of the church property, the church to receive free electric lights and power for organ in return for same.

Hamilton is organizing a movement to have the Dominion Government build the new Welland Canal on the old Grand River-Hamilton Canal survey, securing thereby the cheapest power on the continent, besides bringing enlarged navigation to its doors.

In regard to the application of the Metropolitan Electrical Co. for concessions and an extension of their franchise at Ottawa, it was the general opinion that the city plant should be extended, rather than have an opposing company come into the city and compete with it.

Trenton, Ont., ratepayers on Nov. 15 defeated the proposition to ratify the agreement made with the Trenton Electric and Water Co., for the operation of a dam on the Trent Canal, the surplus water of which has been acquired by the town. This means that the town will operate a municipal plant.

A syndicate backed by London and New York capital is to undertake a huge enterprise at Prince Rupert involving an expenditure of $5,000,000 in providing street car and lighting systems, the erection of a smelter for the treatment of the ores of the mining districts of the north, and kindred industries.

The Westinghouse Co. is installing some electrical machinery at Powassan, Ont. The ma-

chinery is going in from Calander for the Nipissing Power Co., who are generating power on the South River for North Bay and surrounding country. The company have about two-hundred and fifty men at work on the dam.

The Shawinigan Electric Co.'s electric power line from Asbestos to Windsor Mills, a continuation of the line from Shawinigan to Asbestos, has been completed. The wires are now carrying 50,000 volts of electricity to furnish power for the Canada Paper Mills. A telephone line is to be built in connection with the same in the near future.

The tender of the Canadian Westinghouse Co., Hamilton for the electric motors for the electric pumps to be installed at the main pumping station and high-level pumping station at Toronto has been accepted by the Board of Control. The successful tender was for $107,765. The next lowest tender was from a Glasgow firm, $120,000.

Contracts for the additional electrical power development works at Wilson's Falls, Bracebridge, Ont., have been awarded to Canadian Contracts, Ltd., Toronto, dam, intake and power-house foundations. William Kennedy & Sons, Owen Sound, received the contract for the water-wheels, and the Canadian General Electric Co. the contract for the electrical machinery.

St. Lambert, Que., has decided to install an electric water pump to do away with the present steam pump, and to erect poles, wires, and apparatus for the electric lighting of the town the current to be supplied by the L. E. Waterman fountain pen factory. A loan of $7,000 has been passed for the purpose. The action of the council is to pave the way for the town to own a complete power plant of its own.

A special committee dealing with the standardization of equipment reported to a recent meeting of engineers, representing the 12 municipalities in the Niagara Power Union, in favor of the adoption of a luminous arc lamp in business districts and a similar type of Tungsten incandescent lamp for use in the residential districts, the latter to be placed from 125 to 150 feet apart, to overcome any interference of trees.

The by-law raising money for installation of electric pumping plant at Welland has been approved of by the Lieutenant Governor in council and also by the municipal and railway board. The council has advertised for tenders for pump and electric motor, and the contract has been signed by the Ontario Power Co. and the council for street lighting and operation and maintenance of pumping plant. The contract is for a term of five years for the sum of $1,500 per year.

The St. Lawrence Power Co. and the Long Sault Development Co. (the U. S. and Canadian companies which propose damming the St. Lawrence river for power purposes) are seeking power to amalgamate, and have presented to the Dominion Government new plans which will meet the objections to the scheme by improving navigation at the point of development. Government engineers will consider the proposition. Cornwall town council hgs officially endorsed the scheme.

Hamilton having decided some weeks ago to take 1,000 h.p. from the Hydro-Electric Commission, the city council now is asking the Commission for further concessions in the shape of underground wires. This the Commission refuses to do, and as the matter now stands Hamilton has the alternative of complying with the terms submitted by the Hydro-Electric Power Commission and approved by the ratepayers or remain permanently beyond the pale of the government power project.

Contracts have been awarded by the Hydro-Electric Commission in connection with the transmission lines, transformer stations and all mechanical equipment as follows: To Royce, Ltd., of Manchester, England, for electric cranes for the transformer stations at Niagara Falls and Dundas; for electric cranes for the transformer stations at Toronto, London, Guelph, Preston, Berlin, Stratford, St. Mary's Woodstock and St. Thomas, to Mussens, Ltd., of Montreal and Walkerville. Total amount of bids, $17,094.

The Port Arthur power propositions have been causing some excitement in that city. First the Ontario and Michigan Power Co. offered prices more advantageous than the Power Commission. For 3,000 h.p. the price was to be $18; for 4,000, $17; and for 5,000, $15. The Commission's prices submitted were $19, $18 and $17.60 for the same amounts. On a vote by the ratepayers on Nov. 4, the Hydro-Electric Commission's contract was endorsed. James Conmee, M. P., representing the O. & M. Co., applied for an injunction on the ground that the ratepayers had not been afforded opportunity to intelligently vote on the proposition. Justice Clute, sitting at Toronto, granted the injunction.

Planing Mill News.

A new lumber mill will be erected at Nahima, on the Alberni Canal, B.C.

Mr. Quance, of Jaffray, B.C., intends to locate a saw mill at Nakusp, B.C.

The Rainy Lake Lumber Co. will build a large saw mill at Fort Frances next summer.

The Matthews & Smith Lumber Co., are transferring their lumber mill to Oak Point, Man.

The Ratz saw mill at St. Clemens, Ont., was completely wrecked last month by a boiler explosion.

The Quebec and St. Maurice Industrial Co. has started work on the erection of a pulp mill at La Tuque.

The sawmill operated by Hamilton Bros., at Glenhuron, Ont., was destroyed by fire last month. Loss $3,500.

The Goderich Lumber Co. has disposed of its plant at the harbor to J. E. Baechler, who has been running a mill at Camlachie.

The Gage-Harrison saw mills, at Burke's Falls, Ont., owned by J. W. Gage, Hamilton, were destroyed by fire last month. Estimated loss $12,000.

E. W. Backus, president of the power company at Fort Frances, is contemplating erecting a paper mill in Fort Frances in the near future.

The Big Bend Lumber Co.'s mill, at Arrowhead, B.C., was destroyed by fire in November. Some of the capitalists and investors interested belong to Kingston, Ont.

Fire destroyed the mill of the Brackman & Ker Milling Co., at Victoria last month, the loss being about $30,000. Immediate work will be started on the new building, which will be entirely of brick.

Hiland & Sullivan, shingle manufacturers, Surrey, B.C., have bought for $50,000, some property at New Westminster on which they will build a four storey structure early next year at a cost of $20,000.

P. J. Noel, of Merrill, Wis., is looking over the ground at Fort Frances with a view of establishing a manufacturing industry for manufactured articles in woodenware, furniture, excelsior and other commodities.

The Canada Woodenware Co., whose plant at Ossekeag, King's county, N.B., was burned in June, 1907, is being reorganized, and sufficient capital is being secured to build an up-to-date plant at South Bay, St. John county.

The sawmill of the Glen Lumber Co., at Rutherglen, near North Bay, was burned to the ground, together with a small quantity of timber. The mill was insured for $5,000, which will about cover the loss. The lumber was fully insured.

Trade Notes.

The Brantford Emery Wheel Co. has moved into its new and more commodious factory on Pearl Street, Brantford.

D. Freeland, of James Eadie & Sons, Clydesdale Tube Works, Rutherglen, near Glasgow, has been on a visit to Montreal.

Thos. G. Forsyth, of Berlin, and Alfred Vice, of Elmira, have purchased a controlling interest in the Elmira Agricultural Works, from Mr. Laschinger.

James Brennan, foreman of the plow department of the Percival Plow and Stove Co., Merrickville, has just completed fifty years' active service for that company.

The Dominion Foundry Supply Co. shipped a No. 7 Whiting Cupola to the Amherst Foundry Co. This is only one of several that have been shipped in the last month.

Lee G. Smith has resigned as superintendent of the Bucyrus Steel Casting Co., Bucyrus, O., to accept a similar position with the Londonderry Steel Foundry, Londonderry, N. S.

Willis Mitchell, of James Courtland & Sons, Birmingham, Eng., has been making a trip through Canada from coast to coast. He reported business as being exceedingly good.

F. P. Jones' resignation from the Dominion Iron & Steel Company will take place on January 1, when he will assume the management of the Canada Cement Company, at $25,000 a year.

R. W. Robb has been appointed manager of the Montreal office of the Robb Engineering Co., Amherst. Mr. Robb is a practical engineer, having had experience at the works, as well as erecting and operating the firm's engines in various parts of Canada.

Ridout & Maybee, Patent Solicitors, Toronto, after occupying offices at 103 Bay St., for 16 years past, are now removing to more convenient premises in Manning Chambers, at the west side of the City Hall, Queen St. West, where they will be able to receive their clients on and after Dec. 1st.

Smith, Kerry & Chace, consulting engineers, Toronto, have opened an office at Revelstoke, B.C., which will be the head office for western Canada. The work they have on hand in the west includes an expenditure of $15,000,000. This sum includes a power plant in Portland, Oregon, and one in Idaho, U. S.

Barkey Bros., Stouffville, manufacturers of Standard Crown valves, have moved into a more commodious factory. The new plant is a two storey well lighted, brick building 50 x 80 ft. The equipment includes several special grinding and boring machines in connection with the manufacture of valves.

The Brantford friends of Harvey Cockshutt tendered a farewell dinner in his honor at the Brantford Club some days ago. Mr. Cockshutt leaves shortly for Winnipeg, where he will be connected with the west end of the business of the Cockshutt Plow Co., on account of the recent development of the Co.'s business in the west.

The travelers of the Cockshutt Plow Co., Brantford, 25 in number, held their annual reunion and banquet on Nov. 8. The event was held at the Belmont hotel, there. Trade matters were talked over at the gathering. George McFarland was chairman and Harvey Cockshutt vice-chairman. Speeches were delivered by the visiting travelers and R. D. Cockshutt.

A. F. Townsend, manager of the Cape Breton Electric Co. is being transferred by Stone & Webster to one of the company's large New

England concerns the move being an advancement for Mr. Townsend. H. C. Foss, manager of the Sydney and Glace Bay Railway, will assume the joint management of both companies.

The office and sales staff of the Pease Foundry Co., Toronto, gave a complimentary dinner a few nights ago in the St. Charles cafe to T. B. Medforth, who has been their accountant for a number of years, and who has accepted a position with a trust company in Vancouver. A pleasant feature of the evening was the presentation to Mr. Medforth of a case of pipes.

Charles Potter, 85 Yonge St., Toronto, under the management of Mr. Petrie is installing an oxy-acetylene apparatus and will carry on a general repairing business. The system they intend using is that of the Linde Air Products Co., Buffalo. H. G. Orde spent some time in the Buffalo works acquainting himself with the system.

Southams, Ltd., manufacturers of tickets, tags, labels and specialties, Montreal, have added a new department to their business, a folding box department which includes a full assortment of machinery for the manufacture of folding boxes or cartons, candy boxes, raisin boxes, jelly powder boxes, millinery and whitewear boxes, etc. They handle specialties of all kinds.

Harry D. Bayne, for many years manager of the Canadian Westinghouse, at Montreal, has acquired an interest in the Canadian end of the General Electric Co., of Sweden, which has been doing business in a limited way in the Dominion for some time, but an application will be made to Parliament for incorporation in Canada. Mr. Bayne will continue to make his headquarters in Montreal.

At a recent meeting of the board of directors of the Canadian Light and Power Co., St. Timothee, Que., it was decided to increase the number of directors from seven to nine, and Nathaniel Curry, president of the Rhodes-Curry Company, president and general manager of the Canadian Car and Foundry Co., and J. M. Wilson, president of the Boivin-Wilson Company, were elected.

Edward Gurney and E. Holt Gurney, president and sales manager of the Gurney Foundry Co., Toronto, have returned from a month's trip to the Pacific coast. They report a good normal trade being done, with no prospective shortages in stocks of heating apparatus. The announcement of the proposed establishment of a branch foundry at New Westminster they characterize as premature.

Francis Hyde & Co., report a very busy month and have shipped some very nice orders of their furnaces including :—7 rivet furnaces to the Canada Foundry Co. (bridge dept.), 3 furnaces to the American-Abel Thresher Co., and a complete installation of 8 furnaces for general use to Moody & Sons. They have on order 3 furnaces for the T. & N. O. Ry. and the Cockshutt Plow Co., have one on test now.

The Canadian Sales Co., St. James St., Montreal, of which J. Sophus is manager, has been joined by John Drowson, Montreal, and J. E. Johnston, accountant. A factory equipped with the proper machinery has been established on St. Paul St., where a number of specialties will be manufactured. F. S. Downham has charge of this end of the business. There are also the electrical and import departments. The electrical department comprises the cleaning oiling, and general maintenance of electrical motors under contract for various terms, this contract, including a weekly or fortnightly inspection. This is an entirely novel idea, and is being well received. This department is under the charge of W. E. Bullen.

Smart-Turner Machine Co., Hamilton, have recently installed pumps of various designs in the following plants, Northern Crown Bank, Toronto ; H. Frechette, M.D., St. Stanislas de Champlain, P.Q. ; Thos. Lannen, Port Colborne ; Ferranti Ltd., Toronto ; P.E.I. Ry., Charlottetown ; Clark Blanket Co., Bullocks Corners, Ont. ; Rio Motor Co., St. Catharines ; Aberdeen Elevator Co., Tiffin ; Ontario Iron & Steel Co., Welland ; Kirkfield Portland Cement Co., Coboconk ; Buffalo Mines, Cobalt ; Canadian Westinghouse Co., Hamilton ; Fowlers Canadian Co., Hamilton ; Adams Wagon Co., Brantford ; T. & N. O. Ry., North Bay ; Burlington Canning Co., Burlington ; Groble & Wandry, Mimico ; Henry Disston Saw Co., Toronto ; Hanover Specialty Co., Toronto ; Hamilton Bridge Wks., Hamilton; Harris Abattoir Co., Toronto ; Aluminum Stopper Co., Toronto ; and N. B. Pulp & Paper Co., Millerton.

Building Operations.

Two new elevators will be erected at Port Arthur next year.

The C.P.R. will build a new freight shed at Claresholm, Alta.

The C.N.R. will build a large modern roundhouse at Port Arthur.

The Quebec Harbor Commissioners will rebuild the Quebec freight sheds.

The Western Motor Co. will erect a large modern garage at Victoria.

The McLaughlin Carriage Co. is erecting a $25,000 warehouse at Calgary.

A C.N.R. and G.T.R. union station is proposed to be built at Cobourg.

The National Elevator Co. will erect a new cleaning house at Port Arthur.

A match factory will be built at Alexandria, Ont. W. A. Catton is interested.

A $10,000 wing is proposed to be added to Royal Victoria Hospital, Barrie.

The Wetaskiwin Mattress Co. is to have a warehouse erected at Camrose, Alta.

The Prince Albert Laundry Co. will build a new laundry building at that place.

A Chicago company wants to erect a grist mill and brewery at Wainwright, Alta.

The National Elevator Co. will at once erect a 60,000 bushel elevator at Port Arthur.

A special committee has recommended the building of a $30,000 hospital at Wetaskiwin.

Messrs. Battle will shortly erect a building at Thorold for the manufacture of concrete blocks.

The Wetaskiwin Produce Co. will erect a creamery and cold storage building at that town.

The Oliver Mfg. Co. secured the contract to build a new warehouse for Bentley Co., at Lethbridge.

The Battle Creek Health Food Co., London, will build a four storey addition to their plant to cost $2,500.

The Yorkton, Sask., school board are to erect a collegiate next spring at an approximate cost of $13,000.

A large addition is to be made to the Empress Hotel, at Victoria. The addition will cost about $75,000.

The Presbyterian College at Saskatoon will begin building next April, if $50,000 has been collected by that date.

The Parker Dye Works, Toronto, have applied for a building permit for a large and complete gasoline cleaning plant.

The Toronto Street Railway have a permit to erect car barns on Lansdowne Avenue at an approximate cost of $60,000.

W. W. Blair, Winnipeg, is preparing plans for a four storey office building to be erected at a probable cost of $100,000.

V. Williamson has the contract for building an addition to the O. & W. Thum Co.'s fly paper factory at Walkerville.

The McClary Mfg. Co., London, will within a short time, commence work on a new warehouse in the southeast end of that city.

Berry Bros., varnish and paint manufacturers, Walkerville, Ont., contemplate erecting a branch factory at Winnipeg in the near future.

Plans are being prepared for an hotel to be erected at Winnipeg at a cost of $85,000. F. A. Meyers, Fort William, Ont., is interested.

S. Homan has been awarded the contract for the addition to the branch of the International Acheson Graphite Co.'s works, Niagara Falls.

Macleod council has under consideration a project to build a $25,000 hospital, and run it as a civic venture, equipping it in up-to-date fashion.

A building permit was taken out by R. Bowman for a five-storey block at Vancouver. The building is designed for warehouse and factory purposes.

A new eleven-room public school on Logan Avenue, Toronto, instead of the proposed five-room structure, is now the desire of the Board of Education.

The Continental Oil Co. have commenced the foundations of a warehouse at Regina. Stakes have also been set for a warehouse for the Canadian Oil Co.

The Brantford Collegiate Institute trustees have accepted the bulk tender of Schultz Bros. for the erection of the new Collegiate Institute, the price being $64,519.

Negotiations for a site for the Patent Holding & Mfg. Co., of Spokane, have been completed. They intend to erect next spring a $50,000 wagon plant at Calgary.

Hourd & Co., London, have commenced work on additions to their factory which will increase the capacity of the plant over 50 per cent. Two new buildings are being erected.

The Sisters of Charity in Alberta and Saskatchewan announce that a large addition is to be made to the Holy Cross Hospital, Calgary, at a cost of between $75,000 and $80,000.

The congregation of St. Andrew's R.C. Church, Port Arthur, have decided to adopt the plans of G. E. Tanquay, of Quebec, for a new cathedral that will cost from $85,000 to $100,000.

Hon. Geo. A. Cox, Toronto, one of the directors of the Canada Life Association, announces that the company is having plans prepared for a business block to be erected at Vancouver at a cost of $275,000.

A temporary station will be built by the B.C. E.R., so that the present depot may be razed, to make room for the magnificent new station which the company has planned to erect for its New Westminster terminus.

Plans for the reconstruction of the burned wing of the Toronto Parliament Buildings were submitted to Hon Dr. Reaume, Minister of Public Works, by Mr. E. J. Lennox, the architect. The cost is estimated at $285,000.

Mr. Armitage, of Cleveland, Ohio, proposes the building of a $40,000 worsted industry at Ingersoll ; and H. S. Peters, of Dover, N. J., may also establish a Canadian branch factory there for the manufacture of "Brotherhood Overalls."

The Toronto Board of Education will erect a three-storey brick school at Marion Street and Lansdowne Avenue, $55,000 ; a two-storey public school on George Street, $13,000 ; and a three-storey brick high school, on Harbord Street, $50,000.

Work will shortly be commenced on the foundation and basement of the proposed new sanatorium at Little Manitou Lake, near Watrous, Man. At a meeting of the directors held in Winnipeg recently it was decided to appropriate $150,000 of the stock which has already been subscribed, and go ahead with the building at once.

E. M. F. Co. Establish Canadian Plant.

The Studebaker E-M-F Co. will establish a $400,000 automobile plant at Walkerville, Ont. The company will supply the trade of Canada and other British colonies and will be known as the "E-M-F Co. of Canada." The concern will be a subsidiary company of the Detroit firm. Among the incorporators are Frederick H. and J. Harrington Walker, of the Hiram Walker & Sons Co. The money required by the new company will be furnished by the Walkers, and Dr. J. B. Book, Charles L. Palms and Walter E. Flanders, of Detroit. Mr. Flanders will act as president and general manager of the new concern and Robert M. Brownson has been selected as secretary and treasurer. The balance of the board in control of the affairs of the company will be the Walker brothers and Mr. Palms.

Toronto's Pump Contracts.

The following are the descriptions of the pumps for Toronto's waterworks system, and the awards.

Section A—750 revolutions per minute, four pumps, with a capacity of 13,500,000 gallons, main pumping station; tenders from $14,800 to $52,200; awarded to Jens Orten Boving, London, Eng., $14,800.

Section B—Two pumps at the main pumping station, 5,000,000 gallons each, for the high-pressure fire system, from $11,703 to $35,000; awarded to the Caledonia Iron Works, $11,703.

Section C—Four pumps, each with a capacity of 10,000,000 gallons, to be installed at the high level pumping station, from $6,500 to $24,000; awarded to Jens Orten Boving, London, Eng., $6,500.

Section D—Four pumps, to be installed at the high level pumping station, 6,500,000 gallons each, from $7,385 to $18,400; awarded to the Caledonia Iron Works, $7,385.

Section E—Four pumps, to be installed at the Island, each with a capacity of 1,500,000 gallons, from $4,240 to $14,500; awarded to the Canadian General Electric Co., $4,822.

The tender of the Canadian Westinghouse Co., Hamilton, for the electric motors for the electric pumps to be installed at the main pumping station and high-level pumping station has been accepted by the Board of Control. The successful tender was for $107,765. The next lowest tender was from a Glasgow firm, $120,000.

Coke Ovens at the Soo.

A contract for the erection of a coke oven plant, to cost $200,000, is about to be completed by L. N. Willputte, chief engineer of the Kopper Coke Oven Co., with the Lake Superior Corporation of the Soo. The plant will be operated in conjunction with the steel mill. General manager W. C. Franz of the Lake Superior Corporation, confirms the report regarding the contract for the coke oven plant. The plant will be built adjoining the steel plant on the northwest side. A pile driver is already at work on what will mean a $200,000 job. A representative of the Kopper Co. is now in the Soo in the interests of his company.

Hamilton, Ont.

A striking circular has been issued by John P. MacLeod, Assessment Commissioner, Hamilton, containing "a kettle of facts about Hamilton, boiled down and dished up hot." The booklet gives information in regard to the industrial life of the city.

Canadian Crocker Wheel Co.

The St. Catharines City Council has completed the sale of the defunct Ross Traction Engine plant to the Canadian Crocker-Wheeler Co., of Amper, N. J. The company pays $5,000 for the factory and surrounding property, and is given a fixed assessment of $10,000 for a period of ten years, with the understanding that operation be begun at once, the factory to be in complete operation December 31st, 1910, and to continue in operation for a period of ten years, to employ not less than one hundred skilled workmen, and pay annually fifty thousand dollars in wages. They will manufacture motors, generators, etc.

Hamilton Steel & Iron Co.

A meeting of the shareholders of the Hamilton Steel & Iron Co. was held Nov. 17 to confirm the action of the directors in increasing the number of directors from seven to nine and the election of E. B. Osler, M.P., and W. D. Matthews. It is announced that extensive improvements, involving an expenditure of $1,000,000, are to be made to the plant, and that there is no likelihood of the company joining the big steel and coal merger.

British Firm to Erect Factory in Toronto.

The Jens Orten Boving Co., London, England, makers of turbine pumps, and successful tenderers for a number of the pumps to be purchased for Toronto waterworks system, have decided to locate a branch in Toronto. They have contracts in Winnipeg and Calgary.

October Output of Steel Companies.

The Dominion Iron & Steel Co.'s output during October was a heavy one, especially that of the rod mill, which amounted to 8,569 tons. It is claimed that this is a new world's record, being 35 per cent in excess of the previous record for a continuous mill. The October outputs of the Nova Scotia Steel & Coal Co. were: Steel, 7,118 tons; pig iron, 5,640; coal, 77,130 tons. The Dominion Coal Co.'s output for October amounted to 205,215 tons of coal, showing a substantial gain over September. The production for October, 1908, was 262,000 tons.

Opportunities for Canadian Steel Companies.

In the next budget, $20,000,000 will be appropriated for the government railways in Japan, to be used for building a central station at Tokyo, laying two more tracks between Tokyo and Yokohama, and heavier rails over the larger part of the system. If the Canadian steel companies had a representative out here, says G. A. Harris, they could secure some of this business, but it is absolutely impossible to do so unless some one is sent out to make personal effort. In view of the great railway development in China, Canadian manufacturers should not lose this opportunity.

Dominion Iron & Steel Extension.

The Dominion Iron & Steel Co. have closed a contract with the Canada Foundry Co., Toronto, for the construction of an additional blast furnace, two 500-ton open hearth furnaces, and an addition to the Bessemer plant. The blast furnace will give an increase capacity of 100 tons daily. The open hearth furnaces are a new type and will be adopted to the new process of making open hearth steel. A new converter will be added to the Bessemer plant for desiliconizing iron. This will double the capacity of the Bessemer plant.

One hundred and twenty-five coke ovens capable of handling 1,000 tons of coal per day are now under construction. The by-products, such as ammoniacal liquor and coal tar, will also be taken care of by special plants being erected for that purpose.

A number of new mills are also in contemplation by the directors, and it has been practically decided to proceed with the erection of a 22-inch mill. A new rod mill is also contemplated.

A new electric plant will be erected capable of generating 4,000 kilowatts. The pumping station at Sydney river is being equipped for electrical power. It is expected that these extensions will be followed by still other additions of furnaces, ovens and mills.

Second-Hand Engines for Sale

1 LAURIE CORLISS, 15 x 30, with 14 ft. 6 in. flywheel, Corliss gear with double eccentrics, fitted for indicator and complete with lubricators and valves, etc.

1 BROWN ENGINE, 13 x 34, 90 R.P.M., 70 H.P., complete with usual valves, fittings and indicator piping.

1 BROWN ENGINE, 10¼ x 30, 80 R.P.M., 47 H.P., 8' x 4½" fly-wheel, complete with usual valves, fittings and indicator piping.

1 SLIDE VALVE ENGINE, 10 5-16 x 24, 84 R.P.M., 10' x 16" fly-wheel, complete with usual valves, fittings and indicator piping.

The 'Paragon' Way

HIGH SPEED DRILLING

with a "FLATWIST" drill securely held and accurately driven by a simple sleeve.

CIRCULAR "C" GIVES DETAILS

The CLEVELAND Twist Drill Co.

CLEVELAND, OHIO, U.S.A.

It is not possible for you to get a better quality of **High-Speed Steel** or **High-Speed Drill** than

BEARDSHAW'S "CONQUEROR" BRAND

And don't forget **our prices are in your favor.**

Alexander Gibb, - 13 St. John St., Montreal

GENERAL SALES AGENT.

BROWN & SHARPE MFG. CO.

PROVIDENCE, R.I., U.S.A.

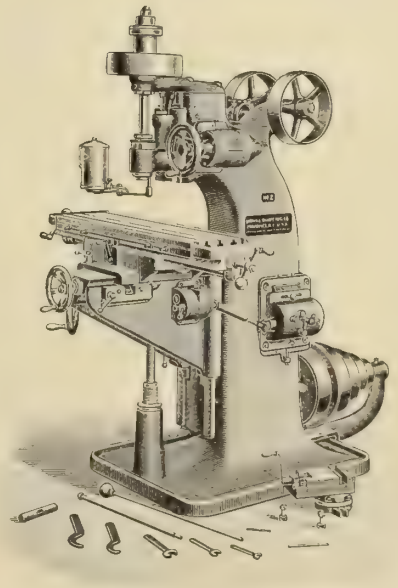
Consider the large variety of light work in your shop that could be economically produced on a

No. 2 Vertical Spindle Milling Machine

and you will readily appreciate the many advantages offered by this machine.

The work can be bolted directly to the table where it is in full sight of the operator at all times—an especially desirable feature when profiling, cutting irregular slots and die sinking. This method of securing the work also dispenses with the use of expensive "jigs" or fixtures. The spindle head has a vertical movement which may be employed for drilling or boring work already in position to be milled. A circular milling attachment can be furnished with the machine and when so equipped all varieties of straight and circular milling can be done.

SEND FOR A SPECIAL CIRCULAR



Capacity:—Longitudinal Feed, 28 in. Transverse Feed, 12 in. Vertical Feed Knee, 16 in.; Spindle Head, 4 in.

Don't look for trouble by using tools of inferior or unknown makes!

First-class mechanics recommend and use

TAPS, DIES and REAMERS

because they are honest "quality" tools, which are thoroughly tested and are made to wear. *Send for Catalogue*

Butterfield & Co., Rock Island, Que.

New Standard

Old Standard

A New Standard

The "Stantool"

SHORT TAPER SHANK WITH HEAVY TANG

modern methods of drilling demand a stronger construction of shank and tang than the old standard. The "Stantool" shank meets this condition. It has much greater strength, offers a positive drive and overcomes the breakage which has heretofore been a serious difficulty.

"Stantool" Sockets and Sleeves

fit the new standard shank and are made to fit the taper spindle of all makes of drill presses.

Automatic Forging Drop
3,000-lb. Hammer

FOR THE **FORGE SHOP**

Automatic Board Lift Drop Hammers
Hot Trimming Presses with Side Shear

The endurance and effectiveness of Automatic Drops depend in no small degree on a proper ratio between the weight of the base and the weight of the hammer. The additional cost with all parts made of proper proportions is more than compensated for by the larger quantity and better quality of the finished product, and by the comparative freedom from breakdowns obtained from their use.

The hammers are made of steel forgings. The bases are cast in a single piece.

Line of Eleven Patterns with Hammers from 200 lbs. to 3,000 lbs. Trimming Presses of Various Designs.

Write for Circulars 245 and 246

No Use Having Two Machines When One Will Do the Work!

An ingenious and high-grade machine.

Both sides independent.

One side, sensitive drill with variable speed friction drive. Capacity up to 7/16 inch.

Other side regular power or hand feed drill. Capacity up to 1 inch.

Removable seat to be used on either side if desired.

Knee feed drill, sensitive drill, manufacturer's drill. It's all there.

Look at illustration and write us for more information.

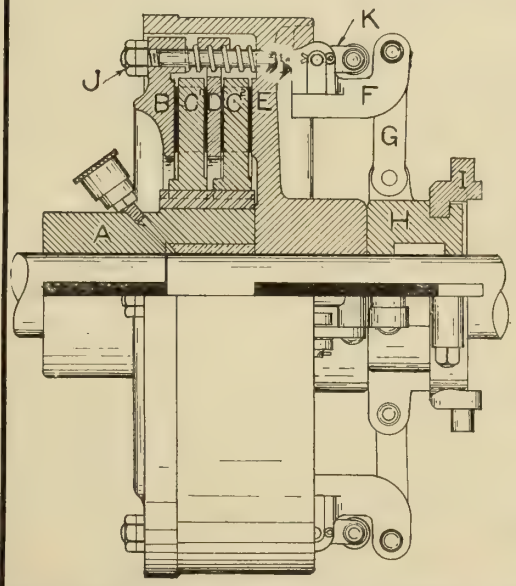
THE IDEAL CLUTCH



IS THE CLUTCH THAT GRIPS

Because it has Large Friction Surfaces and Powerful Lever Movements for size of clutch. Our Friction Clutch is made solid and split. It is also perfectly safe when out of gear, as it cannot start unexpectedly.

We make also a Hub Clutch especially for Counter Shafts or Gas Engines.

Threads 1" to 4" pipe; three step cone and countershaft; back geared; six speeds; Rotary Brown & Sharpe oil pump; write for further particulars. Borden-Canadian Co., 66 Richmond St. East, Toronto. (9)

FOR SALE—New and second hand Curtis Multiple Spindle Automatic Screw Machines, covered by United States patent Nov. 4, 1902; Canadian patent Jan. 20, 1903; English patent Feb. 26, 1903, and Belgium patent No. 167791. The John Morrow Screw. Limited, Ingersoll, Ont. (12)

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

PATENTS.

THE PROPRIETOR of the Canadian Patent No. 83902 "Improvements in camdises for operating the exhaust valve in four-stroke combustion engines," is desirous of en ering into arrangements, by way of license or otherwise, for practically working the patent. For particulars apply to "Reversator," care of S. Gumaelii, Annoncebureau, Stockholm, Sweden. (10)

POSITION WANTED.

YOUNG (Scotch) Engineer seeks position in drafting or commercial office of engineering firm. Mechanical and electrical experience. Apply Box 90, CANADIAN MACHINERY, Toronto. (9)

SUPERINTENDENT WANTED.

A PRACTICAL SUPERINTENDENT, experienced in the manufacture of Traction Engines and Threshing Machines, to take charge of plant. Apply, stating experience, Box 91, CANADIAN MACHINERY, Toronto. (9)

FIRE PROOF SAFES, VAULTS, ETC.

YOU need the best possible protection from fire? If your valuables are in one of our safes, you can rest at ease; no fire is too hot for our safes and vaults to withstand. We manufacture vaults and safes to meet every possible requirement. Write for catalogue "S." The Goldie & McCulloch Co., Ltd., Galt, Ontario. (tf)

MISCELLANEOUS.

ANY MAN who has ever lost money in the mails has had occasion to learn by painful experience that the only proper way to remit money is by Dominion Express Money Orders and Foreign Drafts. If lost or delayed in the mails, a prompt refund is arranged, or new Order issued without further charges. (tf)

BEFORE buying office furniture, filing systems and supplies, see our catalog. Our modern goods at moderate prices will result in money-saving and satisfaction. Write to-day, stating your requirements. Benson Johnston Co., Ltd., 8 John St. N., Hamilton. (tf)

CASH AND PACKAGE CARRIERS — Better and quicker service in your store results from the installation of the "Gipe" system of cash or parcel carriers. They are the latest, strongest, simplest and most effective on the market. Will centralize your business and more than pay for themselves in the first year. Write for catalogue. Gipe Carrier Co., 97 Ontario St., Toronto. (tf)

DOUBLE your floor space. An Otis-Fensom hand-power elevator will double your floor space, enable you to use that upper floor either as stock room or as extra selling space, at the same time increasing space on your ground floor. Costs only $70. Write for catalogue "B." The Otis-Fensom Elevator Co., Traders Bank Building, Toronto. (tf)

ELLIOTT-FISHER STANDARD Writing-Adding Machines make toil easier. Elliott-Fisher Limited, 513, No. 83, Craig Street W., Montreal, and 129 Bay Street, Toronto.

HARRISON FISHER CALENDARS for 1910 make excellent Christmas or New Year gifts. Five pages in full colors. Size 14 x 22 inches. Pictures may be removed and framed at the end of the year as they are only "tipped" on the mounts. Price $3 boxed. Copp, Clark Co., Ltd., Toronto, are Sole Agents for Canada. (tf)

KAY'S Furniture Catalogue No. 36 contains 160 pages of fine half-tone engravings of newest designs in carpets, rugs, furniture, draperies, wall papers and pottery with cash prices. It brings you into close touch with the immense stocks and splendid manufacturing facilities of John Kay Company, Ltd., 36 King St. West, Toronto. Write for a copy to-day. It's free. (tf)

MR BUSINESS MAN, are you progressive? It's up to you to test "Consolidated," our new process carbon paper. Because it costs less. Soft finish, without smutting, and clear, permanent copies. Write for sample sheets and prices. "Consolidated," Stratford, Ont.

PROBABLY the most talked about machine in Canada is the Ha ner Book-keeping Machine. Everybody helps to sell it who has seen it or it will sell itself when exhibited. It combines in one machine the cash and credit register, time recorder and account register. We want representatives everywhere—men alert, intelligent, not afraid to hustle. Write for our proposition. Book-keeping Machines Limited, Head offices and show rooms, 424 Spadina Ave., Toronto. Branches, Vancouver, Winnipeg, Montreal. (tf)

"SYSTEMS" stand for all that is best in loose-leaf binders and supplies, letter-heads, statements and in fact your office stationery of every description. This Barrel Leaks Your Money

¶ Every wooden shop barrel you have is leaking away your money. You are paying more than you used to for wooden barrels — but even when you bought them cheapest you were really losing money that you might have saved with our STEEL SHOP BARRELS.

¶ Steel Shop Barrels you'd need, cost just about what you would pay for wooden barrels used during a year. But the second and third, and maybe other, years you would buy no barrels at all. That looks like 100% a year saving, doesn't it?

¶ Besides, our Steel Shop Barrels are easier to handle, take up less room, look better, and don't fall apart when you are not expecting it—or any other time.

¶ Even a small shop can save hundreds of dollars a year with our Steel Shop Barrels, Boxes, and other money-saving things for factories.

MAKE US PROVE IT—ASK FOR CATALOG NO. 27

The Cleveland Wire Spring Company
CLEVELAND, OHIO

P.S.—And we make Coiled Wire Springs of all kinds.

USE

BASSITE

As a substitute for Tin in your brass castings.

WHY?—

A pound of Bassite will solidify a greater proportion of copper than one pound of tin.

It makes castings cheaper, cleaner and tighter than is possible with tin. Will not burn in the sand.

Bassite is not a theory—not an experiment.
It is a practical success—Tried and Proven.
Does this difference in cost interest you?

Tin at 30c. per lb. Quantity one ton, Total.....$600.00
Bassite at 19c. per lb. Quantity one ton, Total....380.00
Actual saving in cost per ton being.....$220.00

Send us your trial order. No pay if unsatisfactory. Bassite will do just what we claim for it and we will stand back of our proposition to you. Try us.

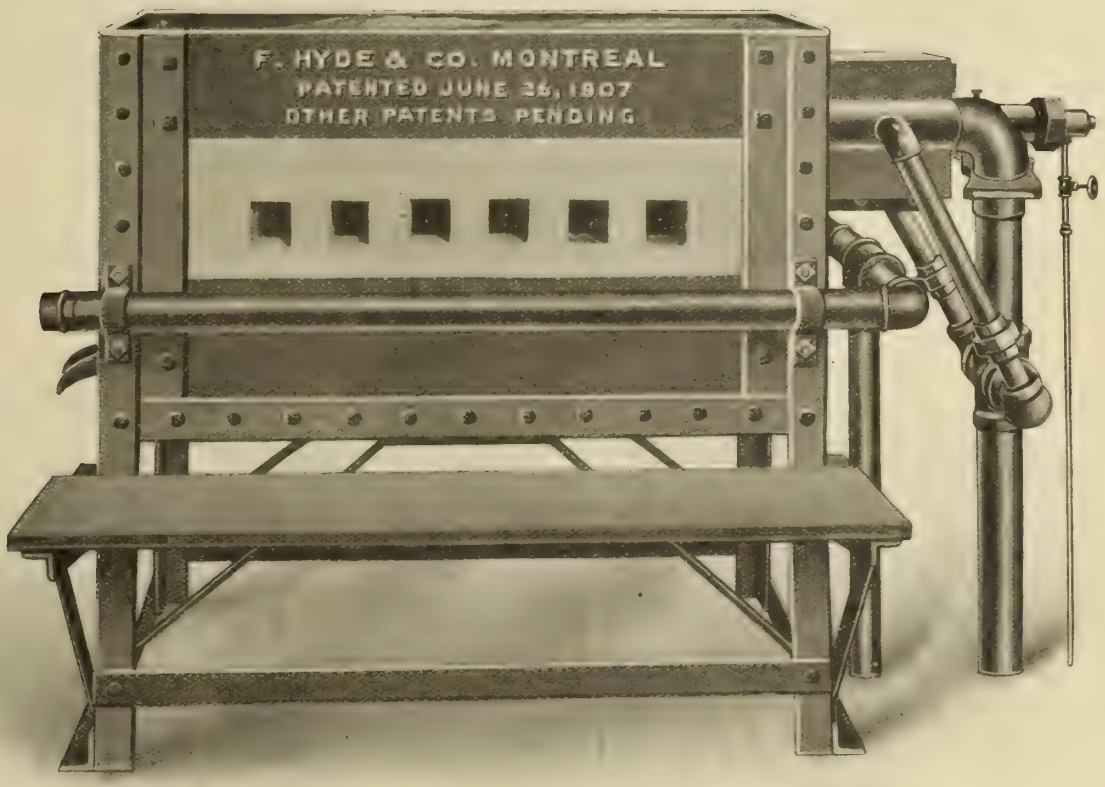
DOUBLE EFFICIENCY

is secured by using

THE KING POWER HAMMER FURNACE



Constructed to be operated from both sides, it actually does the work of TWO furnaces, and long material can be run right through.

The burner and combustion chamber are in full view of the operator, and the burner is so placed that it cannot get clogged. The oil fuel is changed to gas in the combustion chamber, before it reaches the main chamber, thus ensuring **complete combustion** of fuel, and a uniform intense heat.

It is ready to operate five minutes after lighting, and requires but little attention. It will be found to

DECREASE SHOP EXPENSES and INCREASE THE OUTPUT

We make these Furnaces to suit ANY shop conditions, you don't have to suit your shop to the furnace.

MANUFACTURERS OF

Crucibles of Quality

NO FOUNDRY CAN MAKE GOOD
WITH POOR CASTINGS.

The advantages in the use of STEVENS' GENUINE EAST INDIA PLUMBAGO are all the possible advantages that come from the use of the very best facing known to Foundry Practice.

The price is never above the quality, and quality means saving all around—in time in finishing and dressing the mold—the casting coming out so clean that the cost of chipping and cleaning is saved, and so it goes right on towards pocket-book popularity.

The element of quality permeates everything I manufacture, and I manufacture FOUNDRY FACINGS and SUPPLIES, POLISHERS' COMPOSITIONS and PLATERS' SUPPLIES.

Everything for the Foundry from a Dust Bag to a Cupola

That's a large order to be sure—**but we can fill it all the same.** Our range includes every appliance used in modern foundry practice. We can fully equip a foundry from top to bottom, inside and out. We are the **only** manufacturers in Canada of

Foundry Facings

We import the genuine Ceylon Plumbago in large quantities, refine and grade it by our own specially designed machinery. We are so confident of the superior quality of our facings that we **guarantee** them to give **entire satisfaction** or they may be returned at our expense—**we paying the freight both ways.** No guarantee could be stronger than this!

We are now manufacturing the unbeatable

"Climax" Core Oil

in our Hamilton factory. It is quick drying; relieves freely from the casting; makes no smell; will not draw moisture; will mix from 40 to 75 parts of sand to one of oil according to sand used and strength required. Cores made with "Climax" oil will not break or blow.

Power House at Decew Falls of Dominion Power and Transmission Co., Ltd., and Lincoln E. L. and P. Co., Ltd.
2½ miles from St. Catharines, 100,000 H.P.

WHY? BECAUSE——

1. TWENTY-EIGHT PLANTS have located here for good reasons—most of them Metal-working Industries.
2. ELECTRIC POWER is cheaper here—right where it is made—than elsewhere. Less than one-third the cost of steam.
3. WATER SUPPLY is from Lake Erie, with a head of about 200 feet.
4. FREIGHTS are as cheap here as if we had 100 railroads. BESIDES, you can use our port for water shipment to all great lake points and to salt water.
5. LABOR Good supply of skilled mechanics and laborers. Cost workmen own their own homes. They come to stay.
6. SITES are available for YOU to choose from, all good ones, and to be got at figures and terms which are big inducements.
7. INCIDENTALLY—We are one hour (by electric and steam railways) from Niagara Falls and Hamilton.

ALSO—St. Catharines is the market and shipping point for Canada's Greatest Fruit District——

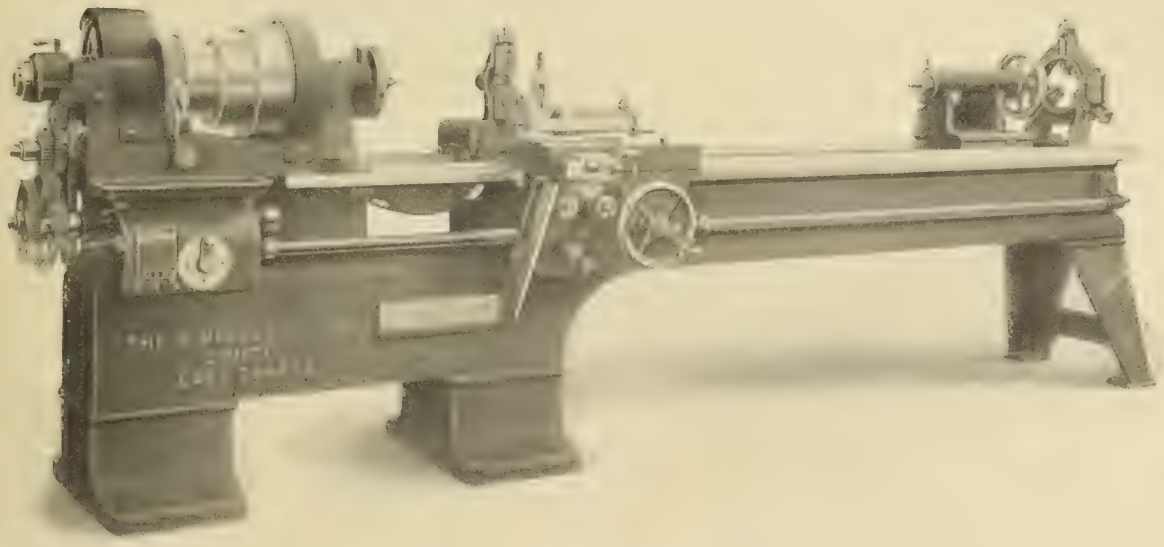
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.
